3. It is a notable sign of the times that there have of late been no discussions, even, of the right of a voter to "scratch" the ticket of his party. A large proportion of the Republican voters of the State of New York, where the reaction against the administration was most violent, wasted no time nor scruples in the matter of scratching the ticket "the machine" had prepared for them, but deliberately and eagerly deposited their votes for the candidates of the party to which for a life-time they had been opposed.

4. Recent events have proved again that the machine methods of party government do not develop leaders capable, on occasion, of taking broad, statesman-like, and saving views. Men that are adepts in packing a primary, running a convention, and using the spoils-system for purely personal ends, naturally fail at the very moment when a certain moral penetration is needed. Such men can count only upon the votes they purchase, either directly or indirectly. They necessarily have a low opinion of human nature, and do not allow its proper weight to those strong human elements—conscience, and a sense of decency. They forget even the universal faculty of memory, which, though sometimes obscured, still exists and holds fast, for instance, such deep political, as well as personal, impressions as were made upon millions of minds by the assassination of President Garfield.

5. Not only do our modern machine methods fail in producing accomplished leaders, but they appear to have a steadily deteriorating effect upon the brains of the whole set of managers, great and little. The spoils-system makes a certain kind of success comparatively easy for unscrupulous men ; but it would seem that the more experience a partisan manager has in the spoils-system, the more unsafe does he become as a partisan manager.

That the great political reaction of 1882 had no mere partisan significance, no one has been more quick to see than the gentleman who has been elected to the Governorship of New York, by a vote unprecedented, we believe, in American politics. On the very night of the election, Mr. Cleveland is reported to have said that the revolution meant not so much the turning of public sentiment to the Democratic party as it did dissatisfaction with the Republican party. "The change," he added, "means reform and good government!"

If Mr. Cleveland and his party throughout the country live up to this programme of "reform and good government," they will have a long hold of power ; for the revolution just accomplished (with some regrettable and grotesque accidents, as in all revolutions) had this programme for its main object. It is evident enough now that the people are disgusted with a party that has lost its sincerity ; that pretends, but no longer performs ; that, from being a party with a moral purpose, has been changed by its leaders into a party with an immoral purpose. The people demand "reform and good government," and, if they cannot get these from one side, they will get them from another ; and if they cannot get them from either of the two great parties which now divide the suffrages of the nation, they will dismiss them both without remorse, as in past epochs, and will create another party to do the work. But whether or no we have a new party, now is the time for new men. Power will not be willingly left in the hands of thrifty renegades to the cause of "reform and good government." In other words, the acceptable leaders of the next ten years will not be men whose conversion to "civil service reform" has been by earthquake.

### "Quantics."

A WRITER in the "St. James's Gazette" says that Professor Sylvester tells an admirably illustrative story about one of his students at the Johns Hopkins University :

"This aspiring youth wanted to become a mathematician ; and he had heard that at the topmost summit of the mathematical tree stood a mysterious subject known as the doctrine of 'quantics,' a calculus of calculi, only to be grasped by the very furthest stretch of the abstract mathematical faculty. So he came and asked to be taught 'quantics.' It was in vain that Professor Sylvester suggested simpler preliminary geometrical and algebraical studies ; the young man wanted to learn 'quantics,' and nothing but 'quantics' would he have."

This anecdote is intended to show that Americans are in haste to get on, and are not disposed to submit in patience to the training requisite for the highest success. This is true. It is the fault of hopeful, eager youth who see great opportunities opening on every side, for fame, for fortune, for usefulness, for

enjoyment. They aim at the best without always attaining to it. They see the rapid advancement which civilized society has made in the domain of a new continent, and they unconsciously participate in the rapid movements of the times in which they live. How could it be otherwise in a land like this,—especially if it be true that this century (as Dumas, the French physicist, has said) is to be known in history "as the age of electricity."

The criticism of the "St. James's Gazette" is, however, rough. It does not show any nice appreciation of the circumstances it discusses. Most English observers of this country judge it from afar—by the capitals in the newspapers, by sensational reports in telegraphic dispatches, by the foolish and provoking parade of personalities in political, ecclesiastical, and social affairs. Even the semi-authorized report of Herbert Spencer's impressions does not indicate that he has fully mastered the situation, though many of his comments are sound and sagacious. Nevertheless, all thoughtful Americans ought to, and they do, weigh, calmly and accurately, the criticisms which foreigners make upon our social life and its tendencies. Such remarks will include a great deal that is true and suggestive, with a spice of that which is false and provoking—but the digestion of it all will be wholesome.

Are the critics not right when they say that the Americans are unwilling to take the pains which are requisite to secure the highest results? Ask a college professor, for example, if the youth come up for matriculation well prepared; ask the editor what sort of manuscripts are offered for his inspection from writers who are eager to make their appearance in print; ask the elders in charge of a vacant pulpit if it is easy to find a new minister; ask in regard to medical education, what proportion of the young doctors annually graduated are fitly trained for their profession; ask for an architect to build a sightly and substantial public building; ask the school committee what sort of candidates offer for vacant places; ask the judges of portrait-painting how many true artists there are in this branch of art. Everywhere the answer may be heard: "many are called"—writers, teachers, artists, architects, physicians—but few are worthy to be "chosen."

So we go on, not so steadily, not so safely, not so wisely as we ought. But the country is so vast, the natural resources are so rich, the freedom is so delightful, and the inheritance so abundant of the best which the world has produced, that we are, as a whole, a happy and contented people. We might, however, be happier in the present if our capacities were more judiciously enlarged and educated,—and surer that the inheritance we possess would be handed down unimpaired to those coming after us.

Meanwhile, if it is necessary, for the sake of a verdict, that the defendant should answer the prosecutor, we may, perhaps, be allowed to add that the writer in the "St. James's" has replied in this article of his to the very query he propounds. He "wonders whether we in Europe, too, are ultimately to give way upon this silly prepossession, and to admit the equal power of everybody to discourse without previous preparation upon every conceivable subject at a moment's notice." The American readers of "St.

James's" can give him their impressions on this point. For, in his hasty and ill-tempered, though partly just, criticism, he has sought only for facts to prove his point.

We do not know whether the story about Professor Sylvester is true or not, but it bears the marks of verisimilitude. Yet, after all, it is no discredit to the country or the youth that there is such a preëminent professor of mathematics among us, and that his presence is inspiring even to those who are but tyros. We can tell a story which is suggested by that of the "St. James's." A few years ago a young school-master of Pennsylvania, sharing, though more wisely than the tyro, the American enthusiasm for the best things, and especially for quantics, went to Baltimore to study with Professor Sylvester, with this result, that before long the writings of that young man were used as a textbook in the University of Cambridge, England.

#### Christmas.

THE almost universal observance of Christmas can hardly be accepted as an indication of a growing interest in the Christian fact which it celebrates, when we remember that it is the one religious festival which not only combines the pagan and Christian sentiments, but in which the pagan sentiment speaks with a more obvious appeal than does the spiritual, to the purely secular side of our nature. The green boughs brought from the frosty woods to freshen our over-civilized homes, and to hide or enhance our restlessly decorated churches, re-awaken the instinct which, in barbarous ages, frankly claimed outdoor nature as the sphere of man's home and religion. The lighted tree, apart from any Christian association, has a charm of its own, fascinating to the veriest skeptic; and the Christmas cheer, the realizing of the gregarious instinct under conditions of civilized feeling, the intense recognition of human ties expressed in seasonable gifts, can hardly be claimed as the product of the purely Christian element in the day. Indeed we suspect that not a little of "Christmas joy" has no deeper source than a Pagan defiance of winter's cold, as though the heart should cry to its chilling demands: "I defy you! I shall revel and be happy in spite of you!"

It is evident that a festival making such an unmistakable appeal to the secular side of our life—the pagan side—offers it a tempting point of compromise with the spiritual significance of the day which many a secularist has already availed himself of. Men whose adjacency to the Christian religion forbids being quite pagan in feeling, and men whose paganism forbids being quite Christian in faith, find a sentimental use of Christmas sufficient. They would probably say: "While you Christians rejoice to celebrate your divine child born in Bethlehem, let us rejoice to celebrate all human births everywhere. Light your Christmas-tree in honor of your Christ-child, of whom we know nothing, while we light ours to shine upon the children gathered around our knee. Keep your legend or fact of the angel-song, the 'Peace, good-will,' the guiding star, the Magi bowing and prophesying at the manger. Enough for us the 'Peace, good-will' from lips that we know and love, that we see a star of hope above our own home, that

our best wisdom confesses childhood's power to bend it at its cradle." It is obvious, however, that such a sentimental use of Christmas indicates a practical rejection of Christianity as a spiritual force. It is only when anything ceases to be regarded as a power that it is accepted as a picturesque ornament. In religious matters, at least, sentimentalism is the evaporation of power; and, in this growing use of the great Christian religion might become should faith in its spiritual force become universally extinct. The unbelieving world would retain it, as the sentimentalist does now, to supply, with the satisfactions of an exquisitely picturesque mythology, those gentler feelings of our nature for which the energies of civilization make no provision. Christian people of a theological cast would be surprised to know how many have already turned over their religion from the conscience to the taste, and how many more are beginning to reject it, not so much as a disproved as an exhausted religion. The old-fashioned "infidelity" which claimed that Christianity was a delusion from the very first, has given place to the idea that whatever moral power it may have had has spent itself, and that the real center of ethical life is elsewhere. Fifty years ago an "infidel" was always suspected—often justly—of denying the Christian faith in order to escape its judgment upon his own ill-regulated character. To-day a skeptic is more likely to justify his denial for the opposite reason, that Christianity fails to exert the moral power claimed for it. Very few, perhaps, hold this view as a reasoned conviction. It is rather a feeling, partly fed, perhaps, by the modern ideas of development and evolution which enable us to think of humanity as having outgrown so many of the forces which once ruled it, but a feeling whose strength is shown in the way in which so many are beginning to treat the Christian religion as of only picturesque value, to be discarded by everything in our nature more serious than the requirements of taste.

What is it in the popular religion of our day which has made it possible for such a suspicion of its moral exhaustion to grow in the midst of every so-called religious community? For although those who hold to the Christian faith have a right to ask those who reject it: "Have you tested its moral power by the final test of trying to live up to it?" such a challenge has no weight unless it suggests to the doubter a clear idea of what it is he is asked to live up to. It is the fault of Christians themselves if no such clear idea challenges the moral skepticism of the age. Certainly it will be their own fault if such skepticism does not force them to some sort of unanimous statement of what it is in their religion which must be tested by the moral necessities of mankind.

In the meantime, the power of Christianity remains a fact quite apart from the insufficient account of it given by the theories and practices of nominal believers, a fact which any intelligent person can test for himself, letting it exert in his life whatever power it has. The moment a man of mental integrity and moral earnestness determines to apply that test to Christianity before discarding it, he will find his determination the best guide to its real power. He will find his attention gradually fixed, not upon a sys-

tem, theory, code of laws, or a church, but upon a divinely human life radiating its inspiration in every age. He will discover that what he is to accept or reject belongs, not to the region of ideas, but to the region of fact. He is to reject or accept the personal influence of the Christ whose name is in all the Christmas airs, and chimes, and carols, as his spirit is in all humanity. He is to test and decide whether that life is or is not an exhausted power,—is, or is not, to be classed with the forces which the world has outgrown. Perhaps, in such an earnest attitude, his first discovery will be of his inability to pass final judgment upon the moral value of such a being. And then, as what is best in him opens to that divinely human appeal that calls from life to life, which never reached him through any of the formulated aspects of religion, he may discover that his reluctance to judge it springs from the fact that his deepest moral nature is still swayed by the very force which he once suspected of exhaustion. Such an earnest inquirer will find it easy to see how the exhaustlessness of Christianity's ethical power means only the exhaustlessness of the life at the center of it, which is itself the realization of our highest ideal. From the heart of this mighty fact of a perfectly realized life, presented as the perpetual standard of all life, issues the most universal and the profoundest encouragement that ever spoke to man—the encouragement of a divine faith in the capacity of his moral nature to adjust its desires and energies to the requirements of that standard. Here we think is reached the essentially invigorating force of the Christian religion. It shows to the universal conscience the personality of Christ as a living statement of the highest moral demand possible to be made upon human nature, and also as a living expression of the divine trust in every one's ability to respond to it.

The question of discarding Christianity, therefore, is the question of discarding an aid to moral effort which no mere system of ethics, however evolved, claims to supply,—the attractive power of a life, perfectly realized and yet in closest sympathy with the most initial desire to adopt it as the standard and inspiration of one's own character. It is hard to understand how an earnest man, who sees that the character and personality of Christ constitute the radiating center of Christianity, can discard so august a thing as though it were outgrown, until he has tested it for himself, or, in the language of common sense, has tried to live up to it. We are familiar enough with the story of intellectual reactions from Christian philosophies and theologies as powers outgrown, but we wait in vain for the man who can look the world in the face and say: "I have judged Christ himself at the bar of my conscience and found him and his ideal insufficient." Who can tell us that he has outgrown the character of Christ?

Unless Christmas has already degenerated to a pagan holiday, it surely has a special meaning for those who are beginning to suspect that the religion of the Son of Man has exhausted its power. It is the one festival through which the "highest, holiest manhood" looks into our life, claiming recognition from what is holiest in us all. As we put aside the accessories of the day and look at the heart of it, we hear an inspiring call, which, through the philosophic con-

fusion of the age, finds our conscience, as a brother's voice might reach us through the tumult of a crowd. No one keeps Christmas, nor hears its true carol, until he sees that vision. He who, having seen it, rejects it

as an exhausted spiritual force, has not so much judged Christianity as confessed himself incapable of responding to the most inspiring appeal possible to be made to the spirit of man.

## COMMUNICATIONS.

### "The Growth of the United States."

BOSTON, MASS., Oct. 17, 1882.

EDITOR OF THE CENTURY MAGAZINE.

SIR: In the article on "The Growth of the United States," in the October issue of your magazine, on page 924, I am sorry to note that one hypsometric group dropped out of my statement of the distribution of the population of the United States according to altitude.

The figures for the several groups should be as follows:

Under 100 feet.....	9,152,296
100 to 500.....	10,776,284
500 to 1000.....	19,024,320
1000 to 1500.....	7,904,780
1500 to 2000.....	1,878,715
2000 + .....	1,419,388
	50,155,783

Truly yours,

*Francis A. Walker.*

### "Lincoln's Height."

EDITOR OF THE CENTURY MAGAZINE.

SIR: I have read the communication in THE CENTURY for October, and can only reiterate that Abraham Lincoln was just *six feet one inch* when I measured him in April, 1860. As before stated, I placed him back against the studio wall, and made a mark over his head, as I had done in the case of Senator Douglas, two years before. I measured from the floor up to the mark several times, in order to be sure I was right, desiring to know the exact difference in the heights of these two men, which was just twelve inches. I thought Mr. Lincoln fairly erect when I marked on the wall. Possibly he might have stretched up an inch or two higher, but at that date it is hardly possible he could have expanded three inches in length! I am now reminded of a story told me while at Springfield, a few years since, of Mr. Lincoln's faculty for stretching himself out in length. I did not know of this, however, at the time I measured him, or I should have requested him to give his fullest height. The following is the story:

A wager was made one day in Springfield, between some friends of Mr. Lincoln and of O. M. Hatch, late secretary of the State of Illinois (also a tall, slen-

der man), as to their relative height. Mr. Hatch was first placed against the wall, so a mark could be made over his head, Mr. Lincoln remarking, at the time, "Now, Hatch, stand fair." When the mark was duly made, Mr. Lincoln was placed beside it, and at first Mr. Hatch's friends declared that they had won the wager. "Wait," said Mr. Lincoln. "The mark is not yet made for me." Then he began to stretch himself out like India rubber, and went nearly two inches above Mr. Hatch's mark, carrying off the stakes amidst the shouts and laughter of the bystanders.

In the model of the statue I made of him in 1878, I represent him six feet three and a half inches high, which is over his real life-size.

Mr. Lincoln looked taller than he really was, owing to his thin, bony, lank form.

*Leonard W. Volk.*

### "The Taxidermal Art": A Correction.

EDITOR OF THE CENTURY MAGAZINE.

SIR: In the December issue of your magazine a clerical error has crept into the article on "The Taxidermal Art." On page 232 is Mr. Beard's illustration "Woodcock and Young," the mounting of which is credited to me. I beg to state that the beautiful little group so graphically represented was mounted by Mr. Thomas W. Fraine, of Rochester, N. Y., and is the result of a careful study of the live birds in captivity. I am unwilling that Mr. Fraine should be denied the honor and the right of having his name appear with his work, or that I should be the recipient of credit which belongs to another.

Very truly yours,

*William T. Hornaday.*

WASHINGTON, D. C., Nov. 23, 1882.

[We are also informed that the Harlequin duck, represented in the same article, was mounted by Mr. Scott, and not by Mr. Webster. These gentlemen being unknown to us, special care was taken to give the proper credits, and we regret exceedingly that our desire to do justice to the taxidermists in this respect should have been thwarted by misinformation. ED. C. M.]

---

## LITERATURE.

### Howells's "A Modern Instance."\*

OUR most artistic novelists seem to have cut quite loose from the old-fashioned story, which was, perhaps, more romance than novel, and to have settled down to steady observation and reportorial reproduction of what is open to the action of the senses. This seems to be a part of the movement of the times. Whether the reportorial element thus introduced into novel writing is to be an improvement or not depends, of course, on the supplementary equipment of our writers. Mr. Howells undoubtedly bears the palm at present as a reporter, and adds to his skill in reproducing manners what seems to us a most essential and happy humor. Mr. Henry James, whose reportorial faculty is less keen, but whose constructive power is greater than that of Mr. Howells, has, in place of the latter's lively sense of humor, an intellectual alertness stimulated into wit under the influence of a foreign school. Wit, both polished and in the rough, is sufficiently plenty with us; yet, after all, it is more native to France, while humor, genial and warming, is the one thing the American novelist is likely to find in himself and his material. It covers a multitude of sins in constructive art, and is perhaps the most valuable among the many happy gifts of the writer of "A Modern Instance."

In this novel, Mr. Howells excels himself as a reporter of manners and customs, and yet does much more. His range of characters is wider, extending over a larger field of New England life, and covering it better. The life in Equity, though a little thin, is admirably portrayed, and is a life common to New England villages, so that Equity may be set down almost anywhere from Maine to Western Massachusetts. The "courting" customs, the "sitting-up," the sleigh-ride, the relation between the girls of the printing-office and the Marcia Gaylords, the part played by the Marcias and Sally Morrisons in the village coquetries, the Gaylords at home, and the family life that gets cornered in the kitchen, the Squire's saturnine manners, Bartley Hubbard's spruce dandyism and Yankee smartness,—these are all prevalent traits in village life. They are minutely detailed, and the picture given is intensely real, as far as it goes, although one who knows New England rural districts well, would be inclined to complain that it is spare in the kindlier elements; more of the jovial quality, the youthful spirit of fun, the warmth of the winter fireside, the customs handed down among the people, which give zest to social life—even to winter social life in the country, and which the outsider can scarcely penetrate—would have made the picture richer in interior effects; and the New Englander, recalling his youth in the old homestead, and the essential honesty and solidity of the home enjoyments, will feel that the author has got at the inner experiences only in a limited way. This feeling

indeed is kindled by most of Mr. Howells's reproductions of social life. In this particular instance it will be felt that, in choosing a "moral to adorn his tale" he has missed many a possible tale that would have suggested a more pleasing moral. It is the business of the reader, however, rather than of the critic, to quarrel with a writer's subject. It is enough for the latter to say how far the subject, as chosen, is worthily treated.

Certainly there could be no more conscientious gathering of material than Mr. Howells shows in this case. The detail is exceedingly full and effective. The sale of the buggy, the restaurant experience, and the pursuit of a boarding-house in Boston, the reportorial venture at the "Events" office, the shifts of a needy man to get a living, and the final scene in the divorce-court in Indiana, are close and perfect work in the minute style of the present day. Marcia as a housekeeper, and as a "baby-tender," her economies, her motherly anxieties, her jealousies, — which may be petty, but are after all the stuff out of which daily life is too often made,—these finish the picture of a faithful, devoted woman of restricted sympathies, which, in its way, is not surpassed by anything we have seen.

When we pass from the report of manners to the working of passions, the novelist widens in his range. The staple of his work heretofore in the passions has generally been those trifles of temper which make a large sum in the end, but which show irritability rather than deeper currents of character. In tracing these, he has shown himself more than once a master. Indeed, in "A Modern Instance," these make a larger element than the reader who reads for development of plot, or for strong, underlying qualities of character, finds pleasing. But here again the critic is obliged to confess that the Marcias and Bartleys of life have little else than irritability for passion, and petty outbursts of temper for emotion—so that the author, having chosen his theme, has perhaps rightly chosen his treatment. The picture is still true to the life, as far as it goes. The lovers' quarrels, Marcia's sudden gusts of jealousy, are of the order of "trifles light as air," but they make the prevailing currents of the book,—to be smiled at, when continued over the reading a long period of time, but trying, when the story is read at a sitting. Mr. Howells's chief rise in the present work is in the touches of deeper passion, of which there are more and better specimens in "A Modern Instance" than in any of his previous work. He has warmed up to the value of continuous and deep-seated forces in human action. We have hints of these in Kinney's strong sense of friendship and in the intensity of his wrath when he finds that liberties have been taken with this relation; in Squire Gaylord's rooted disgust with Bartley's methods, ending in that almost Indian implacability of revenge which costs Bartley his case in court, and the Squire his life. But the best evidence we find of a growing strength on the part of Mr. Howells, in depicting the

\* A Modern Instance. A Novel. By W. D. Howells. Boston: James R. Osgood & Co. Edinburgh: David Douglas.

passions and emotions, lies in the devotion of Ben Halleck to Marcia. While it is difficult for the reader, as it possibly was for the author, to sympathize with Halleck's passion, yet the picture of the working of his love is powerfully drawn. The unsatisfactoriness of the passion, it must be said, results mainly from the inadequacy of its object; but this is not the fault of the story-teller. One notes among one's acquaintances how frequently inadequacy of object may be charged against the noblest affections. There are plenty of men and women who offer the roomy accommodations of a large nature to beings capable at best of filling only a small corner of the space wasted on them. That Mr. Howells should have chosen Marcia for Halleck, and Miss Kingsbury for Atherton, to love, is therefore the reader's quarrel and not the critic's. It is a way with Mr. Howells, as it is also with Mr. James, and unhappily too often a way with the world,—which last is very probably the only justification that either of these genuinely worldly writers could offer to the unsatisfied public.

When he passed from social manners to social morals, Mr. Howells took a bold step, but in a path where he was most likely to succeed. Moral disintegration, like Bartley's, hinges only too often on trifles, and moves on trifles; and ultimate "incompatibility" in the marriage relation is reached in too many cases by processes which Mr. Howells is an adept in tracing,—processes which not only leave outward signs, but are sometimes almost wholly made up of outward signs. At any rate, to this path the author keeps. Bartley's fall and the final ruin of his family life hinge on small things. A little success at the right moment might have sent him to Congress instead of to Indiana. He would have been a "smart" politician, to be sure, for that was his build. But instead of fleeing to the woods, he might have taken a permanent residence under the gilded dome of a certain State House. The lesson of his fall is one of small incidents, and comes but slightly within the range of large social problems. But Atherton's morality and Ben Halleck's over-indulged passion are of higher interest. They are made to represent settled social tendencies, and without "taking sides" himself too strenuously, the author still holds up a high and saving moral standard.

Judging Mr. Howells's present story, then, from the point of view of his previous work, we find in it even greater precision and niceness of detail, an artistic finish of parts and conscientiousness of study,—in all of which he excelled before. We find it more varied as a study of individual character. The humor is less trifling, or, perhaps we should say, less external. In Kinney, it strikes a deeper vein, and is allied to stronger character,—a peculiarity of humor in the Eastern States, where it is imbedded in nature, and is not the product of reading. We find a higher moral purpose. Heretofore Mr. Howells has seemed to be trying to amuse us with the "fleeting show" of things. His view of life, with one or two exceptions, has been that of the watering-place and the railroad. "A Wedding Journey," "Private Theatricals," "A Chance Acquaintance," "Dr. Breen's Practice," were delightful work, but they were of the wayside. The present work is episodic, and we see in the chapters on the "loggers' camp," and in the boarding-house and printing-office scenes, charming material from the old note-books,—capital reading, but for the most part

extraneous matter, and detrimental to the story as a work of art. But with this exception, the story-telling power has increased, and the hold on interior life is firmer.

But one quarrels with all the realistic novelists on just the ground which they seem to think their strongest. They begin, like the scientists, with what they can see and test,—what yields material results, and they end there. They give too little credit to what the mind, by its idealizing processes, adds to character. What a man would like to be is just as much a part of his real life as what he seems to be, and it is after all what he hopes and aspires to be, what in his heart he is in his best moments, that makes him a worthy object of contemplation. Dickens and Thackeray and Scott, and most of the old novelists, recognized this. They were inspiring writers, because they embodied the *possible* virtues, as well as the actual. Man gains a knowledge of anatomy by stepping aside into the dissection room; but the great majority of readers could forget anatomy, especially morbid anatomy, and be the better for it. We have in Thackeray's *Becky Sharp* the most bitter satire in fiction, but, nevertheless, "*Vanity Fair*" is not an altogether depressing book. It leaves our possibilities to us untouched. There is a generous complement of good, deep human life that has not been spoiled, and an incitement to simple living that is all the more keen for the sharpness of Becky's fall. The virtues are not made hard and dry; they are not austere and unfruitful. There is probably, to most of us, far less stimulus to virtue in seeing the wicked punished than in seeing the righteous rewarded. But to see both good and bad alike go down is depressing. To see Isabel, in "*The Portrait of a Lady*," stranded on Osmond, or Guyon, in that charming novel of "*Guernedale*," snuffed out by Phil Symonds's marriage to Annie, or Ben Halleck's pitiful deformity covered with sackcloth and ashes,—will it reform the bad or comfort the good? Will not the ugliness of sin be shown more successfully by the sharp contrast which genuine and not impossible virtue makes with it? We cannot help thinking that more saints have been made by the Madonna than by the Inferno. If this view is a correct one, as it certainly is an old one, is not the present school of novelists making a mistake in giving us too much of the crabbed harshness of fruition, and too little of the sweet fragrance of blossom-time? Have they not some strength of virtue to get from George Eliot, some beauty of sympathy to discover in Dickens, some genial and manly affection to find in Thackeray? Mr. Howells has many qualities fitting him to find in New England life both nobler virtues and uglier vices than any he has yet made out. That life has its charms and beautiful attractions. It has customs as unique, quaint, and pleasing, as any in Old England,—relics of old English customs, perhaps, with a smack of the new soil. It has women refined and beautiful, warm-hearted, high-souled, courageous. It yields, to be sure, its hard, reticent Squire Gaylords, its narrow, unbalanced Marcias, its shaky, disreputable Bartleys; but it yields also energetic merchants, upright statesmen, high-minded scholars, a yeasty quality in politics, an exquisite sentiment, a beautiful philanthropy. We miss this phase of New England life in Howells. Perhaps we have no right to

censure the novelist for not choosing to depict it, but we miss it all the same. Our people are continually saying, "We have been represented long enough by our showy men and women, by our ostentatious orators, by our gambling politicians, by our rakish young men and our thin society girls." The men who have made our greatness, and the women who have adorned it, are, as yet, by this new school of writers—the ablest school since Hawthorne—left almost untouched. It has been the interest of the makers of opinion abroad often enough to keep this side of our life in view, and to ignore the other side: but should it not be the work of our writers, having in view both home growth and the nation's repute abroad, to bring out some of the better phases of our interior life? If we were to be the gainers eventually in character by these depressing confessions, we might take kindly to them; but have we not for all purposes of home profit made a sufficient exhibition of our weaknesses? The coming American novelist must show us not only our lightness and frivolities, but those deeper and grander national forces that carried us strongly through a most terrible civil war, and that have made it possible for us to take in—if we have not yet altogether digested—five millions of Africans, and five millions of England's most tempestuous subjects, and that have still left us sufficient vitality to hold the American continent mightily under control. This work has been done by strong men, and the great coming novelist will find a way to tell us of them.

#### The Plays of Mr. Bronson Howard.\*

If we are beginning to have in America a little band of novelists who know their trade, and whose workmanship is as clean, and as fine, and as skillful as any in Europe, it is largely because of the American magazine in which the writer of prose fiction can practise his 'prentice hand. It is not that the American magazine accepts the serial stories of the beginner in fiction. Far from it; but it is glad to welcome work less ambitious and less exhausting to the untried and untrained hand of the novice. There is nothing an American magazine more earnestly seeks for than a short story by a writer who has eyes to see, and wit enough to find something worth seeing. From the sketch and the short story it is easy to pass to the novelette in two or three parts, and from this to the novel is no great distance; and by the time the clever young writer of fiction is ready to begin his first novel, he has learned the trade of storytelling, and has taught the American public that he is worthy of longer attention. It is thus that Mr. James, Mr. Howells, Mr. Bishop, Mr. Cable, Mr. Eggleston, Miss Woolson, Mrs. Burnett, Mr. Aldrich, and Mrs. Mary Hallock Foote have tried and developed their powers.

But the American dramatist has no such opportunity, though he is in greater need of it: for the trade of play-making is far more difficult than the trade of novel-writing, and requires a longer apprenticeship. A comedy in one act may be taken as a fair equivalent of the short story; but where can any American

dramatist find a market for a comedy in one act? The shortest play that a manager will look at must have three acts. Thus the beginner has no chance to acquire gradually art and confidence and reputation by unambitious efforts. Thus, when he is at last emboldened to attempt a long play in three, four, or five acts, he is probably lacking in the experience and technical knowledge needed for so arduous an undertaking. Thus also, when he presents his play to a manager, he is plainly a novice, and a manager may well hesitate before risking the production of a three-act or four-act play by an untried hand. So it happens that while there are many practical playwrights in the United States,—adepts in devising the slight scaffoldings needed by some wandering "star" for his personal exhibition,—we have scarcely any trained dramatists. Now and then a novelist tries his hand on a play, and these plays sometimes succeed; but this success on the stage is nearly always due, at least in great measure, to the aid and advice of some one, either actor or stage-manager, who thoroughly understands the theater and its requirements. The hack play-makers who have all the stock devices at the ends of their fingers are not uncommon, and the novelists who can tell a story with no lack of merely literary merit are not uncommon; but the trained dramatist is uncommon, one who can set a plot on its legs so that it will run for weeks before the pleased eyes of the public, and who at the same time can clothe this plot with characters and dialogue worthy of serious consideration. Of the few, the very few, trained dramatists whom we have in America, Mr. Bronson Howard is the foremost.

Mr. Howard has written ten or a dozen plays, no one of which has been a dead failure, and four of which have been remarkable artistic and pecuniary successes. These four plays are "Saratoga," a five-act comic drama (1870); "Old Love-Letters," a one-act comedy (1878); "The Banker's Daughter," a comedy-drama (1878); and "Young Mrs. Winthrop," a four-act comedy (1882). The first remark to be made about these plays and their fellows is that they are all original. In these days, when so much of drama which speaks English originally spoke French, it is not a little pleasant to find one American dramatist who is resolutely self-reliant. Only one of Mr. Howard's plays is from the French. This is "Wives" (1879), which was avowedly derived from Molière's "École des Femmes" and "École des Maris," and which in fact was written chiefly to oblige the manager who produced it, and who had previously produced other plays of Mr. Howard's. All Mr. Howard's plays are his own; all of them are American in character and action; all of them reflect the life of our own time; all of them are endowed with what the American manager who introduced them to New York was wont to term "contemporaneous human interest."

Next to originality, the most marked quality of these plays is the technical skill of their construction. Mr. Howard is a working dramatist, and, in his plays, the merely literary feeling is subordinate to the dramatic. He is first of all a practical playwright, and a man of letters afterward, as were Shakspeare and Sheridan, Molière and Beaumarchais. His stories are told by a series of actions, not by haphazard narratives; and the spectator sees all that it is

\*Saratoga: a comic drama in five acts, by Bronson Howard. New York and London: Samuel French & Son. [Mr. Howard's other plays are not published.]

important and interesting for him to see. His characters are distinctly drawn, and they retain their consistency to the end. His dialogue is always direct and appropriate, rising to gentle pathos and simple dignity, and never falling into puerility or bombast. In a word, Mr. Howard knows his trade. He is master of the art and mystery of play-making. He has the grammar of dramatic construction at his fingers' ends, so that he needs no more think of it as he writes than a well-educated man needs recall the rules of English grammar. In a word, he constructs like a Frenchman. So well, indeed, are his plays built that they have successfully stood the trying voyage across the Atlantic, and the substitution of English surroundings for America. "Saratoga" was adapted to the English stage by Mr. Frank Marshall, under the name of "Brighton," and it has been acted over three hundred times in London, and at more than half a dozen different theaters. "The Banker's Daughter" was adapted to the English stage by Mr. James Alberry as "The Old Love and the New," and it has been acted at two London theaters more than two hundred times. "Hurricanes," a three-act farce (1878) was acted in London more than three hundred times as "Truth." It even happened that "Brighton" was taken across the Channel, and adapted into German and acted in Berlin.

The third quality of Mr. Howard as a dramatist is his humor. He has a distinctly American and delightfully easy humor. It is, perhaps, his strong sense of humor which has kept him from bombast and bathos in his serious dialogue, and from "sensation" and brutal effects in his construction. His humor is active as well as passive, and it informs his characters as well as his dialogue. *Mrs. Brown* in "The Banker's Daughter," and *Mrs. Dick Chetwynd* in "Young Mrs. Winthrop," are delightful humorous sketches of lighter American types. They are not in the least exaggerated, though they have the condensation which the stage demands. They have an airy grace and charm, too, and, with all their fantasies and humorous freaks, they have not lost any of their femininity. Consider, too, the frank and hearty independence of the heroine of "Saratoga,"—a lively, unabashed young lady, not without fascination, though Mr. Howard has drawn more finely since. Perhaps his most subtle female character, and the one in which his humor, though ever present, was most subdued, was the lady who made ready to return her "Old Love-Letters." There are touches in this play not unworthy of M. Émile Augier, by all odds the foremost of the French dramatists of to-day, with whose admirable and amusing "Le Postscriptum" it will well bear comparison. Mr. Howard's humor flows easily, without strain or effort. His dialogue is not encrusted with pert jests and punning gibes. It is as simple and direct in its humor as it is in its pathos; and it exists not for its own sake, but only to further the situation or to reveal character.

It is to be noted as a fourth characteristic of Mr. Howard's plays, that his dialogue is always cleanly. He has resisted the great temptation to make fun out of dirt,—a temptation which has overcome so many humorists. It is odd enough to be worth recording that "Saratoga" in Berlin, and "Hurricanes" in London, were thought to have a tinge, or at least a taint, of questionable mo-

rality, although in America the original plays had no hint of impropriety. "Saratoga," indeed, had a bold and lively story, which might easily have yielded a large crop of doubtful jests had Mr. Howard been so minded; but, as he wrote it, it is unobjectionable. It is a model of a Palais Royal farce in all but the impropriety, and its imbroglíos are to the full as ingenious and as comic as any of the dirty dramas of that most Parisian of play-houses.

The weak point in "Saratoga" was the introduction of a duel, or, rather, of seven duels,—a very comic circumstance, indeed, but practically impossible at a cold-water summer resort. The artistic defect in "The Banker's Daughter" was a certain stretching of the story, by the introduction of a very effective duel between a young American and an impossible Frenchman. This stretching, no doubt, made the play better suited to the theater where it was acted; but we are inclined to think that Mr. Howard's original version of this play, called "Lillian," and acted in Chicago and San Francisco, was a more shapely structure. Of "Old Love-Letters" this magazine spoke when it was originally acted, and it then gave a sketch of Mrs. Agnes Booth as the heroine.

Of Mr. Howard's latest work, "Young Mrs. Winthrop," produced at the Madison Square Theater in New York last October, space fails us to speak at length. It is an admirably made play, and its mechanical excellence is nowhere protruded. Its construction is symmetrical, and its plot unites simplicity and strength. The strength, indeed, is evolved out of the simplicity itself. The story has the interest of expectation, though every one might foresee and foretell the outcome of the opening situations: true dramatic interest is not aroused by deceiving or disappointing the spectator as to the end to be reached, but by leaving him in doubt as to the means whereby that end, however obvious, is to be obtained, and by choosing the freshest and best devices to reach the fixed point. Only second to the clean workmanship and constructive ingenuity of "Young Mrs. Winthrop" is the literary quality of the writing, which abounds in touches of tender pathos and strokes of playful humor. Though the sentiment never sinks into sentimentality, yet there is, perhaps, a little too plain an attack on the emotions. "Young Mrs. Winthrop" is an honest and honorable play, creditable alike to the author, the manager, and the public.

#### Shairp's "Aspects of Poetry." \*

PRINCIPAL SHAIRP, of St. Andrew's, who is also Professor of Poetry in Oxford, has here printed twelve selected lectures from a course delivered at the latter University, together with three essays originally contributed to "Good Words." The Chair of Poetry in Oxford has already enriched our critical literature with some of the most valuable essays of Mr. Matthew Arnold, Mr. Shairp's forerunner, and, like him, a Balliol College man. The comparison thus suggested can hardly be to the present incumbent's advantage, but it is perhaps high praise to say that he fills his trying position so creditably as to make the compari-

\* Aspects of Poetry. By John Campbell Shairp. Oxford: The Clarendon Press. Boston: Houghton, Mifflin and Co.

son impertinent, were it not that he continually recalls it himself by appealing to, or, more frequently, by dissenting from some view of his predecessor. His own point of view is quite independent of the Oxford tradition. In opposition to the fastidious culture of Mr. Arnold, he presents the popular, spontaneous quality of poetry. In particular he takes exception, and as we think quite justly, to the former's celebrated dictum, that we can hope for no great creative epoch in modern English poetry until the soil has been first prepared by a thorough critical movement. What he says on this head in his chapter entitled "Criticism and Creation" is obvious, but also, we think, true. And no part of it is truer than the passage in which he describes the chilling effect of the academic atmosphere on original genius: "For those on this side of graduation, whose manhood is harnessed into the duties of the place, what between the routine of work and the atmosphere of omnipresent criticism in which life is lived here, original production becomes almost an impossibility. Any one who may feel within him the stirring of creative impulse, if he does not wish to have it frozen at its source, must, before he can create, leave the air of academic circles." This is written of Oxford, but there are many who could testify that it is equally applicable to Harvard and Yale.

Those who have read the author's previous book "On the Poetic Interpretation of Nature" are already familiar with the position which he takes in the warfare of critical sects which has become such a burden of late. They need not be told that he has no belief in the theory of art for art's sake or the moral indifference of art; that he denies beauty to be the sole criterion of poetry, or the giving of pleasure to be the sole or even the highest aim of the poet; and that he has a rather deficient sympathy with all kinds of poetry which contain no ethical or religious wisdom. It is strange that this question has been so tediously debated. It lies in a nut-shell. A poem may be beautiful but unmoral (not immoral); but it cannot be moral and unbeautiful, for then it ceases to be a poem. That is, beauty is of the essence of poetry, morality is its accident. But when it is asked if beauty of a spiritual kind is not superior to beauty of a merely sensuous kind, the answer may easily be given: yes, if the degree in both is the same. Whether, for example, the sentence,

"Virtue could see to do what Virtue would,  
By her own radiant light, though sun and moon  
Were in the flat sea sunk,"

is better poetry than these lines from the same poem,

"And airy tongues that syllable men's names  
On sands and shores and desert wildernesses,"

is a question which every one must answer for himself. If the glow of spiritual satisfaction produced by the former is equally intense with the excitement of the imagination caused by the latter, then it might be fair to say that the former was the nobler passage and would give a more permanent pleasure. But it is difficult or impossible in many particular instances to balance such very different kinds of pleasure against one another in quantitative scales. The insistence on this and similar questions in the lectures

entitled "The Province of Poetry," "The Spiritual Side of Poetry," and "The Poet as a Revealer," seems to us, therefore, wearisome and unprofitable; all the more so because Mr. Shairp, though a respectable critic, is evidently not a thinker of original insight and has nothing new to add to the discussion.

With his theological prepossessions and his doctrine of the true province of poetry, our author could not fail to be a devout Wordsworthian. Not only in the chapters on "The Three Yarrows," and "The White Doe of Rylstone," but in scores of citations and references throughout the book, it is made manifest that Wordsworth is his *magnus Apollo*. On this ground he is at home, and writes with an authority begotten of long study and strong love of the poet's works. The essay on "The Three Yarrows" seems to be the result of material accumulated by Professor Shairp while preparing his introduction to Dorothy Wordsworth's charming "Recollections of a Tour in Scotland," first published in 1874. Where he treats of poets or poetry outside the somewhat narrow range of his literary sympathies, he writes less confidently and is seldom illuminative. His mention of Keats has always a perfunctory air, and his lecture on Shelley is entirely inadequate, save in so far as it reproduces the ideas and often the language of R. H. Hutton's admirable study of the same subject. Of this indebtedness, of course, he makes due acknowledgment, but it is hard to see why he should have felt called upon to print anything at all on a theme so uncongenial that he is forced to treat it at second hand. That Professor Shairp is a patriotic Scot, appears from the chapters on "Scottish Song and Burns," "The Poetry of the Scottish Highlands," "Modern Gaelic Bards," and "The Homeric Spirit in Walter Scott." The last is an effort to get a reversal of the judgment which the consent of critics has passed upon Scott's poetry,—a judgment best summed up perhaps in Carlyle's essay on the subject.

The freshest thing in the book is the account of Duncan MacIntyre. This last survivor of the genuine old Gaelic bards—who died in 1812—was a forester on Ben Doran in the estates of Lord Breadalbane. He could not read or write, but carried his songs in his head. He was the poet of glen and corrie, of the shealing and the misty Ben; and his songs were composed to pibroch tunes. Specimens of translations from these are given by Professor Shairp, which seem to render the engaging simplicity of the originals with sufficient faithfulness to enable the non-Gaelic reader to judge of their contents and style. We subjoin a few lines from one of them:

"Yestreen I was on Ben Doran  
Which I had good right to know—  
I saw all the glens beneath me  
And the Bens loved long ago.  
Bright vision it used to be,  
Walking on that mountain ground  
When the sun was in gladness rising  
And the deer were bellowing round.

Joyous the frolicsome herd  
As they moved in their jaunty pride,  
While the hinds were at the cold hill-wells  
With their dappled fawns by their side;  
The little doe and the roebuck,  
The black cock and red grouse-bird,  
Their voices were filling the morning air—  
Sweeter melody never was heard."

## Frothingham's Memoir of George Ripley.\*

THE editor of this series is giving a generous construction to its title. Ripley has hardly a place among American authors, though he was emphatically a man of letters. He belonged to that army of toilers with the pen whose work, however useful for the needs of the day, makes little claim upon the morrow. As translator, reviewer, compiler, through a lifetime of nearly eighty years—during the last thirty of which he was the literary editor of the "*Tribune*,"—Ripley produced an amount of manuscript which it is fearful to contemplate, and yet he never wrote a book. As the veteran reviewer of our daily press he long enjoyed an honorable and authoritative position. His critical work was honest, conscientious, and, above all, kindly. Still, for a man whose business was with literature, he was singularly devoid of the literary gift. Mr. Frothingham admits that he had no impulse toward original creation. His papers in the "*Dial*" and elsewhere are heavy and without any grace of style. Even as a critic he had judgment rather than taste, which Mr. Lowell calls "the negative side of genius." He did not make criticism a fine art, as Mr. Matthew Arnold, Mr. Lowell, and others have done. He remained an excellent newspaper reviewer, and never became a critic in a high sense. In fact, to put the matter succinctly, Ripley had understanding, knowledge, and industry, but not a spark of genius.

And yet the most interesting episode in his career, and that which will make him longest remembered, would seem, at first sight, due to the promptings of one of those sudden impulses to which the temperament of genius is most liable. Ripley was thirty-nine years old when, as Carlyle put it, he "left his pulpit in order to reform the world by cultivating onions." The Brook Farm Community was the poem of his life. For five years he worked unremittingly through all manner of drudgery, practical details, and "cold obstruction" to make his ideal come true. Nathaniel Hawthorne was one of the original stockholders, but his attitude toward the experiment was curiously different from Ripley's, and illustrative of the wide distance between the purposes of the earnest social reformer and of the poet who takes a merely artistic delight in strange conditions of society and unusual combinations of men, women, and things. Hawthorne remained always a spectator. He had, under his idealism, a merciless keenness of vision, which made him foresee the failure of an enterprise that lay so close to Ripley's heart that he could not admit a question of its success.

The letters which Mr. Frothingham gives us, written by various inquiring spirits to the founder of Brook Farm, show better than anything else perhaps could do, the highly electric state of the atmosphere in 1840. Brook Farm was not precisely one of those communities where "everything was common but common sense," but it of course drew the eyes of all the long-haired. These letters which "voice the enthusiasm of humanity," which Mr. Frothingham tells us was in the air, would now, we fear, be regarded as the productions of "cranks." In delightful contrast with them is a canny letter from Emerson, whose

"wise smile" becomes almost visible in the following paragraph:

"4. Mr. Hosmer disbelieves that good work will continue to be done for the community if the worker is not directly benefited. His boys receive a cent a basket for the potatoes they bring in, and that makes them work."

Alas! yes. And such is human nature and such will remain, though all the Socinian ministers in the land desert their pulpits for the onion-beds of Ephraim. Nevertheless, Brook Farm was a noble dream, and has left a broad track on our literature.

The break-up of Brook Farm left Ripley, at the age of forty-five, without a profession or resources, and with a load of debt on his shoulders. The courage with which he began life anew, and the patience with which he toiled at the desk at first, doing hack-work for small pay, with his life a failure behind him, and old age in the near future, were indeed admirable; and his final success is a lesson of encouragement that has few parallels. He had, to help him, an almost perfect constitution, and a capacity for steady drudgery more often possessed by German than by American scholars.

Mr. Frothingham has done his work as biographer with good judgment, letting his subject tell his own story, in letters and otherwise, so far as possible. His "*Life of Theodore Parker*" and "*History of New England Transcendentalism*," together with his own personal acquaintance with the leaders of the Unitarian pulpit, qualified him in advance for a task like the present. With the exception of Mr. Charles A. Dana—who was also a Brook Farmer—no one perhaps could have been found more suitable to write the life of Ripley.

## Browning's "Agamemnon."\*

SURELY no writer of the English language at present is so interesting a phenomenon as Robert Browning. He has not the political influence of Victor Hugo, nor has he made on English men of letters the mark that Hugo has stamped on French. He is not what Goethe is to the Germans. He has none of the popularity of Tennyson with minds of mixed sentiment and thoughtfulness, nor does he appeal at all to the great mass of Americans and English who love the simple strains of Longfellow. He has veiled himself in a language often obscure, oftener rough and discursive to the verge of obscurity, sometimes odd to the perilous point of mannerism, and yet his single poetic flights have, perhaps, been higher and stronger than those of any British contemporary. He began to write poetry at about the same period as Théophile Gautier, and was open to some of the same influences as the latter. The star of Byron was still brilliant in its western horizon when Gautier wrote "*Albertus*," betraying the Byronic impulse by many turns of phrase and thought. But faint indeed is the Byronic influence on the "less than adolescent" Browning who wrote "*Pauline*." It is not the work of Byron that is imitated in any way; if the trace can be found at all, it is rather the attitude of Byron's mind toward the world, rather the doings

\* *American Men of Letters*. Edited by Charles Dudley Warner. George Ripley. By Octavius Brooks Frothingham. Boston: Houghton, Mifflin & Co.

\* *Agamemnon*, *La Saisiaz*, and *Dramatic Idyls*. By Robert Browning. London: Smith, Elder & Co. Boston: Houghton, Mifflin & Co.

than the sayings of Byron. In either case, "Pauline" is a most remarkable piece of work, not for the art of it, but as affording a glimpse into the mind of the writer. On the one hand, its concentration on self, its self-importance, its rambling vein, its straining, are most youthful; on the other, its review is really that of a whole lifetime, and the ideas are those of an old, not of a young man. On the one hand, it is not lacking in lines that halt grievously, such as the third of these:

"Then what must be that love  
Which, with the object it demands, would quell  
Reason, though it soared with the seraphim?"

Or, again, the middle line of

"I can mount with the bird  
Leaping airily his pyramid of leaves  
And twisted boughs of some tall mountain tree."

Or once more:

"Scarce worth a moth's flitting which long grasses cross."

On the other hand, it has images most exquisite, passages that roll in the finest musical bass, lines that sound like the best of the classic writers of all great nations. The life that Byron lived, in fact, Browning seems to be living over in his mind; his longing is toward the unattainable. One of his confessions is the fact that he can no longer love. Yet Byron showed this by deserting the women on whom his fancy rested. Browning is content to be appalled at the idea, make the confession, and then draw closer to "Pauline," to whom the monologue is addressed, thus showing that with him it was introspection, with Byron action. Pauline, who appends a still more singular foot-note in French to the middle of this singular "Confession," must be a Swiss, as appears from this passage toward the close:

"We will go hand in hand.  
I will go with thee even as a child,  
Looking no farther than thy sweet commands,  
And thou hast chosen where this life shall be:  
The land that gave me thee shall be our home  
Where nature lies all wild amid her lakes  
And snow-swathed mountains and vast pines all girt  
With ropes of snow—where nature lies all bare,  
Suffering none to view her but a race  
Most stunted and deformed, like the mute dwarfs  
Which wait upon a naked Indian queen.  
And there (the time being when the heavens are thick  
With storms) I'll sit with thee while thou dost sing  
Thy native songs, gay as a desert bird  
Who crieth as he flies for perfect joy."

She is also a judge of poetry and a philosopher, and she alludes in her foot-note to the poet as *mon pauvre ami*, a very odd expression to apply to the man who speaks of her personal charms in the tone of an ardent and favored lover. But, whether Pauline was a living woman or an abstraction, the confession holds a vast deal of what every close and sympathetic reader of Browning must recognize as minute, careful, and perhaps sometimes remorseless, analysis of self.

"O dearest, if indeed I tell the past,  
Mayst thou forget it as a sad, sick dream!  
Or if it linger—my lost soul too soon  
Sinks to itself and whispers, we shall be  
But closer linked, two creatures whom the earth  
Bears singly, with strange feelings unrevealed  
But to each other; or two lonely things,  
Created by some power whose reign is done,  
Having no part in God or His bright world.  
I am to sing whilst ebbing day dies soft,  
As a lean scholar dies worn o'er his book,

And in the heaven stars steal out one by one  
As hunted men steal to their mountain watch.  
\* \* \* \* \*

I am made up of an intensest life,  
Of a most clear idea of consciousness  
Of self, distinct from all its qualities,  
From all affections, passions, feelings, power;  
And thus far it exists if tracked in all:  
But linked, in me, to self-supremacy,  
Existing as a center to all things,  
Most patent to create and rule and call  
Upon all things to minister to it;  
And to a principle of restlessness  
Which would be all, have, see, know, taste, feel, all—  
This is myself; and I should thus have been  
Though gifted lower than the meanest soul."

After telling her how he lost the power to love, the opening up of the stories of the ancients to an eagerly receptive mind is told in this fine passage:

"They came to me in my first dawn of life,  
Which passed alone with wisest ancient books,  
All halo-girt with fancies of my own;  
And I myself went with the tale—a god  
Wandering after beauty, or a giant  
Standing vast in the sunset—an old hunter  
Talking with gods, or a high-crested chief  
Sailing with troops of friends to Tenedos.  
I tell you nought has ever been so clear  
As the place, the time, the fashion of those lives.  
I had not seen a work of lofty art,  
Nor woman's beauty, nor sweet nature's face.  
Yet, I say, never more broke clear as those  
On the dim clustered isles in the blue sea,  
The deep groves and white temples and wet caves:  
And nothing ever will surprise me now—  
Who stood beside the naked Swift-footed,  
Who bound my forehead with Proserpine's hair."

It is pretty well known that Mr. Browning is not merely a great lover of music; it is understood that he is somewhat of a musician. "Music, my life!" he exclaims in this poem, and again, to Pauline:

"Be still to me  
A key to music's mystery when mind fails,  
A reason, a solution, and a clue!"

His love for music is traced at an early period in this bit of autobiography:

"As peace returned, I sought out some pursuit;  
And song rose no new impulse, but the one  
With which all others best could be combined.  
My life has not been that of those whose heaven  
Was lamplless save when poesy shone out;  
But as a clime where glittering mountain-tops  
And glancing sea and forests steeped in light  
Give back reflected the far-flashing sun;  
For music (which is earnest of a heaven,  
Seeing we know emotions strange by it,  
Not else to be revealed) is as a voice,  
A low voice calling fancy, as a friend,  
To the green woods in the gay summer time:  
And she fills all the way with dancing shapes,  
Which have made painters pale, and they go on,  
While stars look at them, and winds call to them  
As they leave life's path for the twilight world,  
Where the dead gather. This was not at first,  
For I scarce knew what I would do. I had  
No wish to paint, no yearning, but I sang."

A good part of this self-dissection, however, seems to refer to age, not to youth. It is the whole life of a man from youth to death, rather than a fragment relating to one period.

"My selfishness is satiated not,  
It wears me like a flame; my hunger  
For all pleasure, howsoe'er minute, is pain;  
I envy—how I envy him whose mind  
Turns with its energies to some one end,  
To elevate a sect or a pursuit,  
However mean! \* \* \*  
This restlessness of passion meets in me  
A craving after knowledge: the sole proof  
Of a commanding will is in that power  
Repressed; for I beheld it in its dawn,  
That sleepless harpy with its budding wings."

Finally the thought of God comforts the poet in some measure; out of the chaos of his thoughts arises the idea of repose in a superior power:

"The last point I can trace is, rest, bencath  
Some better essence than itself, in weakness;  
This is 'myself,' not what I think I should be;  
And what is that I hunger for but God?"

In fact, the poem is both Credo and Confession—"Suntreader, I believe in God and truth and love"—and may perhaps be held as the most curious of all the many curious pieces by Browning; certainly the biographer will find more hints in it than in any other.

What more remains is better known to readers. The translation of the "Agamemnon" is interesting as a variation on the usual translations; in itself it is not great. "The Two Poets of Croisic" is lively and amusing in parts, but too long. The series of Dramatic Idyls in two parts shows Browning equally at ease—or equally himself?—in the dramatization of stories from the East, from classic mythology, from England in the seventeenth century, from Italy in the middle ages, and from the legendary lore of the Jews. They are almost always strong, rugged, and meaty. The taste for them is not given to every one; but, once acquired, it seems to please more than smoother work. The charm of Browning lies partly in the strong point of his story, partly in the comprehensive view he takes of a subject. But the best in him is something that hardly comes to the consciousness of a reader, though it influences him profoundly. This is the reserve power which seems to exist behind all his work and which makes the least sympathetic at least feel the touch of a master.

#### Mrs. Kemble's Reminiscences.\*

THE correspondence contained in this volume covers the period from 1834 to 1848, and is valuable both for the reminiscences it contains of well-known figures in London society and literature, and for the descriptions of life in America as Mrs. Kemble found it. There are numerous anecdotes of Sydney Smith, Lady Holland, Lady Morley, Thackeray, and a host of persons whom it seems Sydney Smith was himself in the habit of dividing into "dilletanti" and "talketanti," nearly all of which are new to us, and scattered as they are through the volume, lighten up its pages and make it thoroughly readable. As time goes on, however, we are inclined to think that the account given of life in America will, as a "record," retain as much permanent interest as any of the rest of the book, because it is a life nearly extinct. Brought up in England, in the midst of a highly cultivated society, surrounded by all sorts of comforts and luxuries, Mrs. Kemble was transplanted to the United States at a time of life when she was most sensitive to external impressions, and when American society was in a condition well calculated to make vivid impressions on any foreigner. She came with a strong good-will for this country, and a conscientious desire to adapt herself to it; but the task was an impossible one, and

why it was impossible every page of her book shows. The war has blotted out the United States which she in her younger days was brought to make a home in; but with a fine, bold touch she brings it back to us.

It was, in fact, not a pleasant country to live in, for the art of living, of extracting from life all the pleasures and benefit which it can be made to yield, was unknown and uncared for. The South (her husband was a planter) was a wilderness, made unendurable to a sensitive and conscientious woman brought up as Mrs. Kemble had been, by the existence of slavery. Mrs. Kemble has given, in this book and elsewhere, a very complete picture of life on a Georgia plantation, and we need not refer to it further than to point out that it will not do to give her the credit of telling the truth about one part of the country and not about another. Mrs. Kemble is eminently a truth-teller; it is her cardinal virtue as well as her weakness. Stories in this book show that she has suffered all her life from being unable to act upon the proverb "*toute vérité n'est pas bonne à dire.*" Therefore, we may safely say that her picture of life in the North, as she found it, holds the mirror up to nature for us, very much as her Georgia journal did for plantation-life in the South.

It was a country in which there was, in the first place, no society as a European of that day or an American of this would understand the word. "It does not strike me," she says, speaking of Philadelphia, "that social intercourse is easy at all here; the dread of opinion and the desire of uniformity seem to me to give a tone of distrust and caution to every individual man and woman, utterly destructive of all freedom of conversation, producing a flatness and absence of all interest that is quite indescribable;" and this tone of uniformity, with the resultant flatness, Mrs. Kemble discovered, not only in Philadelphia, but wherever she went. Cut off from the society she had left behind her in London, she turned to domestic life, and here she gives a most amusing account of her struggles. When she settled down in Pennsylvania, at "Butler Place," or "The Farm," as she preferred to call it, she found to her dismay that all the country interests, duties, and occupations, "the village, the school, the poor, one's relations with the people employed on one's place, etc.," had all been contemplated by her from a point of view which, taken from rural life in England, "had not the slightest resemblance to anything in any American existence." Her husband's place was "in no aspect superior to a second-rate farm-house in England,"—though for all that her calling it "The Farm" probably pleased no one connected with it. Her attempts to gain her neighbors' good-will, which were evidently sincere, were ludicrous failures, because she simply approached them as she would have done had they been English dependants or tenants. In the goodness of her heart she offered to teach the little children of her gardener and farmer, and as many of the village children as liked to come, to read and write; but her benevolent proposal excited nothing but "a sort of contemptuous amazement." There was a public school, which they supported by taxation, and to which they sent their children; and an offer of gratuitous education by a lady in Mrs. Kemble's position was resented almost as an insult. On the 4th of July, Mrs. Kemble

\* Records of Later Life. By Frances Anne Kemble. London: Richard Bentley & Son. New York: Henry Holt & Co.

organized for the yeomanry and their families a feast which, considering her nationality, and the state of feeling toward England in those days, was about as touching and unequivocal a proof as she could have given of her desire to please. Unfortunately she provided her guests with beer and wine, and these beverages proved to be objects of moral reprobation to the Quaker farmer and his family, and were untouched. The feast was a failure. In Lenox, it seems that she sent a considerable distance for a barrel of beer for a number of men mowing in a meadow, and was remonstrated with by one of her best American friends for "introducing among the laborers of Lenox a mischievous need and a deleterious habit." Again, a curious source of disappointment to Mrs. Kemble was not finding any poor to whom she could be charitable. This was true, both of Pennsylvania and New England, and in Lenox, when she proposed to give the proceeds of one of her readings to "the poor of the village," she was assured that there were none, and so she was obliged to add it to a library fund.

Many more curious illustrations might be given; but it is unnecessary to multiply them. Twenty years ago it was the custom to quarrel with any observations made by an Englishman or Englishwoman about this country. Anybody who will take the trouble to read this "record" of an Englishwoman who has been all her life a lover of this country, will see how it was that English travelers of the period she describes found this country a strange, queer place; how it was that we detested all English travelers, and how it is, too, that the quarrel about English descriptions of America has passed away like a disagreeable dream. The America which they described has passed away. It is as strange to us as it once was to them.

The letters describing her visits to England are as entertaining as letters well can be, but it is difficult to give any idea of their character by extracts. The anecdotes of dramatic and musical people are especially valuable, because Mrs. Kemble, by birth, education, and instinct, belongs to the artistic world, notwithstanding her frequently expressed dislike for the stage as a career. Of Macready, his manner of acting, his extraordinary maltreatment of his fellow-actors, his egotism, his bad temper, a very full account is given. Of Rachel there is some descriptive criticism, which is all the more valuable, as the gift of reproducing the effect of fine acting is very rare. But, after all, it is the every-day life and anecdote in England which gives the volume its greatest charm. Mrs. Kemble was a friend of Sydney Smith; of Rogers; of Macaulay; she was run after by Lady Holland, and has a great deal to tell about that extraordinary woman, Mrs. Grote. Her ordinary life was passed among people who were all more or less celebrated, and she brings them and their lives before us with great vividness of outline. Perhaps nothing, on the whole, is pleasanter than the picture of Sydney Smith, of whose witty nonsense she gives some excellent specimens; she makes it evident that a large part of the charm of his conversation was impermanent, and lay in his voice, face, and manner, which invariably put his audience in a humor to enjoy anything. Among his jokes recorded here, one which shows the eccen-

tric operation of his humor as well as any, is the following: He declared that he found traveling abroad very expensive. "I know I never could live under fifty pounds a week," said he. "Oh, but how did you live?" was the next question. "Why," said he, "as a canon should live; and they charged me as enemy's ordnance." On another occasion, he asserted that he had passed a horrible night, having dreamed that he "was chained to a rock and being talked to death by Harriet Martineau and Macaulay." Rogers's dry, biting wit gained also from his cadaverous countenance, which led Smith to refer to him as the "departed" poet, and Mrs. Kemble has a great deal to say about him,—his bad tongue, his good heart, and his high regard for his own poetry, which he always insisted upon her reading aloud to him in preference to any other, much as Wordsworth gravely told an acquaintance that he had bound one of his poems in quarto "to show his own appreciation of it." It was a very remarkable society, that of London in the time of these reminiscences, and no one will lay down Mrs. Kemble's letters without joining in her sigh over its disappearance from the world. There is no better record of it in recent literature than is to be found in her pages.

The peculiarities of Mrs. Kemble's character, as they stand out in bold relief in her reminiscences, are, it is hardly necessary to say, very charming and attractive. A vigorous and vivacious mind, relieved by a playful humor, a generous and quick temper, deep attachments and strong principles, are traits which the most careless reader cannot fail to discover. The good taste and reticence displayed in her complete silence about passages in her life which were well adapted to arouse a vulgar curiosity, can only be fully appreciated by those who know the story of her life.

#### Miss Lazarus's "Songs of a Semite." \*

It is a very curious fact that the Jews, who seem as a race to be possessed of much more than ordinary intelligence, and whose intellectual members tend by no means, as some people assert, exclusively to music and acting, should have done little in literature to record the oppressions to which they have been subject. Even Heine, with his diamond wit and extraordinary attainments, was never the champion of his race in any manly, vigorous fashion. Notwithstanding the facility and versatility of Hebrews, notwithstanding the fact that wherever they have the chance, they take positions more or less before the public, in Germany and elsewhere, they now gravitate naturally toward the press; notwithstanding the fruitfulness of the subject, their own ill-treatment by believers in other religions has been hardly brought to the surface. Is it that they are, speaking of them as a whole, given to materialism, and, when protected by the laws of a country, quite content to feather their nests and live that opulent, pleasure-seeking life which is full of the kindly offices of those who love their families, but is little inclined to look beyond or above? Or does the rough logic of the world receive

\* Songs of a Semite: The Dance to Death and Other Poems. By Emma Lazarus. New York: Office of "The American Hebrew."

their secret approval, that logic worse than rough—cruel and relentless—which says practically that might is right, and that the people who will not fight for freedom do not deserve it? This might explain why the subject of persecutions becomes tabooed among them as soon as the persecutions cease. Or the explanation may be based on the ground on which apologists explain their long suffering under abuse, their inclination to win by ruse instead of hard blows, their preference for commerce, the lighter handicrafts, namely, that many generations of an existence as aliens under oppressive laws have dwarfed in them the militant side and fostered the mercurial. Be it as it may, the phenomenon is worth considering just now, when we have the shocking scenes of the middle ages reenacted in Russia, and at the same time come upon a Jewess who has made a departure from the rule of silence.

Miss Emma Lazarus, of New York, after writing prose and verse of a high grade on topics having to do with anything but Hebrew matters, has recently developed in a line which cannot help exciting the finest indignation of which she is capable, and which in fact has called out her very best resources. Her success hitherto has been among Christians rather than her own folk, but now she appeals to her race. Perhaps her studies of Heine, translations from whose poems appeared last year, may have pointed the way. But much more must the inexcusable misery inflicted on Jews in Russia have sharpened her pen. The fine ringing lines of "The Banner of the Jew" could only have been written under the stress of righteous wrath at the infamies perpetrated under the eyes, and sometimes with the covert approval of, Russian officials.

Oh, for Jerusalem's trumpet now,  
To blow a blast of shattering power,  
To wake the sleepers high and low,  
And rouse them to the urgent hour!  
No hand for vengeance—but to save,  
A million naked swords should wave.

Oh, deem not dead that martial fire;  
Say not the mystic flame is spent!  
With Moses' law and David's lyre,  
Your ancient strength remains unbent.  
Let but an Ezra rise anew  
To lift the *Banner of the Jew!*

A rag, a mock at first—erelong,  
When men have bled and women wept,  
To guard its precious folds from wrong,  
Even they who shrunk, even they who slept,  
Shall leap to bless it, and to save.  
Strike! for the brave revere the brave!

Strange that it should be a woman to say that word: "Strike! for the brave revere the brave!" It invests this little pamphlet with an interest that will go on deepening, if the call is heard, until it may, perhaps, attain some day to the place of a classic phrase among the Jews; for who shall say in these days what a race cannot do that has the domestic virtues, the ability, and the wealth of the Jews, and, behind all, a real grievance that strengthens their hands and makes every liberal and conscientious thinker their ally? In "The Crowing of the Red Cock" there is another cry of agony for the maltreatment of Russian co-religionists, but the mood is softer:

When the long roll of Christian guilt  
Against His sires and kin is known,  
The flood of tears, the life-blood spilt,  
The agony of ages shown,

What oceans can the stain remove  
From Christian law and Christian love?

Nay, close the book; not now, not here,  
The hideous tale of sin narrate,  
Reëchoing in the martyr's ear,  
Even he might nurse revengeful hate;  
Even he might turn in wrath sublime,  
With blood for blood and crime for crime.

Nevertheless, she has not closed the book, for Miss Lazarus has given time and talents to a five act drama in which she narrated one "hideous tale of sin," full of the lurid glare of holocaust of innocent merchants, their wives and babes, and of the fantastic love for the horrible that existed in the humor of the Gothic ages. It is founded on *Der Tanz zum Tode; ein Nachtstück aus dem 14ten Jahrhundert*, a tale of unusual horror compiled by Richard Reinhard, "from authentic documents communicated by Prof. Franz Delitsch." The drama has fine passages, and the plot itself does much to awaken and fascinate the attention. It has also weak parts that might be left out, and the publishers have made mistakes not a few, both in grammar and spelling. Miss Lazarus herself must be in fault for several instances of halting lines. An attempt of this magnitude may well be pardoned for slips which can be corrected in a second edition. Meantime it is a fact to be noted that in "Songs of a Semite" this talented young authoress has struck on solid ground. Her ability to write works *de longue haleine* argues exceedingly well for her future fame in letters. Her appearance as a champion of her race is to be hailed with pleasure. A writer could not have better material from the past or a stronger stimulus in the present.

#### Holley's "Niagara and the Other Cataracts of the World."\*

THE author of this strikingly bound and profusely illustrated work is known as the writer of a guide-book to Niagara Falls, which indeed furnished the basis of this more elaborate volume. In an article contributed several years ago to this magazine, he showed his familiarity with every phase of the subject, and his ability to write entertainingly upon it. Mr. Holley speaks with the full information and enthusiasm of an old resident. It has been his purpose, evidently, to cover the whole ground of the early history, geology, and local features and incidents of the Niagara region, in a manner which will leave little to be done by any historian that may come after him. While the supplementary chapters on the other famous cataracts of the world are a small portion of the work, and make no pretension to originality, they serve the purpose of a comparison between the greatest known cataract and its numerous smaller rivals. Mr. Holley's volume is worthy of a place in every "working library," and visitors to Niagara Falls will find it the best of guides and souvenirs, thanks to its map, illustrations, and full descriptions of the local features and of the many tragic accidents that have happened there.

## HOME AND SOCIETY.

### Young Men and "A Modern Instance."

It is curious to hear the young people of the period discuss the qualities of Mr. Howells's story, especially the young man who, coming in late at night, sits up still later to finish it, and who, when you find him turning its pages in the day, blinks at your discovery. In his more confident morning hours he attempts a certain defense of Bartley, and intimates that a wider experience of the world might alter the writer's treatment.

"There isn't a single thing that Bartley Hubbard did," he declares, "that was so very bad,—not a thing which might not occur in almost any young fellow's life, and not send him to the devil either. It is nonsense to pretend that he is a much worse fellow than another, as the world goes, or that he isn't as much of a man any day as that photograph-keeping, conscience-wrestling Halleck. Talk about his knocking Henry Bird down! Talk about his using that history of Kinney! Talk about his beer! Talk about Sally Morrison even! What I am trying to say is—what I mean is—just this: Take most any man, even those who finally turn out all right, and show him up in that cold-blooded way,—all his secrets, his mean moments, and every little chance action,—and he won't appear much better than Bartley Hubbard. I tell you, all the facts remaining the same, his nature need not be so deeply tainted, and there is no use pitching into him and knocking the bottom out of his merits. Take these goody-goody fellows themselves, who have had their legs broken and their hearts smashed, but not their eye-teeth cut, and I guess you'll find places in them of just as doubtful gentility. What I mean is, that to brand Bartley Hubbard and spare Ben Halleck, coddling a baby's cold nose under his chin, while he shakes with love for the baby's mamma and scorn for the weakness of the baby's papa, shows what a chance it is where contempt shall fall. You needn't tell me that if the right sort of person had taken hold of him, and helped him along, Bartley wouldn't have made the better fellow of the two. Or is there no great good in any of us? Mr. Howells seems to think not. Look at the work Bartley had in him,—his good nature, his wit! It is the fashion to decry men with clever social qualities. I am not trying to say he is all right; but I know if I had to live with such a woman as that Marcia, with her crude passion, her sudden furies, her country stiffness, her exactions, her want of tender attributes, I doubt if we should ever reach the point of keeping house together in the spring. What I mean to say is"—and as this young man goes on his voice rises, and his hand, following his voice, rises and shakes with emphasis.

But deep in his heart he feels accused, and for the time at least, as he returns to his business, some perception of his low tone stirs within him. He has never before had his qualities so clearly presented to him, his motives so closely scrutinized. He is accustomed to think well of himself; to measure care-

fully the lengths he may go, and preserve a moderate self-respect; to make small account of the absence of stern integrity, and frequently to remark in a swelling tone, "That is not the kind of a man I am." "A Modern Instance" attacks his sort of moral structure at the foundation. It smiles at him, snubs him, discovers to him that his recurring derelictions are the outcrop of an unsound nature, and that, when he no longer has power to stay the decay, he may realize the importance of their evidence.

But in his self-defence he suggests the most assailable point of the story. One would like to believe that the men and women who preserve their moral sense, their correct instincts, their probity, their veracity, should sometimes be allowed to enjoy these virtues,—that they should be raised, supported, elevated by them,—that they should know moments when life would be sweet, and that the breaths which they draw through an atmosphere kept pure by these qualities should sometimes make their hearts beat full and strong. But in this story Mr. Howells has admitted nobody with any reach of spirit,—nobody with what he himself calls the poetic lift; and his excellent New Englanders suffer from a more bitter aridity than that which corruption produces in his hero. It might be said that an exception should be made in the case of the old squire,—in that last scene where he holds the stage in the double character of lawyer and father. If it were not that the lawyer so dominated the father,—if the desire to make a telling point against the plaintiff were not so apparent,—there would be something fine about it. As it is, the natural pathos of the situation is sacrificed—and perhaps rightly—to preserve the consistency of the character to its general hardness and lowness of tone.

The side characters of Kinney and Ricker are touched with a saving grace. They have a native spirit which keeps them out of the commonplace. They are alive, sentient, and in a sense sweet. While the Hallecks, the Gaylords, the Witherbys, know no moment of superiority to circumstance, no days that are not bleakish Mondays, they are essentially New Englanders in the constancy with which their thoughts dwell upon detail, in the grip which their environment has upon them, in their cohesion with facts, in their want of lightness and imagination. Mr. Howells does not seem to create them, but merely to present with ease what he has readily found.

S.

### Diaries and Journals.

"OH, that I had had time and patience to keep a diary!" declares the late Charles James Mathews, in the first chapter of that beginning of an autobiography which the present Mr. Charles Dickens edited and completed in 1879. "What a world of trouble it would have saved me, and what endless odd details and incidents, now forgotten, I should have been able to record! Harley kept one for some forty years. I have seen three volumes, all regularly bound and

lettered. They contain a most interesting account of what he had for dinner each day, and what he paid for coach-hire, and not a word of anything else. I doubt whether their publication would interest the public of the present day. I find that I, too, commenced a journal regularly on the first of January every year, and invariably broke down after a few weeks; then resumed, and finally dropped it altogether. My intentions were good, but my perseverance faulty."

In Charles Mathews and in Harley, two old actors, we have the exact opposite of Fanny Kemble, who started a journal early in life and has made a voluminous appearance in literature on the strength of it. Omitting her plays and poems and her latest book of Shaksperian criticism, all of Mrs. Kemble's books are made out of her journals, or out of the letters which were a substitute for it. First came the "Journal of a Residence in America"; then "A Year of Consolation," which was a transcript from a journal kept during a journey to Italy; then again the "Journal of a Residence on a Georgia Plantation"; and last of all come the two charming volumes of "Records of a Girlhood" and "Records of Later Life." But we need not come down to modern times for examples. Pepys lives in literature solely because he kept a diary. The journal of Judge Sewall sheds a light on the thoughts and feelings of our New England ancestors, not elsewhere to be found so fully focused.

It is, however, because most people want to imitate Pepys and Sewall, not to mention Mrs. Kemble and Charles Greville, that most people break down and give up their journals in the first few months, if not weeks, after the fair start has been had. Most people have not the opportunities of Sewall or Greville; most people lead quiet lives, and mix little with the great ones of the world and have but little to record out of the way or important. Yet every man's life is of importance to him and to his. Only one must not attempt too much. Charles Mathews failed because, characteristically enough, he made a great flourish at the outset. Harley failed as dismally, because, although he kept on heroically, he never set down what was really important, even to him. A country school-teacher, leading a humdrum life in a little village, does not need a diary large enough to set down the doings of court and king; but she will probably find much pleasure in jotting down a brief record of her daily life. And our aim is to suggest how this brief record may best be written, with the least expenditure of time and with the utmost benefit in result.

It is not necessary to buy a diary. Any blank book will do. The date can be written at the head of each day's entry. This has the advantage of allowing a long and elaborate entry whenever anything happens to demand it. But it is convenient to have a diary regularly laid off, with dates properly printed and a space for each and every date. There is something in the assured and stable look of a well-arranged blank diary which sustains the beginner in the task of keeping it up. No one who has kept a diary through a year ever needs help to keep at it the next year and the year after. The habit once formed, it is really easier to keep a diary than not. This, of course, is on the supposition that the diary is what has been suggested—a brief record. Indeed, the record can hardly be too brief. I have seen a diary full of interesting personal details, the page of which

was not larger than two inches by three, and each page contained the record of a full week of seven days. This, however, is a little too small. Perhaps the best book for a beginner has a page about four inches high and three inches broad, and gives two pages (facing each other) to a week,—Monday, Tuesday, Wednesday, and Thursday on one page, and Friday, Saturday, and Sunday on the opposite page; this allows a double space for Sunday. In such a diary there is a space a little more than an inch high for every week-day.

Now, as to the things to be set down. Bearing in mind the fact that the diary is to be a brief record, the first question to be considered is—"What happenings in your life are worth recording?" And the answer to this varies with the individual. Every person must determine for himself or herself what he or she deems of most importance. A few general suggestions may be made. Most people take an interest in the weather: it may be well therefore to note first the extreme of temperature, with the general state of the weather. It is advisable to specify all visits paid or received and all letters written or read. Then it is well to record any special payment of money and any change in health, and lastly, to make note of the books read, setting down the day of beginning and ending. For example:

JAN. 1st, 1883, Monday.

36°, slight snow-storm. Went to Newsboys' Lodging House. Sent \$50 ck. to Children's Aid Society. Made eleven calls. Dined with father. Read Stedman's "Poe."

That of course is the record of a gentleman's New Year's day. Here is a lady's entry later in the year:

APRIL 13th, 1883, Friday.

51°, disagreeable wind. Caught slight cold. Called on Dr. From Mary; to her. Mrs. Brown called. Began Aldrich's "Story of Bad Boy."

The words "from Mary; to her," mean, of course, that a letter was received and answered. Obviously there are days when the record is brief to the point of meagerness and there are others when of necessity it must be full and ample. When a lady is going to Europe, the entry of a day on shipboard will probably be short. But, on her arrival in Paris, it may extend to any limit.

JUNE 20th, 1883, Wednesday.

On board SS. "Gallia." Run 343. Head winds. Heavy rain. Quite sea-sick. In berth all day. Tried to read Trollope's "Eye for an Eye."

JULY 16th, 1883, Monday.

Paris. Continental Hotel. Warm and clear. From Mother and Mary. To Father and John. Mr. Whyte and M. Blacque called. Went to Cluny Museum and the Bon Marché. Tried on at Worth's. Dined at the Lion d'Or. Saw Coquelin in "l'Aventurière" at the Théâtre Français. Headache went away.

A diary with memorandums as concise as these is no tax on the time. As it can be written in a minute every night before going to bed, it is no tax on the memory. It costs neither time nor trouble nor money. It may save all three. After keeping one for more than ten years, I can testify to the great advantage of having a brief record.

Arthur Penn.

**Women's Wages.**

I HAVE been looking for some clue to the unsatisfactory relation of woman's work to woman's pay. There are, in reality, two distinct classes of women who are in the field for remunerative employment: those who desire to add to an insufficient income, and those who depend upon themselves absolutely for bread. Both classes call for consideration, and yet the fact of their existence is precisely that in which the difficulty we are considering has its rise. "Women," it is often asserted by their apologists, "are quite as capable as men in many fields of labor; yet for the same work, equally well executed, they receive less pay." That women, under exceptional circumstances, can and do produce work that is equal to, and sometimes superior to, that of men, will be generally conceded; but if they universally did so, if woman's work in the aggregate was equal to that produced by men, then, by the irresistible law of supply and demand, hers would be preferred.

The great governing principle of the labor market is that which exacts the best results for the least expenditure, and all the arguments brought forward against the employment of women in fields at present occupied by men would yield if experience once proved that women, taken as a class, were as efficient as men.

Whatever may have been the case fifty years ago, or may still be true in older civilizations, public opinion in this country now recognizes the right of women to enter upon any field of labor. She has invaded the professions and many branches of business. She is found in factories, in mills, occupying the desk as a clerk, canvassing, teaching, nursing, speculating (unfortunately), and it is not unusual now to find her at the head of large business houses. Where is she not? What then is the meaning of this cry for justice to women who work for a living? Why are women toil-worn, struggling, and dissatisfied? The fault, if fault there be, must be with themselves, either in their physical or mental disability. As regards the former, although unquestionably the disability exists, it has never been prejudicial to women as a class. Mental disability is a far more serious stumbling-block, and one which repeated efforts have been made to overcome. "Women," it has been asserted again and again, "need training," and where training has been possible the results have justified the assertion. Girls trained for special duties in large business establishments have entered the lists with youths of the same age, and have, in many cases, succeeded admirably. Within the last few years, a wide field has opened for them as designers. But there is undoubtedly something which the majority of women lack beyond training, and we are inclined, after much consideration of the successful and non-successful competitors of the labor market, to the conclusion that the real disability of most women lies in the absence of a sense of responsibility.

Of the many who come forward to solicit employment, comparatively few are absolutely and entirely

self-dependent. The ranks are full of applicants who, having a pittance, desire to add to it, and to do so in a "genteel" way, the results in such cases being precisely analogous to those that beset young men seeking careers. The man who succeeds is he who feels impelled by dire necessity to struggle; who feels that upon his success everything depends. Imbued with a sense of responsibility, he strives, and strives successfully: in fact, he is successful in proportion as he has the sense of responsibility.

The same truth, as it appears to us, applies to woman. When she feels a sense of responsibility she does not fail, she succeeds; and for this reason, that, like the man, she sacrifices everything to the one object of success. Can the majority of women do this? When they can, and precisely in the measure that they do, they will compete upon equal terms with men, command equal wages, and work with equal success in every path they enter. For then, and then only, will they realize that it is not their need of employment which entitles them to it, but their capacity to fulfill every obligation, whether of minute detail or of grave moment, in a thorough and worthy manner.

*Janet E. Ruutz-Rees.*

**More Suggestions for a Family Ice-House.**

A PRACTICAL experience of many years enables me to modify the suggestions for "A Family Ice-House," in the November CENTURY. In my opinion, the earth should not be excavated at all where the ice-house is to stand, as the lower tiers of ice would rapidly melt, and the drainage would not be so good. The floor should be simply the ground, level with the surrounding surface. In large ice-houses even, the melting is so gradual that the water soaks into the ground, drains being rarely used, since they are apt to be the means of conveying air to the ice. Where the land is low and wet, a drain is dug outside the building, say three feet from it on all sides, and is filled with loose stones. This will dispose of the surface water and drain the ice-house. In constructing the ice-house the uprights, of two by four or two by six inches, must be set about three feet apart, securely spiked to the bottom plank, and braced between. After boarding up inside and out with common boards, and filling the spaces with dry saw-dust, stamping it down as it is being filled, two-inch narrow strips should be nailed perpendicularly on the outside, about six feet apart, and on these should be nailed the clap-boards. Thus an outside air-space will be obtained, through which the hot air will circulate in summer, reducing the temperature. There should be a square ventilator on the roof, with open slats on each side. In packing the ice, place the cakes close to each other, and close to the sides of the building, chinking the spaces between with broken ice as each layer is completed. No saw-dust should be put on before the top layer is in, and then not so much as to cause heating. Ice packed in this way will keep better, and there is less waste.

*S. J.*

## THE WORLD'S WORK.

### Domestic Applications of Electricity.

THE use of electricity in dwelling-houses and offices—to ring a bell, sound an alarm, or light the gas, is now so general that the methods of applying it need no description. The making of the apparatus is now a regular business, and it only remains occasionally to note improvements in the methods employed and extensions of the field of usefulness. In burglar alarms, the more recent improvements relate to better connections and fittings at the doors and windows where the signals are placed, and better materials and apparatus in the annunciators. Clocks are now placed in the annunciators, and with each clock are one or more “time-sets,” or apparatus for setting the alarm at any desired hour. For instance, by turning the time-set (which is a metallic ring marked with the hours) to any hour, say eleven o'clock, the burglar alarm will be disconnected and silent till that hour. At eleven o'clock, the movement of the clock brings the alarm system into play, and after that time none of the doors or windows can be opened without sounding the alarm and causing the annunciator to display its numbers. In like manner, the alarm can be disconnected at any hour previously decided upon. By this arrangement the burglar alarm may be silent during the evening when not needed, set in order at any desired hour, and disconnected again in the morning, and the arrangement may be automatically repeated every day for an indefinite time. By means of another time-set, a bell in any part of the house or grounds may be made to ring at any hour, for the purpose of waking servants, calling the carriage, etc. In electric gas-lighting apparatus, one of the later improvements is an annunciator for calling attention to breaks or defects in the system. The gas is designed to be turned on by hand, and is then lighted. The current is put on by pulling a cord attached to the lamp. The two wires or electrodes are brought up to the burner, and the circuit is closed by the same motion of the hand; and, when the cord is released, the electrodes spring back out of the reach of the gas-flame. By this device the wires are saved from rusting and burning, and are preserved in good order for a long time. If by any accident, such as throwing a towel over the lamp or hanging anything on the fixtures, the circuit is closed, the annunciator, by means of a clock-work system, automatically cuts out of circuit the affected lamp, and announces the location of the trouble (or room in which the lamp is placed). This cutting out of a section of the system is to prevent trouble and confusion in lighting the remaining lamps of the system, when one is found to be out of order. Time is allowed for other lights to be lit, and then the affected lamp is cut out, and the position of the disorder is announced.

Perhaps the most convenient and effective system of giving a burglar alarm yet introduced is a comparatively new one, in which the intruder's footsteps sound the

alarm-bell. This is accomplished by means of mats placed on or under the carpet of the room to be protected. Each mat acts the part of a circuit closer, the slightest pressure upon it closing the circuit and bringing the alarm-bell into action. The mats are composed of thin strips of wood, glued or cemented to a stout canvas. On each strip are fastened two small copper wires, one end of each wire being joined to a larger wire that leads to the battery and bell. There is a small space left between the ends of each pair of wires, so that, while there are many branches or pairs spread over the under side of the mat, none touch, and the whole system of wires is an open circuit. At short intervals on each strip of wood are fastened light brass springs, each one being wide enough to cover and bridge the two wires. While the mat rests upon the floor, the springs have sufficient tension to keep clear of the wires. The moment a weight is laid on any part of the carpet, one or more of the springs are depressed, touching the wires, and closing the circuit. In one case the mats were arranged in narrow strips before the doors of the room, and out of sight under the carpet. Upon the wall were arranged alarm-bells and electric gas-lighting apparatus and switches for setting the system to work. When the switches were open, it was impossible to enter the room or even cross the floor without causing the alarms to sound. The alarms were arranged to give one stroke, or to ring continuously as long as any person stood on the mat, or to start a continuously ringing bell, that continued to sound even after the weight was removed from the mat, or to light the gas-lamp. The advantages of such a circuit-closing system are obvious, as the mats can be hid in any part of a room.

### Improved Ventilating System.

It appears to be well settled now that merely making an opening in the wall of a room into a ventilating shaft will not of itself ventilate the room. The column of air in the shaft must be made to move by mechanical means, as already described here (see page 796, vol. 19), or by heating the air till it expands and rises. This last is accomplished by means of gas-lamps, stoves, and hot-air flues. When a building, divided into a number of floors, is to be ventilated, it appears to be necessary to add one more feature to the system. This is to make the ventilating shaft larger in diameter as it ascends. From an examination of a ventilating system recently applied to a six-story office building in this city, there appears to be no reason why a large building, containing a great many tenants, may not be made perfectly safe in a sanitary sense. The building is six stories high, with basement, and is divided into small offices for business purposes. There is a hydraulic elevator, with a steam pump for lifting the water, and steam boilers for warming all the floors. The waste heat from these boilers is employed to

move the air in the ventilating shafts. To accomplish this, the toilet-rooms on each floor are placed at one side of the building, and adjoining the air-shaft. This shaft is of brick, extends from the basement to the roof. The cast-iron smoke-pipe of the steam boilers is placed inside the shaft, dividing it into two equal parts. The heat of this stack warms the air of the shaft, and causes a steady and rapid upward current. The shaft increases in diameter at each floor, being three times larger at the top than the bottom. Openings are made near the ceiling on each floor, into one-half the shaft, while the lavatories and toilet-rooms are connected with the other half. This increase of section in the shaft seems to make the system perfect. The movement of air in the shaft is rapid, and the increased burden of air it must carry from each floor does not impede the current. To ventilate the basins, sinks, etc., a copper pipe is placed inside the shaft, close to the smoke-stack, and connected by short pipes with every closet and sink. This pipe is warmed by the smoke-stack up to the fifth floor, and above this point the exhaust steam-pipe from the steam pumps enters the pipe, and continues inside up to the roof. This is to heat the air in the pipe still more, and assist the upward movement. This pipe also increases in diameter at each floor. In summer, when the heating boilers are not used, a small fire is kept in a furnace at the foot of the smoke-stack for the purpose of warming the shaft. To warm the other pipe, argand gas-burners are placed at the bottom of the pipe. These can be lighted in warm weather, and assist the movement of the air in the pipe.

#### Novel Form of Elevator.

THE endless band, with buckets attached, used in ordinary grain elevators, has been adapted recently to a new purpose. In some old mines, there was at one time a rude kind of passenger elevator employed, in which two long rods were hung in the shaft. These rods were provided with steps and handles, and had an alternate up-and-down motion. The miner wishing to ascend the shaft grasped the handle on one of the rods, and stepped upon the foot-board, or step, attached to the rod. In a few seconds the rod rose a few meters, and then paused for a second or more, and then descended. The miner, standing on the rod, was raised with it till a platform was reached, and then, as the rod paused, he stepped off and waited till the rod moved upward again, when he repeated the operation, and in this way he was gradually lifted to the top of the shaft. These two ideas, the endless belt with buckets and the lifting rod, have been used to make a novel kind of passenger elevator. The shaft, or well, is made in two parts, and at the top and bottom, between the division-wall that separates the two wells, are placed large drums, the upper one being controlled by a steam motor. Over these drums is placed a strong endless chain, or wire rope, and under the influence of the motor the rope travels continuously down the center of one shaft and up the other. Attached to the rope at intervals are small passenger cars, each designed to carry two persons. At the top and bottom of the shafts, where the ropes pass over the drums, guides are arranged in such a way that the cars are always kept upright, passing over or under the wheel

from left or right without altering their perpendicular position. The front of each well is open upon each floor of the building in which the elevator stands, and the cars move up and down past each floor. The passenger wishing to go up or down waits till a car comes in sight and is level with the floor, when, taking hold of a handle, he steps upon the car and is carried up or down. On reaching the floor where he wishes to get off, there is nothing to do but step off the instant the car reaches that floor. If by any accident the passenger does not get off in going up, he is simply carried to the top floor, and moves in the car over to the other shaft, and begins to descend. At first sight such a continuously moving elevator would appear to be exceedingly dangerous,—that unless the passenger stepped off just at the right moment, or if his foot extended beyond the edge of the car, he might be crushed against the floor above. To obviate this, the floor is cut away in front of the shafts, and a hinged flap, or cover, is laid down before the elevator. Anything projecting beyond the edge of an ascending car would strike the flap and lift it out of the way till all danger had passed. In a descending car, the only injury that could occur from this cause would be a gentle push back into the car as the passenger descended below the floor level. The mechanism used for controlling the elevator under the continually changing loads appears to be well designed, and the reports of the first machine in use are quite favorable.

#### Design for Fish-Curing Plant.

SOME modifications of the familiar fruit-drying plants have been suggested recently to adapt them to the drying and smoking of fish. In the fruit-dryers only one tower is used, and the trays are put in at the bottom, and are slowly raised to the top by endless travelling chains while a current of hot air rises through the tower. To adapt the system to curing and smoking fish three towers are used, and the double traveling chain passes through them all. In the new design, three towers under one roof are arranged side by side. The first is intended to be warmed by means of a stove at the bottom, precisely as in the evaporators. The second tower is the smoke-shaft, and is filled with smoke, while the last tower is for cooling the smoked fish. The endless chains start in a room outside the drying tower, where tables are arranged for preparing and loading the fish. For large herring the fish are threaded on narrow sticks or rods, and the ends of each rod are inserted in the links of the chains, so that the fish are always suspended vertically, whichever way the chains may travel. As the rods of fish are placed on the chains, they rise to the top of the shaft, and cross over and descend through the rising current of hot air. They then pass out of the tower and rise to the top of the smoke-tower, and descend in that. The fish is now cured, but to cool it off it is carried by the chains to the top of the next tower, through which it is carried to the packing-room, where the rods and loads are taken off. The empty chain then moves on, and passes through a sub-way under the towers back to the place where it started. For fish too small to be threaded on the rods, shallow carriers are provided, in which the fish are thrown loosely. On reaching the end of the trip these carriers

upset automatically, and throw their contents out upon a traveling table ready for the packers. The carriers then pass under revolving brushes, that free them from the dirt or soot that may cling to them. While the design is apparently suggested by the common American fruit-dryers, it differs in one point. The traveling chains, in passing downward (the reverse of the American practice), pass over and under a series of rollers, going part way down and then up again, and so on, and making many turns in the shaft in order to gain time. Another plan is to make the chains travel forward and back horizontally in a zig-zag course down the shaft. This may be necessary to keep the fish in the shaft till cured, but it evidently adds materially to the cost of construction, and enormously to the cost of maintenance, as the many convolutions of the chains would make necessary great power to move them.

#### Metallurgical Progress.

IN all metallurgical work the aim now appears to be to reduce the amount of heat required to do a given amount of work. For instance, the iron ore put in a blast-furnace to be cast in the form of pigs, is subjected to one heat in that step. The cast pigs are suffered to get cold before they are taken to the converter to be re-heated and cast into ingots of steel, or before they are re-heated in some other way to be worked into some new form. By placing the blast-furnace near the converter, the hot metal need not be cooled, but can be supplied while still hot to the next apparatus. The most recent step in this direction is the employment of the hot ingots of steel directly in the rolling-mill. There appears to be a moment when the hot ingot is in just the right condition for re-working on the outside, but is still too hot and fluid inside. If both the outside and inside could be cooled equally, there would be soon reached a moment when the whole ingot would be of the same temperature and fit for rolling. To accomplish this the ingots, as soon as they are taken out of the molds, are placed in brick pits. These pits are each just large enough to hold one ingot, and are closed at the top by a tight-fitting cover. The pits are heated red hot (by inserting hot ingots in them), and serve to keep the fresh ingots placed in them at an equal temperature till both the outside and inside have cooled down equally. The ingots can then be taken out and rolled without the expense and labor of re-heating. The pits have now been tried on a considerable scale, and appear to work well, and they suggest other fields of usefulness in the treatment of metals that require re-heating between the different processes to which they are subjected.

#### Improved Screws and Nuts.

THE common gimlet-pointed wood screw, at the time it was invented, was regarded as a most valuable

invention. The gimlet-point made it possible to put the screw into the wood wholly by screwing and without the use of a gimlet. However excellent this idea, it was quickly perverted, for the carpenter found the gimlet-point enabled him to drive the screw part way in with a hammer, and then a few turns would set it firmly in position. This naturally led to a second and more recent invention—the pointed wood-screw. In this screw the gimlet point is replaced by a sharp conical point. To use it the screw is treated as a nail and driven in with a hammer nearly up to the head and then given a turn or two to bind it firmly in place. To make such a screw the metal rods or blanks are rolled instead of cut. The threads are forced up from the surface of the rod into a spiral ridge, adding to the outside diameter of the screw without decreasing its weight. This leaves the smooth part of the screw above the thread of less diameter, just the reverse of the ordinary cut screw, and preventing the binding or sticking that always occurs at the last strokes in sending the screw home. The screws examined appeared to be well made and to bear out fully the advantages claimed for them. Closely allied to this invention is another in which bolts and nuts may be made self-locking or less liable to rattle loose. The bolt is unchanged, and may be made of the usual standard sizes for car and carriage work. The threads cut in the nut are designed to fit the threads of the bolt for half the thickness of the nut, and then the angle of the thread is gradually changed without changing the number of threads in a given distance. This change in the shape of the nut thread acts as a spiral wedge, and tends to force the metal of the bolt to flow into the new shape of the nut and to make a firm and tight fit between nut and bolt. In the bolts and nuts examined the two pieces had been cut in two after being screwed up, thus showing the union between bolt and nut. The union seemed to be quite perfect, the thread of the bolt having everywhere conformed to the shape of the nut, making a firm and solid joint.

#### Waste Water Alarm.

AMONG minor appliances for preventing waste of water in cities is a simple mechanical signal for indicating a flow of water from cisterns or reservoirs. The ball-cock may be out of order, and the water running in and escaping in silence through the overflow for weeks without discovery. The new device prevents this by causing the overflow to ring a gong-bell continuously as long as the water flows. The apparatus is exceedingly simple, and consists essentially of a small, over-shot water-wheel of metal inclosed in a casing. The escaping water in passing the wheel causes it to revolve, and the movement of the wheel causes a hammer to strike on a gong-bell. Cheap and simple as is this invention, it deserves to be recognized as one more means of preventing the excessive waste of water so common in American cities.

## BRIC-À-BRAC.

### The Rainy Day.

BLEST drizzle that keeps prudent people  
Shut tight in-doors,  
And blots the town roofs and the steeple,  
And builded shores,  
Wipes out all bounds and limitations,  
And leaves but vaguest intimations  
Of his or thine! My old vexations  
Depart by scores;  
Abstract, I am, without relations,  
Whene'er it pours.

What are to me the wretched changes  
Of human life?  
Here, hemmed by mists, my being's range is  
All closed to strife.  
Despair may tackle me to-morrow,  
And I may share the whole world's sorrow,  
Or others woe from me may borrow,  
But not to-day,  
The sphere I walk in is too narrow  
To breed dismay.

The woods and fields I roam about in,  
Wet as an eel,  
At every step the water spouting  
From toe and heel,  
The traveling seeds of weeds and grasses  
I furnish gayly with free passes,  
They board me singly and in masses,  
By hook and crook,  
And, being of the clinging classes,  
Cannot be shook.

But night comes on; I'm stiff and weary,  
The storm grows rude,  
The landscape all is wild and dreary,  
And so's my mood;  
The task assigned by the Creator  
To me, as weed-disseminator,  
Is done; I'm ready now my fate for,  
And I would fain  
A gust of wind exchange my state for,  
Or drift of rain.

*Roger Riordan.*

### Affinities.

Stars, that from the purple depths  
Of Heaven gaze out above us;  
Eyes, that from the far-off homes  
Of hope look down and love us;  
Souls that from the pearly gates  
Steal forth and, smiling, listen;  
All things above—stars, eyes, and love—  
That watch and wake and glisten:

Moon, that in the tranquil eves  
Riseth in placid wonder;  
And music of the hollow seas,  
Drawn out in low-toned thunder;  
And winds that wander through the grass  
As sunset-lights are waning;  
And all sweet sounds that Nature hath,  
Apart from Man's complaining:

Most fair though far, as soul to star,  
Our lives their lives inherit;  
Each atom hath its dual part,  
Each soul its answering spirit;  
No song of bird, no bell-tone heard  
At night o'er languid waters,  
But strikes a thousand chiming chords,  
In music's sons and daughters!

*William M. Briggs.*

### Cupid's Mistake.

BLIND Cupid, on a summer's sultry eve,  
Went on love's errand, as we may believe,—  
But lost his way, and stumbled to a cave,  
Dark as the night and silent as the grave.  
But, pray, behold the strange reverse of fate!  
Death, who to Cupid ever bears a hate,  
Happened, likewise to stroll in there to hide,  
And slyly dropped his darts near Cupid's side.  
Where weary lay the lad, thick mists arose,  
And hid his senses in a doze.  
Awaking from his nap, strange news to tell,  
His pointed arrows from the quiver fell.  
Not quite awake, he stretched his arms around,  
To gather up his arrows from the ground;  
He took his darts, he thought, but thought in vain,  
So like they were, he knew them not again.  
Cupid took some of Death's, O fate unkind!  
And left some part of his, for Death, behind!  
Hence many sprightly youths in blooming prime,  
Struck with the darts of Death, forestall old Time;  
While greybeards, just preparing for their graves,  
Struck with Love's bolts, become his doting slaves.

*S. B. Foster.*

### Two Triolets.

#### WHAT HE SAID:

THIS kiss upon your fan I press,—  
Ah! Sainte Nitouche, you don't refuse it?  
And may it from its soft recess—  
This kiss upon your fan I press—  
Be blown to you, a shy caress,  
By this white down, whene'er you use it.  
This kiss upon your fan I press,—  
Ah, Sainte Nitouche, you *don't* refuse it!

#### WHAT SHE THOUGHT:

To kiss a fan!  
What a poky poet!  
The stupid man,  
To kiss a fan,  
When he knows that—he—can—  
Or ought to know it—  
To kiss a *fan*!  
What a poky poet!

*Harrison Robertson.*

## Uncle Remus's Christmas Dance-Songs.

[THESE songs, or something like them (I have endeavored to catch the spirit as nearly as possible) are sung with what Uncle Remus would call the "knee-racket"; that is to say, they are "patting" songs. If the reader will bear in mind that the rhythmical effect of these songs is based on *time*—on recurring and invariable pauses,—there will be no difficulty in catching the swing. The last verses of each stanza should be read with a quickening effect. The refrains in each are in the nature of a chorus. In the second song, the line "My honey, my love" is sung by all, and the last four verses of each stanza constitute the chorus proper.]

## I.

## RABBIT-TUM-A-HASH.

RABBIT foot quick, Rabbit foot light,  
—Tum-a-hash, tum-a-heap!  
Hop, skip, jump! Oh, mon, he's a sight!  
Kaze he res' all de day en run all de night,  
—Tum-a-hash, tum-a-heap,  
Oh, Rabbit-tum-a-hash!

Crow fly Eas', de crow fly Wes',  
—Tum-a-hash, tum-a-heap,  
Jay-bird hunt de sparrer nes',  
En he eat all de aigs fer ter see w'ich de bes',  
—Tum-a-hash, tum-a-heap,  
Oh, Rabbit-tum-a-hash!

Little pot simmer, big pot bubble,  
—Tum-a-hash, tum-a-heap!  
Dumplin' flirt like he done got in trouble,  
He flirt en he slip twel he look like he double,  
—Tum-a-hash, tum-a-heap,  
Oh, Rabbit-tum-a-hash!

Pot, he bigger dan de fryin' pan,  
—Tum-a-hash, tum-a-heap!  
En 'pun dis groun' I take my stan',  
I druther be a nigger dan a po' w'ite man,  
—Tum-a-hash, tum-a-heap,  
Oh, Rabbit-tum-a-hash!

Nigger, he chunk up de fire en grin,  
—Tum-a-hash, tum-a-heap!  
Oh, do run yer, Miss Sooky Blueskin,  
You forgot fer ter put dat seas'nin' in,  
—Tum-a-hash, tum-a-heap!  
Oh, Rabbit-tum-a-hash!

W'en Pa'tridge call—*Bob White! Bob White!*  
—Tum-a-hash, tum-a-heap!  
*Does yo' dogs bite? Oh, yes, at night!*  
Oh, den Mister Rabbit lif' he foot mighty light,  
—Tum-a-hash, tum-a-heap,  
Oh, Rabbit-tum-a-hash!

## II.

## MY HONEY, MY LOVE.

HIT's a mighty fur ways up de Far'well Lane,  
My honey, my love!  
You may ax Mister Crow, you may ax Mister Crane,  
My honey, my love!  
Dey'll make you a bow, en dey'll tell you de same,  
My honey, my love!  
Hit's a mighty fur ways fer ter go in de night,  
My honey, my love!  
My honey, my love, my heart's delight—  
My honey, my love!

Mister Mink, he creep twel he wake up de snipe,  
My honey, my love!  
Mister Bull-Frog holler, *Come-a light my pipe!*  
My honey, my love!  
En de Pa'tridge ax, *Aint yo' peas ripe?*  
My honey, my love!  
Better not walk erlong dar much atter night,  
My honey, my love!  
My honey, my love, my heart's delight—  
My honey, my love!

De Bully-Bat fly mighty close ter de groun',  
My honey, my love!  
Mister Fox, he coax 'er, *Do come down!*  
My honey, my love!  
Mister Coon, he rack all 'roun' en 'roun'  
My honey, my love!  
In de darkest' night, Oh, de nigger, he's a sight!  
My honey, my love!  
My honey, my love, my heart's delight—  
My honey, my love!

Oh, flee, Miss Nancy, flee ter my knee,  
My honey, my love!  
'Lev'm big, fat coons lives in one tree,  
My honey, my love!  
Oh, ladies all, won't you marry me?  
My honey, my love!  
Tu'n lef, tu'n right, we'll dance all night,  
My honey, my love!  
My honey, my love, my heart's delight—  
My honey, my love!

De big Owl holler en cry fer his mate,  
My honey, my love!  
Oh, don't stay long! Oh, don't stay late!  
My honey, my love!  
Hit aint so mighty fur ter de Good-By Gate,  
My honey, my love!  
Whar we all got ter go w'en we sing out de night,  
My honey, my love—  
My honey, my love, my heart's delight!  
My honey, my love!

## AMERICAN ETCHERS.

THE term etching has a definite and limited significance too often disregarded in popular speech. Its maltreatment seems the more excusable when we remember that it is not a word originally wider in meaning which has been narrowed by the custom of the studio into limited technical applicability; but that its etymological, dictionary force is at one with its employment in artistic parlance. And as it denotes not an effect but a process, there should not be the least confusion with regard to it. Even if it were possible—as it is not—to produce identical effects by other methods, no work so produced could be called etched work. *To etch* comes from the same root as *to eat*, the Greek *ἐσθω*. Only such prints as are made from plates that have been acted upon by acid—bitten into, eaten away—are to be named etchings. To produce a print of this kind, the artist takes a plate—usually of copper, though sometimes of zinc—and coats it with a preparation formed of wax and other ingredients. Upon this “ground,” after it has been blackened with smoke so that his strokes will show more clearly, he draws his subject with a sharp-pointed instrument called a “needle” or “point,” using just sufficient pressure to remove the ground along the line of his strokes without scratching the metal underneath. The plate is then immersed in a shallow pan of acid called a “bath.” This acid, or “mordant,” acts upon the uncovered portions of the plate—upon the artist’s lines, that is—but has no effect upon the portions still protected by the ground. When the “biting” is accomplished, the plate is cleaned, inked, and printed on a roller-press. This is the bald theory of etching; but its practice is a much more complicated affair than might be thought. Variety in the blackness or strength

of lines cannot be produced—as in pen-drawing, for example—by varying degrees of pressure given to the draughtsman’s tool. This can do no more than remove the ground with a finer or a blunter point, thus producing lines which would vary in width, but scarcely at all in blackness, were all acted upon to an equal extent by the acid. But all are not thus equally acted upon. The palest, finest lines in a print have been bitten for a very short period; the darkest, strongest ones for a comparatively long period; and all intermediate lines for periods of intermediate lengths. There are various ways of obtaining these results. In one—the traditionary process employed by the great etchers of other days—the subject is completely drawn upon the plate, which is then immersed in the acid long enough to bite the lines intended to be palest. Then the plate is removed from the bath, the finished lines are “stopped out” with protecting varnish, so that the acid can no longer touch them, and the biting is resumed, these “stoppings out” being continued until all the desired gradations have been successively arrived at.\*

Another process, usually called the “continuous,” consists in drawing at first upon the plate only such lines as are intended to be darkest, biting these, cleaning and re-grounding the plate, laying and biting the lines of the next degree of strength, and so proceeding until the plate is finished. A third process, first brought into favor by Mr. Haden, presupposes the use of an acid which works rather slowly. In this the untouched plate is immersed, and the etcher’s work is done upon

\* Of course the *order* in which the gradations are secured may be varied to suit individual desires. But it is impossible here to dwell upon the manifold minor resources of the art.

it through the liquid. Of course, here also the strongest lines will be laid in first and the work carried on gradually up to the very palest. This process has many advantages,—and not alone in its saving of trouble,—but it requires such mastery of the art, so perfect a foreknowledge of just what effects are desired and just what methods must be used to get them, that it is only fit for the most able hands. There are other methods and combinations of methods in use, but they cannot be here described. Enough has been said, I think, to show the general technical principles of the art. But a few words must be added with reference to the completion of a plate. The reader will understand that the biting plays as important a part in an etching as the draughtsmanship proper, since upon it depend all the artist's effects of tone and color and aerial perspective. But even when the last biting is finished, the plate is not of necessity complete. It may afterward be worked upon: with the "dry point,"—that is, with the needle, in lines that *cut* the copper, and are not submitted to the acid at all, and that give a peculiar effect of their own; with a line-engraver's burin; with the "roulette,"—a tiny wheel that gives results analogous to those of mezzotinting; with pumice-stone, to roughen

the surface; and in more than one way besides. Moreover, when the plate leaves the etcher's hands, the printer often has his special work to do. The simplest way to print an etching is, of course, to wipe the surface of the plate quite clean. Then nothing prints save the lines which hold the ink below the surface and into which the paper is driven by the action of the press. But to obtain *flat* tints, films of ink, of greater or less strength, are often left on or applied to portions of the plate, which films print tints of greater or less blackness. Often, as in the etching by Mr. Blum here reproduced, this so-called "artificial" or "artistic" printing plays a very important rôle. And some of my readers may remember the many "monotypes" which have been exhibited during the past year. These are produced by artificial printing *alone*—unassisted by any etched lines. Of course, with this process—as its name implies—a plate can only give a single impression; and equally of course, an etched plate, whether with or without added inked spaces, must be inked anew before the taking of each impression.

It is difficult, in the short space at my command and hampered by the desire to reserve as many pages as possible for a notice of

A MODERN ETCHER. (ROBERT BLUM.)

J. HEWHITNEY SC.

JOE. (JAMES A. M. WHISTLER.)\*

individual American workmen, even to hint at the peculiar characteristics of the etcher's art, the peculiar gifts necessary for its successful practice. But I must try, though in the fewest words. Why, in the first place, is etching held to be a much more "artistic" process than any other manner of engraving? Why does it attract the hand of original, creative artists who leave other processes to their special students? Simply because it is infinitely *freer* than any other multiplying process, being, indeed, freer than any other *point* process whatsoever, as the etching ground offers even less resistance to an artist's touch than paper to the pen or pencil. It is the only graphic process by which an artist can *improvise*

—can put his own thoughts—directly, and with such ease that his most fleeting vision can be fixed and the least idiosyncrasy of his handling be preserved—upon a plate from which many duplicates may be printed. And, of course, it is this characteristic which makes etching so seductive to the artist, and which makes its results so interesting to the amateur.

Another charm of etched work—one which is less easy to explain in words, however, and which cannot be fully understood from the wood-cut reproductions here put before the reader—lies in the fact that the lines obtained by it differ vastly *in kind* from those obtained by any other engraver's process. Its blacks are deeper and richer and more velvety than

\* Reprinted from this magazine for August, 1879.

those possible to any other linear process (whether a multiplying process or not), and its lights by contrast higher and more brilliant. Thus a wider range for the translation of color is at command. Moreover, an etched line, of whatever degree of strength or delicacy, has a peculiar quality of its own. An engraved line, cut slowly and painfully into the metal, will not only be stiffer, more mechanical, less autographic, than a line cut swiftly and easily into yielding wax, but when printed, from its even, monotonous structure, will always look cold and hard. But the action of acid is *not* even and mechanical. A bitten line is full of slight irregularities, ragged and minutely uneven; and when printed it will have far more of life and vivacity and accent. A lover of etching finds in the contemplation of a single strong, well-bitten line a pleasure akin to that found by the amateur of painting in the contemplation of a single strong, well-laid brush-stroke—a pleasure which has no equivalent if we study an engraved line in isolation. There is nothing at all in linear work (whether engraved or merely drawn) that compares with an etching for freedom, strength, and personal expression; and there is nothing like it in monochromatic work for warmth, variety, tenderness, and beauty of color.

A word must, however, be said as to the limitations of the art—limitations which its lovers will hardly acknowledge to be drawbacks. As it is a strictly linear process it cannot cope with processes where tints and masses are employed in the rendering of full and perfect tone. Almost perfect tonality can, it is true, be accomplished with the needle and its various aids, but only with much labor and a sacrifice of frank, linear expressiveness. Of the degree to which excellence has been attained in this respect, by modern "reproductive" etchers especially, I shall say a brief word later on. Here I will only note that the greatest original etchers are usually content to give tone and gradation in a partial, arbitrary, and strictly interpretative way, since by so doing they retain rapidity of handling and—the prime excellence of the art—strong linear expression. In a word, they think more of form and color and freedom than of complete tonality.

When we begin to examine etched work in particular examples, we shall prize most highly those prints in which its characteristic qualities are most perfectly exhibited, its limitations most loyally respected,—since, as Mr. Hamerton well says, an art is at its best when most thoroughly *itself*. Those etchings which are the freest and most personal in handling and the richest in color, and in

which the line is most strongly and expressively employed, will be the finest. Of course, as in all other arts so with this one, there is something more than technical skill to be considered: there is the idea which it expresses or the sentiment which it interprets. But as etching is not an imitative art, even to the comparative degree in which some arts may be so esteemed, as it is the most boldly and frankly interpretative of all graphic modes,—original, valuable ideas must have existed where really fine workmanship is seen. The etcher's translation into expressive linear language of something which has shown no similar lines in nature, presupposes a power of clear analysis. And in so interpretative an art, where very many facts in every theme must be omitted, their effect dispensed with altogether or merely suggested to the observer's memory, the converse power of synthesis is implied as well. An etcher who speaks strongly must speak concisely, significantly, rapidly, and, if I may so express it, typically or symbolically. Therefore he must be possessed by a clear idea of the things he wants to say, looking to it that they are not so many as to confuse or so alien as to confound his peculiar form of speech. And so it is that when we see in an etching really strong and individual workmanship, it vouches for intellectual qualities as well—it presupposes, by its very existence, clear, individual ideas or characteristic sentiments in the etcher, with the presence of the high artistic powers to which I have just referred,—the powers of analysis, condensation, and interpretation. It was his recognition of these facts which made Jules Dupré exclaim: "Artists paint on their good days and their bad, but etch on their good ones only." And such facts and such testimony may well dispose of the too prevalent idea that etching is an "easy" art,—one fitted for the casual attention of any dilettante.

And these facts imply that perhaps the chief thing to be prized in an etcher's work is *economy of labor*. As the art is essentially a free and rapid one, and as it is difficult (and so far as the action of the acid is concerned) always more or less uncertain, one's effects should be produced with as much simplicity as possible. An elaborate, patiently worked-up plate is never as delightful as one executed with more freedom, with less expenditure of time and effort,—provided, of course, that the desired effect has been secured. Work done with few lines and vital ones, its meaning suggested by subtle "short-hand" methods, which leave the white paper to play an important part in the general result, appeals to most lovers of the art with especial force and

charm. I should repeat, perhaps, that I am speaking now of original etchings only—"painter etchings" as distinguished from reproductive work.

I hope the reader has not found his patience too sorely tried by so many technical explanations. He must remember that we cannot understand an artist's speech in all its meaning or appreciate one-half his skill, unless we know how he has been helped and limited by his tools. And with regard to so artistic and so peculiar a process as etching, such knowledge is doubly needful.\*

The history of etching is a peculiar one. Though brought into notice by Albrecht Duerer and his contemporaries on both sides of the Alps, the full possibilities of the art were first developed a century later by Dutch and Flemish artists. The greatest of these as a painter was the greatest also as an etcher—the completest master of the art who has yet been born. In Rembrandt we find all the endowments of an etcher in such force, and find them displayed along so many lines,—with so many results of surprising unlikeness but of equal excellence,—that a study of his work alone would serve to show nearly all of which the art is capable. During a long period which succeeded the extinction of the great Netherland schools and lasted into our own century, the art fell into almost complete disuse and into completer public disesteem. But when a growing love of "romantic" and "picturesque" tendencies in art opposed itself to the insipidities, the "classicism," and the formalities of preceding generations, modern artists were inspired by the etched as well as by the painted work of their great Dutch predecessors. Delacroix, Charles Jacque, and Daubigny were among the first to re-create an art most admirably adapted to express what in their time had become the prevailing artistic mood. Méryon, one of the greatest etchers of our day, was at work in 1850, and with him a host of scarcely inferior workmen. And after the establishment of the Second Empire, etchers were recognized as a special class of exhibitors at the Paris *Salons*.

Strictly speaking, the art revived a little earlier in England than in France, but with so much less of truth and energy that the

English school was soon outstripped by the Parisian, to which all others are even yet inferior. Not only are etchers more numerous in France than in any other country and their products far more widely appreciated, but these last are, as a rule, more original and various and in greater conformity to the true spirit of the art. I do not forget that one or two of the very ablest modern etchers have been Englishmen, but, nevertheless, my words hold true of French etchers as a class. And it is, therefore, a matter of congratulation that our own men have started in French rather than in English paths, though by no means in a servile or an imitative spirit.

If we consider now the brief history of etching in America, here, too, it will be found to have had its ups and downs. An exhibition of American etchings, held at the Boston Museum of Fine Arts, in the spring of 1881, showed that as early as the thirties and forties there had been etchers in this country. Among the names of these long-forgotten pioneers we read some which are quite unfamiliar; some, like that of William Dunlap, the first historian of American art, which are associated with quite other things; and some which are of artists who, like Edwin White, have since gone over to the majority, or who, like Mr. Falconer and George L. Brown, still live and work among us. It would be too much to say that any of these men were etchers in the true sense of the word, with the exception, I think, of Mr. Falconer; still less were they etchers of originality or force. Usually they drew upon the copper with little idea of its unique requirements and with results of no artistic value. But their aspirations should be held in grateful recollection none the less, for theirs was the day of small things,—a time when every earnest student of art must have had an appreciable influence in a community where his fellows were so few.

A name which should not be forgotten is that of Edwin Forbes, who published\* a large portfolio of etchings called "Life Studies of the Great Army," containing forty plates illustrating the life of the Union armies during the years 1861-65. They are not executed in the true "etcher's spirit" or with great technical skill, but they are clever and interesting none the less, and will have historic value as the most complete and characteristic contemporary record of our military life. Mr. Forbes's work won foreign praise, and caused him to be elected a member of the French Etching Club and an honorary foreign member of the old London Etching Club as well.

In the year 1866 a spasmodic interest in

\* For complete instruction in the theory and history of the art, the reader is referred to Mr. Hamerton's delightful volume, "Etching and Etchers." His "Etcher's Handbook" gives full directions for its practice, but should be read, not only by those who aspire to work, but also by those who wish to understand the work of others. Lalanne's book on "Etching," translated and annotated by Mr. S. R. Koehler, may also be recommended to every student, and much information may be got from Mr. Hamerton's essay on Mr. Haden's work in this magazine for August, 1880.

\* In what year I cannot say, but they were copyrighted in 1876.

RIVA DEGLI SCHIAVONI, VENICE. (FRANK DUENECK.)

the art was prompted by a M. Cadart, who established in New York what he called a "French Etching Club," and whose instructions drew about him some of the younger artists of the day. But there followed another apathetic period, and it is only within very recent years that the art has shown any real, spontaneous activity likely to result in vigorous and fruitful growth. The year which followed that of the Centennial Exhibition, when so many unaccustomed eyes had been led to look with interest at things of art, may almost be called an epoch in the history of American development. In 1877, the torpid National Academy precincts saw the advent of certain young men from Munich who caused a great rattling of dry bones at the moment, and who proved but the advance guard of a whole battalion of fresh and eager painters. And, what more nearly concerns us here, it was this year which saw the birth of the "New York Etching Club," an association formed by a few earnest students of the art to incite activity by brotherly reunions and to spread its

results by annual exhibitions. The young society went through that struggle for existence which seems ordained for babes of every sort,—even for those which, like this artistic infant, are well fathered and tenderly watched over. The public was indifferent, and some of the Club's own members were too much absorbed in other work even to heed that condition of membership which prescribed that each should produce at least two plates every year. But though its survival was due to the pains and sacrifices of a few men who deserve well of the republic, the Etching Club is now prosperous and busy, and has been more potent than any other influence in aiding the progress of the art among us and in winning the public to its love.

An event which should be named as having worked with vigor toward the same good ends was the establishment, in 1879, of the "American Art Review." Its editor, Mr. S. R. Koehler, was especially anxious to foster etching in America, and gave with each monthly number of the magazine original

A WET EVENING IN VENICE. (OTTO H. BACHER.)

etchings by native workmen, accompanied by clear critical notices from his own pen. During the two years of the "Review's" most regrettably brief career it did much to benefit both the artist and the public, and its discontinuance was, in the words of the Etching Club itself, "a bereavement to the American etcher." In the spring of 1881, as I have said, an exhibition of American etchings was held in Boston, chiefly owing to the exertions of Mr. Koehler. At the same time, our workmen were winning their first foreign laurels. In the month of May was held in London the first exhibition of the English "Society of Painter-Etchers." The prints solicited from American artists caused such general surprise and were so cordially praised by the best foreign judges that a thrill of pride must have stirred every needle in this country. No less than nine or ten Americans—Mrs. Thomas Moran, Messrs. Thomas Moran, Farrer, Falconer, Swain Gifford, James Smillie, Bellows, Parrish, F. S. Church, and, I think, Frank Duveneck—were at once elected members of the new society, one print by each being chosen for its collection. Mrs. Moran's "Goose-pond," here reproduced, was one of the "diploma" pictures thus selected.

The exhibition held in New York last winter under the patronage of the Club, though not confined to the work of its members, was a surprise even to those who had watched with appreciative eyes the rapid progress of the art among us. Two rooms were filled with prints signed by fifty-three American names. Most of them were more than satisfactory, and some of them were quite admirable. We may not be able to count as yet any name of the highest rank save that of Mr. Whistler. But we must remember that, as Mr. Hamerton says, great etchers are produced at about the rate of two or three to a generation. And in an art so essentially artistic, and

so exacting and peculiar in its requirements, there are many places below the very highest which admirable workmen alone can fill.

One or two external influences have worked so palpably to encourage etching in America, that they also must be mentioned before I pass from this brief history of our school to a briefer criticism of the work it has thus far done. Mr. Hamerton's teaching is one such influence. It would be hard to compute the good done by his book,—which won a sudden wide popularity very unusual to volumes of its sort,—both in prompting artists to take up the point, and in telling the public how to appreciate their efforts. Mr. Haden's etchings have worked strongly in the same direction, not only in and by themselves, but through the benefits their success has conferred upon the least of Mr. Haden's brethren in art as well as upon himself. It is not necessary here to dwell upon the degree of that success or upon the merit which secured it. Just now, when Mr. Haden has so recently come to visit us, the most casual reader may be supposed to know something of the one and of the other. Before the day of that success it was difficult indeed to sell modern etchings in England or America. But Mr. Haden opened the market to all good workmen, for he opened the eyes of his countrymen and our own. It is hoped and believed that his visit will give a fresh impulsion to the etcher's art among us. The mere presence of a great man has an inspiring effect upon his fellow artists; and the words of such an one, whether speaking in print or from the lecture platform, appeal to a more receptive audience than is reached by a whole chorus of lesser voices. Mr. Whistler's influence is another that should not be forgotten in a summary of the things which have helped us on our way. He is an American artist and so must be discussed

with more of detail. First, however, I would say a word as to the characteristics of our school in general,—for it is, I think, sufficiently independent and sufficiently well-established to have some that are worthy of the name.

One of the chief temptations which assail an artist in our day is the temptation to make a show of boldness and rapidity and synthesis if the real things are not at his command,—to work in a rough and careless or pretentious way, which, to untrained eyes, may pass for the freedom and vigor and breadth of a master hand. And as etching is an art where freedom is especially prized, and where, from the strictly interpretative nature of the method, the public may find

best things. As a school they have begun conscientiously and soberly, and are therefore more likely to work their way to complete mastery than if they had begun in careless over-confidence or willful posturing.

Another fact which has struck me most favorably is that as a rule our men show a very just instinct in the choice of their material. There is no kind of material, scarcely an "effect" of any sort, which may not be attempted with success in etching,—which has not been successfully interpreted by the great men of one day or of another. But it is nevertheless true, with this art as with all others, that certain things are by nature best adapted to its use. From the description of

SEA-SHORE, LIDO, VENICE. (OTTO H. BACHER.)

it difficult to distinguish between an almost arbitrary yet truthful and brilliant interpretation of nature like one of Mr. Haden's, and a "free" but meaningless scribble on the copper,—it was to be feared that our young etchers might fall into sins of a careless or pretentious sort. But such has not been the case. When they do sin it is usually in the way of too much timidity, too little personality and force of handling, too much useless elaboration, too little abstraction and condensation and insistence upon the vital structure of their subject. They have not always conquered the possibilities of their art in the way of breadth and strength and originality; but they have not often travestied these

the process it will be felt that it must work most easily and surely upon things which can be expressed by few and powerful lines and simple tonic schemes. Form and color are its strongholds; strength and directness its great virtues; and, as Charles Blanc says, "It is attracted most by everything that is irregular, *bizarre*, incomplete, unexpected, disordered, or in ruin." And with these requirements our etchers seem to be in unison.

There is still a third tendency to be discovered in our work which cannot be too highly praised. Our best men—with the exception of Mr. Whistler and a few who have been inspired by him and Venice—have learned their art at home and have chosen local themes for

HAY-RICKS. (H. FARRER.)

its display. While our art is still so young and so rapidly developing, it cannot be too often said that all hope for its future as a characteristic national school must lie in the willingness of our men to interpret the life which gave them birth, and to which—in spite of foreign residence and training—their spirits must be most akin. Nor need the American etcher, by the way, be the man to complain that nature so decrees. Admirable material for his art lies ready to his hand,—especially in our great harbors and in our coast lands, with their long reaches of sand and rock, their changeful skies, their rugged, wind-torn growths of stem and foliage, their quaint forms of hull and sail, their tangled lines of mast and cordage, and the picturesqueness of their weather-beaten little towns, with the irregular shapes and strong outlines proper to wooden structures no longer in the ugly pride of newness. It is fortunate indeed that our men see the value of these things—fortunate for themselves as well as for the national repute, since every worker does his best when most at home with his subject-matter, and since, moreover, there is no such spur to originality of expression—

that chief of charms in etching—as freshness of material. We cannot be the parrots of any other man if we are saying something that none has said before.

Mr. Whistler's name is, of course, the first that should be mentioned in a list of American etchers. Though most of his art education was obtained in Paris, and though his long residence in England has caused him to be identified with the younger English school, Whistler is an American by birth and breeding; and—what is of more importance in deciding his artistic nationality—he is, it seems to me, quite peculiarly American in his temperament. He is one of the very first few among living etchers, and his plates assisted those of Mr. Haden in the good work of bringing the etcher's art once more into wide popularity. Mr. Whistler cares little for orthodox "composition," and does not often try for even approximate tonality, but in individuality, in sentiment, and in free, frank, artistic, and "telling" use of the line, he has no superior among the moderns and few equals in any age. His work is at times extremely strong, at times supremely delicate, and always wonderfully vital and original.

AN OCTOBER DAY. (R. SWAIN GIFFORD.)

His strength is nervous and brilliant and incisive, not massive like Mr. Haden's; but his utmost delicacy has never a hint of commonplace or weakness. Every stroke has meaning, and each is set with beautiful skill and rare artistic feeling. His best-known plates—a series representing the Thames in and about London—had, at the time of their publication, some twelve years back, a quite noteworthy influence in showing what may

his products are of an original sort. It is hard to explain such differences in words; but I may say that his plates are more massive, more full of detail and color, while showing less individuality of sentiment and a less free and graceful linear beauty than Mr. Whistler's. He is, too, less of an "impressionist" and more of a "realist,"—if I may use these words now consecrated to meanings which they but imperfectly convey. Some of Mr. Duveneck's

A GOOSE-POND—EAST HAMPTON, LONG ISLAND. (MARY NIMMO MORAN.)

be done with materials essentially modern and supposedly unpicturesque. His figure and portrait etchings are, to me, the finest that have come from any living hand. Mr. Whistler has stood, by the fact of his foreign residence, outside the main current of the art as developed in America; but he has had a strong direct influence upon some few of our men, as well as a stronger indirect influence upon the art in general. Of late years he has worked largely in Venice, and has had about him there from time to time a group of younger workmen who, while not imitating him in any servile fashion, yet show the impress of his example. Among them is Mr. Duveneck—far too strong a man to be beholden even to a Whistler for thoughts or manner. Though doubtless inspired by Whistler's plates to work from similar themes,

large plates are among the best things done in recent years, and are quite wonderful in the way they reproduce the color and busy stir and strongly contrasted effects of modern Venice. Next, perhaps, I may speak of Mr. Otto Bacher, a young artist who worked at first in a simple, quiet style, and from simple pastoral subjects, but who, since his Venetian visits, has adopted a bolder, stronger manner and tried more complicated themes. His aims are very much the same as those of Mr. Duveneck, but he is not quite so skillful as the elder artist in his management of the vigorous, crowded lines which they both delight in. Mr. Bacher has usually etched direct from nature. At first he worked in the bath, but while in Venice he found the older process of biting and stopping out indoors to be more convenient. Other young men who have done

THE BREAKING WAVE. (THOMAS MORAN.)

good work from similar themes are Messrs. Corwin, Wendell, Rosenberg, and Hopkins.

It should be noted—as a happy sign once more—that, from Whistler and Duveneck down to their last young pupil, it is not the Venice of tradition or of fantasy which has inspired the needle, but the Venice of to-day,—that modern life where the nineteenth century utilizes the relics of the *cinqe cento*; where great ships loom up amid the hurrying gondolas, and where smoke and steam play their not ignoble part in the gorgeous panorama of Venetian skies.

Turning from this little band of clever workmen we find few American etchers who have chosen foreign themes, and not one

who, if so choosing upon occasion, has done his best work thereupon. Mr. Henry Farrer, for example, one of the earliest and most prolific of our etchers, has tried subjects of many sorts, but all of local flavor, producing his best plates, perhaps, when depicting scenes in and about the harbor of New York. His early work was very careful and elaborate, but he has gradually made his way to far greater simplicity and far greater power. I would especially name several plates with dark hulls relieved against a brilliant evening or morning sky, as strikingly effective and thoroughly good in workmanship. The "Hayricks" here reproduced is not very characteristic of his most individual mood or choice

GLOUCESTER FERRY. (STEPHEN PARRISH.)

of theme. But it has seemed better,—in this as in more than one other instance,—to choose for reproduction such a plate as the wood-engraver could give most successfully, rather than one which, while intrinsically finer, would suffer more by interpretation into another art.

In his etched as in his painted work, Mr. Swain Gifford goes most often to our low coast-lands for his subject-matter. In choice

this is the most perfect plate, in sentiment and in execution, that has yet been done in America, though less brilliant and immediately "effective" than some others. It was chosen by the English Society as Mr. Gifford's "diploma" print. Mr. Gifford usually finishes his work from nature, and employs the oldest processes of the art; but sometimes he works by the "continuous" method.

Mrs. Moran is, as yet, the only woman who

AN AMERICAN VENICE. (JOSEPH PENNELL.)

of theme he is peculiarly happy, and his handling combines both decision and delicacy to an unusual degree. It is difficult and might be unjust to use absolute superlatives when speaking of men so nearly on a par as our best etchers—to name one as superior to all the others. But I shall keep within a quite undisputed fact in saying that there is not one among them who shows a truer feeling for the requirements of this peculiar art than Mr. Gifford; who etches more truly in the etcher's spirit; who knows so exactly what to omit and what to insist upon, and thus produces such complete effects by such simple and synthetic means. His finest plate, to my eyes, is the "Pandaram Salt Works,"—most remarkable for quiet simplicity of manner and fullness of meaning, and for a truly artistic management of line and detail. I am only citing, of course, an individual preference; but to me,

is a member of the New York Etching Club, and no name stands higher on its roll. Her work would never reveal her sex—according, that is, to the popular idea of feminine characteristics. It is, above all things, direct, emphatic, bold,—exceeding in these qualities, perhaps, that of any of her male co-workers. The fine plate called "Solitude," published in the "American Art Review," in 1881, with its tall, thin tree-trunks cutting sharply against a back-ground half dark foliage and half pale sky, and its solid, well-contrasted effects of light and shadow, is a preëminently manly piece of work. The "Goose-Pond," here reproduced, is quite as good, though not so original in motive, while the largest plate yet etched by her, the "Twilight," shown at the New York Exhibition of 1882, is even finer. Mrs. Moran painted in oil and water colors for a number of years; but she found her true artistic voice only when she took up the point

INTERIOR OF FISH-HOUSE. (CHARLES PLATT.)

some three years ago. She has always etched direct from nature, usually finishing her plates to the very last stroke in presence of the chosen scene, and completing them with bitings as few and as vigorous as possible. In the "Twilight" she has made an extensive but well-calculated use of the roulette to produce effects of tone. Her methods are not so exquisitely frank and simple as those of Mr. Gifford, and she seeks more for "pictorial" results than he. For this reason her work is, perhaps, more popular than his. But this reason does not make it less praiseworthy. Their chief plates might well be put side by side to show how the art can vary while remaining at the same level of artistic excellence.

Mrs. Moran's immediate success with the needle was doubtless owing to the fact that she was her husband's pupil. Mr. Thomas Moran had etched for many years before the art became so popular as now, and has experimented in a score of ways, even with the little-practiced art of etching on glass. His plates are very various in character, but to me his best results are those of delicacy and refinement and grace, rather than those of force. His sea-shore sketches are especially attractive. If there is a fault to be found with his work—which, by the way, has won him hearty praise from Mr. Ruskin, who is not a lover of the art in general—it will be that his compositions sometimes lack unity of conception and consequently of effect,—an excellence that is strongly characteristic of the other names just mentioned.

Mr. Peter Moran has also been a prolific etcher. Animal life chiefly attracts him, and

a large plate called "The Return of the Herd," may possibly be called his best. He and his brother have both been fortunate in finding unhackneyed themes in the picturesque regions of the Yellowstone and of Spanish New Mexico.

Mr. Stephen Parrish, whom I should put with Mr. Gifford and Mr. Farrer and Mrs. Moran in the very first rank of our home-keeping etchers, and who is the most popular of them all, has tried his hand at themes of many sorts, but his name is especially associated with sea-board scenes. Our ragged fisher-villages, with their rocky foundations and primitive vessels, have found in him a first and most clear-voiced interpreter. He has experimented widely with his art, especially in the matter of sky-treatment. Those plates in which he has left the largest amount of almost untouched paper to play its part seem to me the most thoroughly successful. Unlike his associates just mentioned, Mr. Parrish does not believe in etching direct from nature, but thinks the peculiar requirements of his art may be better met if pencil sketches are leisurely adapted to the use of point and acid. He usually etches without stopping out, and sometimes altogether in the bath.

Mr. Joseph Pennell's work was hardly known, I think, until a couple of years ago, but secured him at once a place among the foremost. He too has struck out an original line for himself in his sketches of old Philadelphia, with its diversities of level and unexpected flights of steps, its quaint architectural forms, and its narrow streets and

BARNEY'S JOY. (LEROY MILTON VALE.)

curious court-yard so rich in effects of light and shade.\* During the last few months he has treated with success similar themes found in lower Louisiana. Mr. Pennell writes me: "I should be most happy to tell you about my 'usual method of working'—but I haven't any. I either work from dark to light, or in the bath, or make the whole drawing in the old-fashioned way and use stopping-out varnish. In fact all my work thus far has merely been a series of experiments \* \* \*

\* In an article called "From Cape Ann to Marblehead," published in this magazine in November, 1881, will be found wood-cuts after Mr. Parrish's best plates, while Mr. Pennell's work is similarly reproduced in "A Ramble in Old Philadelphia," in the number for March, 1882.

of my plates (in fact all, so far as I remember) have been done in a day—and most of them in half of one. About half were done out of doors and the rest from sketches. In future I intend to do everything from nature direct on the plate."

Mr. Charles A. Platt is a very young man, and just beginning, with energy and serious effort, his work in etching. He seems to have been influenced a good deal by Mr. Parrish, both in his choice of theme and in his manner of working. But his taste is artistic, his individuality is visible, and his master is a good one; so we may hope the three facts will work together till the former predominate in an art of first-rate quality.

Mr. Vanderhoof has done but few plates,

SOLITUDE. (CHARLES A. VANDERHOOF.)

in the preparation of which he has used the dry point very freely. They are all individual and poetic in sentiment and charming in workmanship. The one here reproduced is, so far as I know, the largest and most important he has published.

Mr. Nicoll is another artist worthy of all attention; and Mr. Falconer, the earliest of all our present etchers, has done a great deal of work of various sorts and qualities, from the most painstaking to the most sketchy sort,—the best being in clever renderings of time-worn and curious buildings.

Dr. Yale's name will not be found among those of our professional artists. Etching has been his recreation only, not even a minor branch of his main activity. But he deserves the name of artist none the less, and he is entitled to peculiar honor for the reason that, though standing outside the actual artistic guild, he was one of the most earnest founders and fosterers of the New York Etching Club.

Mr. Coleman, Mr. Bellows, Mr. George H. Smillie, Mr. Miller, and Mr. Kruseman Van Elten; Mr. Harry Chase, Mr. Laffan, Mr. McCutcheon, Mr. Sabin, Mr. Kimball, and Mr. Garrett—these are all men, of the elder or the younger generation, who have done interesting things, but whom the lack of space must deprive of further comment. Mrs. Greatorex has also produced many good plates, though rather in the spirit of the pen-and-ink draughtsman than of the etcher properly so-called. Still, her records of old New York are artistically as well as historically valuable.

As yet I have spoken only of our landscape etchers, and they form, indeed, a great majority among our workmen. But there are a few who have succeeded with other themes. Chief among these is Mr. F. S. Church, an artist who is so popular, and whose work has been so thoroughly discussed in Europe as well as here at home, that neither my description nor my praise is needed. His fantastic, graceful imagination is unique in our art, and works as well through the medium of point and acid as in other ways. The little cut here given does not show him in his most characteristic mood; but that mood is so familiar to every eye that perhaps a novelty was better chosen.\*

Mr. John Ames Mitchell began life as an architect and has done some good etched work with architectural motives. He studied with Brunêt-Debaines, one of the best French

THE ROSE OF PAIN. (F. S. CHURCH.)

etchers of our day, and learned from him a delicacy and refinement in the management of his tools which stood him in good stead in several series of small figure-subjects published a while ago in Paris. He is especially clever, if at times a bit theatrical, in his management of strong floods of light, and has an expressive touch when drawing one of his comically characteristic little faces.

Mr. Dielman's name should not be forgotten in this connection, nor that of Mr. Gaugengigl, who, though a German by birth and education, had never etched till he came to this country.

Mr. Blum shows only two or three plates as his work thus far; but the one here reproduced is among the most ambitious and dashing things we have yet accomplished. It is strongly sketched on zinc, and the

\* For a full and most appreciative notice of Mr. Church's work, the reader is referred to an article by Mr. Comyns Carr in "L'Art" for November 13th and December 4th, 1881.

LOUIS AGASSIZ. (ANNA LEA MERRITT.)

elaborate tonality is secured, as has been said, by a somewhat lavish use of artificial printing. The biting was done in a rough-and-ready way, which may be noted to show how many odd devices an etcher can employ. The whole plate was bitten once, and then the acid was poured on certain spots and wiped off when its purpose was accomplished. Naturally, no delicate gradations could be secured in such a way, but for Mr. Blum's purpose it has answered well enough.

Mr. Chase, too, has as yet done little with the needle, but enough to prove him possessed of abilities that would repay further exercise. Quite rightly he does not carry his methods with the brush into his practice with the point. His plate after his own picture called "The Jester," is not a "reproductive" etching, but an etcher's free version of a theme he had quite differently put on canvas. The face, for example, is not carefully modeled so as to duplicate the effect of the painting, but is cleverly and quickly touched with an etcher's characteristic lines and dots.

And thus I come at last to say a brief word about reproductive etching. It is a quite distinct branch of the art, though, as always, we may find many good works occupying a middle ground between two logical extremes. As so very widely practiced by modern engravers it was unknown in earlier days. Etching was long used as an auxiliary

in other kinds of engraving, but has only lately grown to its full proportions as an independent reproductive craft, its development being due to the decline of the great art of line-engraving, and to that newly born taste which demands color and tone and the preservation of a painter's technical method in a black-and-white reproduction of any sort. These things can all be secured to a quite wonderful degree in etching, but only at a sacrifice of some qualities we prize most highly in original work. The engraver-etcher's methods are very delicate, very subtle, very artistic, but almost always very slow and, of necessity, very complicated. So he lacks not only the individuality but the spontaneity and the swiftness of the artist, who is called—to mark him off from these engravers with the needle—the *painter-etcher*. Thus, while employing the same technical processes, the reproductive etcher uses them with such different aims that his art is quite another thing from that of Mr. Haden, for example. For has not Mr. Haden said that an etching which is finished in one sitting is likely to be the best? Each art is right and good in its own place. It is only when the spheres of the two have been confused in the same work, when the etcher has not been clear as to his aims and consistent in his methods, that we may call either aims or methods illegitimate.

It is curious to reflect—when we remember the wonderful interpretative skill of our wood-engravers, and also how American art has always been taunted with its lack of originality—that our etched work is almost exclusively "painter's etching," that only a few of our men have attempted reproductive work, and that even these have shown little love for its more tedious if completer methods. Among these few, however, are some who must not go unmentioned. It would have been better, perhaps, to speak of Mrs. Merritt among original workmen. Her plates are chiefly portraits, done from painted or photographic originals, often from her own pictures, but, though quite elaborate in workmanship, are not exactly to be called "reproductive" etchings. Whenever she finds her theme, she treats it in a somewhat interpretative way. Her work is essentially English in flavor, delicate and artistic, but not over strong in handling. The portrait of Sir Gilbert Scott, after a painting by George Richmond, R. A., (published in the late *Review*) is to my thinking the best she has accomplished.

Mr. James Smillie has done good original work, but more often clever reproductions. Among the best are versions of pictures by Charles Jacque and Bridgeman. Mr. Stephen

Ferris, too, has not confined himself to reproductions (having done among other original things some clever little portraits), but has won most of his reputation by their means. Mr. Peter Moran has also done reproductive work, and Mr. Thomas Moran's very large plate, after the Turner in his possession, is the most ambitious and also the most successful reproductive etching yet attempted in America. While acknowledging that we have no names to put into even remote comparison with the great French and German engraver-etchers of our day, we should not at all regret that our men show more inclination toward original, free, creative work.

*M. G. van Rensselaer.*

### OUR WOOD IN WINTER.

THE circle of the wind-swept ground  
Was paved with beechen leaves around,  
Like Nero's golden house in Rome;  
While here and there in solemn lines  
The dark pilasters of the pines  
Bore up the high wood's somber dome;  
Between their shafts, like tapestry flung,  
A soft blue vapor fell and hung.

We paused with wonder-taken breath:  
It seemed a spot where frost and death  
Themselves were chained at nature's feet;  
And in the glow of youth and love,—  
The colored floor, the lights above,—  
Our hearts, refreshed, with rapture beat;  
The beauty thrilled us through and through  
And closer to your side I drew.

Ah, tell me when we both are old,  
On dismal evenings bleak and cold,  
When not a spark is in the west,  
When love, aweary grown and faint,  
Scarce stirs the echo of complaint  
Within the sad and laboring breast,—  
Ah! tell me then, how once we stood  
Transfigured in the gleaming wood.

And in a vision I shall turn  
To see the fallen beech-leaves burn  
Reflected in your lifted eyes,  
And so for one brief moment gain  
The power to cast aside my pain,  
And taste once more what time denies;  
Nor linger till the dream has fled,  
But on your shoulder sink my head.

*Edmund W. Gosse.*

KO-LO-WISSI, GOD OF THE PLUMED SERPENT.

## MY ADVENTURES IN ZUÑI. II.

WHEN the frost first crackles the corn-leaves in the valley of Zuñi, it is, to the dweller in that desert land, what the first April shower is to husbandmen of New England. For in Zuñi autumn is spring-time. It is the time of soft breezes and hazy beauty of sky, not the days of blazing sun, driving sand-blasts and dust-hidden clouds and distances. You may stand on the topmost terraces of the old pueblo and see the busy harvesters bringing in their last crops, and the old women who have been off among the

mountains gathering peaches all day, staggering home at sunset, under huge baskets, strapped across their foreheads, full of the most delicious fruit. As you stroll through the narrow terrace-bounded streets your foot slips on pulpy melon-rinds, and from every dark window-hole dusky faces grin at your mishap. From as many door-ways welcomes greet you in unpronounceable clicks and guttural aspirations, which you are not long in comprehending, for basket after basket of the fruit brought in last evening is set before you. Day after day you may hear from the open plazas the sound of the drum and rattle, telling in strange cadences of the general joy of the time when "the corn grows aged, and the summer birds chase the butterfly to the land of everlasting summer."

It was toward the close of these merry days, one bleak evening in November, just as the red sun had set behind heavy black-bordered clouds at the western end of the plain of Zuñi, and the wind was wildly rushing to the opposite end, with its heavy freightage of sand, dead corn-leaves, and dried grasses, that the herald of Zuñi and I were walking down past the scalp-house toward the buildings of the mission. My companion turned to me with a pleasant smile on his face, and, tucking the corner of his *serape* more closely under one arm, raised his fingers as if to count them.

"Little brother, make your heart glad," said he, "a great festival is now every one's thought. Eighteen days more, and from the west will come the Shá-la-k'o; it welcomes the return of the Kâ-kâ and speeds the departure of the Sun. Make your heart glad, for you shall see it too."

Elated with the change of spirit toward me,

THE RETURN OF THE FLOCKS.

which this indicated on the part of the Indians, who had previously constantly opposed my presence at their ceremonies, I turned to reply, but he was shading his eyes and gazing intently off toward the road over the eastern mesas.

"Look! I wonder who are coming," said he.

A train of wagons was appearing at the

hail pelted fiercely down on the roof and against the plates of selenite in the windows. But the fire burned only the more brightly, shooting red tongues of flame up into the black, box-shaped flue, and casting dancing shadows against the white walls and over the stone-paved floor.

Next morning I crossed the pueblo, and looked down over the plain. The storm had

ZUÑI WEAVING.

FARNY  
O.

crest of the black, distant head-lands. It came but slowly in the dusk, and against the wind-storm, so we returned to the pueblo.

My room was no longer lonely as at first. Huge blocks of piñon blazed on the hearth, and the Governor, now my inseparable friend, with his watchful, industrious wife, were there to welcome me. Night grew black outside. The wind howled in the chimneys. Rain and

ceased. Tents were pitched in the corral of the mission; white-topped wagons stood around, and smoke rose from a little fire in the corner. By these signs I knew that the caravan we had seen was my party returning from Moqui.

Hastening back to tell the good news to my "old brother," as the Governor insisted I should call him now, I met at the entrance

CHIEF PRIEST OF  
THE BOW.

Colonel Stevenson. In-  
changed, he drew forth  
ed me a letter from the  
ian Institution, informing  
a continuation of leave had been granted as I  
requested.

That night, doubtful of the results, I told  
the Governor that Washington wished me to  
remain there some months longer, to write all  
about his children, the Zuñis, and to sketch  
their dances and dresses.

"Hai!" said the old man. "Why does  
Washington want to know about our Kâ-kâ?  
The Zuñis have their religion and the Amer-  
icans have theirs."

"Do you want Washington to be a friend  
to the Zuñis? How can you expect a people  
to like others without knowing something  
about them? Some fools and bad men have  
said 'the Zuñis have no religion.' It is be-  
cause they are always saying such things of  
some Indians, that we do not understand  
them. Hence, instead of all being brothers,  
we fight."

"My little brother speaks wisely, but many  
of my people are fools, too. He may get  
in trouble if he pictures the Kâ-kâ too much."

"Suppose I do."

"Well, then, what makes you puff up your

face with sad thoughts?"  
asked the old man impa-  
tiently. "Don't you have  
plenty to eat? When you  
came here you lived on  
pig's grease and baked  
dough, but I threw the  
light of my favor on you  
and cooked some mutton.  
Have you ever had to ask  
for more? Sister would make  
all the paper-bread, corn-  
cakes, and dumplings you could  
eat, but you will not eat them,  
and she has grown ashamed.  
What's the matter anyway?"  
he persisted. "Do you want  
to see your mother? Pah?  
Well you can't, for if Washing-  
ton says 'You stay here,' what have  
you to say? Now go to bed. You  
had better cut down that hanging bed  
of strings, though, and sleep on a cou-  
ple of sheepskins, like a man. Some  
night you will dream of 'Short Nose'  
[my mule], and tumble out of that  
'rabbit net,' and then Washington  
will say I killed you. You just wait  
till 'Teem-sy' [Colonel Stevenson] and  
his beasts [the Mexican cook and driv-  
ers] go away, I'll make a man of you then;"

and with this he leaned back against the  
adobe bench, with all the complacency of a  
tolerant, dutiful, and very responsible guardian.

A day or two afterward he approached me  
with a designing look in his eyes, and snatched  
off my helmet hat and threw it among some  
rubbish in the corner, producing from behind  
his back a red silk handkerchief. Folding  
this carefully, he tied it around his knee,  
and then placed it on my head. With a re-  
mark denoting disgust, he hastily removed  
it, and disappeared through a blanket-closed  
door into a quaint mud-plastered little room.  
After rummaging about for a time, he came  
out with a long black silken scarf, fringed at  
either end, which must have belonged once  
to some Mexican officer. He wound this  
round and round my head, and tied the ends  
in a bow-knot at my temple, meanwhile turn-  
ing his head from side to side critically.  
"Good! good!" said the old man. "There,  
now, go out and show the Zuñis, then travel  
down to the camp and show the 'Teem-  
sy-kwe' [Stevenson people] what a sensible  
man you are, and how much better an *óthl-  
pan* is than a mouse-head-shaped hat." He  
also insisted on replacing my "squeaking  
foot-packs," as he called a pair of English  
walking shoes, with neat red buckskin moc-  
casins.

Thus, in a blue flannel shirt, corduroy breeches, long canvas leggings, Zuñi moccasins and head-band, heartily ashamed of my mongrel costume, I had to walk across the whole pueblo and down to camp, the old man peering proudly around the corner of an eagle-cage at me as I started. The Zuñis greeted me enthusiastically, but when I reached camp great game was made of me. I returned thoroughly disgusted, determined

nials others would be elected for the ensuing year. Followed by a great crowd, they went from court to court, repeating in a sing-song, measured tone prayers to the gods and instructions to the people, whom they directed to prepare within four days for the coming festivities. Each of these clowns, save one,—their reputed father,—would start out soberly and properly enough in his recitation, but would soon, as if confused, wander off to

WOMEN GRINDING CORN.

never to wear the head-band again; but, when I looked for the hat and shoes, they were nowhere to be found. When I asked for them, the Governor said, "No-o-o-o! The Americans are asses. Don't you suppose I know what becomes a man? Here, what have you got that on sidewise for? You Americans *will* stick things on your heads as though your skulls were flat on one side; are they? Well, then! wear your head-band straight and don't make a hat of it. There!" said he, straightening the band. And every morning, just as I was about to go out, he would carefully equip me in the black silk head-band. He took so much satisfaction in this, and it pleased the other Indians so much, that I decided to permit them thenceforth to do with me as they pleased.

One night, toward the close of the month, there appeared in the pueblo the ten Kó-yi-ma-shis. It was for the last time, the Indians told me, for during the old Sun ceremo-

some ridiculous, childish nonsense, which would bring down the rebuke of the older one. Forthwith the culprit was hunted forth from the line and replaced by one of his companions. This one, in turn, repeated the failure of the first. Each sally of rude wit was greeted with loud laughter and shouts of applause from the by-standers, who crowded around the little circle and lined the house-tops in the dark. Those near the Kó-yi-ma-shis held torches in order that the grotesque faces might be seen. As soon as the prayer of the oldest one began, however, the torches were lowered, and the whole court was hushed until it was finished. Then the ceremony, varied only in the jokes, was repeated in some other plaza or court.

After all the plazas had been visited, I stealthily followed the retiring Kó-yi-ma-shis to a large room on the south side of the pueblo. A sentinel stood at the door, and no one but these clowns was permitted to enter.

ZUÑI SPINNING.

Nor could I catch more than a glimpse of the fire-lit interior, as the windows were heavily curtained with blankets. I learned that the group had been confined in this room four days and nights, engaged in fasting, prayer, and sacred incantations; so I determined to visit them.

Two days later I collected some tobacco and candles. The evening meal over, I asked where the Kó-yi-ma-shis were.

"They are tabooed," was the reply.

"I know," said I, "but where are they?"

"How do you know? What do you want with them?" the Indians glumly asked.

"They are good men," said I, "and I wish to give them some candles and tobacco."

It happened that an old man whom I knew, was one of the ten. He had temporarily come home after some plumes, and was standing aloof from the rest. A little while after his departure, a messenger came from the high-priest, with the request that I visit them, as "no harm would come from the presence of a *ki-he*." Forthwith, I was instructed how to behave.

"When you go in, little brother, you must breathe on your hand and, as you step into the fire-light, you must say, 'My fathers, how are you these many days?' They will reply, 'Happy, happy'! You must not touch one of them, nor utter a single word in Spanish or American, nor whistle. But you must behave very gravely, for it is *ák-ta-ni* [fearful] in the presence of the gods. If you should happen to forget and say a Spanish word, hold out your left

hand and then your right, one foot and then the other, and they will strike them very hard with a wand of yucca."

The messenger guided me to the low door, which I entered, breathing audibly on my hand. Stepping into the brightly lighted center of the room, I started off very well with, "My fathers" (*Hóm a tá-tchu*), but here broke down, and placing the candles and tobacco on the floor, with a muttered apology, I unfortunately finished, partly in Spanish. Instantly two or three of the sprawling priests started up exclaiming, "*Shu! shu!*" and stretched their hands excitedly toward me. One of them took a wand from the front of the altar, and gravely advanced toward me. Without a word I stretched out my hand, and he hit me a terrific blow directly across the wrist. Never wincing, however, although the pain was excruciating, I stretched out the other hand and my two feet in succession, receiving the hard blows on each. I breathed on my hand and said, *E-lah-kwa* (thanks!). The priest spat on the wand, smiled, and waved it four or five times around my head. The white-haired father of the ten then approached me, placed his finger on his lips as a warning, thanked me for the presents, and asked that the "light of the gods might shine on my path of life." But he directed that I be hustled away, for fear I might commit some other indiscretion.

I had gained my object, however, in merely entering the room. It was large. At the western end stood an altar, composed of tablets of various heights and widths, strangely

carved and painted in representation of gods, and set up in the form of a square. At the back were larger tablets, on and through which figures of the sun, moon, and stars were painted and cut. Within the square stood a number of sacred wands of long macaw feathers inserted into beautiful wicker-work handles. Overhead hung the figure of a winged god, a little in front of and below which was suspended horizontally an elaborate cross. It was composed of two tablets, carved to zigzag points at the ends, and joined at the center, so as to resemble a wind-mill with four arms. Numerous eagle-plumes depended from the lower edges of the four arms, on each of which was perched the effigy of a swallow.\* Underneath this stood

painted in red, green, blue and yellow, the figures of animals, birds, human monsters, demons, and significant pictographs.

This little glimpse revealed to me a mysterious life by which I had little dreamed I was surrounded, and I looked forward with curious anxiety to the coming ceremonies.

That night, on my way home, I saw great fires blazing on the south-western hills. I could hear the sound of rattles, and the long, weird cries of the dancers, whose forms were too distant to be seen even against the snow-sprinkled slopes. "The Long-horn and the Hooter, the wand-bearers and the sacred guardians, whom you shall see four days hence," said my brother, as he opened the

MAKING HÍ-WÉ (PAPER BREAD).

a large medicine-bowl with terraced edges. It was covered with figures of frogs, tadpoles, and dragon-flies, and contained a clear, yellowish fluid. Over this two of the priests were crouching and muttering incantations. Behind the altar, partly covered with little, embroidered cotton kilts, were the warty masks and the neck-cloths of these priestly clowns. Almost immediately on entering, my guide had uttered prayers and scattered medicine flour over them. All along the walls of the great room, now vivid in the fire-light, now indistinct in the flickering shadows, were

\* I have since learned that this represented the great morning star, and that the swallows were emblematic of the summer rains.

door to let me in, and motioned with his head in the direction of the sounds.

During the next day, hundreds of Navajos, Moquis, and Indians from the Rio Grande pueblos, gathered in from the surrounding country. Everybody was busy. Oxen were slaughtered by the dozen, sheep by the hundred. In every household some of the men could be seen sewing garments both for themselves and the women. The latter were busily engaged in grinding corn, cooking paper-bread over great polished, black stones, cutting up meat, bringing water, and weaving new blankets and belts. Outside, continual streams of burros, heavily laden with wood, came pouring in from the surrounding mesas.

My old brother, however, was none too busy to insist constantly that I should not sketch the "fearful Shá-la-k'o," when they came in from the west. If I would promise this, the party and I should be permitted to see the great ceremonial, which never before had the white man been allowed to look upon.

Toward evening, on the second day following, people began to gather all over the southern terraces, and away out over the

the shoulder-blades of deer, and in their left, painted plumed sticks. Following came two red-bodied, elaborately costumed and ornamented characters wearing round, green helmets, across the tops of which were attached painted round sticks with shell-rattles at either end. They bore in their hands white deer-horns and plumed sticks, and were, with the others, guarded by two nearly nude figures with round-topped, long-snouted, red

THE TOWER OF THE SHADOWS AND THE ROAD OF THE RED DOOR.

plain there appeared seven gigantic, black-headed, white forms, towering high above their crowd of attendants. Gradually they came toward the pueblo, stopping, however, midway in the plain across the river, to perform some curious ceremonials. Meanwhile, eight remarkably costumed figures preceded them, crossed the river, and passed along the western end of the pueblo. These were the same the Governor had told me of. The "Long-horn" and the "Hooter" were clothed in embroidered white garments, and their faces were covered by horrible, ghastly, white masks, with square, black eye and mouth-holes. Their head-dresses were distinguished from each other only by the large white appendages, like bat-ears, attached to one of them, while the other was furnished with a long, green horn, from which depended a fringe of wavy black hair, tufts of which covered the heads of both. They bore in their right hands clattering rattles made from

masks, surrounded at the neck by collars of crow-feathers. They carried rattles like those of the chief figures, and long yucca wands with which to chastise spectators who might approach too near.

All of these were preceded by a gorgeously costumed, bare-headed priest, with streaks of black, shining paint across his eyes and chin, and profusely decorated with turquoise earrings and shell necklaces. A snow-white deer-skin mantle was thrown gracefully over his shoulders and trailed in the dust behind. He carried a tray of sacred plumes in his hand, and was closely followed by a representation of the fire-god. This was an entirely nude boy, the body painted black and covered all over with many-colored round spots. His face and head were entirely concealed by a round-topped, equally black and speckled mask or helmet. Slung across his shoulder was a pouch made from the skin of a fawn, and in his hand a long, large, smoking torch

of cedar bark, which he kept gracefully waving from side to side.

The whole party passed rapidly toward one of the plazas, where a square hole had been dug by the Priest of the Sun. After dancing back and forth four times to the clang of their rattles, uttering at intervals cries of hoo too! hoo too! the four principal characters, with long prayers and ceremonials,\* deposited sacrifices of some of the plumed sticks. This ceremonial was repeated in the chief plazas of the pueblo, and outside of it north, south, and east, after which the whole party, just at sunset, retired into one of the immense sacred rooms at the southern side of the town.

After dusk, the giant figures which had been left on the plain across the river came in one by one. They were, by all odds, the most monstrous conceptions I had seen among the Zuñi dances. They were at least twelve feet high. Their gigantic heads were shocks of long black hair with great horns at the sides, green masks with huge, protruding eye-balls, and long, pointed, square-ended, wooden beaks; and their bodies were draped with embroidered and tasseled cotton blankets, underneath which only the tiny, bare, painted feet of the actor could be seen. The spasmodic rolling of the great eyeballs and the sharp snapping of the beak as it rapidly opened and closed, together with a fan-shaped arrangement of eagle-feathers at the back of the head, gave these figures the appearance of angry monster-birds.

To each new house of the pueblo one of these monsters was guided by two priests. The latter were clad in closely fitting buckskin armor and round, helmet-like skull-caps of the same material. Several elaborately costumed flute-players, together with a Kó-yi-ma-shi or two, attended. After prayers and ceremonials before the ladders of the houses to be entered, each, with his two attendant priests, mounted with great difficulty, descended through the sky-hole, and was stationed at one end of the room, near the side of an altar, differing only in details from the one already described as belonging to the Kó-yi-ma-shis. Immense fires of sputtering piñon-wood, and rude, bowl-shaped lamps of grease, brilliantly lighted up each one of these closely curtained rooms.

Toward midnight, my brother explained to me that, in each new room and sacred house of Zuñi, the twelve "medicine" orders of the tribe were to meet, and that, as he was a priest of one of them, I could go with him, if I would sit very quiet in one corner, and

not move, sleep, nor speak during the entire night.

As we entered the closely crowded, spacious room into which the first party of dancers had retired, a space was being cleared lengthwise through the center, from the altar down toward the opposite end. With many a hasty admonition, the Governor placed me in a corner so near the hearth that, for a long time, controlled by his directions, I was nearly suffocated by the heat. Along the northern side of the room were the dancers, their masks now laid aside. Conspicuous among them were the two priests, who were engaged in a long, rhythmical prayer, chant, or ritual, over eight or ten nearly prostrate Indians who squatted on the floor at their feet. As soon as this prayer was ended, great steaming bowls of meat, trays of paper-bread, and baskets of melons were placed in rows along the cleared space. A loud prayer was uttered over them by an old priest, who held in his hands a bow, some arrows, and a war-club, and who wore over one shoulder a strange badge of buckskin ornamented with sea-shells and flint arrow-heads.† He was followed by the Priest of the Sun, from the other end of the room. The little fire-god then passed along the array of victuals, waving his torch over them, with which the feast was pronounced ready.

Many of the dishes were placed before the dancers and priests and a group of singers whose nearly nude bodies were grotesquely painted with streaks and daubs of white. They were gathered, rattles in hand, around an immense earthen kettle-drum at the left side of the altar, opposite the now crouching monster. As soon as the feast was concluded, many of the women bore away on their heads, in huge bowls, such of the food as remained.

The singers then drawing closely around the drum, facing one another, struck up a loud chant, which, accompanied by the drumming and the rattles, filled the whole apartment with a reverberating din, to me almost unendurable. Two by two the dancers would rise, step rapidly and high from one foot to the other, until, covered with perspiration and almost exhausted, they were relieved by others. At the close of each verse in the endless chant, the great figure by the altar would start up from its half-sitting posture, until its head nearly touched the ceiling, and, with a startling series of reports, would clap its

† This, as I afterward learned, was Nai-iu-tchi, the Chief Priest of the Bow, or the high-priest of a powerful sacred order of war, in many ways strangely like the Masonic Order, and of which I have since become a member.

\* The purification of the pueblos.

long beak and roll its protruding eyes in time to the music.

When the little fire-god took his place in the center of the room, no one relieved him for more than an hour and a half, and I feared momentarily that he would drop from sheer exhaustion. But I learned later that this was a trial ceremonial, and that it was one of the series of preparations which he had to pass through before becoming a priest, to which rank his birth rendered him eligible.

Just as the morning star was rising, the music ceased, the congregation became silent, and the chief dancer was led to the center of the room, where he was elaborately costumed. Then the Priest of the Sun took him up the ladder to the roof, where, facing the east, he pronounced in measured, solemn tones a long prayer to the waning Sun of the Old Year. Descending, he pronounced before the multitude (signalizing the end of each sentence

with a clang of his rattles) a metrical ritual of even greater length. Then the spectators gathered around the altar, and hastily said their prayers, the sound of which reminded me of a recitation in concert in a large school-room. The sun rose, and they dispersed to their various homes.

Some time after, the dancers, one by one, still in costume, passed over the river toward the southward; and the monsters, to the sounds of chants, accompanied by rude music on the flutes, were guided across to a flat, snow-covered plain, where, in the presence of the assembled priests of Zuñi,—but no others,—they ran back and forth, one after another, over a great square, planted plumed sticks at either end of it, and, forming a procession, slowly marched away and vanished among the southern hills. Toward evening no fewer than seven curious dance-lines of the Kâ-kâ at one time occupied the principal court. Most of that, as well as of the three succeeding nights, were passed in ceremonials at the sacred houses and estufas. With this the great festival was over. The assembled Indian visitors, laden with food and the products of Zuñi looms, departed for their various tribal homes.

During the evening of the last day, just as I was sitting down with the rest around the family supper-bowl, Colonel and Mrs. Stevenson came in to bid me good-bye.

A NIGHT WITH THE SHÁ-LA-K'O.

And on the following morning, long before daylight, their train passed over the lava-hills, and I was once more alone in Zuñi.

During the day I told the Governor that I would follow my friends before two months were over. With great emphasis and a smile of triumph, he replied, "I guess not."

On the evening of the second day he beckoned me to follow, as he led the way into the mud-plastered little room, whither he had unearthed my head-band. In one corner stood a forge, over which a blanket had been spread. All trappings had been removed, and the floor had been freshly plastered. A little arched fire-place in the corner opposite the forge was aglow with piñon, which lighted even the smoky old rafters and the wattled willow ceiling. Two sheepskins and my few belongings, a jar of water and a wooden poker, were all the furnishings. "There," said he, "now you have a little house, what more do you want? Here, take these two blankets,—they are all you can have. If you get cold, take off all your clothes and sleep next to the sheepskins, and *think* you are warm, as the Zuñi does. You must sleep in the cold and on a hard bed; that will harden your meat. And you must never go to Dust-eye's house [the Mission], or to Black-beard's [the trader's] to eat; for I want to make a Zuñi of you. How can I do that if you eat American food?" With this he left me for the night.

I suffered immeasurably that night. The cold was intense, and the pain from my hard bed excruciating. Although next morning, with a mental reservation, I told the Governor I had passed a good night, yet I insisted on slinging my hammock lengthwise of the little room. To this the Governor's reply was: "It would not be good for it to hang in a smoky room, so I have packed it away." I resigned myself to my hard fate and harder bed, and suffered throughout long nights of many weeks rather than complain or show any unwillingness to have my "meat hardened."

An old priest, whom I had seen at the head of one of the dances, and whose fine bearing and classic, genial face had impressed me, used to come and chat occasionally of an evening with the Governor, in the other

ARRIVAL OF THE SHÁ-LA-K'O.

room. Often, as he sat in the fire-light, his profile against the blazing background made me wonder if the ghost of Dante had not displaced the old Indian for a moment, so like the profile of the great poet was the one I looked upon. He had conceived a great affection for me, and his visits became more and more frequent, until at last one day he told me his name was Laí-iu-ah-tsai-lun-kia, but that I must forget his name whenever I spoke to him, and call him "father." Now that I wore the head-band and moccasins of his people, his attentions were redoubled, and he insisted constantly that I should dress entirely in the native costume, and have my ears pierced. That would make a complete Zuñi of me, for had I not eaten Zuñi food long enough to have starved four times, and was not my flesh, therefore, of the soil of Zuñi?"

I strongly opposed his often repeated suggestions, and at last he so rarely made them that I thought he had altogether given up the idea.

One day, however, the Governor's wife came through the door-way with a dark blue bundle of cloth, and a long, embroidered red belt. She threw the latter on the floor, and unrolled the former, which proved to be a strip of diagonal stuff about five feet long

ANCIENT MINES IN THE VALLEY OF THE PINES.

by a yard in width. Through the middle a hole was cut, and to the edges, either side of this hole, were stitched, with brightly colored strips of fabric, a pair of sleeves. With a patronizing smile, the old woman said,—

"Put this on. Your brother will make you a pair of breeches, and then you will be a handsome young man."

Under her instructions I stuck my head through the central hole, pushed my arms down into the little blanket sleeves, and gathered the ends around my waist, closely securing them with the embroidered belt. The sudden appearance of the Governor was the signal for the hasty removal of the garment. He folded it up and put it away under the blanket on the forge. Long before night he had completed a pair of short, thin, black cotton trowsers, and secured a pair of long, knitted blue woolen leggings.

"Take off that blue coat and rag necklace," said he, referring to my blue flannel shirt and a tie of gray silk. "What! *another* coat under that. Take it off."

I removed it.

"There, now! Go over into that corner and put these breeches on. Don't wear anything under them."

Then the coarse woolen blanket shirt was again put on as before, only next to my skin. There were no seams in this remarkable garment, save where the sleeves were attached to

the shoulders and from the elbows down to the wrists. The sides, a little below the armpits, and the arms inside down to the elbow, were left entirely exposed. I asked the Governor if I could not wear the under-coat.

"No," said he. "Didn't I say you must have your meat hardened?"

Fortunately, however, a heavy gray serape, striped with blue and black, and fringed with red and blue, was added to this costume. One of the young men gave me a crude copper bracelet, and the old priest presented me with one or two strings of black stone beads for a necklace.

The first time I appeared in the streets in full costume the Zuñis were delighted. Little children gathered around me; old women patronizingly bestowed compliments on me as their "new son, the child of Wa-sin-tona." I found the impression was good, and permitted the old Governor to have his way. In fact, it would have been rather difficult to have done otherwise, for, on returning to my room, I found that every article of civilized clothing had disappeared from it.

During my absence for several days on an expedition to the Valley of the Pines in search of mines which had formerly been worked by the Zuñis, the old Governor and his wife industriously plastered my room, whitewashed the walls and even the rafters, spread blankets over the floor, and furnished it in Indian style more luxuriously than any other room in Zuñi. On the wall at one end, the Governor, in recollection of the pictures in officers' quarters which he had seen, had

pasted bright gilt and red prints, which no one knows how many years past had been torn from bales of Mexican *bayeta*. Above, carefully secured by little pegs, was a photograph of Colonel Stevenson, which the latter had given the Governor before leaving, and which the Indians had designed as my companion. On my return I was so cordially greeted that I could no longer doubt the good intentions of the Zuñis toward me.

My foster father and many other of the principal men of the tribe, now insisted that my ears be pierced. I steadily refused; but they persisted, until at last it occurred to me that there must be some meaning in their urgency, and I determined to yield to their request. They procured some raw Moqui cotton, which they twisted into rolls about as large as an ordinary lead-pencil. Then they brought a large bowl of clear cold water and placed it before a rug in the eastern part of the room. K'iawu presently came through the door-way, arrayed in her best dress, with a sacred cotton mantle thrown over her shoulders and abundant white shell beads on her neck. I was placed kneeling on the rug, my face toward the east. My old father, then solemnly removing his moccasins, approached me, needle and cotton in hand. He began a little shuffling dance around me, in time to a prayer chant to the sun. At the pauses in the chant he would reach out and grasp gently the lobe of my left ear. Each time he grasped, I braced up to endure the prick, until finally, when I least expected it, he ran the needle through. The chant was repeated, and the other ear grasped and pierced in the same way. As soon as the rolls of cotton had been drawn through, both the old man and K'iawu dipped their hands in the water, prayed over them, and, at the close of the prayer, sprinkled my head, and scattered the water about like rain-drops on the floor, after which they washed my hands and face, and dried them with the cotton mantle.

A BIVOUAC IN THE VALLEY OF THE PINES.

I could not understand the whole prayer; but it contained beautiful passages, recommending me to the gods as a "Child of the Sun," and a "Son of the Coru people of earth" (the sacred name for the priests of Zuñi). At its close, the old man said—"And thus become thou my son, Té-na-tsa-li," and the old woman followed him with, "This day thou art made my younger brother, Té-na-tsa-li." Various other members of the little group then came forward, repeating the ceremonial and prayer, and closing with one or the other of the above sentences, and the distinct pronunciation of my new name.

When all was over, my father took me to the window, and, looking down with a smile on his face, explained that I was "named after a magical plant which grew on a single mountain in the west, the flowers of which were the most beautiful in the world, and of many colors, and the roots and juices of which were a panacea for all injuries to the flesh of man. That by this name,—which only one man in a generation could bear,—would I be known as long as the sun rose and set, and smiled on the Coru people of earth, as a *Shi wi* (Zuñi)."

Frank H. Cushing.

### THE CONSTANT HEART.

SADDE songe is out of season  
 When birdes and lovers mate,  
 When soule to soule must paye swete toll  
 And fate be joynd with fate;  
 Sadde songe and wofull thought controle  
 This constant heart of myne,  
 And make newe love a treason  
 Unto my Valentine.

How shall my wan lippes utter  
 Their summons to the dedde,—  
 Where nowe repeate the promise swete,  
 So farre my love hath fledd?  
 My onely love! What musicke fleet  
 Shall crosse the walle that barres?  
 To earthe the burthen mutter,  
 Or singe it to the starrs.

Perchance she dwelles a spirite  
 In beautye undestroyed  
 Where brightest starrs are closely sett  
 Farre out beyonde the voyd;  
 If Margaret be risen yet  
 Her looke will hither turne,  
 I knowe that she will heare it  
 And all my trewe heart learne.

But if no resurrection  
 Unseale her dwellinge low,  
 If one so fayre must bide her there  
 Until the trumpe shall blowe,  
 Nathlesse shall Love outvie Despaire,  
 (Whilst constant heart is myne)  
 And, robbed of her perfection,  
 Be faithfull to her shrine.

At this blythe season bending  
 Ile whisper to the clodde,  
 To the chill grasse where shadowes passe  
 And leaflesse branches nodde;  
 There keepe my watche, and crye—Alas  
 That Love may not forget,  
 That Joye must have swifte ending  
 And Life be laggard yet!

*Edmund Clarence Stedman.*

## A WOMAN'S REASON.\*

BY W. D. HOWELLS,

Author of "Venetian Life," "A Chance Acquaintance," "A Modern Instance," etc.

### I.

THE day had been very oppressive, and at half-past five in the afternoon the heat had scarcely abated, to the perception of Mr. Joshua Harkness, as he walked heavily up the Park street mall in Boston Common. When he came opposite the Brewer Fountain, with its Four Seasons of severe drouth, he stopped short, and stared at the bronze group with its insufficient dribble, as if he had never seen it before. Then he felt infirmly about the ground with his stick, stepped aside, and sank tremulously into one of the seats at the edge of the path. The bench was already partly occupied by a young man and a young woman; the young man had his arm thrown along the back of the seat behind the young woman; their heads were each tilted toward the other, and they were making love almost as frankly in that public place as they might in the seclusion of a crowded railway train. They both glanced at the intruder, and exchanged smiles, apparently of pity for his indecency, and then went on with their love-making, while Mr. Harkness, unconscious of his offense, stared eagerly out over the Common, and from time to time made gestures or signals with his stick in that direction. It was that one day of the week when people are not shouted at by a multitude of surly sign-boards to keep off the grass, and the turf was everywhere dotted with lolling and lounging groups. Perhaps, to compensate for the absence of the sign-boards (which would reappear over night like a growth of disagreeable fungi), there was an unusual number of policemen sauntering about, and it was one of these whom Mr. Harkness was trying to attract with his cane. If any saw him, none heeded, and he had to wait till a policeman came down the mall in front of him. This could not have been so long a time as it seemed to Mr. Harkness, who was breathing thickly, and, now and then, pressing his hand against his forehead, like one who tries to stay a reeling brain.

"Please call a carriage," he panted, as the officer, whom he had thrust in the side with his cane, stopped and looked down at him;

and then, as the man seemed to hesitate, he added: "My name is Harkness; I live at 9 Beacon Steps; I wish to go home at once; I've been taken faint."

Beacon Steps is not Beacon street, but it is of like blameless social tradition, and the name, together with a certain air of moneyed respectability in Mr. Harkness, had its effect with the policeman.

"Sick?" he asked. "Well, you *are* pale. You just hold on a minute. Heh, there! heh!" he shouted to a passing hackman, who promptly stopped, turned his horses, and drew up beside the curb next the Common. "Now you take my arm, Mr. Harkness, and I'll help you to the carriage." He raised the gentleman to his benumbed feet, and got him away through the gathering crowd; when he was gone, the crowd continued to hang about the place where he had been sitting, in such numbers that the young man first took his arm down from the back of the seat and the young woman tilted her head away from his, and then they both, with vexed and impatient looks, rose and walked away, seeking some other spot for the renewal of their courtship.

The policeman had not been able to refrain from driving home with Mr. Harkness, whom he patronized on the way with a sort of municipal kindness; and for whom, when he had got him indoors and comfortably stretched upon a lounge in the library, he wanted to go and call the doctor. But Mr. Harkness refused, saying that he had had these attacks before, and would soon be all right. He thanked the officer by his name, after asking him for it, and the officer went away, leaving Mr. Harkness to the care of the cook, who, in that mid-summer time, seemed to have sole charge of the house and its master. The policeman flipped the dust from the breast and collar of his coat, in walking back to his beat, with the right feeling of a man who would like to be better prepared if summoned a second time to befriend a gentleman of Mr. Harkness's standing, and to meet, in coming out of his house, a young lady of such beauty and elegance as he had just encountered. This young lady, as he closed the door behind

him, had run up the steps with the loop of her train in one hand, after the fashion of ten years ago, and in the other a pretty traveling-bag, carried with the fearlessness of a lady who knows that people are out of town. She glanced a little wonderingly, a little defiantly, at the policeman, who, seeing that she must drop one or other of her burdens to ring, politely rang for her.

"Thank you!" said the young lady, speaking a little more wonderingly, a little more defiantly than she had looked.

"Quite welcome, Miss," returned the policeman, and touched his hat in going down the steps, while the young lady turned and stared after him, leaning a little over the top step on which she stood, with her back to the door. She was very pretty indeed, with blue eyes at once tender and honest, and the fair hair, that goes with her beauty, hanging loosely upon her forehead. Her cheeks, in their young perfection of outline, had a flush beyond their usual delicate color; the heat, and her eager dash up the steps, had suffused them with a dewy bloom, that seemed momentarily to deepen and soften. Her loveliness was saved from the insipidity of faultless lines by a little downward curve, a quirk, or call it dimple, at one corner of her mouth, which, especially in repose, gave it a touch of humorous feeling and formed its final charm: it seemed less a trait of face than of character. That fine positive grace, which is called style, and which is so eminently the gift of exquisite nerves, had not cost her too much; she was slim, but not fragile, and her very motionlessness suggested a vivid, bird-like mobility; she stood as if she had alighted upon the edge of the step. At the opening of the door behind her she turned alertly from the perusal of the policeman's retreating back, and sprang within.

"How d' do, Margaret?" She greeted the cook in a voice whose bright kindness seemed a translation of her girlish beauty into sound. "Surprised to see me?" She did not wait for the cook's answer, but put down her bag and began pulling off her gloves, after shaking out her skirt, and giving that penetrating sidelong downward look at it which women always give their drapery at moments of arrival or departure. She turned into the drawing-room from the hall, and went up to the long, old-fashioned mirror, and glanced at the face which it dimly showed her in the close-shuttered room. Her face had apparently not changed since she last saw it in that mirror, and one might have fancied that the young lady was somehow surprised at this.

"May I ask *why* policemen are coming and going, in and out of our house, Mar-

garet?" she demanded of the cook's image, which, further down in the mirror, hesitated at the doorway.

"He come home with your father, Miss Helen," answered the cook, and as Helen turned round and stared at her in the flesh, she continued: "He had one of his faint turns in the Common. He's laying down in the library now, Miss Helen."

"Oh, poor papa!" wailed the young lady, who knew that in spite of the cook's pronoun, it could not be the policeman who was then reposing from faintness in the library. She whirled away from the mirror, and swooped through the doorway into the hall, and back into the room where her father lay. "The heat has been too much for him," she moaned, in mixed self-reproach and compassion, as she flew; and she dropped upon her knees beside him, and fondly caressed his gray head, and cooed and lamented over him, with the irreverent tenderness he liked her to use with him.

"Poor old fellow," she murmured. "It's too bad! You're working yourself to death, and I'm going to stay with you now, and put a stop to your being brought home by policemen. Why, you ought to be ashamed, breaking down in this way, as soon as my back is turned? Has Margaret done everything for you? Wouldn't you like a little light?" She started briskly to her feet, flung up the long window, and raising and lowering the shade to get the right level for her father's eyes, stood silhouetted against the green space without: a grass plot between high brick walls, on one of which clambered a grape-vine, and on the other a wistaria, while a bed of bright-leaved plants gave its color in the center of the yard. "There!" she said, with a glance at the succinct landscape. "That's the prettiest bit of nature I've seen since I left Boston." She came back and sat down on a low chair beside her father, who smiled fondly upon her, and took one of her hands to hold, while she pushed back his hair with the other.

"Are you awfully glad to see me?"

"Awfully," said Mr. Harkness, falling in with her mood, and brightening with the light and her presence. "What brought you so suddenly?"

"Oh, *that's* a long story. Are you feeling better now?"

"Yes. I was merely faint. I shall be all right by morning. I've been a little worn out."

"Was it like the last time?" asked Helen.

"Yes," said her father.

"A little more like?"

"I don't think it was more severe," said Mr. Harkness, thoughtfully.

"What had you been doing? Honor bright, now; was it accounts?"

"Yes, it was accounts, my dear."

"The same old wretches?"

"The same old ones; some new ones, too. They're in hopeless confusion," sighed Mr. Harkness, who seemed to age and sadden with the thought.

"Well, now, I'll tell you what, papa," said Helen, sternly: "I want you to leave *all* accounts, old *and* new, quite alone till the cold weather comes. Will you promise?"

Harkness smiled, as wearily as he had sighed. He knew that she was burlesquing somewhat her ignorance of affairs; and yet it was not much burlesqued, after all; for her life, like that of other American girls of prosperous parentage, had been almost as much set apart from the hard realities of bread-winning as the life of a princess, as entirely dedicated to society, to the studies that refine, and the accomplishments that grace society. The question of money had hardly entered into it. Since she was a little child, and used to climb upon her father's knee, and ask him, in order to fix his status in her fairy tales, whether he was rich or poor, she might be said never to have fairly thought of that matter. Of course, she understood that she was not so rich as some girls, but she had never found that the difference was against her in society; she could not help perceiving that in regard to certain of them it was in her favor, and that she might have patronized them if she had liked, and that they were glad of her friendship on any terms. Her father's great losses had come when she was too young to see the difference that they made in his way of living; ever since she could remember they had kept to the same scale of simple ease in the house where she was born, and she had known no wish that there had not been money enough to gratify. Pleasures of every kind had always come to her as freely and with as little wonder on her part as if they had been, like her youth, her bounding health, her beauty, the direct gift of heaven. She knew that the money came from her father's business, but she had never really asked herself how it was earned. It is doubtful if she could have told what his business was; it was the India trade, whatever that was, and of late years he had seemed to be more worried by it than he used to be, and she had vaguely taken this ill as an ungrateful return on the part of business. Once he had gone so far as to tell her that he had been hurt by the Great Fire somewhat. But the money for all her needs and luxuries (she was not extravagant, and really did not spend much upon herself) had come as before, and

walking through the burnt district, and seeing how handsomely it had been rebuilt, she had a comforting sense that its losses had all been repaired.

"You look a little flushed and excited, my dear," said her father, in evasion of the commands laid upon him, and he touched her fair cheek. He was very fond of her beauty and of her style; in the earlier days of her young ladyhood he used to go about with her a great deal, and was angry when he thought she did not get all the notice she ought, and a little jealous when she did.

"Yes, I *am* flushed and excited, papa," she owned, throwing herself back in the low chair she had pulled up to his sofa, and beginning to pluck nervously at those little tufts of silk that roughened the cobwebby fabric of the gray summer stuff she wore. "Don't you think," she asked, lifting her downcast eyes, "that coming home and finding you in this state is enough to make me look flushed and excited?"

"Not quite," said her father quietly. "It's not a new thing."

Helen gave a sort of lamentable laugh. "I know I was humbugging, and I'm as selfish as I can be, to think more of myself even now than I do of you. But, oh, papa! I'm *so* unhappy!" She looked at him through a mist that gathered and fell in silent drops from her eyes without clearing them, so that she did not see him carry the hand she had abandoned to his heart, and check a gasp. "I suppose we all have our accounts, one way or other, and they get confused like yours. Mine with—with—a certain person had got so mixed up that there was nothing for it but just to throw them away."

"Do you mean that you have broken with him finally, Helen?" asked her father gravely.

"I don't know whether you call it *finally*," said Helen, "but I told him it was no use—not just in those words—and that he ought to forget me; and I was afraid I wasn't equal to it; and that I couldn't see my way to it clearly; and unless I could see my way clearly, I oughtn't to go on any longer. I wrote to him last week, and I thought—I thought that perhaps he wouldn't answer it; perhaps he would come over to Rye Beach—he could easily have run over from Portsmouth—to see me—about it. But he didn't,—he didn't,—he—wrote a very short letter—oh, I didn't see *how* he could write such a letter; I tried to spare *him* in every way; and yesterday he—he—s—s—sailed!" Here the storm broke, and Helen bowed herself to the sobs with which her slimness shook, like a tall flower beaten in the wind. Then she suddenly stopped, and ran her

hand into her pocket, and pulled out her handkerchief. She wiped away her tears, and waited for her father to speak; but he lay silent, and merely regarded her pitifully. "I couldn't bear it any longer there with those geese of Merrills,—I'm sure they were as kind as could be,—and so I came home to burden and afflict you, papa. Don't you think that was like me?" She gave her lamentable laugh again, sobbed, laughed once more, dried the fresh tears with her handkerchief, which she had mechanically shaped into a rabbit, and sat plucking at her dress as before. "What do people do, papa," she asked presently, with a certain hoarseness in her voice, "when they've thrown away their accounts?"

"I never heard of their doing it, my dear," said her father.

"Well, but when they've come to the very end of everything, and there's nothing to go on with, and they might as well stop?"

"They go into bankruptcy," answered the old man, absently, as if the thought had often been in his mind before.

"Well, that's what I've gone into—bankruptcy," said Helen. "And what do they do after they've gone into bankruptcy?"

"They begin the world again with nothing, if they have the heart," replied her father.

"That's what I have to do then—begin the world again with nothing! There! my course is clear, and I hope I like it, and I hope I'm satisfied!"

With these words of self-reproach, Helen again broke down, and bowed herself over the ruin she had made of her life.

"I don't think you need despair," said her father, soothingly, yet with a sort of physical effort which escaped her self-centered grief, "Robert is such a good fellow that if you wrote to him——"

"Why, papa! Are you crazy?" shouted the young girl. "Write to him? He's off for three years, and I don't think he'd come posting back from China, if I *did* write to him. And how *could* I write to him, even if he were in the next room?"

"It wouldn't be necessary, in that case," said her father. "I'm sorry he's gone for so long," he added, rather absently.

"If he were gone for a *day*, it couldn't make any difference," cried Helen, inexorably. "I argued it all out—and it's a perfect chain of logic—before I wrote to him. I looked at it in this way. I said to myself that it was no use having the affair off and on, any longer. It would be perfect misery to a person of my temperament to be an officer's wife, and have my husband with me to-day and at the ends of the earth to-morrow. Besides his pay

wouldn't support us. You told me that yourself, papa."

"Yes," said Mr. Harkness. "But I thought Robert might leave the navy, and——"

"I never would have let him!" Helen burst in. "He would have been as unhappy as a fish out of water, and I wouldn't have his wretchedness on my conscience, and his idleness—you know how long that splendid Captain Seymour was trying to get into business in Boston, after he left the service: and then he had to go to California before he could find anything to do; and do you suppose I was going to have Robert mooning round in that way, for ages?"

"He might have gone into business with me for the time being," said Mr. Harkness, not very hopefully.

"Oh, yes! you could have *made* a place for him, I know! And we should both have been a burden to you, then. But I shouldn't have cared for all that. I would have met any fate with Robert, if I had believed that I felt toward him just as I should. But, don't you see, papa? If I had felt toward him in that way, I never should have thought of any—any—prudential considerations. That was what convinced me, that was what I couldn't escape from, turn which way I would. That was the point I put to Robert himself, and—and—oh, I don't see how he could answer as he did! I *don't* see how he could!" Helen convulsively clutched something in the hand which she had thrust into her pocket. "It isn't that I care for myself; but oh, I am so sorry for him, away off there all alone, feeling so hard and bitter toward me, and thinking me heartless, and I don't know what all,—and hating me so."

"What did he say, Helen?" asked her father, tenderly. She snatched her hand from her pocket and laid a paper, crumpled, be-wet, distained, in the hand he stretched toward her, and then bowed her face upon her knees.

Helen and her father were old confidants, and she had not more reluctance in showing him this letter than most girls would have had in trusting such a paper to their mother's eyes. Her own mother had died long ago, and in the comradeship of her young life her father had entered upon a second youth, happier, or at least tranquil, than the first. She adored him and petted him, as a wife could not, and this worship did not spoil him as it might if it had been a conjugal devotion. They had always a perfect understanding; she had not withdrawn her childish intimacy of thought and feeling from him to give it to her mother, as she would have done if her mother had lived; he knew all her small

heart-affairs without asking, more or less in a tacit way; and she had an abidingly grateful sense of his wisdom in keeping her from follies which she could see she had escaped through it. He had never before so directly sought to know her trouble; but he had never before seen her in so much trouble; besides, he had always been Robert Fenton's friend at court with Helen; and he had quietly kept his hopes of their future through rather a stormy and uncertain present.

He liked Robert for the sake of Robert's father, who had been captain and supercargo of one of Harkness and Co's ships, and had gone down in her on her home voyage, when he was returning to be junior partner in the house, after a prosperous venture of his own in Wenham ice. He left this boy, and a young wife who died soon afterwards. Then Mr. Harkness, who was the boy's guardian, gave him and the small property that remained to him more than a guardian's care. He sent him to school, but he made him at home in his own house on all holidays and in vacation. These sojourns and absences, beginning when Robert was ten years old, and continuing through his school-boy age, had renewed alternately his intimacy and strangeness with Helen, and kept her a mystery and enchantment which grew with his growth, while to her consciousness he was simply Robert, a nice boy, who was now at school or now at home, and who was often so shy that it was perfectly silly. When he was old enough to be placed in some career he was allowed to choose Harvard, and a profession afterwards, or any more technical training that he liked better. He chose neither: the sea called him, as the old superstition is, and every nerve in his body responded. He would have liked to go into the trade in which his father had died, but here his guardian overruled him. He knew that the India trade was dying out. If Robert's soul was set upon the sea, of which there seemed no doubt, it was better that he should go into the navy; at Annapolis he would have a thorough schooling, which would stand him in good stead if future chance or choice ever cast him ashore to live.

Helen was in the sophomore year of the class with which she was dancing through Harvard when Robert came home from his first cruise. She was then a very great lady, and she patronized the midshipman with killing kindness as a younger brother, though he was in fact half a year her senior. He now fell in love with her outright: very proud love, very jealous, very impatient. She could not understand it. She said to her father it was so *queer*.

She never *thought* of such a thing. Why, *Robert!* It was *absurd*. Besides, he had such a funny name: *Fenton!* But a passion like his was not to be quenched with reasons even so good as these. He went to sea again, bitterly, rapturously brooding over her idea, and came home in the autumn after Helen's class-day. All the fellows had scattered now; and she was left much younger and humbler in her feelings, and not so great a lady for all her triumphs. Two of her class had proposed to her, and lots had come near it; but her heart had been left untouched, and she perceived, or thought she perceived, that these young gentlemen, who were wise and mature enough for their age, though neither Solomons nor Methuselahs, were all silly boys. In herself, on the contrary, the tumult of feeling with which she had first entered the world had been succeeded by a calm, which she might well have mistaken for wisdom. She felt that she now knew the world thoroughly, and while she was resolved to judge it kindly, she was not going to be dazzled by it any longer. She had become an observer of human nature; she analyzed her feelings; sometimes she made cutting remarks to people, and was dreadfully sorry for it. She withdrew a great deal from society, and liked being thought odd. She had begun to take lessons in painting with a number of ladies, under an artist's criticism; she took up courses of reading; she felt that life was a serious affair. On his return, Robert at first seemed to her more boyish, more brotherly than before. But in talking with him certain facts of his history came out that showed him a very brave and manly fellow, and good, too. This gave her pause; so keen an observer of human nature at once discerned in this young man,—who did not brag of his experiences, nor yet affect to despise them as trifles, but honestly owned that at one time he was scared, and that at another he would have given everything to be ashore,—an object worthy of her closest and most reverent study. She proceeded to idealize him, and to stand in awe of him. Oh, *yes!* with a deep sighing breath, and a long dreamy look at him—*he!* What *he* had been through, must have changed the whole *world* to him. After that night in the *typhoon*—*well*, nothing could ever have been the same to *her* after that. He must find all the interests at home sickeningly mean. This was the tone she took with him, driving him to despair. When he again urged his suit, she said that she could not see why he should care for her. At the same time she wanted to ask him why he did not wear his uniform ashore, instead of that unnatural civil dress that he seemed so anxious to make himself ridiculous in. Being pressed

for some sort of answer, she said that she had resolved never to marry. After this Robert went off very melancholy upon his third cruise. But she wrote him such kind and sympathetic letters that he came home from this cruise, which was a short one, more fondly in love than ever, but more patiently, more pleasingly in love; and he now behaved so sensibly, with so much apparent consideration for her uncertainty of mind, that she began to think seriously of him. But though she liked him ever so much, and respected him beyond anything, the very fact that she was wondering whether she could ask him to leave the navy or not, and where and how they should live, seemed sufficient proof to her that she did not care for him in the right way. Love, she knew, did not consider ways and means; it did not stop to argue; it found in itself its own reason and the assurance of a future. It did not come after years of shilly-shallying, and beating about the bush, and weighing this and that, and scrutiny of one's emotions. If she loved Robert so little as to care what happened after they were married, she did not love him at all. Something like this, but expressed with infinite kindness, was what she had written from Rye Beach to Robert stationed at Portsmouth. She ended by leaving the case in his hands. She forbade him to hope, but she told him there *had* been a time, a moment, when she thought that she might have loved him.

Robert took all this away. He did not deign to ask her when this mysterious moment was, far less whether it might ever recur; he did not answer one of her arguments; he did not even come over to Rye Beach to combat and trample on her reasons. He wrote her a furious, foolish reply, in which he agreed with her that she had never loved him, and never would, and he bade her farewell. He managed to exchange with a friend who was bemoaning his hard lot in being ordered away from his young wife to the China station, and he sailed with their blessing three days after getting Helen's letter. She only learned of his departure by chance.

The old man held the letter in his hand, after reading it, for so long a time, that at last Helen looked up. "It seems to me you take it pretty coolly, papa," she said, her lips quivering.

"Yes, yes. Poor Robert! Poor boy!" sighed her father. Then, while she bridled indignantly at his misplaced compassion, he added, "I'm sorry, Helen. I think you would have come to like him. Well, well! If you are contented, my dear——"

"How can you *say* such a thing, papa?" cried Helen, astonished that he should have

taken what he understood of her letter just as Robert had done, "when you know,—when you know I—" but Helen could not finish what she was going to say. She could not own that she thought her letter susceptible of quite a different answer. She set her lips and tried to stop their trembling, while her eyes filled.

Her father did not notice. "My dear," he said presently, "will you ask Margaret to make me a cup of tea? I feel unpleasantly weak."

"Why, papa!" cried Helen, flying to the bell, "why didn't you tell me before, instead of letting me worry you with all this foolishness? Why didn't you *say* you were not so well?"

"I wasn't thinking of it," said her father, meekly accepting her reproof. "It's nothing. The wind has changed, hasn't it. I feel the east a little."

"You're *chilly*?" Helen was now tempted to be really harsh with him for his remissness, but she did not stay from running after the wrap, soft and light, which she had brought back from the sea-side with her, and had thrown down with her bag in the hall, and though she bemoaned his thoughtlessness, as she flung it over him, still she did not pour out upon him all the self-reproach in her heart. She went and hurried Margaret with the tea, and then set an old-fashioned tea-pot beside the sofa, and when the tea came, she drew up her chair, and poured it for him. She offered to pull down the window, but he made her a sign to let it be; and, in fact, it was not cooler without than within, and no chill came from the little yard, on whose lofty walls the sunset was beginning to burn in tender, red light. She poured herself a cup of tea when she came back, and when she had made her father repeat again and again that he felt much better, she began to see the absurdity of being tragic about Robert at this late day, when she had so often refused him before without the least tragedy. This, to be sure, was not quite like the other refusals; not so one-sided; but really, except for Robert's own sake, what had she to be sorry for, and why should she pity his towering dudgeon? An ache, faint and dull, made itself felt deep in her heart, and she answered sadly, "Well," to her father's tentative "Helen."

He did not go on, and she asked presently, "What is it, papa?"

"Oh, nothing. There was something I was going to speak to you about. But it will do another time." Helen recollected that once or twice before this her father had begun in the same way, and had postponed whatever he

had been going to say in the same fashion. It was not a thing to be curious about, and she had never pressed him to speak. She knew that he would speak when he really thought best. But she wondered now a little if his mind was still running upon Robert.

"Was it something in regard to—to—me, papa!"

"Why, yes. Yes, indirectly."

"Well, then, don't think of it any more. I shall not. I'm sorry I worried you about it."

"About what, my dear?" asked her father, who could not have followed her.

"Robert!" said Helen abruptly.

"Oh! I wasn't thinking about Robert."

"Because, if you were, papa, I want to tell you that I am quite reconciled to have everything end as it has done. Robert and I will always be good friends. You needn't be troubled about that."

"Oh, yes, certainly," assented her father, closing his eyes.

Helen sat looking at him, as if she would like to go on. But she was a little ashamed, and a little piqued that her father should shut his eyes in that way while she was talking of Robert. He had taken the whole affair rather oddly. She had been prepared to defend Robert if her father were angry with him, as she expected; but, instead of being angry, he had really seemed to side with Robert, and had somehow, by his reticence, implied that he would have been glad to have her humble herself to Robert.

"If you wish to sleep, papa," she said, with a dignity wasted upon him, for he still lay with his eyes closed, "I will go away."

"I'm drowsy," said her father. "But don't go, Helen. Sit down here."

He made a motion for her to sit beside him, and after an instant's further resentment she drew up her chair and laid her beautiful head down upon the cushion by his. She gave him a kiss, and dropped a large tear against his withered cheek and wiped it away with her handkerchief; and then she hid her face again, and wept peacefully till all her tears were gone. At last she lifted her face and dried her eyes, and sat dreamily watching the red sunset light creeping up the wall on which the wistaria clambered. It rose slowly, leaf by leaf, till it lit an airy frond at top that swayed in it like a pennon. Suddenly it leaped from this and left it dark, and a shiver coursed through the next rank of foliage. It somehow made her think of a ship going down below the horizon, and the waves running along the sky where the streamers had just hung. But Robert must have been out of sight of land for two days and more before that.

## II.

HELEN sat beside her father, while the solitude of the house deepened from silence to silence. Then Margaret came to the door and looked in as if to ask whether it was not time for her to fetch away the tea-things. Helen gave her a nod of acquiescence and presently rose and followed her out to the kitchen to tell her that she was going to her own room, and to say that she must be called when her father woke. But in the kitchen Margaret's company was a temptation to her loneliness, and she made one little pretext after another for remaining, till Margaret set her a chair in the door-way. Margaret had been in the house ever since Helen was born, and Helen still used the same freedom with her that she had in childhood, and gave herself the range of places to which young ladyhood ordinarily drives its radiant presence. She had, indeed, as much intimacy with the cook as could consist with their different ages, and she got on smoothly with the cook's temper, which had not been so good as her looks in youth, and had improved quite as little with age. Margaret was of a remote sort of Irish birth; but her native land had scarcely marked her accent, and, but for her church and her sense of place, which was sometimes very respectful and sometimes very high and mighty with those above her, she might have been mistaken for an American. She had a low voice, which only grew lower as she grew angry. A family in which she could do all the work had been her ideal when she first came to Boston, but she had failed of this now for some thirty years, and there seemed little hope that the chances would still turn in her favor. In Helen's childhood, when she used to ask Margaret, in moments of tenderness following the gift of dough in unexpected quantity, whether she would come and live with her after she got married, Margaret had always answered: "Yes, if you wont have any one else bothering round," which was commonly too much for the just pride of the actual second-girl. She had been cook in the family so long ago as when Mr. Harkness had kept a man; she had pressed upon the retreat of the last man with a broom in her hand and a joyful sarcasm on her lips; and she would willingly have kept vacant the place that she had made too hot for a long succession of second-girls. In the intervals of their going and coming, she realized her ideal of domestic service for the time being; and in the summer, when Helen was away a good deal, she prolonged these intervals to the utmost. She was necessarily much more the housekeeper than Helen,

though they both respected a fiction of contrary effect, and Helen commonly left her the choice of her helpers. She had not been surprised to find Margaret alone in the house, but she thought it well to ask her how she was getting on without anybody.

"Oh, very well, Miss Helen! You know your father don't make any trouble."

"Well, I've come now, and we must get somebody," said Helen.

"Why, I thought you was going back on Monday, Miss Helen," answered Margaret.

"No, I shall not leave papa. I think he's not at all well."

"He does seem rather poorly, Miss Helen. But I don't see why you need any one, in the summer, this way."

"Who's to go to the door?" asked Helen. "Besides, you couldn't take care of both of us, Margaret?"

"Just as you say, Miss Helen; I'd just as lives," answered Margaret, stubbornly. "It isn't for me to say; but I don't see what you want with anybody; you won't see a soul."

"Oh, you never can tell, Margaret. You've had a good rest now, and you must have somebody to help you." Helen's sadness smiled at this confusion of ideas, and its suitability to Margaret's peculiar attitude. "Get somebody that you know, Margaret, and that you'll like. But we must have somebody." She regarded Margaret's silent and stiff displeasure with a moment's amusement, and then her bright face clouded, and she asked softly: "Did you know, Margaret, that Robert—that Lieutenant Fenton—had sailed again?"

"Why, no, Miss Helen! You don't mean that? Why, I thought he was going to stay the summer at Portsmouth."

"He was," said Helen, in the same low voice, "but he changed his mind, it seems."

"Sailors is a roving set, anyway," Margaret generalized. Then she added: "Did he come down to say good-bye to your father?"

"Why, no," sadly answered Helen, who now thought of this for the first time. Her heart throbbed indignantly; then she reflected that she had kept him from coming. She looked up at the evening blue, with the swallows weaving a woof of flight across the top of the space framed in by the high walls on every hand, and "He hadn't time, I suppose," she said sadly. "He couldn't get off."

"Well, I don't call it very nice, his not coming," persisted Margaret. "I'd 'a' deserted first." Her associations with naval service had been through gallant fellows who were not in a position to resign.

Helen smiled so ruefully at this that she

would better for cheerfulness have wept. But she recognized Margaret's limitations as a confidant, and said no more. She rose presently, and again asked Margaret to look in pretty soon, and see if her father were awake, and call her, if he were; she was going to her room. She looked in a moment herself as she went, and listened till she heard him breathing, and so passed on through the drawing-room, and trailed heavily upstairs.

The house was rather old-fashioned, and it was not furnished in the latest taste, but it made the appeal with which things out of date, or passing out of date, touch the heart. It was, in fact, beginning to be respectable, because it was no longer in the contest for effect, which the decorations of the newer houses carried on about it, and there was a sort of ugly keeping throughout.

In the very earliest days of Mr. Harkness's house-keeping, the ornamentation of his home had reflected the character of his business somewhat. There had been even a time when the young super-cargo brought back—it was his first voyage—quaint and beautiful shells from the East, for his wife to set about the tables and mantels; but these objects, so exquisite in themselves, so unyielding in composition, had long since disappeared. Some grotesque bronzes, picked up in Chinese ports, to which his early ventures had taken him, survived the expulsion of ivory carvings and Indian idols and *genre* statuettes in *terra cotta* (like those you see in the East Indian Museum at Salem), and now found themselves, with the new feeling for Oriental art, in the very latest taste. The others were bestowed in neglected drawers and shelves, along with boxes containing a wealth of ghastly rich and elaborate white crape shawls from China, and fantastically subtle cotton webs from India which Helen had always thought she should use in tableaux, and never had worn. Among the many pictures on the walls (there were too many), there were three Stuarts; the rest were of very indifferent merit,—large figure paintings or allegorical landscapes, after the taste of Cole and Poussin, in great carved and scrollwork frames. Helen had once thought of making a raid upon these enemies of art, and, in fact, she had contemplated remodeling the whole equipment of the parlors, in conformity to the recent feeling in such matters; but she had not got further than the incomplete representation of some golden-rod and mullein-stalks upon the panels of her own chamber-door; and now that the fervor of her first enthusiasm had burnt itself out, she was not sorry she had left the old house in peace.

"Oh, I should think you'd *be* so rejoiced," said the chief of her friends; "it's such a comfort to go into *one* house where you don't have to admire the artistic sentiment, and where every wretched little æsthetic prig of a table or a chair isn't asserting a principle or teaching a lesson. Don't touch a cobweb, Helen!" It had never even come to a talk between her and her father, and the house remained unmolested—the home of her childhood. She had not really cared much for it since she was a child. The sense of our permanent relation to the parental roof comes to us very early in life; and, perhaps, more keenly to a young girl than to her brothers. They are of the world, by all the conditions of their active, positive being, almost from the first,—a great world that is made for them,—but she has her world to create. She cannot sit and adorn her father's house, as she shall one day beautify and worship her husband's; she can indeed do her duty by it, but the restless longing remains, and her housewifeliness does not voluntarily blossom out beyond the precincts of her own chamber, which she makes her realm of fancy and of dreams. She could not be the heart of the house if she would, as her mother is, or has been; and though, in her mother's place, she can be housekeeper, thrifty, wise, and notable, still some mysterious essential is wanting which it is not in her nature to supply to her father's house.

Helen went to her own room, and flinging up the windows, let in the noises of the streets. A few feet went by in the secluded place, and a sound of more frequent trampling came from the street into which it opened. Further off rose the blurred tumult of business, softened by the stretch of the Common, and growing less and less with the lapse of the long summer day. It was already a little cooler, and the smell of the sprinkled street stole refreshingly in at the window. It was still very light, and when Helen opened her blinds, the room brightened cheerfully all about her, and the sympathetic intimacy of her own closest belongings tenderly appealed to her. After something has happened, and we first see familiar things about us as they were, there comes, just before the sense of difference in ourselves returns to torment us, a moment of blind and foolish oblivion, and this was Helen's as she sat down beside the window, and looked round upon the friendly prettiness of her room. It had been her room when she was a child, and there were childish keepsakes scattered about in odd places, out of the way of youngladyish luxuries, high-shouldered bottles of perfume, and long-handled ivory brushes, and dainty boxes and cases,

and starred and beveled hand-glasses, and other sacred mysteries of toilet. Of the period when she had thought herself wedded to art, there were certain charcoal sketches pinned against the wall, and in *one* corner, not very definite at first glance under the draperies tossed upon it from time to time, was her easel. On projections of her mirror-frame hung souvenirs of Robert's first cruise, which had been in the Mediterranean; ropes of Roman pearls; nets and bracelets and necklaces of shells and beads from Venice; filigree silver jewelry from Genoa; strands and rosaries of black, barbarically scented wooden beads from the Levant,—not things you could wear at all, but very pleasant to have; they gave a sentiment to your room when you brought any one into it; they were nice to have lying about, and people liked to take them into their hands; they were not so very uncommon, either, that you had to keep telling what they were. She had never thought that, possibly, Robert had expected her to wear the absurd things. With an aching recurrence to their quarrel (it could be called no less) and a penitent self-pity, she thought of it now. It did not seem to her that she could touch them, but she went languidly to the mirror and took some of them down, and then all at once fantastically began to array herself in them; like a mad girl, she reflected. She threw the loops of Roman pearls and the black strands of Levantine beads about her neck; she set a net of the Venetian shell-work on her hair, and decked her wrists and her lovely ears with the Genoese filigree; a perfectly frantic combination, she mused, as she shook her head a little to make the ear-bobs dance. "Yes, perfectly frantic," she said aloud, but not much thinking of the image confronting her from the mirror, thinking rather of Robert, and poignantly regretting that she had never put them on for him; and thinking that if the loss of him had made her certain about him too late for ever, how fatally strange that would be. Again she went over all the facts of the affair, and was able to make much surer of Robert's motives than of her own. She knew that if he had understood her saying that she might have loved him once to be any encouragement for the future, he would not have written as he did. She could imagine Robert's being very angry at the patronizing tone of the rest of her letter; she had entire faith in his stupidity; she never doubted his generosity, his magnanimous incapability of turning her refusal of him into a refusal of her; his was not the little soul that could rejoice in such a chance. She wondered if now, far out at sea, sailing, sailing away, three years away, from her, he

saw anything in her letter but refusal; or was he still in that blind rage? Did he never once think that it had seemed such a great thing for her to make confession, which meant him to come to her? But had she really meant that? It seemed so now, but perhaps then she had only thought of mingling a drop of kindness in his bitter cup, of trying to spare him the mortification of having loved a person who had never thought for a moment of loving him? From time to time, her image appeared to advance upon her from the depths of the mirror, decked in all that incongruous frippery, and to say with trembling lips, "Perfectly frantic, perfectly frantic," while the tears ran down its face; and she found a wild comfort in regarding herself as quite an insane, irresponsible creature, who did not know what she was about. She felt that fate ought not to hold her to account. The door-bell rang, and she snatched the net from her hair with a fearful shudder, and flung down all the ornaments in a heap upon her dressing-table. Bumping sounds in the hall below reminded her that in her trance before the glass she had remotely known of a wagon stopping at the door, and presently she heard Margaret coming up the stairs behind the panting expressman who was fetching up her trunk. She fled into another room, and guiltily lurked there till they went out again, before she returned to unlock and unpack the box. It was one of Helen's economies not to drive home from the station, but to send her baggage by express and come up in a horse-car. The sums thus saved she devoted to a particular charity, and was very rigid with herself about spending every half-dollar coach-fare for that object. She only gave twenty-five cents to the express, and she made a merit of the fact that neither the coach-hire nor the charity ever cost her father anything. Robert had once tried to prove that it always cost him seventy-five cents, but she had easily seen through the joke, and had made him confess it.

She was still busy unpacking when Margaret came up to say that her father was awake now, and then she left off at once to go to him. The gas had been lighted in the hall and library, and that made life another thing. Her father was in his arm-chair, and was feeling decidedly better, he said; he had told Margaret to have tea there in the library. Helen laughed at him for having two teas within two hours; he owned to being hungry, and that reminded her that she had eaten nothing since an early dinner. When the tea and toast came in, and the cloth was laid half across the round table, in the mellow

light of the study lamp, they were very cozy. Helen, who was always thinking of Robert, whatever else she thought of, began to play in fancy at a long life of devotion to her father, in which she should never marry. She had always imagined him living with her, but now she was living with him, and they were to grow old together; in twenty years, when he was eighty, she would be forty-three, and then there would not be much difference between them. She now finally relinquished the very last idea of Robert, except as a brother. She did not suppose she should ever quite like his wife, but she should pet their children.

"Helen," said her father, breaking in upon these ideas, "how should you like to live in the country?"

"Why, papa, I was just thinking of it! That is, not in the country exactly, but somewhere off by ourselves, just you and I. Of course, I should like it."

"I don't mean on a farm," pursued her father, "but in some of the suburban towns, where we could have a bit of ground and breathing space. I think it grows closer and closer in town; at times it seems as if I could hardly catch my breath. I believe it would agree with me in the country. I can't get away from business entirely for a few years yet,—if the times continues so bad, I must bend all my energies to it, in fact,—and I have a fancy that the coming in and out of town would do me good. And I have a notion that I should like to build. I should like a new house—a perfectly new house. We could live on a simpler scale in the country."

"Oh, yes, indeed," said Helen. "I should come into town to shop, with my initials worked in worsted on the side of my bag, and I should know where the bargains were, and lunch at Copeland's. I should like it."

"Well, we must think about it. I daresay we could let the house here without much trouble. I feel it somehow a great burden upon me, but I shouldn't like to sell it."

"Oh, no, papa! We couldn't think of selling it. I should just like to let it, and then never go near it, or look in the same direction, till we were ready to come back to it."

"I have lived here so long," continued her father, making her the listener to his musings rather than speaking to her, "that I should like a change. I used to think that I should never leave the house, but a place may become overcrowded with associations. You are too young, Helen, to understand how terrible it is to find one's own past grow into the dumb, material things about one, and become, as it were, imprisoned in them."

"Oh, yes," sighed the girl, "there are some

dresses of mine that I can't bear the sight of, just because I felt or said or did certain things when I wore them."

"An old house like this," Mr. Harkness went on, "gets to be your body, and usurps all your reality, which doesn't seem to live in it either, while you move round like a ghost. The past is so much more than the present. Think how much more these walls and these old chairs and tables have known of us than we now are!"

"No, no! Don't think of it, papa, or we shall be getting into the depths again," pleaded Helen.

"Well, I won't," consented her father, coming back to himself with a smile, which presently faded. "But it all makes me restless and impatient. I should like to begin a new life somewhere else, in a new house." He was silent awhile, trifling with the toast on his plate; his appetite had passed at the sight of the food, and he had eaten scarcely anything. He looked at Helen, and then at a portrait on the wall, and then at Helen again.

"I'm not much like mamma, am I, papa?" she asked.

"Not much in face," said Mr. Harkness.

"Do you wish I was more?" she pursued timidly.

"No, I don't think I do," said her father.

"It would only make me more painful, if I looked more like her, such a helpless, selfish thing as I am," morbidly assented Helen. "I should only make you miss her the more."

"Why, Helen, you're a very good girl—the best child in the world," said her father.

"Oh, no, I'm not, papa. I'm one of the worst. I never think of anybody but myself," said Helen, who was thinking of Robert. "You don't know how many times I've gone down on my mental knees to you and asked you to have patience with me."

"Asked *me* to have patience with you?" said her father, taking her by the chin, and pressing against his cheek the beautiful face which she leaned toward him. "Poor child! There's hardly a day since you were born that I haven't done you a greater wrong than the sum of all your sins would come to. Papas are dreadful fellows, Helen; but they sometimes live in the hope of repairing their misdeeds."

"Write them on a slip of paper, and hide it in a secret drawer that opens with a clasp and spring, when you don't know they're there," said Helen, glad of his touch of playfulness. "We've both been humbugging, and we know it."

He stared at her and said, "Your voice is like your mother's; and just now, when you came in, your movement was very like hers.

I hadn't noticed it before. But she has been a great deal in my mind of late."

If he had wished to talk of her mother, whom Helen could not remember, and who had been all her life merely the shadow of a sorrow to her,—a death, a grave, a name upon a stone, a picture on the wall,—she would not spare herself the duty of encouraging him to do so. "Was she tall, like me?" she asked.

"Not so tall," answered her father. "And she was dark."

"Yes," said Helen, lifting her eyes to the picture on the wall.

"She had a great passion for the country," continued Mr. Harkness, "and I liked the town. It was more convenient for me, and I was born in Boston. It has often grieved me to think that I didn't yield to her. I must have been dreaming of her, for when I woke a little while ago, this regret was like a physical pang at my heart. As long as we live, we can't help treating each other as if we were to live always. But it's a mistake. I never refused to go into the country with her," he said, as if to appease this old regret. "I merely postponed it. Now I should like to go."

He rose from the table, and taking the study-lamp in his hand, he feebly pushed apart the sliding-doors that opened into the drawing-room. He moved slowly down its length, on one side, throwing the light upon this object and that, before which he faltered, and so returned on the other side, as if to familiarize himself with every detail. Sometimes he held the lamp above, and sometimes below his face, but always throwing its age and weariness into relief. Helen had remained watching him. As he came back she heard him say less to her, as it seemed, than to himself, "Yes, I should like to sell it. I'm tired of it."

He set the lamp down upon the table again, and sank into his chair, and lapsed into a reverie which left Helen solitary beside him. "Ah," she realized, as she looked on his musing, absent face, "he is old and I am young, and he has more to love in the other world, with my mother and both my brothers there, than he has in this. O Robert, Robert, Robert!"

But, perhaps, his absent mind was not so much bent upon the lost as she thought. He had that way fathers have of treating his daughter as an equal, of talking to her gravely and earnestly, and then of suddenly dropping her into complete nothingness, as if she were a child to be amused for a while, and then set down from his knee and sent out-of-doors. Helen dutifully accepted this condition of their companionship; she cared for it so little as never to have formulated it

to herself; when she was set down she went out, and ordinarily she did not think of it.

A peremptory ring at the door started them both, and when Margaret had opened it there entered, all at the same instant, a loud, kindly voice, the chirp of boots, heavily trodden upon by a generous bulk, that rocked from side to side in its advance, and a fragrance of admirable cigars, that active and passive perfume which comes from smoking and being smoked in the best company. "At home, Margaret?" asked the voice, whose loudness was a husky loudness, in a pause of the boots. "Yes? Well, don't put me in there, Margaret," which was apparently in rejection of the drawing-room. "I'll join them in the library."

The boots came chirping down the hall in that direction, with a sound of heavy breathing. Helen sprang from her chair, and fled to meet the cheerful sound; there was the noise of an encountering kiss, and a jolly laugh, and "Well, Helen!" and "Oh, Captain Butler!" and later, "Harkness!" and "Butler!" as Helen led the visitor in.

"Well!" said this guest, for the third time. He straightened his tall mass to its full height, and looked out over his chest with eyes of tender regard upon Harkness's thin and refined face, now lit up after the handshaking with cordial welcome. "Do you know," he said, as if somehow it were a curious fact of natural history, "that you have it uncommonly close in here?" He went over to the window that opened upon the little grassy yard and put it up for himself, while Harkness was explaining that it had been put down while he was napping. Then he planted himself in a large leathern chair beside it, and went on smoking the cigar on the end of which he had been chewing. He started from the chair with violence, coughing and gesturing to forbid Helen, who was hospitably whispering to Margaret. "No, no; don't do it. I won't have anything. I couldn't. I've just dined at the club. Yes, you may do that much," he added to Helen, as she set a little table, with an ash-holder, at his elbow. "You've no idea what a night it is. It's cooler, and the air's delicious. I say, I want to take Helen back with me. I wish she'd go alone, and leave us two old fellows together here. There's no place like Boston in the summer, after all. But you haven't told me whether you're surprised to see me." Captain Butler looked round at them with something of the difficulty of a sea-turtle in a lateral inspection.

"Never surprised, but always charmed," said Helen, with just the shade of mockery in her tone which she knew suited this visitor.

"Charmed, eh?" asked Captain Butler. Apparently he meant to say something satirical about the word, but could not think of anything. He turned again to her father: "How are you, Harkness?"

"Oh, I'm very well," said Harkness evasively. "I'm as well as usual."

"Then you have yourself fetched home in a hack by a policeman every day, do you!" remarked Captain Butler, blowing a succession of white rings into the air. "You were seen from the club window. I'll tell you what: you're sticking to it too close."

"Oh, yes, Captain Butler, *do* get him away," sighed Helen, while her father, who had not sat down, began to walk back and forth in an irritated, restless way.

"For the present I can't leave it," said Harkness, fretfully. He added more graciously: "Perhaps in a week or two, or next month, I can get off for a few days. You know I was one of the securities for Bates and Mather," he said, looking at Captain Butler over Helen's head.

"I had forgotten that," answered Captain Butler, gravely.

"They left things in a complete tangle. I can't tell just where I am yet, and, of course, I've no peace till I know."

"Of course," assented Captain Butler. "I wont vex you with retroactive advice, Joshua," he added affectionately; "but I hope you wont do anything of that kind again."

"No, Jack, I wont. But you know, under the circumstances, it would have been black ingratitude to refuse."

"Yes," said Captain Butler. He smoked awhile in silence. Then he said, "I suppose it's no worse with the old trade than with everything else, at present."

"No, we're all in the same boat, I believe," said Harkness.

"How is Marian?" asked Helen, a little restive under the cross firing.

"Oh, Marian's all right. But if she were not, she wouldn't know it."

"I suppose she's very *much* engaged," said Helen, with a faint pang of something like envy.

"Yes," said Captain Butler. "I thought you were at Rye Beach, young lady."

"I thought you were at Beverly, old gentleman," retorted Helen; she had been saucy to Captain Butler from infancy.

"So I was; but I came up unexpectedly to-day."

"So did I."

"Did you? Good! Now I'll tell you why I came, and you shall tell me why *you* did. I came because I got to thinking of your father,

and had a fancy I should like to see him. Did you?"

Helen hung her head.

"No," she said at length.

The captain laughed.

"Whom had you a fancy to see here, then, at this time of year?"

"Oh, I didn't say I should tell. You made that bargain all yourself," mocked Helen. "But it was very kind of you to come on papa's account," she added softly.

"What are you making there?" asked the captain, bending forward to look at the work Helen had taken into her lap.

"Who—I?" she asked, as if she had perhaps been asked what Robert was making. Her mind had been running upon him since Captain Butler asked her why she had come up to Boston. "Oh!" she recovered herself. "Why, this," she said, taking the skeleton frame-work of gauze and wire on her fingertips, and holding it at arm's length, with her head aslant, surveying it, "this is a bonnet for Margaret."

"A bonnet, hey?" said the captain. "It looks like a Shaker cap."

"Yes?" Helen clapped it on her head, and looked jauntily at the captain, dropping her shoulders, and putting her chin out. "Now, does it?"

"No, not now. The Shaker sisters don't wear crimps, and they don't smile in that wicked way." Helen laughed, and took the bonnet-frame off. "So you make Margaret's bonnets, do you? Do you make your own?"

"Sometimes. Not often. But I like millinery. It's what I should turn to if I were left to take care of myself."

"I'm afraid you wouldn't find it such fun," said the captain.

"Oh, milliners make lots of money," returned Helen. "They must. Why, when this bonnet is done, you couldn't get it for ten dollars. Well, the materials don't cost three."

"I wish my girls had your head for business," said the captain, honestly. Helen made him a burlesque obeisance. "Yes, I mean it," he insisted. "You know that I always admired your good sense. I'm always talking it into Marian."

"Better not," said Helen, with a pin between her teeth.

"Why?"

"Because I haven't got it, and it'd make her hate me if I had."

"Do you mean to tell me that you're not a sensible girl?" inquired the captain.

Helen nodded, and made "yes" with her lips, as well as she could with the pin between her teeth. She took it out to say, "You should have seen my performances in my room a

little while ago." She was thinking of that rehearsal before the mirror.

"What were they?" asked the captain.

"Oh, as if I should tell!"

Helen bowed herself over the bonnet, and blushed and laughed. Her father liked to hear the banter between her and his old friend. They both treated her as if she were a child, and she knew it and liked it; she behaved like a child.

"Harkness," said the captain, turning his fat head half round toward his friend, who sat a little back of him, and breaking off his cigar-ash into the bronze plate at his elbow, "do you know that your remaining in the trade after all the rest of us have gone out of it is something quite monumental?"

Captain Butler had a tender and almost reverential love for Joshua Harkness, but he could not help using a little patronage toward him, since his health had grown delicate and his features had not distinctly prospered.

"I am glad you like it, Jack," said Harkness quietly.

"The captain is a mass of compliments tonight," remarked Helen.

The captain grinned his consciousness. "You are a minx," he said admiringly to Helen. Then he threw back his head and pulled at his cigar, uttering between puffs, "No, but I mean it, Harkness. There's something uncommonly fine about it. A man gets to be *noblesse* by sticking to any old order of things. It makes one think of the *ancien régime* somehow to look at you. Why, you're still of the oldest tradition of commerce, the stately and gorgeous traffic of the Orient; you're what Samarcand and Venice and Genoa and Lisbon and London and Salem have come to."

"They've come to very little in the end, then," said Harkness as before.

"Oh, I don't know about that;" the captain took the end of his cigar out and lit a fresh one from it before he laid it down upon the ash-holder; "I don't know about that. We don't consider material things merely. There has always been something romantic—something heroic about the old trade. To be sure, now that it's got down to telegraphing, it's only fit for New Yorkers. They're quite welcome to it." This was not very logical, taken as a whole, but we cannot always be talking reason. At the words romantic and heroic Helen had pricked her ears, if that phrase may be used concerning ears of such loveliness as hers, and she paused from her millinery. "Aha, young lady," cried the captain, "you're listening, are you? You didn't know there was any romance or heroism in business, did you?"

"What business?" asked Helen.

"Your father's business, young woman; my old business, the India trade."

"The India trade? Why, were *you* ever in the India trade, Captain Butler?"

"Was *I* ever in the India trade?" demanded the captain, taking his cigar out of his mouth in order to frown with more effect upon Helen. "Well, upon my word! Where did you think I got my title? I'm too old to have been in the war."

"I didn't know," said Helen.

"I got it in the India trade. I was captain and super-cargo many an eleven months' voyage, just as your father was."

Helen was vastly amused at this.

"Why, papa! were *you* ever captain of a ship?"

"For a time," said Mr. Harkness, smiling at the absurdity.

"Of course he was!" shouted the captain.

"Then why isn't he captain now?"

"Because there's a sort of captain that loses his handle when he comes ashore, and there's a sort that keeps it. I'm one sort and your father's the other. It's natural to call a person of my model and complexion by some kind of title, and it isn't natural to call such a man as your father so. Besides, I was captain longer than he was. I was in the India trade, young lady, and out of it before you were born."

"I was born a great while ago," observed Helen, warningly.

"I daresay you think so," said the captain.

"I thought *I* was, at your age. But you'll find, as you grow older, that you weren't born such a very great while ago after all. The time shortens up. Isn't that so, Harkness?"

"Yes," said Mr. Harkness. "Everything happened day before yesterday."

"Exactly," said the captain. Helen thought how young she must be to have already got that letter of Robert's so many centuries ago. "Yes," the captain pursued. "I had been in the India trade twenty-five years when I went out of it in 1857—or it went out of me." He nodded his great, close-clipped head in answer to her asking glance. "It went out of a good many people at that time. We had a grand smash. We had overdone it. We had warnings enough, but we couldn't realize that our world was coming to an end. It hadn't got so low as telegraphing, yet; but it was mere shop then, even, compared with the picturesque traffic of our young days. Eh, Harkness?"

"Yes, it had lost all attraction but profit."

"Were you ever down at India Wharf, Helen?" demanded the captain. "I don't blame you; neither were my girls. But were you?"

"Of course," said Helen, scorning to lift her eyes from her work. "The Nahant boat starts from it."

"The Nahant boat!" repeated the captain in a great rage. "In my day there was no Nahant boat about India Wharf, I can tell you, nor any other steamboat; nor any dirty shanties ashore. The place was sacred to the shipping of the grandest commerce in the world. There they lay, those beautiful ships, clean as silver, every one of them, and manned by honest Yankee crews." The captain got upon his feet for the greater convenience of his eloquence. "Not by ruffians from every quarter of the globe. There were gentlemen's sons before the mast, with their share in the venture, going out for the excitement of the thing; boys from Harvard, fellows of education and spirit; and the fore-castle was filled with good Toms and Jims and Joes from the Cape; chaps whose aunts you knew; good stock through and through, sound to the core. The super-cargo was often his own captain, and he was often a Harvard man—you know what *they* are!"

"Nicest fellows in the world," consented Helen.

The captain blew a shaft of white smoke into the air, and then cut it through with a stroke of his cigar.

"We had on a mixed cargo, and we might be going to trade at eastern ports on the way out. Nobody knew what market we should find in Calcutta. It was pure adventure, and a calculation of chances, and it was a great school of character. It was a trade that made men as well as fortunes; it took thought and forethought. The owners planned their ventures like generals planning a campaign. They were not going to see us again for a year; they were not going to hear of us till we were signaled outside on our return. When we sailed it was an event, a ceremony, a solemnity; and we celebrated it with song from all the tarry throats on board. Yes, the men used to sing as we dropped down the bay."

"Oh, Captain Butler, it *was* fine!" cried Helen, dropping her hands on her work, and looking up at the captain in his smoke cloud, with rapture. "Papa, why didn't you ever let me come down to see your ships sail?"

"It was all changed before you were born, Helen," began her father.

"Oh, yes, all changed," cried the captain, taking the word away from him. "The ships had begun, long before that, to stop at East Boston, and we sold their cargoes by sample, instead of handling them in our warehouses, and getting to feel some sort of human interest in them. When it came to that, a mere

shopman's speculation, I didn't much care for the New Yorkers' getting it."

The captain sat down and smoked in silence.

"How did the New Yorkers get it?" asked Helen, with some indignant stir in her local pride.

"In the natural course of things," said her father. "Just as we got it from Salem. By being bigger and richer."

"Oh, it was all changed anyway," broke in the captain. "We used to import nearly all the cotton goods used in this country,—fabrics that the natives wove on their little looms at home, and that had the sentiment you girls pretend to find in hand-made things,—but before we stopped, we got to sending our own cottons to India. And then came the telegraph, and put the finishing stroke to romance in the trade. Your father loads now, according to the latest dispatches from Calcutta. He knows just what his cargo will be worth when it gets there, and he telegraphs his people what to send back." The captain ended in a minor key. "I'm glad I went out of it when I did. You'd have done well to go out too, Harkness."

"I don't know, Jack. I had nothing else in view. You know I had become involved before the crash came, and I couldn't get out."

"I think you could," returned the captain, stubbornly. And he went on to show his old friend how. And the talk wandered back to the great days of the old trade, and to the merchants, the super-cargoes, the captains, the mates of their youth. They talked of the historic names before their date, of Cleaveland and his voyages, of Handasyd Perkins, of Bromfield, of the great chiefs of a commerce which founded the city's prosperity, and which embraced all climes and regions; the Dutch colonies and coffee; the China trade and tea; the North-west coast and furs; the Cape, and its wines and oil; the pirates that used to harass the early adventurers; famous shipwrecks; great gains and magnificent losses; the splendor of the English nabobs and American residents at Calcutta; mutinies aboardship; the idiosyncrasies of certain sailors; the professional merits of certain black cooks. These varied topics and interests conspired to lend a glamour to the India trade as it had been, that at last moved Captain Butler to argument in proof of the feasibility of its revival. It was the explanation of this scheme that wearied Helen. At the same time she saw that Captain Butler did not mean to go very soon, for he had already sunk the old comrade in the theorist so far as to be saying "Well, sir," and "Why, sir,"

and "I tell you, sir." She got up—not without dropping her scissors from her lap, as the custom of her sex is—and gave him her hand, which he took in his left, without rising.

"Going to bed? That's right. I shall stay a bit yet. I want to talk with your father."

"Talk him into taking a little rest," said Helen, looking at the captain as she bent over her father to kiss him good-night.

"I shall give him all sorts of good advice," returned the captain, cheerily.

Her father held her hand fondly till she drew an arm's length away, and then relinquished it with a very tender "Good-night, my dear."

Helen did not mean to go to bed, and, when she reached her own room, she sat a long time there, working at Margaret's bonnet, and overhearing now and then some such words of the captain's as "dyes," "muslins," "ice," "teak," "gunny-bags," "shellac," "Company's choppers,"—a name of fearful note, descriptive of a kind of Calcutta handkerchief once much imported. She imagined that the captain was still talking of the India trade. Her father spoke so low that she could not make out any words of his. The sound of his voice somehow deeply touched her; his affection appealed to hers in that unintelligible murmur, as the disembodied religion of a far-heard hymn appeals to the solemnity of the listener's soul. She began to make a fantastic comparison of the qualities of her father's voice and the captain's, to the disadvantage of the captain's other qualities. She found that her father was of finer spirit and of gentler nature, and, by a natural transition, she perceived that it was a grander thing to be sitting alone in one's room with one's heart-ache than to be, perhaps, foolishly walking the piazza with one's accepted commonplace destiny, as Marian Butler was at that moment. At this point she laughed at herself, said "Poor Marian!" aloud, and recognized that her vagaries were making Captain Butler an ill return for his kindness in dropping in to chat with her father. She hoped he would not chat too long, and tire him out. And so her thoughts ran upon Robert again, and she heard no more of the talk below till after what seemed to her, starting from it, a prolonged reverie. Then she was aware of Captain Butler's boots chirping out of the library into the hall toward the door, with several pauses, and she caught fragments of talk again: "I had no idea it was as bad as that, Harkness \* \* \* bad business, must see what can be done \* \* \* weather it a few weeks longer \* \* \* confoundedly straitened myself \* \* \* pull you through," and, faintly, "Well, good-night, Joshua. I'll see you

in the morning." There was another pause, in which she fancied Captain Butler lighting his cigar at the chimney of the study-lamp with which her father would be following him to the door. The door closed, and her father went slowly back to the library, where she felt rather than heard him walking up and down. She wanted to go to him, but she would not; she wanted to call to him, but she remained silent. When, at last, she heard his step upon the stairs, heavily ascending, and saw the play of his lamp-light on the walls without, she stealthily turned down the gas that he might not think her awake. Half an hour later, she crept to his door, which stood a little ajar, and whispered, "Papa!"

"What is it, Helen?" He was in bed, but his voice sounded very wakeful. "What is it, my dear?"

"Oh, I don't know!" She flung herself on her knees beside his bed in the dark, and put her arms about his neck. "But I feel so unhappy!"

"About—" began her father, but she quickly interrupted.

"No, no! About *you*, papa! You seem so sad and careworn, and I'm nothing but a burden and a trouble to you!"

"You are nothing but a comfort and a help to me. Poor child! You mustn't be worried by my looks. I shall be all right in the morning. Come, come!"

"But weren't you perplexed somehow about business? Weren't you thinking about those accounts?"

"No, my dear."

"What were you thinking of?"

"Well, Helen, I was thinking of your mother and your little brothers."

"Oh!" said Helen, with the kind of recoil which the young must feel even from the dearest dead. "Do you often think of them?"

"No, I believe, not often. Never so much as to-night, since I first lost them; the house

seemed full of them then. I suppose these impressions must recur."

"Oh, doesn't it make you feel strange?" asked Helen, cowering a little closer to him.

"Why should it? It doesn't make me feel strange to have your face against mine."

"No; but— Oh, don't, don't talk of such things, or I can't endure it! Papa, papa! I love you so, it breaks my heart to have you talk in that way. How wicked I must be, not to like you to think of them! But don't, to-night! I want you to think of me, and what we are going to do together, and about all our plans for next winter, and for that new house, and everything. Will you? Promise!"

Her father pressed her cheek closer against his, and she felt the fond smile which she could not see in the dark. He gave her his promise, and then began to talk about her going down to the Butlers', which it seemed the captain had urged further after she had bidden him good-night. The captain was going to stay in Boston a day or two, and Mr. Harkness thought he might run down with him at the end of the week. Helen did not care to go, but with this in view she did not care to say so. She let her father comfort her with caressing words and touches, as when she was a child, and she frankly staid her weak-heartedness upon his love. She was ashamed; but she could not help it nor wish to help it. As she rested her head upon his pillow she heard his watch ticking under it; in this sound all the years since she was a little girl were lost. Then his voice began to sink drowsily, as it used to do in remote times, when she had wearied him out with her troubles. He answered at random, and his talk wandered so that it made her laugh. That roused him to full consciousness of her parting kiss. "Good-night," he said, and held her hand, and drew her down by it again, and kissed her once more.

(To be continued.)

## FEATURES OF THE NEW NORTH-WEST.

### SOLVING THE INDIAN PROBLEM.

GENERAL MILES, who has probably had more experience in fighting Indians than any other officer of the army, believes that any wild tribe can be civilized up to the point of becoming self-supporting, in four or five years, if the right method is pursued. His success with the Cheyennes, who surrendered to him at Fort Keogh a few years ago, gives him the right to hold this opinion. The Cheyennes were savages, who had never come into any relation with the whites, other than that of hostility, until Miles conquered them. When they surrendered they showed a decided repugnance to going upon a reservation. They thought they could shift for themselves if they were not put in charge of an agent. General Miles sold all their ponies, except one or two to a lodge, and with the money bought cattle for them. He detailed a soldier who understood farming to teach them to raise crops. They went to work on the Fort Keogh military reservation. For about a year it was necessary to issue rations to them, but the allowance was steadily diminished, and finally stopped altogether. The Indians raised wheat, corn, and potatoes, made gardens, and soon had a surplus of vegetables, grain, and melons to sell. In the winter they hunted buffalo, and with the proceeds of the sale of the skins bought wagons and plows. They soon learned the value of money and became expert in barter. When I visited Fort Keogh last May nearly all of them had left the military reservation and gone up the Little Rosebud River, to open farms and build log-houses. They asked nothing from the Government except to be let alone. Their only apprehension was that they would be forced to submit to the agency system. To a suggestion that the Government would provide a school for the children, the chiefs replied that they would establish a school of their own if they had good crops this year, and that they would rather pay the expense themselves and not be dependent upon the Government. Yet these people were roaming the plains, clad in skins, three years ago,—as wild and warlike a tribe of painted savages as ever harassed the frontier. They were wise enough to know that the agency system meant demoralization and poverty, and to understand that by working, as they saw the white man work, they

could get for themselves the good things they saw the white man enjoy.

I saw a little of the Indians of British Columbia during a visit to Victoria. The authorities of that province never treated the Indian tribes as though they were independent nations, owning all the land they roamed over. No treaties were made with them. Small reservations were set apart for their homes, but no money annuities were paid them, and there was no effort to pauperize them by feeding and clothing them at the public expense. The result is that these Indians are not only self-sustaining, but contribute in no inconsiderable degree to the trade and wealth of the province. Last spring over \$50,000 was spent by Indians at the Victoria stores for clothing and groceries, from the proceeds of their winter catch of furs. Nor do they live wholly by hunting and fishing. I saw Indians unloading vessels, driving teams, and doing other kinds of labor. Many are at work on the Canada Pacific Railroad.

The universal opinion in the North-western territories is that the reservation and agency system is wholly vicious and ought to be abolished. The essence of this system is to make the Indian think the Government is afraid of him, and is eager to buy his friendship and furnish him with food and blankets to keep him from going on the war-path. This makes him an arrogant pauper who is ready to turn murderer on the smallest provocation. The Canadians and British Columbians always treated the Indian as if he had reason to fear them, not they him. They protected him in his rights as a human being, and told him that if he wanted food and clothes, he must work as they did.

### THE PUGET SOUND INDIANS.

IN the Puget Sound country the Indian question is settling itself by the rapid decrease of the tribes living on the shores of that beautiful inland sea. Old steam-boat captains who navigated the Sound thirty years ago say that its surface then swarmed with the canoes of the natives, and that the aboriginal population was not less than thirty thousand. Now it is probably not over six thousand. No tribes have been removed to the interior. All are still living upon little reservations fronting the tide-water, where they can fish and dig clams as of old. Nor have there

been wars to thin their numbers. Whisky, and the law of the survival of the fittest, is fast exterminating them. It is a crime to sell them intoxicating drink, and the Government maintains a penitentiary on an island near Steilacoom, chiefly for the confinement of men breaking the law in this respect; but the Indian manages to procure the means of getting drunk now and then in spite of the Revised Statutes. These Sound Indians are a mild, harmless folk, subsisting partly on fish and partly on the Government. They are not picturesque, like their kindred of the interior, because they have adopted civilized costume and wear such cheap, ill-fitting garments as they can get at the clothing stores. They look best when skimming along the water in their boats, which are dug out of tree-trunks, and are of uniform model, with graceful lines and a high, curving beak. Painted black, these swift little craft are not unlike a Venetian gondola. A whole family will paddle to a town in a canoe, with dried fish enough to subsist on for a few days, sleeping in the boat at night and hanging idly about the streets in the day-time, sitting motionless on the sidewalk for hours, like so many bundles of rags. The number of light-complexioned faces among the young folks is remarkable and significant.

#### CHINESE TRAITS.

THE Chinese question is as important in Oregon and Washington as in California. Of the 30,000 inhabitants of Portland, at least 5,000 are Chinamen. About the same proportion prevails in the smaller towns. Every town has its Chinese quarter. The yellow, pig-tailed people abound as far up the coast as Vancouver's Island and the villages of the British Columbian mainland. On the Canada Pacific Railroad about 5,000 are employed; on the Northern Pacific 4,000; on the Oregon Railway and the Navigation Company's road building along the Columbia River about 3,000; on the Oregon and California Railroad, now being extended southward into California, 4,000. Thus there are 16,000 Coolies engaged in railway work in the coast country north of California. When the roads are finished they will be thrown upon the general labor market. In California 25,000 were landed between Jan. 1 and Aug. 4, when the new Chinese law went into operation.

There is a mistaken notion in the East that the Chinese are always humble and submissive, and much put upon and abused by the whites of the Pacific coast. There was a time when the hoodlums of San Francisco maltreated the Asiatic immigrants shamefully, but that time has gone by. Now the Chinaman appears to be as secure in his rights of

person and property as anybody. Instead of being deferential and timid he is often pushing and insolent. He does not give way in the street. He hustles you as rudely as an English navvy. A body of Chinese laborers marching down a narrow street will crowd ladies into the gutter. The Chinese merchants, doctors, and others belonging to the better classes, are as polite as Frenchmen, but the masses of the Chinese population on the Pacific coast are rude and brutal. The chief thing in their favor is their habit of personal cleanliness. The railroad laborers, who are the poorest and most ignorant class, wash themselves from head to foot at the end of each day's work. All classes are frequent customers of the barber, who gives minute attention to their heads, faces, ears, and necks.

Among the common laborers there is little sympathy for sick and injured comrades. If a man is likely to become a burden, the other members of his gang want to get rid of him as soon as possible. It is commonly believed by the white bosses on the railways that the Chinese doctors put sick men out of the way by poison when they think they cannot be speedily cured. A case was told me in Oregon of a Coolie railway laborer who had an arm broken. It was set by the company's doctor, and was doing well, but the man's comrades insisted on bringing a Chinese doctor to attend him. The doctor came from a distant camp and gave the patient a dose. In an hour the poor fellow was dead. In such cases there is no investigation; nobody cares that there is one Chinaman less. The death of a cart-horse is of much more consequence. One great difficulty the employers of Chinese labor have to contend with is the superstition of these queer people. Their religious worship consists chiefly in propitiating the malevolent spirits of the dead. If a Chinese domestic fancies there is a ghost in the house he departs at once, and leaves an inscription behind to warn his successors. It often happens that a family will be unable to keep a servant longer than a single day. Man after man will come and go without giving any reason for his abrupt departure. At last the warning sign is found in the kitchen or the servant's room and expunged; then there is no more trouble. Not long ago two Chinamen were killed in Oregon by the premature explosion of a blast on a new railway line. One of their fellow workmen declared that just before the explosion he saw two devils come to the opposite bank of the river and heard them talking. Thereupon the whole gang of forty men dropped work, and could not be induced, by threats or persuasions, to return to the spot. It was neces-

sary to send them to another part of the line, and bring on a fresh gang who had not heard of the occurrence.

It is commonly supposed in the East, that the Chinese make excellent servants. Some of them do, no doubt, but I met no housekeeper on the Pacific coast, who did not say she would greatly prefer a good, white woman, if one could be obtained, to the best Chinaman. As a rule, the Chinese domestic servants, while they do faithfully and in a machine-like way what they agree to do, and are shown how to do, are stubborn and disobliging if asked to go outside their regular day's routine of labor. They insist on having their evenings to themselves, and on leaving the house to smoke opium and gamble with their comrades in some dirty den. If, for any reason, breakfast is wanted at an earlier hour than common, the mistress must get it herself. The greatest trouble with them is, however, to teach them to show the same deference to the mistress of the house that they show to the master. They despise women as a lower order of beings, and cannot understand, until they have been some time in this country, how a woman can rightfully have authority in a household. The only reason the Chinese are valued as house-servants on the Pacific coast is because white service is scarce and very bad. Knowing that they can always get situations, the few white women who go out to serve are, as a rule, arrogant, lazy, and incompetent.

#### FRONTIER MANNERS.

THERE is an amusing amount of self-assertion in the manners of the frontier people. When you are introduced to a man, after giving you a cordial hand-grip, he pushes his hat back on his head, thrusts his hands into his pockets and throws his body back from the hips, in a swaggering way. He is far from meaning anything offensive. It is the custom of the country for every man to behave as if he were a tremendous fellow, and were determined the world should estimate him up to his full value. An introduction is almost invariably followed by an invitation to drink. The saloons are the social clubs and business exchanges of the male population. In them the lawyer meets his client, and the merchant his customer. Usually, there are two or three gaming-tables in the saloon, and the click of the ivory chips mingles with the clinking of glasses, and the din of many voices. Women are treated with great respect, if they are respectable, and with none at all if they are not. Not long ago, a timid lady from the East, on her way to join her husband, a government engineer officer, on getting out of a stage-coach, at the door of a hotel, in Southern

Oregon, was met by the stout French woman who managed the establishment, with this greeting: "Are you a decent woman, madam? If you are, you can come in; if not, you can't stop at my house."

Frontier towns swarm with dissolute creatures who drink at the bars and mingle with the men in the gaming-houses, betting recklessly at faro and keno. In one town, I heard a leading citizen openly defend the tolerance shown them by the authorities. He said they brought money to the place, and made trade good. Most men, in the new settlements, are known to their acquaintances by their first name, or by some droll nickname. Listening to a conversation between two ex-miners in Montana, both now prosperous men, about old times and acquaintances, I heard them speak of "Shirt-collar Bill," "Yeast-powder Joe," "Sour-dough Jim," "Six-toed Pete," and "Snapping Andy."

As a rule, however, the traveler from the East is more frequently surprised by the comforts and good manners encountered on the far frontier, than by rudeness and bad manners. People who live in cabins will go to an extravagant outlay of money to bring, over hundreds of miles of mountain roads, some articles of taste to remind them of their former homes in the East: an upholstered chair, perhaps a carpet, an engraving, or even a piano. I found pianos, carpets, and pictures in little log-houses in Montana far distant from any town. Often the grade of intelligence and culture of the inhabitants would be equal to that of the best class of country people in New England or New York. They like to show that it is possible to cultivate the graces of life in the wilderness as well as in cities. In Western Oregon and Washington, where civilization has had thirty years growth, manners and modes of living come pretty well up to Eastern standards. Indeed there is not enough newness and roughness for picturesque effects; save for a certain breezy frankness of manner and a little carelessness in dress, and a more hearty tone in conversation, you remark no special Western stamp in the people. Such towns as Olympia, on Puget Sound, and Salem, Albany, and Corvallis in the Willamette Valley, might almost have been transported bodily from Ohio or Northern Illinois.

The first harbinger of civilization in all the vast interior between Eastern Dakota and the settled country on the Pacific coast, is the saloon. It does not follow population; it takes the lead. If there is any reason to suppose that settlers will go into any distant and isolated section a year hence, you will find the whisky seller already on the ground

with his tent or his "shack," patiently waiting for customers. In mining camps, on bare and desolate cattle-ranges, at river fords, where a few horsemen or a mule team may cross, now and then, and on lonely forest trails, traversed only by prospectors and Indians, the man of decanters and bottles has established himself. Usually his only stock in trade is a barrel of whiskey and a few pounds of sugar, but if he be convenient to wagon transportation, he will have bottled beer. The consumption of beer in the camps of the railway builders is enormous. At Bismarck I saw an entire freight train of thirty cars laden with bottled beer from a Chicago brewery, bound for the town nearest the end of track. The chief engineer of the construction force said that an average of one bottle for every tie laid was consumed, and that the tie and the beer cost the same—fifty cents. Thus the workmen pay as much for their drink as the company for one of the important elements of railway construction.

#### NEWSPAPERS.

THE fecundity of the Far North-west in newspapers is remarkable. Towns which, in the Middle or older Western States, would barely sustain a weekly, have one or two dailies, and mere hamlets of two or three hundred inhabitants support a weekly to trumpet their advantages and aspirations. The proportion of newspapers to population in Oregon and Washington must be twice or three times as great as in Iowa or Illinois. As the town precedes the country in the development of this region, the papers must mainly subsist on such patronage as can be obtained within gunshot of their offices. The four dailies of Walla Walla, for example, depend upon a town which, in the East, would perhaps sustain two or three weeklies; but there are no tributary villages, the surrounding country being an immense wheat-field, with three or four families to a square mile of territory. The three dailies of Seattle depend upon a lumber town of perhaps 6,000 inhabitants with a wilderness on one side and the water on the other. The daily at Port Townsend is supported by a population not exceeding 2,500, including Indians and Chinese. The fact that newspapers live in such small communities argues a great deal of enterprise and liberality on the part of the people and a pretty high average of intelligence.

The general news field of the Pacific North-west is monopolized by a single rich and prosperous newspaper, the "Portland Oregonian," which controls the associated press dispatches and sells them in condensed form to small dailies in the interior and on the

Sound. There is no parallel case in the United States of a single newspaper having an absolute monopoly of so large a field of circulation, which is about 1,000 miles square.

An affectation of odd and original names prevails among the journals of the Far West. For instance: The "Lewiston Teller," the "Salem Daily Talk," the "Reese River Reveille," the "Pinal Drill," the "Las Vegas Optic," the "Colton Semi-Tropic," the "Calico Print," published in the new mining town of Calico, and the "Tombstone Epitaph" of the town of Tombstone, Arizona.

#### NORTH-WESTERN RIVERS.

THE rivers of the Pacific North-west are, in many instances, badly named. The Columbia should have been allowed to keep the old name of the Oregon; but, once called the Columbia, the name should have been applied to the longer branch of the stream, which flows wholly in United States Territory, instead of to the shorter branch, which heads in British America. The longer branch, called Clark's Fork in its lower course, is one of the most picturesque streams on the continent. Its dignity is diminished by its bearing at different points of its course no fewer than five names. First it is Clark's Fork—a clumsy appellation; above Pend d'Oreille Lake it is locally called the Pend d'Oreille River, as far up as the mouth of the Flat Head River; further up it bears the soft, musical name of the Missoula; still further, above the mouth of the Bitter Root, it is called the Hell Gate, from the savage gorge through which it flows, and finally, in South-western Montana, where it heads, it is called the Deer Lodge. As it seems now to be too late to call the entire stream the Columbia, would it not be well for Congress to christen it the Missoula? If an effort is made to abolish the confusing local names given to this noble stream, the Snake River, once called Lewis's Fork of the Columbia, might, at the same time, be given its Indian name of Shoshone, or be called Lewis River. It is a powerful stream, navigable for two hundred miles and draining an immense area of country. Its present name is detestable. The original Indian names for the smaller streams have very generally been retained. Some of them are pretty and melodious, like the Willamette, the Alsea, the Palouse, the Pataha, the Kalama, the Chehalis, and the Nesal. Some are barbarous and jaw-breaking, like the Stignamish, the Swinomish, the Cathlapootle, the Skagit, the Ya Chats, the Hy-as-kna-ha-laos, the Wenatchapam, and the Hum-tu-lups. The old resident rolls these names off his tongue with evident enjoyment.

## QUEER NAMES.

IN Oregon and Washington are many queer names of towns and streams that testify in some cases to the quaint fancy of the early settlers, and, in others, to a blunt, rude realism still displayed in mining camps. In the Willamette Valley you can pass through the hamlet of Needy, and a few miles further on arrive at Glad Tidings, and then, in ten miles more, reach Sublimity. On Puget Sound are two neighboring logging-camp towns, one called Arcadia and the other Hardscrabble. In neither of them does life appear to be Arcadian, and Hardscrabble is quite as attractive or unattractive as its neighbor with the poetic name.

A southern Oregon settlement, where the early gold-seekers met with disappointment, was called Humbug, and the name sticks to it to this day. Not far off are Louse Creek, Whiskytown, and Jump-off-Joe Creek, the latter named on account of an adventure of old General Joe Lane, who fought the Indians in that region. In Eastern Washington a railway station is called Eltopia—a euphemism for the Hell-to-Pay of the first settlers.

## RAILWAY LINES.

IN all parts of the Far West railway enterprise runs in advance of population. Powerful companies, backed by eastern or foreign capital, carefully survey the unsettled regions, sending out parties of experts to study the character of the soil, the grasses, the mineral deposits, and the timber, and report on the probable traffic to be had when settlers come in. The companies know that settlers will follow the new road and occupy a broad band of country on either side of it. A given population will afford a given amount of freight and passenger business; thus the problem is as simple as a sum in arithmetic, provided excessive competition does not lead to the construction of too many roads. Eastern Dakota is already well supplied with rail transportation, and the enormous wheat crop of that region is promptly moved to Chicago or to water transit at the head of Lake Superior. Oregon and Washington have also a remarkably well developed railway system, carrying their immense wheat surplus to tide-water at Portland and the Puget Sound ports. Between these two systems the long line of the Northern Pacific Railroad is rapidly advancing from both directions. Next summer the gap will be closed and the whole North-west will be linked together. The advanced condition of the transportation system of the

Pacific North-west is really remarkable, considering the isolated situation and slender population of that section. Two standard gauge and two narrow gauge lines traverse the Willamette Valley, and few farmers in that wonderfully productive region need haul their grain further than ten miles to reach a railway station. One of these lines is being pushed southward through the Umpqua and Rogue River Valleys and over three mountain ranges to California, where it joins a road building northward up the valley of the Sacramento. The completion of these roads next year will unite California and Oregon by unbroken railway between San Francisco and Portland.

A trunk line, owned by the Oregon Railway and Navigation Company, runs westward from Portland, up the deep gorge of the Columbia River, past the two great obstructions to navigation at the Cascades and the Dalles, and out into the open, fertile country east of the Cascade Mountains, draining all the rich grain and grazing regions of Eastern Oregon and Eastern Washington, and taking their products westward to tide water. At Umatilla this line throws off a branch to the Grande Ronde Valley, which is being extended southward to Baker City, where it will meet the Oregon Short Line now building North-westward from the Union Pacific Road at Ogden. At Wallula junction it meets the main stem of the Northern Pacific, and, by an alliance between the two companies, becomes its Western extension to Portland and Puget Sound; the original plan of throwing the Northern Pacific over the Cascade Mountains directly to the Sound having been laid aside for a few years. At the same junction begins an important system of local roads, partly completed and being steadily extended, which throws out branches on both sides of the Snake River, penetrates the new, rich, wheat country skirting the base of the Blue and Cœur d'Alene Mountains and will next summer reach as far as the towns of Lewiston and Moscow in Northern Idaho.

In Western Washington a link of the Northern Pacific system runs from Kalama on the Columbia River, one hundred and five miles due North to Tacoma at the head of Puget Sound. The connection with Portland is now made by steamers on the Columbia, but next year the forty miles' gap will be closed by rail. Then the whole interior system of railways in the North-west will have two termini at ocean navigation—one at Portland and one on Puget Sound. In all there are now in operation in Oregon and Washington, over eleven hundred miles of railway, to be joined to the transportation

system of the East in 1883, by the completion of the Northern Pacific Transcontinental line. When one considers that the two communities of the Pacific North-west have only a quarter of a million of inhabitants, and are wholly isolated from direct communication with the rest of the United States, their enterprise in railway building is remarkable. Every locomotive and every rail used on their lines has been brought around Cape Horn. Practically, Oregon and Washington have, up to this time, been in the position of an island out in the Pacific Ocean, for their commercial relations with the rest of the world have been carried on by means of steamer lines to San Francisco and sailing ships going round the Horn to New York and Liverpool. When these beautiful and productive regions are brought within seven days of New York, their direct development will be enormously accelerated.

#### THE OREGON METROPOLIS.

PORTLAND has a population of about 25,000, and is growing rapidly. It has grown rich by handling and shipping the wheat of the Willamette Valley and the upper Columbia country and selling goods to the farmers of the interior. It has none of the look of a raw Western town. The business streets are well built with brick, the residence streets are handsomely shaded, and bordered by pretty white and cream-colored houses, each with its lawn, rose-bushes, and flower-beds. The streets running back from the water-front climb a gentle slope to a dense, dark forest. Ships with foreign flags, lie in the stream, and white, river steamers come and go. The town has large school-houses, fine churches, gas and water works, street-railways, a theater, a club, spacious stores, well-filled with all goods that appeal to the fancy of women in the East—in short, the attractions and comfort to be found in Eastern cities. It has also a stable, intelligent population, largely of the New England and Middle State elements. Portland, sitting at the gateway of the rich Willamette Valley and controlling the transportation lines leading up and down the Columbia River, has got beyond the stage of experiment.

#### THE PUGET SOUND TOWNS.

BETWEEN the Columbia River and Puget Sound, a distance of about one hundred miles, the country is all forest, save where a few settlements have been made along the Cowlitz River, or on spots of prairie land left

open by nature. The shores of the Sound, too, are one enormous, and almost unbroken forest, notched here and there, on the water-front by clearings for logging camps, and saw-mill villages. The towns are few and far between, and are encircled not by belts of cultivated fields, but by the dim aisles of the primeval woods. Lumbering is the chief industry, and an immense industry it is, counting its annual product by hundreds of millions of feet, sending building material to South America, China, and Australia, as well as to the whole California coast, and furnishing masts and spars to the navies of the world.

Seattle is the chief Sound port. It has about 8,000 inhabitants, and besides its big saw-mills, enjoys the profits of the coal business from the neighboring mines, and of a trade with the little lumbering hamlets up and down the Sound, on its numerous bays, coves, and straits. Big hotels, bustling business streets, two-story coal-wharves, and a young university are among the features of this thriving, ambitious place.

Tacoma, on Commencement Bay, is the terminus of the Northern Pacific Railroad, and of its branch to the Wilkeson coal fields, which is eventually to climb over the Cascade Mountains. It has perhaps 3,000 inhabitants. From the plateau on which it stands there is an inspiring view of the dark green base and dazzling snowy summit of Mount Rainier, the noblest of the white giants of the Cascade Range—a grander mountain than Mont Blanc, and though a thousand feet lower, apparently more lofty because it is seen from the sea level towering up into the sky, individual and alone. Its Indian name is Mount Tacoma, and so it should be called instead of after an English admiral who never saw it.

Olympia, the capital of Washington Territory, is a pretty village, embowered in fruit trees, with 2,500 inhabitants, a branch railroad and a steam-boat that runs to Seattle and Tacoma. There is some farming country back of the place, and a good water-power close by.

Port Townsend, at the entrance to the Sound, looks down on the green water from a high plateau. There is a lower town by the wharves connected with the upper one by a long flight of wooden stairs. The population is about the same as that of Olympia. The custom-house is here for all the Sound ports, and it is in some sort a supply station for shipping. The other Sound towns are considerable settlements depending on big saw-mills for their existence, or on rather feeble agricultural settlements on tidal flats redeemed by dikes, or in the narrow bottoms of the little rivers that are fed by the melting snows of the mountains.

## COAL DEPOSITS.

WEST of the Missouri River, in the small valleys of the Heart and Little Missouri Rivers, numerous seams of lignite or brown coal are found, which furnish a valuable fuel resource for a region nearly destitute of timber. Two of the thicker seams are being worked. Further west, the whole valley of the Yellowstone abounds in lignite deposits. Many of them are too thin for working, but there are thick seams enough exposed on the face of the bluffs along the river to indicate that the supply is practically inexhaustible. The quality of the lignite varies considerably in different seams. The best develop a heat-producing power equal to about sixty-five per cent. of that of the same weight of good bituminous coal. On the slopes of the Belt Mountains, near Bozeman, veins of true bituminous coal were found last summer, which will be worked this year. They promise to yield much the best fuel to be found anywhere between the Mississippi Valley and the Pacific coast. A hundred and fifty miles north-west of these veins, on the farther side of the main divide of the Rockies, I saw a mine that had been worked for local consumption in the neighboring valley of Deer Lodge, and abandoned, no doubt, because wood was cheaper to burn, when the rude facilities for mining, the high price of labor, and the small demand for fuel were taken into account. With the denser settlement of the country and the building of railways, an extensive coal-mining industry will, no doubt, be developed in the Rocky Mountain region.

The important coal region of the Pacific North-west lies east of Puget Sound and close under the western base of the Cascade Mountains. From this field is now derived the coal supply of San Francisco and all the cities on the Pacific coast. It probably extends north and south for a distance of one hundred and fifty miles. Thus far it has been systematically developed at two points only, one known as the Newcastle region, about twenty miles east of Seattle, and the other called the Wilkeson and Carbonado region, thirty miles west of Tacoma. Both these regions are connected by rail with tide-water on the Sound, the outlet of one being at Seattle and the other at Tacoma, and from each of these ports fleets of steam and sail colliers run to San Francisco. As the demand increases the output increases. New deposits are constantly being discovered, and the quality—a hard, black lignite, not readily slacked—improves as deeper veins are reached. The importance of these coal-fields in the future industrial

development of the Pacific coast communities can scarcely be overestimated.

## TIMBER LANDS.

PRACTICALLY, the whole country between the Minnesota prairies and the Rocky Mountains is bare of timber. There are little strips of forest trees along the water-courses in Dakota, but they consist mainly of cottonwood, soft maple, and alder, and furnish only a scanty supply of fuel to the settlers, and are of no value as a source of building material. West of the Missouri there is nothing worth sawing up into lumber until the advanced spurs of the Rockies are reached—the Big Horn, the Belt, the Judith, the Big Snowy, and the Yellowstone Mountains. In the gorges running up their sides there is sufficient “bull pine” and spruce for the settlers’ purposes and for railway ties and bridge timbers, but there are no large, well-timbered areas. On both sides of the main divide of the Rockies about the same condition is found. The pines are somewhat larger, and some cedar is met with. For want of something better, the timber is of great value for local consumption, for fuel and building purposes in the neighboring valleys, but this is all that can be said of it. Not until I reached Clark’s Fork of the Columbia, or the Pend d’Oreille, as it is known to the settlers, did I see any extensive body of good timber. On both sides of that stream, between the Cœur d’Alene and Cabinet Mountains, lies a heavily timbered belt of about one hundred miles in length by thirty in width, reaching down to and around Pend d’Oreille Lake. The trees are “bull pine,” cedar, hemlock, and spruce, with a little white pine. The western slopes of the Cœur d’Alene Mountains and the Bitter Root Mountains, which are a continuation of the same range, are moderately well timbered and furnish material for fuel, fences, and buildings for a wide stretch of rich, bare country further west. From these mountains, westward to the narrow valleys running up into the Cascade Range, the country is nearly destitute of forest growth. A few stunted pines grow on the sides of the deep narrow valleys through which the streams run. Along the lower course of the Columbia and around Puget Sound there are immense forests of fir, furnishing a practically inexhaustible lumber supply. Eastern Oregon is mostly treeless, but the slopes of the mountain ranges bear sufficient timber for local uses. Eastern Washington, fast becoming a great wheat field, feels most the lack of forests. Western Oregon, including the fertile, well-settled Willamette Valley, is well supplied

from both the coast and Cascade Mountains, while Western Washington is all a vast forest, where the clearings are mere specks upon the immense expanse of woodland. This magnificent forest is destined to be a source of great wealth for centuries to come. The lumbering operations up to this time, although very extensive, have only notched it here and there at long intervals close to the water-side.

#### CLIMATIC PECULIARITIES.

It is a common mistake in the East to suppose that the rigorous winter climate of Minnesota continues westward on parallels of latitude all the way to the Rocky Mountains. Dakota winters are even more severe than those of Minnesota, because there are no forests to break the force of the blizzards. There is, however, a great deal of bright, still weather, when the cold is hardly felt, because of the dryness of the air. West of the Missouri the mean winter temperature steadily increases as you go toward the Rockies, and the weather in December, January, and February, in the valley of the Yellowstone, is no more rude than in Maryland or Southern Ohio, with the great advantage of a dry, bracing atmosphere, instead of the cold rains and sloppy snow-falls which characterize the season in the middle latitudes of the Atlantic coast and Mississippi Valley. The snow-fall is much less than in the belt of country along the Union Pacific Railroad. On the Northern Pacific line, which runs at one point in Idaho almost as far north as the boundary of British America, the only region of heavy snow-fall is around Lake Pend d'Oreille, and for a hundred miles up Clark's Fork of the Columbia; but there the road is protected from drifts by the heavy forest growth. No serious obstacle to regular winter traffic will be occasioned by snow on any of the railways penetrating the northern line of States and Territories between Lake Superior and Puget Sound. The fact that Montana was formerly the great buffalo range, and is fast becoming a vast cattle and sheep range, verifies the assertions of its inhabitants regarding the light snow-fall.

Between the Rockies and the Cascade Range, in the new agricultural regions of Washington and Oregon, the climate does not greatly differ from that of Pennsylvania. The summers are cooler, because of the greater elevation above the sea level, and the winters dryer, with less snow. Cattle and horses live on the dried grasses all winter, in the whole region, as far north as the British line. West of the Cascades, in the rich valley of the Willamette, and the Puget Sound country, the summer weather is perfect; but there

are five disagreeable, rainy months, from October to April. Very little snow falls, but "the rain it raineth every day"; or, to be more precise, about two days out of three. Perhaps the best climate, the year round, of the Pacific North-west, is that of the Rogue River Valley, in Southern Oregon. The south-west winds, which bring the winter rains, strike the coast a little north of this valley, and its winter climate is said to resemble that of Italy. The summer climate is not unlike that of the interior of Massachusetts. On all the Pacific coast, it is the direction of the mountain ranges and of the currents of sea-air, that determine climate more than latitude. Thus, the winter in Victoria, on Vancouver's Island, is no colder than that of Baltimore, while the summer resembles that of Newfoundland, if any parallel to its delightful, cool, bracing weather can be found on the Atlantic coast. For the most agreeable climatic conditions possible, one should have a cottage in Victoria for the summer, looking out over the blue waters of the Strait of Juan de Fuca, and a fruit ranch for the winter in one of the warm valleys of Southern California.

#### FUTURE STATES.

PUBLIC opinion in Dakota has firmly decided that the territory shall be cut into halves by a line following the 45th parallel of latitude, and be thus made into two States. The line is not a natural boundary. It is chosen because it gives about an equal area to North and South Dakota, and runs through the center of an unsettled belt now dividing the settled region along the Northern Pacific Railroad from the southern section of the present territory, already well supplied with railway facilities. Very soon this vacant belt will fill up with people, and the completion of north and south railroad lines, now considerably advanced, will make of both sections a homogeneous community. Still the territory is too large for one State, and the reasons for dividing it are identical with those which led to separating Minnesota from Iowa, and Kansas from Nebraska. Montana is even larger than Dakota, but it contains far less farming land and, save in a few valleys, will never support a dense population. The eastern portion is mainly a grazing country, while the western portion is a mass of mountain ridges, between which lie narrow, fertile valleys, where agriculture is very profitable, but can only be carried on with the aid of irrigation. There is no talk yet of dividing this immense territory, but the time will come when conflicts of opinion will arise between the people living on the Yellowstone and its

tributaries, and those inhabiting the mountain country. Perhaps it will then be found wise to make two States out of Montana, by a line drawn north and south.

Washington is destined to become a rich, populous State. It has in its eastern counties an extensive area of remarkably productive wheat land, yielding thirty, forty, and even fifty bushels to the acre. The Puget Sound counties are rich in coal and lumber, and in the region north of the Columbia, as yet only partly explored, both iron and coal have lately been found, as well as mines of nickel, silver, and gold. The population of Washington, now a little over 100,000, will probably increase to a million in a quarter of a century. Idaho develops very slowly. The streams mostly run in deep cañons, making no fertile valleys, and the high lands are too dry for cultivation. Mining for the precious metals is the leading industry. This territory and Wyoming will be the last to come in as States. The only section of Idaho containing broad, contiguous areas of arable land is embraced in the Pan Handle on the extreme north, and the four counties comprising that district are eagerly seeking to be detached and to be united with Washington, with which they are closely identified both geographically and commercially.

#### THE ULTIMATE FRONTIER.

IMMIGRATION pushes eastward from the Pacific coast as well as westward from the Valley of the Mississippi. In Oregon and Washington I met hundreds of families going East. They came from the well-settled valley of the Willamette and were bound for the new grain and pasture regions east of the Columbia River. The ultimate frontier may be said to be in Idaho. Into that territory emigrants seeking a new country come from east, west, and south. The whole Rocky Mountain region will, however, remain practically a frontier country for a long time to come. It is only adapted for very sparse settlement and will always afford a field of adventure for hunters and tourists. A belt of country about two hundred miles wide, in Montana and Idaho, and widening out to nearly one thousand in New Mexico and Arizona, will probably always preserve most of its present characteristics of wildness and vacancy. The lofty wooded ranges of the Cascade Mountains in Oregon and Washington, with their sublime isolated snow peaks and their profound gorge-like valleys, will also repel all settlement save that of hunters, lumbermen, and miners. Along the Pacific coast, between the Coast Range and the sea,

there is another belt of country too heavily timbered for occupancy by farmers save on the bottom lands along the streams.

#### DEFECTS OF THE PUBLIC LAND SYSTEM.

TRAVEL in the scantily settled regions of the Far West has convinced me that our present system of land laws abounds in mischievous defects. It was adopted when the central and extreme western portions of the continent were little known, and was well enough adapted at that day to encourage immigration into regions of nearly uniform fertility like Illinois and Iowa, and to parcel out the public domain among those who intended to occupy and cultivate it. The system is, however, poorly adapted to meet the conditions existing in regions like Montana, where the arable lands lie in narrow strips of valleys and most of the country consists of mountain ranges, or high, dry pasture tracts unfit for crops. In Eastern Dakota, one hundred and sixty acres of rich wheat-land are ample for a homestead, which will support a family; but what is a settler to make of one hundred and sixty acres of grassy plateau, too dry for any crop, but good for cattle and sheep, if he had enough of it.

The preëmption feature of the land system should be abolished altogether. Under it the gigantic wheat farms of Dakota have been formed. The owners first bought the alternate sections of land from the railroad company, and then placed their own hired men upon the government sections to preëmpt, purchase, and transfer them. Six months' real, or pretended residence in a six by nine shanty is sufficient to perfect a preëmption claim. The claimant then gets his patent by paying \$2.50 an acre if within the limits of a railroad grant, or \$1.25 if not, and he can at once sell out to the speculator or the "bonanza farmer." The public land laws ought to make the way of the land-grabber a hard one, and preserve the arable portions of the public domain for actual settlement and cultivation in small tracts. The "bonanza farm" system secures the cultivation of large areas, but only by the hired labor of men without families, who leave the farm as soon as the crop is harvested. Ten thousand acres tilled on this plan will support, as permanent residents, perhaps half a dozen families of employés, who look after the machinery, animals, and buildings. If divided into small, separate holdings, the same tract would sustain a hundred families, raising less wheat, perhaps, but more children, to become good citizens of the republic.

## THE CREOLES IN THE AMERICAN REVOLUTION.

BY GEORGE W. CABLE,

Author of "Old Creole Days," "The Grandissimes," etc.

### I.

#### PRAYING TO THE KING.

IN 1699, France, by the hand of her gallant sailor, D'Iberville, founded the province of Louisiana. In 1718, his younger brother, Bienville, laid out the little parallelogram of streets and ditches, and palisaded lots which formed New Orleans. Here, amid the willow-jungles of the Mississippi's low banks, under the glaring sunshine of bayou clearings, in the dark shadows of the Delta's wet forests, the Louisiana Creoles came into existence,—valorous, unlettered, and unrestrained, as military outpost life in such a land might make them. In sentiment they were loyal to their king; in principle, to themselves and their soil. Sixty-three years had passed, with floods and famines and Indian wars, corrupt misgovernment and its resultant distresses, when in 1762 it suited the schemes of an unprincipled court secretly to convey the unprofitable colony—land and people, all and singular—to the King of Spain.

In the early summer of 1764, before the news of this unfeeling barter had startled the ears of the colonists, a certain class in New Orleans had begun to make formal complaint of a condition of affairs in their sorry little town (commercial and financial rather than political) that seemed to them no longer bearable. There had been commercial development; but, in the light of their grievances, this only showed through what a débris of public disorder the commerce of a country or town may make a certain progress.

These petitioners were the merchants of New Orleans. Their voice was now heard for the first time. The private material interests of the town and the oppressions of two corrupt governments were soon to come to an open struggle. It was to end, for the Creoles, in ignominy and disaster. But in better years further on there was a time in store when arms should no longer overawe; but when commerce, instead, was to rule the destinies, not of a French or Spanish military post, but of the great southern sea-port of a nation yet to be. Meanwhile, the spirit of independence was stirring within the inhabitants. They

scarcely half-recognized it themselves (there is a certain unconsciousness in truth and right); but their director-general's zeal for royalty was chafed.

"As I was finishing this letter," wrote M. d'Abbadie, "the merchants of New Orleans presented me with a petition, a copy of which I have the honor to forward. You will find in it those characteristic features of sedition and insubordination of which I complain."

A few months later came word of the cession to Spain. The people refused to believe it. It was nothing that the king's letter directly stated the fact. It was nothing that official instructions to M. d'Abbadie as to the manner of evacuating and surrendering the province were full and precise. It was nothing that copies of the treaty and of Spain's letter of acceptance were spread out in the council chamber, where the humblest white man could go and read them. Such perfidy was simply incredible. The transfer *must* be a make-believe, or they were doomed to bankruptcy,—not figuratively only, but, as we shall presently see, literally also.

So, when doubt could stay no longer, hope took its place,—the hope that a prayer to their sovereign might avert the consummation of the treaty, which had already been so inexplicably delayed. On a certain day, therefore, early in 1765, there was an imposing gathering on the Place d'Armes. The voice of the people was to be heard in advocacy of their rights. Nearly all the notables of the town were present; planters, too, from all the nearer parts of the Delta, with some of the superior council and other officials,—an odd motley of lace and flannel, powdered wigs, buckskin, dress-swords, French leather, and cow-hide. One Jean Milhet was there. He was the wealthiest merchant in the town. He had signed the petition of the previous June, with its "features of sedition and insubordination." And he was now sent to France with this new prayer that the king would arrange with Spain to nullify the act of cession.

Milhet met, in Paris, Bienville, ex-governor of the province and unsuccessful campaigner against its Indian foes, who, in his eighty-sixth year, was fated to fail once more in his effort to serve Louisiana. They sought, to-

gether, the royal audience. But the minister, the Duc de Choiseul (the transfer had been part of his policy) adroitly barred the way. They never saw the king, and their mission was brought to naught with courteous dispatch. Such was the word Milhet sent back. But a hope without foundations is not to be undermined. The Creoles, in 1766, heard his ill-tidings without despair, and fed their delusion on his continued stay in France and on the non-display of the Spanish authority.

By another treaty Great Britain had received a vast territory on the eastern side of the Mississippi. This transfer was easier to understand. The English had gone promptly into possession, and, much to the mental distress of the acting-governor of Louisiana, M. Aubry (M. d'Abbadie having died in 1765), were making the harbor of New Orleans a highway for their men-of-war and transports, while without ships, ammunition, or money, and with only a few soldiers, and they entitled to their discharge, he awaited Spain's languid receipt of the gift which had been made her only to keep it from these very English.

But, at length, Spain moved, or seemed about to move. Late in the summer a letter came to the superior council from Havana, addressed to it by Don Antonio de Ulloa, a commodore in the Spanish navy, a scientific scholar and author of renown, and now revealed as the royally commissioned governor of Louisiana. This letter announced that Don Antonio would soon arrive in New Orleans.

Here was another seed of cruel delusion. For month after month went by, the year closed, January and February, 1766, came and passed, and the new governor had not made his appearance. Surely, it seemed, this was all a mere diplomatic maneuver. But, when the delay had done as much harm as it could, on the 5th of March, 1766, Ulloa landed in New Orleans. He brought with him only two companies of Spanish infantry, his government having taken the assurance of France that more troops would not be needed.

## II.

### ULLOA, AUBRY, AND THE SUPERIOR COUNCIL.

THE cession—a sentence, as it seemed to the Louisianians, of commercial and industrial annihilation—had now only to go into effect. It was this, not loyalty to France, that furnished the true motive of the Creoles and justification of the struggle of 1768. The merchants were, therefore, its mainspring. But merchants are not apt to be public leaders. They were behind and under the people. Who, then, or

what, was in front? An official body whose growth and power in the colony had great influence in forming the public character of the Creoles,—the Superior Council.

It was older than New Orleans. Formed in 1712 of but two members, of whom the governor was one, but gradually enlarged, it dispensed justice and administered civil government over the whole colony, under the ancient "custom of Paris," and the laws, edicts, and ordinances of the kingdom of France. It early contained a germ of popular government in its power to make good the want of a quorum by calling in notable inhabitants of its own selection. By and by its judicial functions had become purely appellate, and it took on features suggestive, at least, of representative rule.

It was this Superior Council which, in 1722, with Bienville at its head, removed to the new settlement of New Orleans, and so made it the colony's capital. In 1723, it was exercising powers of police. It was by this body that, in 1724, was issued that dark enactment which, through the dominations of three successive national powers, remained on the statute-book,—the Black Code. One of its articles forbade the freeing of a slave without reason shown to the council, and by it esteemed good. In 1726, its too free spirit was already receiving the reprimand of the home government. Yet, in 1728, the king assigned to it the supervision of land titles and power to appoint and remove at will a lower court of its own members.

With each important development in the colony it had grown in numbers and powers, and, in 1748, especially, had been given discretionary authority over land titles, such as must have been a virtual control of the whole agricultural community's moral support. About 1752 it is seen resisting the encroachments of the Jesuits, though these were based on a commission from the Bishop of Quebec; and it was this body that, in 1763, boldly disposed this same order of its plantations, a year before the home government expelled it from France. In 1758, with Kerlerec at its head, this council had been too strong for Rochemore, the intendant-commissary, and too free,—jostled him rudely for three years, and then procured of the king his dismissal from office. And lastly, it was this body that d'Abbadie, in another part of the dispatch already quoted from, denounced as seditious in spirit, urging the displacement of its Creole members, and the filling of their seats with imported Frenchmen.

Ulloa, the Spanish governor, stepped ashore on the Place d'Armes in a cold rain, with that absence of pomp which character-

izes both the sailor and the recluse. The people received him in cold and haughty silence that soon turned to aggression. Foucault, the intendant-commissary, was the first to move. On the very day of the governor's arrival he called his attention to the French paper money left unprovided for in the province. There were seven million livres of it, worth only a fourth of its face value. "What was to be done about it?" The governor answered promptly and kindly: It should be the circulating medium at its market value, pending instructions from Spain. But the people instantly and clamorously took another stand: It must be redeemed at par.

A few days later he was waited on by the merchants. They presented a series of written questions touching their commercial interests. They awaited his answers, they said, in order to know *how to direct their future actions*. In a dispatch to his government, Ulloa termed the address "imperious, insolent, and menacing."

The first approach of the Superior Council was quite as offensive. At the head of this body sat Aubry. He was loyal to his king, brave, and determined to execute the orders he held to transfer the province. The troops were under his command. But, by the rules of the council it was the intendant, Foucault, the evil genius of the hour, who performed the functions of president. Foucault ruled the insurgent council and signed its pronunciamientos, while Aubry, the sternly protesting but helpless governor, filled the seat of honor. And here, too, sat Lafrénière, the attorney-general. It was he who had harangued the notables and the people on the Place d'Armes when they sent Milhet to France. The petition to the king was from his turgid pen. He was a Creole, the son of a poor Canadian, and a striking type of the people that now looked to him as their leader: of commanding mien, luxurious in his tastes, passionate, over-bearing, ambitious, replete with wild energy, and equipped with the wordy eloquence that moves the ignorant or half-informed. The council requested Ulloa to exhibit his commission. He replied coldly that he would not take possession of the colony until the arrival of additional Spanish troops, which he was expecting; and that then his dealings would be with the French governor, Aubry, and not with a subordinate civil body.

Thus the populace, the merchants, and the civil government—which included the judiciary—ranged themselves at once in hostility to Spain. The military soon moved forward and took their stand on the same line, refusing point-blank to pass into the Spanish service.

Aubry alone recognized the cession and Ulloa's powers, and to him alone Ulloa showed his commission. Yet the Spanish governor virtually assumed control, set his few Spanish soldiers to building and garrisoning new forts at important points in various quarters, and, with Aubry, endeavored to maintain a conciliatory policy pending the arrival of troops. It was a policy wise only because momentarily imperative in dealing with such a people. They were but partly conscious of their rights, but they were smarting under a lively knowledge of their wrongs; and their impatient temper could brook any other treatment with better dignity and less resentment than that which trifled with their feelings.

Ill-will began, before long, to find open utterance. An arrangement by which the three or four companies of French soldiers remained in service under Spanish pay, but under French colors and Aubry's command, was fiercely denounced.

Ulloa was a man of great amiability and enlightenment, but nervous and sensitive. Not only was the defective civilization around him discordant to his gentle tastes, but the extreme contrast which his personal character offered was an intolerable offense to the people. Yet he easily recognized that behind and beneath all their frivolous criticisms and imperious demands, and the fierce determination of their Superior Council to resist all contractions of its powers, the true object of dread and aversion was the iron tyrannies and extortions of Spanish colonial revenue laws. This feeling it was that had produced the offensive memorial of the merchants; and yet he met it kindly, and, only two months after his arrival, began a series of concessions looking to the preservation of trade with France and the French West Indies, which the colonists had believed themselves doomed to lose. The people met these concessions with resentful remonstrance. One of the governor's proposals was to fix a schedule of reasonable prices on all imported goods, through the appraisement of a board of disinterested citizens. Certainly it was unjust and oppressive, as any Spanish commercial ordinance was likely to be; but it was intended to benefit the mass of consumers. But consumers and suppliers for once had struck hands, and the whole people raised a united voice of such grievous complaint that the ordinance was verbally revoked.

A further motive—the fear of displacement—moved the office-holders, and kept them maliciously diligent. Every harmless incident, every trivial mistake, was caught up vindictively. The governor's "manner of living, his tastes, his habits, his conversation, the most trivial occurrences of his household,"

were construed offensively. He grew incensed and began to threaten. In December, 1767, Jean Milhet returned from France. His final word of ill-success was only fuel to the fire. The year passed away, and nine months of 1768 followed.

Ulloa and Aubry kept well together, though Aubry thought ill of the Spaniard's administrative powers. In their own eyes they seemed to be having some success. They were, wrote Aubry, "gradually molding Frenchmen to Spanish domination." The Spanish flag floated over the new military posts, the French ensign over the old, and the colony seemed to be dwelling in peace under both standards.

But Ulloa and the Creoles were sadly apart. Repeated innovations in matters of commerce and police were only so many painful surprises to them. They were embarrassed. They were distressed. What was to become of their seven million livres of paper money no one yet could tell. Even the debts that the Spaniards had assumed were unpaid. Values had shrunk sixty-six per cent. There was a specie famine. Insolvency was showing itself on every hand; and the disasters that were to follow the complete establishment of Spanish power were not known but might be guessed. They returned the governor distrust for distrust, censure for censure, and scorn for scorn.

And now there came rumor of a royal decree suppressing the town's commerce with France and the West Indies. It was enough. The people of New Orleans and its adjacent river "coasts," resolved to expel the Spaniards.

### III.

#### THE INSURRECTION.

NEW ORLEANS, in 1768, was still a town of some thirty-two hundred persons only, a third of whom were black slaves. It had lain for thirty-five years in the reeds and willows with scarcely a notable change to relieve the poverty of its aspect. During the Indian wars barracks had risen on either side the Place d'Armes. When, in 1758, the French evacuated Fort Duquesne, and floated down the Ohio and Mississippi to New Orleans, Kerlerec added other barracks, part of whose ruin still stands in the neighborhood of Barracks street. Salients had been made at the corners of its palisade wall; there was "a banquette within and a very trifling ditch without." Just beyond this wall, on a part of the land of the banished Jesuits, in a large, deeply shaded garden was a house that had become the rendezvous of a conspiracy.

Lafrénière sat at the head of its board. His majestic airs had got him the nickname of "Louis Quatorze." Foucault was conspicuous. His friendship with Madame Pradal, the lady of the house, was what is called notorious. Jean Milhet and a brother, Joseph Milhet, and other leading merchants, Caresse, Petit, and Poupet, were present; also Doucet, a prominent lawyer, and Marquis, a captain of Swiss troops; with Balthasar de Masan, Hardy de Boisblanc, and Joseph Villeré, planters and public men, the last, especially, a man of weight. And, as if the name of the city's founder must be linked with all patriotic disaster, among the number were two of Bienville's nephews, Noyan, a young ex-captain of cavalry, and Bienville, a naval lieutenant, Noyan's still younger brother.

On the 25th of October, 1768, the mine was sprung. From twenty to sixty miles above New Orleans on the banks of the Mississippi lies the Côte des Allemands, the German coast, originally colonized by John Law's Alsatians. Here the conspirators had spread the belief that the Spanish obligations due the farmers there would not be paid; and when, on the date mentioned, Ulloa sent an agent to pay them, he was arrested by a body of citizens under orders from Villeré, and deprived of the money.

Just beyond the German coast lay the coast of the "Acadians." From time to time, since 1755, bands of these exiles from distant Nova Scotia had found their way to Louisiana, and had settled on the shores of the Mississippi above and below the mouth of La Fourche and down the banks of that bayou. Hardships and afflictions had come to be the salt of their bread, and now a last hope of ending their days under the flag for which they had so pathetic an affection depended on the success of this uprising. They joined the insurgents.

On the 27th, Foucault called a meeting of the Superior Council for the 28th. In the night, the guns at Tchoupitoulas gate—at the upper river corner—were spiked. Farther away, along a narrow road, with the wide and silent Mississippi now hidden by intervening brakes of cotton-wood or willow and now broadening out to view, but always on the right, and the dark, wet, moss-draped forest always on the left, in rude garb and with rude weapons,—muskets, fowling-pieces, anything,—the Germans and Acadians were marching upon the town.

On the morning of the 28th, they entered Tchoupitoulas gate. At the head of the Acadians was Noyan. Villeré led the Germans. Other gates were forced, other companies entered, stores and dwellings were closed, and

the insurgents paraded the streets. "All," says Aubry, "was in a state of combustion." The people gathered on the square. "Louis Quatorze" harangued them. So did Doucet and the brothers Milhet. Six hundred persons signed a petition to the Superior Council, asking the official action which the members of that body, then sitting, were ready and waiting to give.

Aubry had a total force of one hundred and ten men. What he could do he did. He sent for Lafrénière, and afterward for Foucault, and protested bitterly, but in vain. Under his protection, Ulloa retired with his family on board the Spanish frigate, which had slipped her cables from the shore and anchored out in the river. The Spanish governor's staff remained in his house, which they had barricaded, surrounded by an angry mob that filled the air with huzzas for the King of France. The council met again on the 29th. A French flag had been hoisted in the Place d'Armes, and a thousand insurgents gathered around it demanding the action of the council. As that body was about to proceed to its final measure, Aubry appeared before it, warning and reproaching its members. Two or three alone wavered, but Lafrénière's counsel prevailed, and a report was adopted enjoining Ulloa to "leave the colony in the frigate in which he came, without delay."

Aubry was invited by the conspirators to resume the government. His response was to charge them with rebellion and predict their ruin. Ulloa, the kindest if not the wisest well-wisher of Louisiana that had held the gubernatorial commission since Bienville, sailed, not in the Spanish frigate, which remained "for repairs," but in a French vessel, enduring at the last moment the songs and jeers of a throng of night roysterers, and the menacing presence of sergeants and bailiffs of the council.

#### IV.

##### THE PRICE OF HALF-CONVICTIONS.

THE next move on the part of all concerned was to hurry forward messengers, with declarations, to the courts of France and Spain. The colonists sent theirs; Aubry and Ulloa, each his; and Foucault, his,—a paper characterized by a shameless double-dealing which leaves the intendant-commissary alone, of all the participants in these events, an infamous memory.

The memorial of the people was an absurd confusion of truth and misstatement. It made admissions fatal to its pleadings. It made arrogant announcements of unapplied prin-

ciples. It enumerated real wrongs, for which France and Spain, but not Ulloa, were to blame. And with these it mingled such charges against the banished governor as: That he had a chapel in his own house; that he absented himself from the French churches; that he inclosed a fourth of the public common to pasture his private horses; that he sent to Havana for a wet-nurse; that he ordered the abandonment of a brick-yard near the town, on account of its pools of putrid water; that he removed leprous children from the town to the inhospitable settlements at the mouth of the river; that he forbade the public whipping of slaves in the town; that masters had to go six miles to get a negro flogged; that he had landed in New Orleans during a thunder-and-rain storm, and under other ill omens; that he claimed to be king of the colony; that he offended the people with evidences of sordid avarice; and that he added to these crimes—as the text has it—"many others, equally just [!] and terrible!"

Not less unhappy were the adulations offered the king who so justly deserved their detestation. The conspirators had at first entertained the bold idea of declaring the colony's independence and setting up a republic. To this end Noyan and Bienville, about three months before the outbreak, had gone secretly to Governor Elliott, at Pensacola, to treat for the aid of British troops. In this they failed; and, though their lofty resolution, which, by wiser leaders, among a people of higher discipline or under a greater faith in the strength of a just cause, might have been communicated to the popular will, was not abandoned, it was hidden, and finally suffocated under a pretense of the most ancient and servile loyalty: "Great king, the best of kings, [Louis XV.] father and protector of your subjects, deign, sire, to receive into your royal and fraternal bosom the children who have no other desire than to die your subjects," etc.

The bearers of this address were Le Sassier, St. Lette, and Milhet. They appeared before the Duc de Choiseul unsupported; for the aged Bienville was dead. St. Lette, chosen because he had once been an intimate of the duke, was cordially received. But the deputation as a body met only frowns and the intelligence that the King of Spain, earlier informed, was taking steps for a permanent occupation of the refractory province. St. Lette remained in the duke's bosom. Milhet and Le Sassier returned, carrying with them only the cold comfort of an order re-funding the colonial debt at three-fifths of its nominal value, in five per cent. bonds.

It was the fate of the Creoles—possibly a

climatic result—to be slack-handed and dilatory. Month after month followed the October uprising without one of those incidents that would have succeeded in the history of an earnest people. In March, 1769, Foucault covertly deserted his associates, and denounced them, by letter, to the French cabinet. In April the Spanish frigate sailed from New Orleans. Three intrepid men (Loyola, Gayarre, and Navarro), the governmental staff which Ulloa had left in the province, still remained, unmolested. Not a fort was taken, though it is probable not one could have withstood assault. Not a spade was struck into the ground, or an obstruction planted, at any strategic point.

At length the project of forming a republic was revived and was given definite shape and advocacy. But priceless time had been thrown away, the opportune moment had passed, an overwhelming Spanish army and fleet was approaching, and the spirit of the people was paralyzed. The revolt against the injustice and oppression of two royal powers at once, by "the first European colony that entertained the idea of proclaiming her independence," was virtually at an end.

It was the misfortune of the Creoles to be wanting in habits of mature thought and of self-control. They had not made that study of reciprocal justice and natural rights which becomes men who would resist tyranny. They lacked the steady purpose bred of daily toil. With these qualities, the insurrection of 1768 might have been a revolution for the overthrow of French and Spanish misrule and the establishment and maintenance of the right of self-government.

The Creoles were valorous but unreflecting. They had the spirit of freedom, but not the profound principles of right which it becomes the duty of revolutionists to assert and struggle for. They arose fiercely against a confusion of real and fancied grievances, sought to be ungoverned rather than self-governed, and, following distempered leaders, became a warning in their many-sided short-sightedness, and an example only in their audacious courage.

They had now only to pay the penalties; and it was by an entire inversion of all their first intentions that they at length took part in the struggle which brought to a vigorous birth that American nation of which they finally became a part.

#### V.

#### COUNT O'REILLY AND SPANISH LAWS.

ONE morning toward the end of July, 1769, the people of New Orleans were brought

suddenly to their feet by the news that the Spaniards were at the mouth of the river in overwhelming force. There was no longer any room to postpone choice of action.

Marquis, the Swiss captain, with a white cockade in his hat (he had been the leading advocate for a republic), and Petit, with a pistol in either hand, came out upon the ragged, sunburnt grass of the Place d'Armes and called upon the people to defend their liberties. About a hundred men joined them; but the town was struck motionless with dismay; the few who had gathered soon disappeared, and by the next day the resolution of the leaders was distinctly taken, to submit. But no one fled.

On the second morning Aubry called the people to the Place d'Armes, promised the clemency of the illustrious Irishman who commanded the approaching expedition, and sent them away, commanding them to keep within their homes.

Lafrénière, Marquis, and Milhet descended the river, appeared before the commander of the Spaniards, and by the mouth of Lafrénière in a submissive but brave and manly address presented the homage of the people. The captain-general in his reply let fall the word seditious. Marquis boldly but respectfully objected. He was answered with gracious dignity, and the assurance of ultimate justice, and the insurgent leaders returned to New Orleans and to their homes.

The Spanish fleet numbered twenty-four sail. For more than three weeks it slowly pushed its way around the bends of the Mississippi, and on the 18th of August it finally furled its canvas before the town. Aubry drew up his French troops with the colonial militia at the bottom of Place d'Armes, a gun was fired from the flagship of the fleet, and Don Alexandro O'Reilly, accompanied by twenty-six hundred chosen Spanish troops, and with fifty pieces of artillery, landed in unprecedented pomp, and took formal possession of the province.

On the 21st, twelve of the principal insurrectionists were arrested. Two days later Foucault was also made a prisoner. One other, Brand, the printer of the seditious documents, was apprehended, and a proclamation announced that no other arrests would be made. Foucault, pleading his official capacity, was taken to France, tried by his government, and thrown into the Bastille. Brand pleaded his obligation as government printer to print all public documents, and was set at liberty. Villeré either "died raving mad on the day of his arrest," as stated in the Spanish official report, or met his end in the act of resisting the guard on board the frigate where

he had been placed in confinement. Lafrénière, Noyan, Caresse, Marquis, and Joseph Milhet were condemned to be hanged. The supplications both of colonists and Spanish officials saved them only from the gallows, and they fell before the fire of a file of Spanish grenadiers.

Against young Bienville no action seems to have been taken beyond the confiscation of his property, and his name disappears from the record with his refusal to be the bearer of the petition to France in the preceding October. But Petit, Masan, Doucet, Boisblanc, Jean Milhet, and Poupet were consigned to the Morro Castle, Havana, where they remained a year, and were then set at liberty, but were forbidden to return to Louisiana and were deprived of their property. About the same time Foucault was released from the Bastille. The declaration of the Superior Council was burned on the Place d'Armes. Aubry refused a high commission in the Spanish army, departed for France, and had already entered the River Garonne, when he was shipwrecked and lost. "Cruel O'Reilly" — the captain-general was justly named.

There could, of course, be but one fate for the Superior Council as an official body, and the Count O'Reilly, armed with plenary powers, swept it out of existence. The *cabildo* took its place. This change from French rule to Spanish lay not principally in the laws, but in the redistribution of power. The crown, the sword, and the cross absorbed the lion's share, leaving but a morsel to be doled out, with much form and pomp, to the *cabildo*. Very quaint and redolent with Spanish romance was this body, which for the third part of a century ruled the pettier destinies of the Louisiana Creoles. Therein sat the six *regidores*, or rulers, whose seats, bought at first at auction, were sold from successor to successor, the crown always coming in for its share of the price. Five of them were loaded down with ponderous titles; the *alferes real* or royal standard bearer; the *alcalde-mayor-provincial*, who overtook and tried offenders escaped beyond town limits; the *alguazil-mayor*, with his eye on police and prisons; the *depositarario-general*, who kept and dispensed the public stores; and the *recibidor de penas de cámara*, the receiver of fines and penalties. Above these six sat four whom the six, annually passing out of office, elected to sit over their six successors. These four must be residents and householders of New Orleans. No officer or attaché of the financial department of the realm, nor any bondsman of such, nor any one aged under twenty-six, nor any new convert to the Catholic faith, could qualify. Two were *alcaldes ordinarios*, common judges.

In addition to other duties, they held petty courts at evening in their own dwellings, and gave unwritten decisions; but the soldier and the priest were beyond their jurisdiction. A third was *sindico-procurador-general*, and sued for town revenues; and the fourth was town treasurer, the *mayor-domo-de-propios*. At the bottom of the scale was the *escribano*, or secretary, and at the top, the governor.

It was like a crane,—all feathers. A sample of its powers was its right to sell and revoke at will the meat monopoly and the many other petty municipal privileges which characterized the Spanish rule and have been handed down to the present day in the city's offensive license system. The underlying design of the *cabildo*'s creation seems to have been not to confer, but to scatter and neutralize power in the hands of royal sub-officials and this body. Loaded with titles and fettered with minute ministerial duties, it was, so to speak, the Superior Council shorn of its locks; or if not, then, at least, a body whose members recognized their standing as *guardians* of the people and *servants* of the king.

O'Reilly had come to set up a government, but not to remain and govern. On organizing the *cabildo*, he announced the appointment of Don Louis de Unzaga, colonel of the regiment of Havana, as governor of the province, and yielded him the chair. But under his own higher commission of captain-general he continued for a time in control. He had established in force the laws of Castile and the Indies and the use of the Spanish tongue in the courts and public offices. Those who examine the dusty notarial records of that day find the baptismal names, of French and Anglo-Saxon origin, changed to a Spanish orthography, and the indices made upon these instead of upon the surnames.

So, if laws and government could have done it, Louisiana would have been made Spanish. But the change in the laws was not violent. There was a tone of severity and a feature of arbitrary surveillance in those of Spain; but the principles of the French and Spanish systems had a common origin. One remotely, the other almost directly, was from the Roman Code, and they were pointedly similar in the matters which seemed, to the Creole, of supreme importance,—the marital relation, and inheritance. But it was not long before he found that now under the Spaniard, as, earlier, under the French, the laws themselves, and their administration, pointed in very different directions. Spanish rule in Louisiana was better, at least, than French, which, it is true, scarcely deserved the name of government. As to the laws themselves, it is worthy of notice that Louisiana "is at this

## VI.

ALEXANDRO O'REILLY. (FROM A MINIATURE IN POSSESSION OF C. GAYARRE, ESQ.)

time the only State, of the vast territories acquired from France, Spain, and Mexico, in which the civil law has been retained, and forms a large portion of its jurisprudence."

On the 29th of October, 1770, O'Reilly sailed from New Orleans with most of his troops, leaving the Spanish power entirely and peacefully established. The force left by him in the colony amounted to one thousand two hundred men. He had dealt a sudden and terrible blow; but he had followed it only with velvet strokes. His suggestions to the home government of commercial measures advantageous to New Orleans and the colony, were many, and his departure was the signal for the commencement of active measures intended to induce, if possible, a change in the sentiments of the people,—one consonant with the political changes he had forced upon them. Such was the kindlier task of the wise and mild Unzaga.

CROZAT — Law — Louis XV. — Charles III. — whoever at one time or another was the transatlantic master of Louisiana managed its affairs on the same bad principle: To none of them had a colony any inherent rights. They entered into possession as cattle are let into a pasture or break into a field. It was simply a commercial venture projected in the interests of the sovereign's or monopolist's revenues, and restrictions were laid or indulgences bestowed upon it merely as those interests seemed to require. And so the Mississippi delta, until better ideas could prevail, could not show other than a gaunt, ill-nourished civilization. The weight of oppression, if the governors and other officers on the spot had not evaded the letter of the royal decrees and taught the Creoles to do the same, would actually have crushed the life out of the province.

The merchants of New Orleans, when Unzaga took the governor's chair, dared not import from France anything but what the customs authorities chose to consider articles of necessity. With St. Domingo and Martinique they could only exchange lumber and grain for breadstuffs and wine. Their ships must be passported; their bills of lading were offensively policed; and these "privileges" were only to last until Spain could supplant them by a commerce exclusively her own. They were completely shut out from every other market in the world except certain specified ports of Spain, where, they complained, they could not sell their produce to advantage nor buy what was wanted in the province. They could employ only Spanish bottoms commanded by subjects of Spain; these could not put into even a Spanish-American intermediate port except in distress, and then only under onerous restrictions.

RELICS OF THE SPANISH OCCUPATION.

A PAGE FROM THE ARCHIVES OF NEW ORLEANS, CONTAINING THE SIGNATURES OF FIVE SPANISH GOVERNORS.

They were virtually throttled merely by a rigid application of the theory which had always oppressed them, and only by the loose and flexible administration of which the colony and town had survived and grown, while Anthony Crozat had become bankrupt, Law's *Compagnie d'Occident* had been driven to other fields of enterprise, and Louis XV. had heaped up a loss of millions more than he could pay.

Ulloa's banishment left a gate wide open which a kind of cattle not of the Spanish brand lost no time in entering.

"I found the English," wrote O'Reilly, in October, 1769, "in complete possession of the commerce of the colony. They had in this town their merchants and traders, with open stores and shops, and I can safely assert that they pocketed nine-tenths of the money spent here. \* \* \* I drove off all the English traders and the other individuals of that nation whom I found in this town, and I shall admit here none of their vessels." But he recommended what may have seemed to him a liberal measure,—an entirely free trade with Spain and Havana, and named the wants of the people: "flour, wine, oil, iron instruments, arms, ammunition, and every sort of manufactured goods for clothing and other domestic purposes," for which

they could pay in "timber, indigo, cotton, furs, and a small quantity of corn and rice."

Unzaga, a man of advanced years and a Spaniard of the indulgent type, when in 1770 he assumed control, saw the colony's extremity, and began at once the old policy of meeting desirable ends by lamentable expedients. His method was double-acting. He procured, on the one hand, repeated concessions and indulgences from the king, while on the other he overlooked the evasion by the people of such burdens as the government had not lifted. The Creoles on the plantations took advantage of this state of affairs. Under cover of trading with the British posts on the eastern bank of the Mississippi above Orleans Island, the English traders returned and began again to supply the Creole planters with goods and slaves. Business became brisk, for anything offered in exchange was acceptable, revenue laws were mentioned only in jest, profits were large, and credit was free and long. Against the river bank, where now stands the suburb of Gretna, lay moored (when they were not trading up and down the shores of the stream) two large floating warehouses, fitted up with counters and shelves and stocked with assorted merchandise. The merchants, shut out from these contraband benefits, complained

loudly to Unzaga. But they complained in vain. The trade went on, the planters prospered; the merchants gave them crop-advances, and they turned about and, ignoring their debt, broadened their lands and bought additional slaves from the British traders. Hereupon Unzaga moved, and drawing upon his large reserve of absolute power, gently but firmly checked and corrected this imposition.

The governor's quiet rule worked another benefit. While the town was languishing under the infliction of so-called concessions that were so narrowed by provisos as to be almost neutralized, a new oppression showed itself. The newly imported Spanish Capuchins opened such a crusade, not only against their French brethren, but also against certain customs which these had long allowed among the laity, that but for Unzaga's pacific intervention an exodus would have followed which he feared might even have destroyed the colony.

The province could not bear two, and there had already been one. Under O'Reilly so many merchants and mechanics had gone to St. Domingo that just before he left he had ceased to grant passports. Their places were not filled, and in 1773 Unzaga wrote to the Bishop of Cuba that, "There were not in New Orleans and its environs two thousand souls (possibly meaning whites) of all professions and conditions," and that most of these were extremely poor.

But conciliation soon began to take effect. Commissions were eagerly taken in the governor's "regiment of Louisiana," where the pay was large and the sword was the true emblem of power, and the offices of *regidor* and *alcalde* were by and by occupied by the bearers of such ancient Creole names as St. Denis, La Chaise, Fleurieu, Forstall, Duplessis, Bienvenue, Dufossat, and Livaudais.

In 1776, Unzaga was made captain-general of Carácas, and the following year, left in charge of Don Bernardo de Galvez, then about twenty-one years of age, a people still French in feeling, it is true, yet reconciled in a measure to Spanish rule.

## VII.

### THE AMERICAN REVOLUTION ON THE GULF SIDE.

Now, at length, the Creole and the Anglo-American were to come into active relation to each other,—a relation which, from that day to the present, has qualified every public question in Louisiana.

At a happy moment the governorship of

Unzaga, a man advanced in life, of impaired vision and failing health, who was begging to be put on the retired list, gave place to the virile administration of one of the most brilliant characters to be seen in the history of the South-western United States. Galvez was the son of the Viceroy of Mexico and nephew of the Spanish secretary of state, who was also president of the council of the Indies. He was barely grown to manhood, but he was ardent, engaging, brave, fond of achievement and display, and, withal, talented and sagacious.

A change now took place, following the drift of affairs in Europe. The French, instead of the English, merchants, commanded the trade of the Mississippi. The British traders found themselves suddenly treated with great rigor. Eleven of their ships, richly laden, were seized by the new governor, while he exceeded the letter of the Franco-Spanish treaty in bestowing privileges upon the French. New liberties gave fresh value to the trade with French and Spanish-American ports. Slaves were not allowed to be brought thence, owing to their insurrectionary spirit; but their importation direct from Guinea was now specially encouraged, and presently the prohibition against those of the West Indies was removed.

Galvez was, as yet, only governor *ad interim*; yet, by his own proclamation, he gave the colonists the right to trade with France, and, a few days later, included the ports of the thirteen British colonies then waging that war in which the future of the Creoles was so profoundly, though obscurely, involved. New liberties were also given to traders with Spain; the government became the buyer of the tobacco crop, and a French and French-West Indian immigration was encouraged.

But these privileges were darkly overshadowed by the clouds of war. The English issued letters of marque against Spanish commerce, and the French took open part in the American revolution. The young governor was looking to his defenses, building gun-boats, and awaiting from his king the word which would enable him to test his military talents.

Out of these very conditions, so disappointing in one direction, sprang a new trade, of the greatest possible significance in the history of the people. Some eight years before, at the moment when the arrival of two thousand six hundred Spanish troops and the non-appearance of their supply-ships had driven the price of provisions in New Orleans almost to famine rates, a brig entered port, from Baltimore, loaded with flour. The owner of the cargo was one Oliver Pollock. He offered to sell it to O'Reilly on the captain-general's

own terms, and finally disposed of it to him at fifteen dollars a barrel, two-thirds the current price. O'Reilly rewarded his liberality with a grant of free trade to Louisiana for his life-time. Such was the germ of the com-

the oath of allegiance to Spain. The commercial acquaintance made a few years before with the Atlantic ports was now extended to the growing West, and to be cut off from European sources of supply was no longer a

INTERIOR OF AN OLD SPANISH HOUSE.

merce of New Orleans with the great ports of the Atlantic. In 1776, Pollock, with a number of other merchants from New York, Philadelphia, and Boston, who had established themselves in New Orleans, had begun, with the countenance of Galvez, to supply, by fleets of large canoes, arms and ammunition to the American agents at Fort Pitt (Pittsburg). This was repeated in 1777, and, in 1778, Pollock became the avowed agent of the American Government.

Here, then, was a great turning-point. Immigration became Anglo-Saxon, a valuable increase of population taking place by an inflow from the Floridas and the United States, that settled in the town itself and took

calamity, but a lesson of that frugality and self-help in the domestic life which are the secret of public wealth. Between St. Louis and New Orleans, Natchitoches and Natchez (Fort Panmure), there was sufficient diversity of products and industries to complete the circuit of an internal commerce; the Attakapas and Opelousas prairies had been settled by Acadian herdsmen; in 1778, immigrants from the Canary Islands had founded the settlement of Venezuela on La Fourche, Galvez-town on the Amite, and that of Terre aux Bœufs just below New Orleans. A paper currency supplied the sometimes urgent call for a circulating medium, and the colonial treasury warrants, or *liberanzas* were re-

OLD SPANISH HOUSE ON BOURBON STREET.

deemed by receipts of specie from Vera Cruz often enough to keep them afloat at a moderately fair market value.

Were the Creoles satisfied? This question was now to be practically tested. For in the summer of 1779 Spain declared war against Great Britain. Galvez discovered that the British were planning the surprise of New Orleans. Under cover of preparations for defense he made haste to take the offensive. Only four days before the time when he had appointed to move, a hurricane struck the town, demolishing many houses, ruining crops and dwellings up and down the river "coast," and sinking his gun flotilla. Nothing dismayed, the young commander called the people to

their old rallying ground on the Place d'Armes, and with a newly received commission in one hand confirming him as governor, and his drawn sword in the other, demanded of them to answer his challenge: "Should he appear before the cabildo as that commission required, and take the oath of governor? Should he swear to defend Louisiana? Would they stand by him?" The response was enthusiastic. Repairing his disasters as best he could, and hastening his ostensibly defensive preparations, he marched, on the 22d of August, 1779, against the British forts on the Mississippi. His force, besides the four Spanish officers who ranked in turn below him, consisted of one hundred

LUGGERS IN THE MISSISSIPPI.

and seventy regulars, three hundred and thirty recruits, twenty carbineers, sixty militia men, eighty free men-of-color, six hundred men

spectacle of harming no fugitives, and of bearing in their arms to Galvez, uninjured, children who with their mothers had hid themselves in the woods.

In the following February, reënforced from Havana, and commanding the devotion of his Creole militia, Galvez set sail down the Mississippi, with two thousand men,—regulars, Creoles, and free blacks,—and issued from that mouth of the river known as the Balize or Pass à l'Outre, intending to attack Fort Charlotte, on the Mobile River. His fleet narrowly escaped total destruction and his landing on the eastern shore of Mobile River was attended with so much confusion and embarrassment that for a moment he contemplated precipitate retreat in the event of a British advance from Pensacola. But the British for some reason were not prompt, and Galvez pushed forward to Fort Charlotte, erected six batteries, and engaged the fort, which surrendered on the 14th of March, to avoid being stormed. A few days later, the English arrived from Pensacola in numbers sufficient to have raised the siege, but with no choice then but to return whence they had come. Galvez, at that time twenty-four years of age, was rewarded for this achievement with the rank of major-general.

He now conceived the project of taking Pensacola. But this was an enterprise of altogether another magnitude. Failing to secure reënforcements from Havana by writing for them, he sailed to that place in October, 1780, to make his application in person, intending, if successful, to move thence directly upon the enemy. Delays and disappointments could not baffle him, and early in March, 1781, he appeared before Pensacola with a ship of the line, two frigates, and transports containing fourteen hundred soldiers, well furnished with artillery and ammunition. On the 16th and 17th, such troops as could be spared from Mobile, and Don Estevan Miro from New Orleans, with the Louisiana forces, arrived at the western bank of the Perdido River; and on the afternoon of the 18th, though unsupported by the fleet until dishonor was staring its jealous commander in the face, Galvez moved under hot fire, through a passage of great peril, and took up a besieging position.

The investing lines of Galvez and Miro began at once to contract. Early in April, their batteries and those of the fleet opened fire from every side. But the return fire of the English, from a battery erected under their fort, beat off the fleet, and as week after week wore on it began to appear that the siege might be unsuccessful. However, in the early part of May, a shell from the Spaniards

AN OLD LAMP.

from the coast ("of every condition and color"), one hundred and sixty Indians, nine American volunteers, and Oliver Pollock. This little army of 1430 men was without tents or other military furniture, or a single engineer. The gun fleet followed in the river abreast of their line of march, carrying one twenty-four, five eighteen, and four four-pounders. On the 7th of September Fort Bute on Bayou Manchac, with its garrison of twenty men yielded easily to the first assault of the unsupported Creole militia. The fort of Baton Rouge was found to be very strong, armed with thirteen heavy guns, and garrisoned by five hundred men. The troops begged to be led to the assault; but Galvez landed his heavy artillery, erected batteries, and on the 21st of September, after an engagement of ten hours, reduced the fort. Its capitulation included the surrender of Fort Panmure, with its garrison of eighty grenadiers, a place that by its position would have been very difficult of assault. The Spanish gun-boats captured in the Mississippi and Manchac four schooners, a brig, and two cutters. On lake Pontchartrain an American schooner fitted out at New Orleans captured an English privateer. A party of fourteen Creoles surprised an English cutter in the narrow waters of Bayou Manchac, and rushing on board after their first fire, and fastening down the hatches, captured the vessel and her crew of seventy men. The Creole militia won the generous praise of their commander for discipline, fortitude, and ardor; the Acadians showed an impetuous fury; while the Indians presented the remarkable

having exploded a magazine in one of the English redoubts, the troops from Mobile pressed quickly forward and occupied the ruin, and Galvez was preparing to storm the main fort, when the English raised the white flag. Thus, on the 9th of May, 1781, Pensacola, with a garrison of eight hundred men, and the whole of West Florida, was surrendered to Galvez. Louisiana had heretofore been included under one domination with Cuba, but now one of the several rewards bestowed upon her governor was the captain-generalship of Louisiana and West Florida. He, however, sailed from St. Domingo to take part in an expedition against the Bahamas, leaving Colonel Miro to govern *ad interim*, and never resumed the governor's chair in Louisiana. In 1785, the captain-generalship of Cuba was given him in addition, and later in the same year, he laid down these offices to succeed his father, at his death, as Viceroy of Mexico. He ruled in this office with great

credit, as well as pomp, and died suddenly, in his thirty-eighth year, from the fatigues of a hunt.

Such is a brief summary—too brief for full justice—of the achievements of the Creoles under a gallant Spanish soldier in aid of the war for American independence. Undoubtedly the motive of Spain was more conspicuously and exclusively selfish than the aid furnished by the French; yet a greater credit is due than is popularly accorded to the help afforded in the brilliant exploits of Galvez, discouraged at first by a timid cabildo, but supported initially, finally, and in the beginning mainly, by the Creoles of the Mississippi Delta. The fact is equally true, though much overlooked even in New Orleans, that while Andrew Jackson was yet a child the city of the Creoles had a deliverer from British conquest in Bernardo de Galvez, by whom the way was kept open for the United States to stretch to the Gulf and to the Pacific.

## DAKOTA.

AGAINST the cold, clear sky a smoke  
 Curls like some column to its dome.  
 An ax with far, faint, boyish stroke,  
 Rings feebly from a snowy home.  
 "Oh, father, come! The flame burns low.  
 We freeze in this vast field of snow."

But far away, and long, and vain,  
 Two horses plunge with snow to breast.  
 The weary father drops the rein,—  
 He rests in the eternal rest;  
 And high against the blue profound  
 A dark bird circles round and round.

*Joaquin Miller.*

## SONGS.

### THE MUSIC OF NATURE.

THE songs of Nature never cease,  
Her players sue not for release.  
In nearer fields, on hills afar,  
Attendant her musicians are ;  
For aye, from brook or hedge or tree,  
Is borne some gentle melody.  
The dearer voices never die,—  
A song to soothe is ever nigh :  
The very air is music blent,  
An universal instrument.  
With myriad harmonies alive,  
The loves of Nature aye survive ;  
Beneath the voice of brook or bird,  
There is another nigh unheard.  
Does sound a moment drop the strain,  
Then silence takes it up again,  
Still sweeter,—as a memory  
Is sweeter than the things that be.  
Pleased Nature's heart is always young,  
Her golden harp is ever strung ;  
Singing and playing, day to day,  
She passes happy on her way.

### SONG OF THE SLEEPERS.

THE mold is our mother ;  
She trusteth no other.  
Sweet life must lay down  
Her robe and her crown ;  
There's naught that can keep  
The fairest from sleep ;  
His labors shall close,  
And the toiler repose.

The mold is our mother ;  
We have no other.  
All lips shall be sealed,  
And the old hurts healed ;  
On the mother's breast  
Shall her children rest.

As the day is bright,  
So dark is the night,—  
A glowing, a gloom ;  
The cradle, the tomb ;  
'Tis to come and go  
Like the summer, the snow ;  
Remembered, forgot,  
We are—and are not.

The mold is our mother,  
More kind than another :  
With the gift of years  
For smiling and tears,  
Is a better, she saith,—  
The blessing of death.

Set the font by the urn ;  
For the given return.  
No joy or sorrow  
Is sure of the morrow ;  
The fairest we know,  
Hath her bed below,  
And the daughter of care  
Findeth quiet there.

We may laugh or may weep,  
We have waked and must sleep ;  
The young and the old,  
In the mother-mold,  
The blamed and the blest  
On the mother-breast.

### RAIN-DROPS.

FIRST drops of rain  
Against my window-pane,  
I hasten, little hearts of air,  
To meet you, beating, beating there.  
Look not so timid through,—  
The world's at home to you.  
The leaves in languor close,  
And waiting is the rose.  
Rose and lily-cup,—  
Fill each chalice up.  
Soft the passions of the sky  
In the breasts of blossoms lie.

### "I NEED NOT HEAR."

I NEED not hear each night-wind loud  
Go moaning down the wold,  
I need not lift each bleachen shroud  
From bodies white and cold.

Call not, O naked, wailing Fall,  
O man's unhappy race !  
One drifting leaflet tells me all,  
'Tis all in one pale face.

*John Vance Cheney.*

## THE SPECTRAL MORTGAGE.

TOWARD the close of a beautiful afternoon in early summer I stood on the piazza of the spacious country-house which was my home. I had just dined, and I gazed, with a peculiar comfort and delight, upon the wide-spreading lawn and the orchards and groves beyond; and then, walking to the other end of the piazza, I looked out toward the broad pastures, from which a fine drove of cattle were leisurely coming home to be milked, and toward the fields of grain, whose green was beginning already to be touched with yellow. Involuntarily (for, on principle, I was opposed to such feelings) a pleasant sense of possession came over me. It could not be long before all this would virtually be mine.

About two years before, I had married the niece of John Hinckman, the owner of this fine estate. He was very old, and could not be expected to survive much longer, and had willed the property, without reserve, to my wife. This, in brief, was the cause of my present sense of prospective possession, and although, as I said, I was principled against the voluntary encouragement of such a sentiment, I could not blame myself if the feeling occasionally arose within me. I had not married my wife for her uncle's money. Indeed, we had both expected that the marriage would result in her being entirely disinherited. His niece was John Hinckman's housekeeper and sole prop and comfort, and if she left him for me she expected no kindness at his hands. But she had not left him. To our surprise, her uncle invited us to live with him, and our relations with him became more and more amicable and pleasant, and Mr. Hinckman had, of late, frequently expressed to me his great satisfaction that I had proved to be a man after his own heart; that I took an interest in flocks and herds and crops; that I showed a talent for such pursuits, and that I would continue to give, when he was gone, the same care and attention to the place which it had been so long his greatest pleasure to bestow. He was old and ill now, and tired of it all, and the fact that I had not proved to be, as he had formerly supposed me, a mere city gentleman, was a great comfort to his declining days. We were deeply grieved to think that the old man must soon die. We would gladly have kept him with us for years; but, if he must go, it was pleasant to know that he and ourselves were so well

satisfied with the arrangements that had been made. Think me not cold and heartless, high-minded reader. For a few moments put yourself in my place.

But had you, at that time, put yourself in my place on that pleasant piazza, I do not believe you would have cared to stay there long; for, as I stood gazing over the fields, I felt a touch upon my shoulder. I cannot say that I was actually touched, but I experienced a feeling which indicated that the individual who had apparently touched me would have done so had he been able. I instantly turned, and saw, standing beside me, a tall figure in the uniform of a Russian officer. I started back but made no sound. I knew what the figure was. It was a specter—a veritable ghost.

Some years before this place had been haunted. I knew this well, for I had seen the ghost myself. But before my marriage the specter had disappeared, and had not been seen since; and I must admit that my satisfaction, when thinking of this estate, without mortgage or incumbrance, was much increased by the thought that even the ghost, who used to haunt the house, had now departed.

But here he was again. Although in different form and guise, I knew him. It was the same ghost.

"Do you remember me?" said the figure.

"Yes," I answered, "I remember you in the form in which you appeared to me some time ago. Although your aspect is entirely changed, I feel you to be the same ghost that I have met before."

"You are right," said the specter. "I am glad to see you looking so well, and apparently happy. But John Hinckman, I understand, is in a very low state of health."

"Yes," I said, "he is very old and ill. But I hope," I continued, as a cloud of anxiety began to rise within me, "that his expected decease has no connection with any prospects or plans of your own."

"No," said the ghost. "I am perfectly satisfied with my present position. I am off duty during the day, and the difference in time between this country and Russia gives me opportunities of being here in your early evening, and of visiting scenes and localities which are very familiar and agreeable to me."

"Which fact, perhaps, you had counted upon when you first put this uniform on," I remarked.

The ghost smiled.

"I must admit, however," he said, "that I am seeking this position for a friend of mine, and I have reason to believe that he will obtain it."

"Good heavens!" I exclaimed. "Is it possible that this house is to be haunted by a ghost as soon as the old gentleman expires? Why should this family be tormented in such a horrible way? Everybody who dies does not have a ghost walking about his house."

"Oh, no," said the specter. "There are thousands of positions of the kind which are never applied for; but the ghostship here is a very desirable one, and there are many applicants for it. I think you will like my friend, if he gets it."

"Like him!" I groaned.

The idea was horrible to me.

The ghost evidently perceived how deeply I was affected by what he had said, for there was a compassionate expression on his countenance. As I looked at him an idea struck me. If I were to have any ghost at all about the house, I would prefer this one. Could there be such things as duplex ghostships? Since it was day here when it was night in Russia, why could not this specter serve in both places? It was common enough for a person to fill two situations. The notion seemed feasible to me, and I broached it.

"Thank you," said the ghost. "But the matter cannot be arranged in that way. Night and day are not suitably divided between here and Russia; and, besides, it is necessary for the incumbent of this place to be on duty at all hours. You remember that I came to you by day as well as at night?"

Oh, yes; I remembered that. It was additionally unfortunate that the ghostship here should not be one of the limited kind.

"Why is it," I asked, "that a man's own spirit does not attend to these matters? I always thought that was the way the thing was managed."

The ghost shook his head.

"Consider for a moment," he replied, "what chance a man's own spirit, without experience and without influence, would have in a crowd of importunate applicants, versed in all the arts, and backed by the influence necessary in such a contest. Of course there are cases in which a person becomes his own ghost, but this is because the position is undesirable, and there is no competition."

"And this new-comer," I exclaimed, in much trouble, "will he take the form of Mr. Hinckman? If my wife should see such an apparition it would kill her."

"The ghost who will haunt this place," said my companion, "will not appear in the form of John Hinckman. I am glad that is so,

if it will please you; for you are the only man with whom I have ever held such unrestrained and pleasant intercourse. Good-bye."

And with these words no figure of a Russian officer stood before me.

For some minutes I remained motionless, with downcast eyes, a very different man from the one who had just gazed out with such delight over the beautiful landscape. A shadow, not that of night, had fallen over everything. This fine estate was not to come to us clear and unencumbered, as we thought. It was to be saddled with a horrible lien, a spectral mortgage.

Madeline had gone upstairs with Pegram. Pegram was our baby. I disliked his appellation with all my heart, but Pegram was a family name on Madeline's side of the house, and she insisted that our babe should bear it. Madeline was very much wrapped up in Pegram, often I thought too much so, for there were many times when I should have been very glad of my wife's society, but was obliged to do without it because she was entirely occupied with Pegram. To be sure, my wife's sister was with us, and there was a child's nurse; but, for all that, Madeline was so completely Pegramized, that a great many of the hours which I, in my anticipations of matrimonial felicity, had imagined would be passed in the company of my wife, were spent alone, or with the old gentleman, or Belle.

Belle was a fine girl; to me not so charming and attractive as her sister, but perhaps equally so to some other persons, certainly to one. This was Will Crenshaw, an old school-fellow of mine, then a civil engineer, in South America. Will was the declared suitor of Belle, although she had never formally accepted him, but Madeline and myself both strongly favored the match, and felt very anxious that she should do so, and indeed were quite certain that when Will should return everything would be made all right. The young engineer was a capital fellow, had excellent prospects, and was my best friend. It was our plan that after their marriage the youthful couple should live with us. This, of course, would be delightful to both Belle and her sister, and I could desire no better companion than Will. He was not to go to distant countries any more, and who could imagine a pleasanter home than ours would be.

And now here was this dreadful prospect of a household ghost!

A week or so passed by, and John Hinckman was no more. Everything was done for him that respect and affection could dictate, and no one mourned his death more heartily than I. If I could have had my way he would have lived as long as I, myself, remained upon this earth.

When everything about the house had settled down into its accustomed quiet, I began to look out for the coming of the expected ghost. I felt sure that I would be the one to whom he would make his appearance, and with my regret and annoyance at his expected coming was mingled a feeling of curiosity to know in what form he would appear. He was not to come as John Hinckman—that was the only bit of comfort in the whole affair.

But several weeks passed, and I saw no ghost, and I began to think that perhaps the aversion I had shown to having such an inmate of my household had had its effect, and I was to be spared the infliction. And now another subject occupied my thoughts. It was summer, the afternoons were pleasant, and on one of them I asked Belle to take a walk with me. I would have preferred Madeline, but she had excused herself as she was very busy making what I presumed to be an altar cloth for Pegram. It turned out to be an afghan for his baby carriage, but the effect was the same: she could not go. When I could not have Madeline I liked very well to walk with Belle. She was a pleasant girl, and in these walks I always talked to her of Crenshaw. My desire that she should marry my friend grew stronger daily. But this afternoon Belle hesitated, and looked a little confused.

"I am not sure that I shall walk to-day."

"But you have your hat on," I urged, "I supposed you had made ready for a walk."

"No," said she, "I thought I would go somewhere with my book."

"You haven't a book," I said, looking at her hands, one of which held a parasol.

"You are dreadfully exact," she replied, with a little laugh, "I am going into the library to get one." And away she ran.

There was something about this I did not like. I firmly believed she had come downstairs prepared to take a walk. But she did not want me; that was evident enough. I went off for a long walk, and when I returned supper was ready, but Belle had not appeared.

"She has gone off somewhere with a book," I said. "I'll go and look for her."

I walked down to the bosky grove at the foot of the lawn, and passed through it without seeing any signs of Belle. Soon, however, I caught sight of her light dress in an open space a little distance beyond me. Stepping forward a few paces I had a full view of her, and my astonishment can be imagined when I saw that she was standing in the shade of a tree talking to a young man. His back was turned toward me, but I could see from his figure and general air that he was young. His hat was a little on one side, in his hand he carried a short whip,

and he wore a pair of riding boots. He and Belle were engaged in very earnest conversation, and did not perceive me. I was not only surprised but shocked at the sight. I was quite certain Belle had come here to meet this young man, who, to me, was a total stranger. I did not wish Belle to know that I had seen her with him, and so I stepped back out of their sight, and began to call her. It was not long before I saw her coming toward me, and, as I expected, alone.

"Indeed," she cried, looking at her watch, "I did not know it was so late."

"Have you had a pleasant time with your book?" I asked, as we walked homeward.

"I wasn't reading all the time," she answered.

I asked her no more questions. It was not for me to begin an inquisition into this matter. But that night I told Madeline all about it. The news troubled her much, and like myself she was greatly grieved at Belle's evident desire to deceive us. When there was a necessity for it my wife could completely de-Pegramize herself, and enter with quick and judicious action into the affairs of others.

"I will go with her to-morrow," she said. "If this person comes, I do not intend that she shall meet him alone."

The next afternoon Belle started out again with her book, but she had gone but a few steps when she was joined by Madeline, with hat and parasol, and together they walked into the bosky grove. They returned in very good time for supper, and as we went in to that meal, Madeline whispered to me:

"There was nobody there."

"And did she say nothing to you of the young man with whom she was talking yesterday?" I asked, when we were alone some hours later.

"Not a word," she said, "though I gave her every opportunity. I wonder if you could have been mistaken."

"I am sure I was not," I replied. "I saw the man as plainly as I see you."

"Then Belle is treating us very badly," she said. "If she desires the company of young men let her say so, and we will invite them to the house."

I did not altogether agree with this latter remark. I did not care to have Belle know young men. I wanted her to marry Will Crenshaw, and be done with it. But we both agreed not to speak to the young lady on the subject. It was not for us to pry into her secrets, and if anything was to be said she should say it.

Every afternoon Belle went away, as before, with her book, but we did not accompany her, nor allude to her newly acquired love for solitary walks and studies. One

afternoon we had callers, and she could not go. That night, after I had gone to sleep, Madeline awoke me with a little shake.

"Listen," she whispered. "Whom is Belle talking to?"

The night was warm, and all our doors and windows were open. Belle's chamber was not far from ours, and we could distinctly hear her speaking in a low tone. She was evidently holding a conversation with some one whose voice we could not hear.

"I'll go in," said Madeline, rising, "and see about this."

"No, no," I whispered. "She is talking to some one outside. Let me go down and speak to him."

I slipped on some clothes and stole quietly down the stairs. I unfastened the back door and went round to the side on which Belle's window opened. No sooner had I reached the corner than I saw, directly under the window, and looking upward, his hat cocked a good deal on one side, and his riding whip in his hand, the jaunty young fellow with whom I had seen Belle talking.

"Hello!" I cried, and rushed toward him. At the sound of my voice he turned to me, and I saw his face distinctly. He was young and handsome. There was a sort of half laugh on his countenance, as if he had just been saying something very witty. But he did not wait to finish his remark or to speak to me. There was a large evergreen near him, and, stepping quickly behind it, he was lost to my view. I ran around the bush, but could see nothing of him. There was a good deal of shrubbery hereabouts, and he was easily able to get away unobserved. I continued the search for about ten minutes, and then, quite sure that the fellow had got away, I returned to the house. Madeline had lighted a lamp, and was calling down-stairs to ask if I had found the man; some of the servants were up, and anxious to know what had happened; Pegram was crying; but in Belle's room all was quiet. Madeline looked in at the open door, and saw her lying quietly in her bed. No word was spoken, and my wife returned to our room, where we discussed the affair for a long time.

In the morning I determined to give Belle a chance to speak, and at the breakfast-table I said to her:

"I suppose you heard the disturbance last night?"

"Yes," she said quietly. "Did you catch the man?"

"No," I answered, with considerable irritation, "but I wish I had."

"What would you have done if you had caught him?" she asked, as with unusual

slowness and deliberation she poured some cream upon her oat-meal.

"Done!" I exclaimed, "I don't know what I would have done. But one thing is certain, I would have made him understand that I would have no strangers prowling around my house at night."

Belle colored a little at the last part of this remark, but she made no answer, and the subject was dropped.

This conversation greatly pained both Madeline and myself. It made it quite clear to us that Belle was aware that we knew of her acquaintance with this young man, and that she still determined to say nothing to us either in the way of confidence or excuse. She had treated us badly, and we could not help showing it. On her side Belle was very quiet, and entirely different from the gay girl she had been some time before.

I urged Madeline to go to Belle and speak to her as a sister, but she declined. "No," she said, "I know Belle's spirit, and there would be trouble. If there is to be a quarrel I shall not begin it."

I was determined to end this unpleasant feeling, which, to me, was almost as bad as a quarrel. If the thing were possible I would put an end to the young man's visits. I could never have the same opinion of Belle I had had before, but if this impudent fellow could be kept away, and Will Crenshaw should come back and attend to his business as an earnest suitor ought, all might yet be well.

And now, strange to say, I began to long for the ghost, whose coming had been promised. I had been considering what means I should take to keep Belle's clandestine visitor away, and had found the question rather a difficult one to settle. I could not shoot the man, and it would indeed be difficult to prevent the meeting of two young persons over whom I had no actual control. But I happened to think that if I could get the aid of the expected ghost the matter would be easy. If it should be as accommodating and obliging as the one who had haunted the house before, it would readily agree to forward the fortunes of the family by assisting in breaking up this unfortunate connection. If it would consent to be present at their interviews the affair was settled. I knew from personal experience that love-making in the presence of a ghost was extremely unpleasant, and in this case I believed it would be impossible.

Every night, after the rest of the household had gone to bed, I wandered about the grounds, examining the porches and the balconies, looking up to the chimneys and the ornaments on top of the house, hoping to see that phantom, whose coming I had, a short

time before, anticipated with such dissatisfaction and repugnance. If I could even again meet the one who was now serving in Russia, I thought it would answer my purpose as well.

On the third or fourth night after I had begun my nocturnal rounds, I encountered, on a path not very far from the house, the young fellow who had given us so much trouble. My indignation at his impudent reappearance knew no bounds. The moon was somewhat obscured by fleecy clouds, but I could see that he wore the same jaunty air, his hat was cocked a little more on one side, he stood with his feet quite wide apart, and in his hands, clasped behind him, he held his riding whip. I stepped quickly toward him.

"Well, sir!" I exclaimed.

He did not seem at all startled.

"How d'ye do?" he said, with a little nod.

"How dare you, sir," I cried, "intrude yourself on my premises? This is the second time I have found you here, and now I want you to understand that you are to get away from here just as fast as you can; and if you are ever caught again anywhere on this estate, I'll have you treated as a trespasser."

"Indeed," said he, "I would be sorry to put you to so much trouble. And now let me say that I have tried to keep out of your way, but since you have proved so determined to make my acquaintance I thought I might as well come forward and do the sociable."

"None of your impertinence," I cried. "What brings you here, anyway?"

"Well," said he, with a little laugh, "if you want to know I don't mind telling you I came to see Miss Belle."

"You confounded rascal!" I cried, raising my heavy stick. "Get out of my sight, or I will break your head!"

"All right," said he, "break away!"

And drawing himself up he gave his right boot a slap with his whip.

The whip went entirely through both legs! It was the ghost!

Utterly astounded I started back, and sat down upon a raised flower-bed, against which I had stumbled. I had no strength, nor power to speak. I had seen a ghost before, but I was entirely overcome by this amazing development.

"And now I suppose you know who I am," said the specter, approaching, and standing in front of me. "The one who was here before told me that your lady didn't fancy ghosts, and that I had better keep out of sight of both of you; but he didn't say anything about Miss Belle; and by George! sir, it wouldn't have mattered if he had; for if it hadn't been for that charming young lady I shouldn't have been here at all. I am the ghost of Buck Edwards, who was pretty well known

in the lower part of this county about seventy years ago. I always had a great eye for the ladies, sir, and when I got a chance to court one I didn't miss it. I did too much courting, however, for I roused up a jealous fellow, named Ruggles, and he shot me in a duel early one September morning. Since then I have haunted, from time to time, more than a dozen houses where there were pretty girls."

"Do you mean to say," I asked, now finding strength, "that a spirit would care to come back to this earth to court a girl?"

"Why, what are you thinking of?" exclaimed the phantom of Buck Edwards. "Do you suppose that only old misers and love-lorn maidens want to come back and have a good time? No, sir! Every one of us, who is worth anything, comes if he can get a chance. By George, sir! do you know I courted Miss Belle's grandmother? And a couple of gay young ones we were too! Nobody ever knew anything of it, and that made it all the livelier."

"Do you intend to stay here and pay attention to my sister-in-law?" I asked, anxiously.

"Certainly I do," was the reply. "Didn't I say that is what I came for?"

"Don't you see the mischief you will do?" I asked. "You will probably break off a match between her and a most excellent gentleman whom we all desire——"

"Break off a match!" exclaimed the ghost of Buck Edwards, with a satisfied grin. "How many matches I have broken off! The last thing I ever did, before I went away, was of that sort. She wouldn't marry the gentleman who shot me." There was evidently no conscience to this specter.

"And if you do not care for that," I said, in considerable anger, "I can tell you that you are causing ill-feeling between the young lady and the best friends she has in the world, which may end very disastrously."

"Now, look here, my man," said the ghost; "if you and your wife are really her friends you won't act like fools and make trouble."

I made no answer to this remark, but asserted, with much warmth, that I intended to tell Miss Belle exactly what he was, and so break off the engagement at once.

"If you tell her that she's been walking and talking with the ghost of the fellow who courted her grandmother,—I reckon she could find some of my letters now among the old lady's papers, if she looked for them,—you'd frighten the wits out of her. She'd go crazy. I know girls' natures, sir."

So do I, I groaned.

"Don't get excited," he said. "Let the girl alone, and everything will be comfortable and pleasant. Good-night."

I went to bed, but not to sleep. Here was

a terrible situation. A sister-in-law courted by a ghost! Was ever a man called upon to sustain such a trial! And I must sustain it alone. There was no one with whom I could share the secret.

Several times after this I saw this baleful specter of a young buck of the olden time. He would nod to me with a jocular air, but I did not care to speak to him. One afternoon I went into the house to look for my wife, and, very naturally, I entered the room where Pegram lay in his little bed. The child was asleep, and no one was with him. I stood and gazed contemplatively upon my son. He was a handsome child, and apparently full of noble instincts, and yet I could not help wishing that he were older, or that in some way his conditions were such that it should not be necessary, figuratively speaking, that his mother should continually hover about him. If she could be content with a little less of Pegram and a little more of me, my anticipations of a matrimonial career would be more fully realized.

As these thoughts were passing through my mind I raised my eyes, and on the other side of the little bedstead I saw the wretched ghost of Buck Edwards.

"Fine boy," he said.

My indignation at seeing this impudent existence within the most sacred precincts of my house was boundless.

"You vile interloper!" I cried.

At this moment Madeline entered the room. Pale and stern, she walked directly to the crib and took up the child. Then she turned to me and said:

"I was standing in the door-way, and saw you looking at my babe. I heard what you said to him. I have suspected it before." And then, with Pegram in her arms, she strode out of the room.

The ghost had vanished, as Madeline entered. Filled with rage and bitterness, for my wife had never spoken to me in these tones before, I ran down-stairs and rushed out of the house. I walked long and far, my mind filled with doleful thoughts. When I returned to the house, I found a note from my wife. It ran thus:

"I have gone to Aunt Hannah's with Pegram, and have taken Belle. I cannot live with one who considers my child a vile interloper."

As I sat down in my misery, there was one little spark of comfort amid the gloom. She had taken Belle. My first impulse was to follow into the city and explain everything, but I quickly reflected that if I did this I must tell her of the ghost, and I felt certain that she would never return with Pegram to a haunted house. Must I, in order to regain my wife, give

up this beautiful home? For two days I racked my brains and wandered gloomily about.

In one of my dreary rambles I encountered the ghost. "What are you doing here?" I cried. "Miss Belle has gone."

"I know that," the specter answered, his air expressing all his usual impertinence and swagger, "but she'll come back. When your wife returns, she's bound to bring young Miss."

At this, a thought flashed through my mind. If any good would come of it, Belle should never return. Whatever else happened, this insolent ghost of a gay young buck should have no excuse for haunting my house.

"She will never come back while you are here," I cried.

"I don't believe it," it coolly answered.

I made no further assertions on the subject. I had determined what to do, and it was of no use to be angry with a vamping creature like this. But I might as well get some information out of him.

"Tell me this," I asked; "if, for any reason, you should leave this place and throw up your situation, so to speak, would you have a successor?"

"You needn't think I am going," it said contemptuously. "None of your little tricks on me. But I'll just tell you, for your satisfaction, that if I should take it into my head to cut the place, there would be another ghost here in no time."

"What is it," I cried, stamping my foot, "that causes this house to be so haunted by ghosts, when there are hundreds and thousands of places where such apparitions are never seen?"

"Old fellow," said the specter folding its arms, and looking at me with half-shut eyes, "it isn't the house that draws the ghosts, it is somebody in it; and as long as you are here the place will be haunted. But you needn't mind that. Some houses have rats, some have fever-and-ague, and some have ghosts. *Au revoir.*" And I was alone.

So then the spectral mortgage could never be lifted. With heavy heart and feet I passed through the bosky grove to my once happy home.

I had not been there half an hour when Belle arrived. She had come by the morning train, and had nothing with her but a little hand-bag. I looked at her in astonishment.

"Infatuated girl," I cried, "could you not stay away from here three days?"

"I am glad you said that," she answered, taking a seat, "for now I think I am right in suspecting what was on your mind. I ran away from Madeline to see if I could find out what was at the bottom of this dreadful trouble between you. She told me what you

said, and I don't believe you ever used those words to Pegram. And now I want to ask you one question. Had I, in any way, anything to do with this?"

"No," said I, "not directly." And then emboldened by circumstances, I added: "But that secret visitor or friend of yours had much to do with it."

"I thought that might be so," she answered, "and now, George, I want to tell you something, I am afraid it will shock you very much."

"I have had so much to shock me lately that I can stand almost anything now."

"Well then, it is this," she said. "That person whom I saw sometimes, and whom you once found under my window, is a ghost."

"Did you know that?" I cried. "I knew it was a ghost, but did not imagine that you had any suspicion of it."

"Why, yes," she answered, "I saw through him almost from the very first. I was a good deal startled, and a little frightened when I found it out, but I soon felt that this ghost couldn't do me any harm, and you don't know how amusing it was. I always had a fancy for ghosts, but I never expected to meet with one like this."

"And so you knew all the time it wasn't a real man," I exclaimed, still filled with astonishment at what I had heard.

"A real man!" cried Belle, with considerable contempt in her tones. "Do you suppose I would become acquainted in that way with a real man, and let him come under my window and talk to me? I was determined not to tell any of you about it, for I knew you wouldn't approve of it, and would break up the fun some way. Now I wish most heartily that I had spoken of it."

"Yes," I answered, "it might have saved much trouble."

"But, oh! George," she continued, "you've no idea how funny it was! Such a ridiculous, self-conceited, old-fashioned ghost of a beau!"

"Yes," said I, "when it was alive it courted your grandmother."

"The impudence!" exclaimed Belle. "And to think that it supposed that I imagined it to be a real man! Why, one day, when it was talking to me it stepped back into a rose bush and it stood there ever so long, all mixed up with the roses and leaves."

"And you knew it all the time?"

These words were spoken in a hollow voice by some one near us. Turning quickly, we saw the ghost of Buck Edwards; but no longer the jaunty specter we had seen before. His hat was on the back of his head, his knees were turned inward, his shoulders

drooped, his head hung, and his arms dangled limp at his sides.

"Yes," said Belle, "I knew it all the time."

The ghost looked at her with a faded, misty eye; and then, instead of vanishing briskly as was his wont, he began slowly and irresolutely to disappear. First his body faded from view, then his head, leaving his hat and boots. These gradually vanished, and the last thing we saw of the once Buck Edwards was a dissolving view of the tip-end of a limp and drooping riding whip.

"He is gone," said Belle. "We'll never see him again."

"Yes," said I, "he is gone. I think your discovery of his real nature has completely broken up that proud spirit. And now, what is to be done about Madeline?"

"Wasn't it the ghost you called an interloper?" asked Belle.

"Certainly it was," I replied.

"Well, then, go and tell her so," said Belle.

"About the ghost and all!" I exclaimed.

"Certainly," said she.

And together we went to Madeline, and I told her all. I found her with her anger gone, and steeped in misery. When I had finished, all Pegramed as she was, she plunged into my arms. I pressed my wife and child closely to my bosom, and we wept with joy.

When Will Crenshaw came home and was told this story, he said it didn't trouble him a bit.

"I'm not afraid of a rival like that," he remarked. "Such a suitor wouldn't stand a ghost of a chance."

"But I can tell you," said Madeline, "that you had better be up and doing on your own account. A girl like Belle needn't be expected to depend on the chance of a ghost."

Crenshaw heeded her words, and the young couple were married in the fall. The wedding took place in the little church near our house. It was a quiet marriage, and was attended by a strictly family party. At the conclusion of the ceremonies I felt, or saw, for I am sure I did not hear—a little sigh quite near me.

I turned, and sitting on the chancel-steps I saw the specter of Buck Edwards. His head was bowed, and his hands, holding his hat and riding-whip, rested carelessly on his knees.

"Bedad, sir!" he exclaimed, "to think of it! If I hadn't cut up as I did I might have married, and have been that girl's grandfather!"

The idea made me smile.

"It can't be remedied now," I answered.

"Such a remark to make at a wedding!" said Madeline, giving me a punch with her reproachful elbow.

Author of "That Lass o' Lowrie's," "Haworth's," "Louisiana," "A Fair Barbarian," etc., etc.

### CHAPTER XXVII.

MRS. MERRIAM saw faint traces of tears in Mrs. Sylvestre's eyes when she returned from her call on the Bosworths, and speculated, with some wonder, as to what her exact mental condition was, but asked very few questions, feeling that, upon the whole, she would prefer to hear the version of the story given to Mr. Arbuthnot when he called. He did so the following evening, and, having seen the Bosworths in the interval, had comments of his own to make.

"It was very good in you to call so soon," he said to Agnes.

"I wished very much to call," she replied. "I could not have waited longer."

"You left a transcendent impression," said Arbuthnot. "Tom was very enthusiastic, and Kitty feels that all their troubles are things of the past."

"They talked to me a great deal of you," said Agnes. "I felt after hearing them that I had not known you very well—and wished that I had known you better."

She said it with a sweet gravity which he found strangely disturbing; but his reply did not commit him to any special feeling.

"They will prove fatal to me, I see," he said. "Don't allow them to prejudice you against me in that manner."

"I wish," she said, "that my friends might be prejudiced against me in the same way."

Then he revealed a touch of earnestness in spite of himself. They had both been standing upon the hearth, and he took a step toward her.

"For pity's sake," he said, "don't overrate me! Women are always too generous. Don't you see you will find me out, and then it will be worse for me than before."

She stood in one of her perfect, motionless attitudes, and looked down at the rug.

"I wish to find you out," she said, slowly. "I have done you injustice."

And then she turned away and walked across the room to a table where there were some books, and when she returned she brought one of them with her and began to speak of it. He always felt afterward that the memory

of this "injustice," as she called it, was constantly before her, and he would have been more than human if he had not frequently wondered what it was. He could not help feeling that it had taken a definite form, and that she had been betrayed into it on the evening he had first spoken to her of the Bosworths, and that somehow his story had saved him in her eyes. But he naturally forbore to ask questions or even touch upon the subject, and thanked the gods for the good which befell him as a result of the evil he had escaped. And yet, as the time passed by, and he went oftener to the house and found keener pleasure in each visit, he had his seasons of fearing that it was not all going to be gain for him; when he faced the truth, indeed, he knew that it was not all gain, and yet he was not stoic enough to turn his back and fly.

"It will cost!" he said to himself. "It will cost! But——"

And then he would set his lips together and be silent for an hour or so, and those of his acquaintance who demanded constant vivacity from him began to wonder among themselves if he was quite the fellow he had been. If the friendship was pleasant during the season, it was pleasanter when the gayeties ceased and the spring set in, with warmer air and sunshine, and leaves and blossoms in the parks. There was a softness in the atmosphere not conducive to sternness of purpose and self-denial. As he walked to and from his office, he found his thoughts wandering in paths he felt were dangerous, and once unexpectedly meeting Mrs. Sylvestre, when so indulging himself, he started and gained such sudden color that she flushed also, and, having stopped to speak to him, forgot what she had intended to say, and was a little angry, both with herself and him, when a confusing pause followed their greeting.

Their interest in the Bosworths was a tie between them which gave them much in common. Agnes went to see them often, and took charge of Kitty, watching over and caring for her in a tender, half-maternal fashion. Arbuthnot took private pleasure in contemplating. He liked to hear Kitty talk about

her, and, indeed, had on more than one occasion led her with some dexterity into doing so. It was through Kitty, at last, that his mystery was solved for him.

This happened in the spring. There had been several warm days, one so unusually warm, at last, that in the evening Mrs. Sylvestre accepted his invitation to spend an hour or so on the river with him. On their way there they stopped to leave a basket of fruit for Tom, whose condition was far from being what they had hoped for, and while making their call Kitty made a remark which caused Arbuthnot's pulse to accelerate its pace somewhat.

"When you saw me crying on the street that night ——" she began, addressing Agnes. Arbuthnot turned upon her quickly.

"What night?" he asked.

"The night you took me into Lafayette Square," said Kitty; "Mrs. Sylvestre saw me, though I did not know it until yesterday. She was going to call on Mrs. Amory, and ——"

Arbuthnot looked at Agnes; he could not have forbore, whatever the look had cost him. The color came into her cheek and died out.

"Did you?" he demanded.

"Yes," she answered, and rose and walked to the window, and stood there perfectly still.

Arbuthnot did not hear the remainder of Kitty's remarks. He replied to them blindly, and as soon as possible left his chair and went to the window himself.

"If you are ready, perhaps we had better go," he said.

They went out of the room and down the stairs in silence. He wanted to give himself time to collect his thoughts, and get the upper hand of a frantic feeling of passionate anger which had taken possession of him. If he had spoken he might have said something savage, which he would have repented afterward in sackcloth and ashes. His sense of the injustice he had suffered, however momentary, at the hands of this woman whose opinion he cared for, was natural, masculine, and fierce. He saw everything in a flash, and for a moment or so forgot all else in his bitterness of spirit. But his usual coolness came to the rescue when this moment was past, and he began to treat himself scornfully as was his custom. There was no reason why she should not think ill of him, circumstances evidently having been against him, he said to himself; she knew nothing specially good of him; she had all grounds for regarding him as a creature with neither soul nor purpose nor particularly fixed principles, and with no other object in life than the gratification of his

fancies; why should she believe in him against a rather black array in the form of facts. It was not agreeable, but why blame her? He would not blame her or indulge in any such personal folly. Then he glanced at her and saw that the color had not come back to her face. When he roused himself to utter a civil commonplace remark or so, there was the sound of fatigue in her voice when she answered him, and it was very low. She did not seem inclined to talk, and he had the consideration to leave her to herself as much as possible until they reached the boat-house. He arranged her cushions and wraps in the boat with care and dexterity, and, when he took the oars, felt that he had himself pretty well in hand. The river was very quiet, and the last glow of sunset red was slowly changing to twilight purple on the water; a sickle-shaped moon hung in the sky, and somewhere farther up the shore a night bird was uttering brief, plaintive cries. Agnes sat at the end of the boat, with her face a little turned away, as if she were listening to the sound. Arbuthnot wondered if she was, and thought again that she looked tired and a little pathetic. If he had known all her thoughts he would have felt the pathos in her eyes a thousand times more keenly.

She had a white hyacinth in her hand, whose odor seemed to reach him more powerfully at each stroke of the oars, and at last she turned and spoke, looking down at the flower.

"The saddest things that are left to one of a bitter experience," she said, in a low voice, "are the knowledge and distrust that come of it."

"They are very natural results," he replied, briefly.

"Oh, they are very hard!" she exclaimed. "They are very hard! They leave a stain on all one's life, and—and it can never be wiped away. Sometimes I think it is impossible to be generous—to be kind—to trust at all——"

Her voice broke; she put her hands up before her face, and he saw her tremble.

"One may have been innocent," she said, "and have believed—and thought no evil—but after one has been so stained——"

He stopped rowing.

"There is no stain," he said. "Don't call it one."

"It must be one," she said, "when one sees evil—and is suspicious and on the alert to discover wrong. But it brings suffering, as if it were a punishment. I have suffered."

He paused a second and answered, looking backward over his shoulder.

"So did I—for a moment," he said. "But it is over now. Don't think of me."

"I must think of you," she said. "How could I help it?"

She turned a little more toward him and leaned forward, the most exquisite appeal in her delicate face, the most exquisite pathos in her unsteady voice.

"If I ask you to forgive me," she said, "you will only say that I was forgiven before I asked. I know that. I wish I could say something else. I wish—I wish I knew what to do."

He looked up the river and down, and then suddenly at her. The set, miserable expression of his face startled her and caused her to make an involuntary movement.

"Don't do anything—don't say anything!" he said. "I can bear it better."

And he bent himself to his oars and rowed furiously.

She drew back and turned her face aside. Abrupt as the words were, there was no rebuff in them; but there was something else which silenced her effectually. She was glad of the faint light, and her heart quickened, which last demonstration did not please her. She had been calm too long to enjoy any new feeling of excitement; she had liked the calmness, and had desired beyond all things that it should remain undisturbed.

"There is one prayer I pray every morning," she had once said to Bertha, earnestly. "It is that the day may bring nothing to change the tone of my life."

She had felt a little ripple in the current ever since the eventful night, and had regretted it sorely, and now, just for the moment, it was something stronger. So she was very still as she sat with averted face, and the hour spent upon the water was a singularly silent one.

When they returned home they found Colonel Tredennis with Mrs. Merriam, but just on the point of leaving her.

"I am going to see Amory," he said. "I have heard some news he will consider bad. The Westoria affair has been laid aside, and will not be acted upon this session, if at all. It is said that Blundel heard something he did not like, and interfered."

"And you think Mr. Amory will be very much disappointed?" said Agnes.

"I am afraid so," answered Tredennis.

"And yet," said Agnes, "it isn't easy to see why it should be of so much importance to him."

"He has become interested in it," said Mrs. Merriam. "That is the expression, isn't it? It is my opinion that it would be better for him if he were less so. I have seen that kind of thing before. It is like being bitten by a tarantula."

She was not favorably inclined toward Richard. His sparkling moods did not exhilarate her, and she had her private theories concerning his character. Tredennis she was very fond of; few of his moods escaped her bright eyes; few of the changes in him were lost upon her. When he went away this evening, she spoke of him to Agnes and Arbuthnot—

"If that splendid fellow does not improve," she said, "he will begin to grow old in his prime. He is lean and gaunt; his eyes are dreary; he is beginning to have lines on his forehead and about his mouth. He is enduring something. I should be glad to be told what it is."

"Whatever he endured," said Agnes, "he would not tell people. But I think 'enduring' is a very good word."

"How long have you known him?" Mrs. Merriam asked of Arbuthnot.

"Since the evening after his arrival in Washington, on his return from the West," was the reply.

"Was he like this then?" rather sharply.

Arbuthnot reflected.

"I met him at a reception," he said, "and he was not Washingtonian in his manner. My impression was that he would not enjoy our society, and that he would finally despise us; but he looked less fagged then than he does now. Perhaps he begins to long for his daily Pi-ute. There *are* chasms which an effete civilization does not fill."

"You guess more than you choose to tell," was Mrs. Merriam's inward thought. Aloud, she said,—

"He is the finest human being it has been my pleasure to meet. He is the natural man. If I were a girl again, I think I should make a hero of him, and be unhappy for his sake."

"It would be easy to make a hero of him," said Agnes.

"Very!" responded Arbuthnot. "Unavoidable, in fact." And he laid upon the table the bit of hyacinth he had picked up in the boat, and brought home with him. "If I carry it away," was his private thought, "I shall fall into the habit of sitting, and weakening my mind over it. It is weak enough already." But he knew, at the same time, that Colonel Tredennis had done something toward assisting him to form the resolution. "A trivial masculine vanity," he thought, "not unfrequently strengthens one's position."

In the meantime, Tredennis went to Amory. He found him in the room, which was, in its every part, so strong a reminder of Bertha. It wore a desolate look, and Amory had evidently been walking up and down it, pushing chairs and footstools aside carelessly,

when he found them in his way. He had thrown himself, at last, into Bertha's own special easy chair, and leaned back in it, with his hands thrown out over its padded arms. He had plainly not slept well the night before, and his dress had a careless and disheveled look, very marked in its contrast with the customary artistic finish of his attire.

He sprang up when he saw Tredennis, and began to speak at once.

"I say!" he exclaimed, "this is terrible!"

"You have been disappointed," said Tredennis.

"I have been rui——" he checked himself, "disappointed isn't the word," he ended. "The whole thing has been laid aside—*laid aside*—think of it!—as if it were a mere nothing; an application for a two-penny half-penny pension! Great God! what do the fellows think they are dealing with!"

"Whom do you think is to blame?" said the Colonel stolidly.

"Blundel, by Jove, Blundel, that fool and clown!" and he flung himself about the room, mumbling his rage and irritation.

"It is not the first time such a thing has happened," said Tredennis, "and it won't be the last. If you continue to interest yourself in such matters, you will find that out as others have done before you. Take my advice, and give it up from this hour."

Amory wheeled round upon him.

"Give it up!" he cried, "I can't give it up, man! It is only laid aside for the time being. Heaven and earth shall be moved next year—heaven and earth! the thing won't fail—it *can't* fail—a thing like that; a thing I have risked my very soul on!"

He dashed his hand through his tumbled hair and threw himself into the chair again, quite out of breath.

"Ah, confound it!" he exclaimed, "I am too excitable! I am losing my hold on myself!"

Tredennis rose from his seat, feeling some movement necessary. He stood and looked down at the floor. As he gazed up at him, Amory entered a fretful mental protest against his size and his air of being able to control himself. He was plainly deep in thought even when he spoke, for his eyes did not leave the floor.

"I suppose," he said, "this is really no business of mine. I wish it was."

"What do you mean?" said Amory.

Tredennis looked up.

"If it were my business, I would know more about it," he said, "I would know what *you* mean, and how deep you have gone into this—this accursed scheme."

The last two words had a sudden ring of

intensity in their sound, which affected Amory tremendously. He sprang up again and began to pace the floor.

"Nothing ever promised so well," he said, "and it will turn out all right in the end—it must! It is the delay that drives one wild. It will be all right next season—when Bertha is here."

"What has she to do with it?" demanded Tredennis.

"Nothing very much," said Amory, restively, "but she is effective."

"Do you mean that you are going to set her to lobbying?"

"Why should you call it that? I am not going to set her at anything. She has a good effect, that is all. Plane-field swears that if she had stayed at home and taken Blundel in hand he would not have failed us."

Tredennis looked at him stupefied. He could get no grasp upon him. He wondered if a heavy mental blow would effect him. He tried it in despair.

"Do you know," he said slowly, "what people are beginning to say about Plane-field?"

"They are always saying something of Plane-field. He is the kind of man who is always spoken of."

"Then," said Tredennis, "there is all the more reason why his name should not be connected with that of an innocent woman."

"What woman has been mentioned in connection with him?"

"It has been said more than once, that he is in love with—your wife, and that his infatuation is used to advance your interests."

Richard stopped on his walk.

"Then it is a confoundingly stupid business," he said, angrily. "If she hears it she will never speak to him again. Perhaps she has heard it—perhaps that was why she insisted on going away. I thought there was something wrong at the time."

"May I ask," said Tredennis, "how it strikes *you*?"

"Me!" exclaimed Richard. "As the most awkward piece of business in the world, and as likely to do me more harm than anything else could."

He made a graceful, rapid gesture of impatience.

"Every thing goes against me!" he said. "She never liked him from the first, and if she has heard this she will never be civil to him again, or to any of the rest of them. And, of course, she is an influence, in a measure; what clever woman is not? And why should she not use her influence in one way as well as another. If she were a clergyman's wife she would work hard enough to gain favors. It

is only a trifle that she should make an effort to be agreeable to men who will be pleased by her civility. She would do it if there were nothing to be gained. Where are you going? What is the matter?" for Tredennis had walked to the table and taken his hat.

"I am going into the air," he answered; "I am afraid I cannot be of any use to you to-night. My mind is not very clear just now. I must have time to think."

"You look pale," said Amory, staring at him. "You look ghastly. You have not been up to the mark for months. I have seen that. Washington does not agree with you."

"That is it," was Tredennis's response. "Washington does not agree with me."

And he carried his hat and his pale and haggard countenance out into the night, and left Richard gazing after him, feverish, fretted, thwarted in his desire to pour forth his grievances and defend himself, and also filled with baffled amazement at his sudden departure.

#### CHAPTER XXVIII.

MRS. AMORY did not receive on New Year's day. The season had well set in before she arrived in Washington. One morning in January Mrs. Sylvestre, sitting alone, reading, caught sight of the little coupé as it drew up before the carriage step, and laying aside her book reached the parlor door in time to meet Bertha as she entered it. She took both her hands and drew her toward the fire, still holding them.

"Why did I not know you had returned?" she said. "When did you arrive?"

"Last night," Bertha answered. "You see I come to you early."

It was a cold day and she was muffled in velvet and furs. She sat down, loosened her wrap and let it slip backward, and as its sumptuous fullness left her figure it revealed it slender to fragility and showed that the outline of her cheek had lost all its roundness. She smiled faintly, meeting Agnes's anxious eyes.

"Don't look at me," she said. "I am not pretty. I have been ill. You heard I was not well in Newport? It was a sort of low fever and I am not entirely well yet. Malaria you know is always troublesome. But you are very well?"

"Yes, I am well," Agnes replied.

"And you begin to like Washington again?"

"I began last winter."

"How did you enjoy the spring? You were here until the end of June."

"It was lovely."

"And now you are here once more, and how pretty everything about you is!" Bertha said, glancing around the room. "And you are ready to be happy all winter until June again. Do you know, you look happy? Not excitably happy, but gently, calmly happy, as if the present were enough for you."

"It is," said Agnes. "I don't think I want any future."

"It would be as well to abolish it if one could," Bertha answered, "but it comes—*it comes!*"

She sat and looked at the fire a few seconds under the soft shadow of her lashes, and then spoke again.

"As for me," she said, "I am going to give dinner parties to Senator Planefield's friends."

"Bertha!" exclaimed Agnes.

"Yes," said Bertha, nodding gently. "It appears somehow that Richard belongs to Senator Planefield, and as I belong to Richard, why, you see —?"

She ended with a dramatic little gesture, and looked at Agnes once more.

"It took me some time to understand it," she said. "I am not quite sure that I understand it quite thoroughly even now. It is a little puzzling, or, perhaps, I am dull of comprehension. At all events, Richard has talked to me a great deal. It is plainly my duty to be agreeable and hospitable to the people he wishes to please and bring in contact with each other."

"And those people?" asked Agnes.

"They are political men, they are members of committees, members of the House, members of the Senate—and their only claim to existence in our eyes is that they are either in favor of or opposed to a certain bill not indirectly connected with the welfare of the owners of the Westoria lands."

"Bertha," said Agnes, quickly, "you are not yourself."

"Thank you," was the response, "that is always satisfactory, but the compliment would be more definite if you told me whom I happened to be. But I can tell you that I am that glittering being, the female lobbyist. I used to wonder last winter if I was not on the verge of it, but now I know. I wonder if they all begin as innocently as I did and find the descent—isn't it a descent?—as easy and natural. I feel queer, but not exactly disreputable. It is merely a matter of being a dutiful wife and smiling upon one set of men instead of another. Still, I am slightly uncertain as to just how disreputable I am. I was beginning to be quite reconciled to my atmosphere until I saw Colonel Tredennis, and I confess he unsettled my mind and embarrassed me a little in my decision."

"You have seen him already?"

"Accidentally, yes. He did not know I had returned, and came to see Richard. He is quite intimate with Richard now. He entered the parlor and found me there. I do not think he was glad to see me. I left him very soon."

She drew off her glove, and smoothed it out upon her knee, with a thin and fragile little hand, upon which the rings hung loosely. Agnes bent forward and involuntarily laid her own hand upon it.

"Dear," she said.

Bertha hurriedly lifted her eyes.

"What I wished to say," she said, "was that the week after next we give a little dinner to Senator Blundel, and I wanted to be sure I might count on you. If you are there—and Colonel Tredennis—you will give it an unprofessional aspect, which is what we want. But, perhaps, you will refuse to come?"

"Bertha," said Mrs. Sylvestre, "I will be with you at any time—at all times—you wish for or need me."

"Yes," said Bertha, reflecting upon her a moment, "I think you would."

She got up and kissed her lightly and without effusion, and then Agnes rose, too, and they stood together.

"You were always good," Bertha said. "I think life has made you better instead of worse. It is not so always. Things are so different—everything seems to depend upon circumstances. What is good in me would be far enough from your standards to be called wickedness."

She paused abruptly, and Agnes felt that she did so to place a check upon herself: she had seen her do it before. When she spoke again it was in an entirely different tone, and the remaining half-hour of her visit was spent in the discussion of every-day subjects. Agnes listened, and replied to her with a sense of actual anguish. She could have borne better to have seen her less self-controlled; or she fancied so, at least. The summer had made an alteration in her, which it was almost impossible to describe. Every moment revealed some new, sad change in her, and yet she sat and talked commonplaces, and was bright and witty and epigrammatic until the last.

"When we get our bill through," she said, with a little smile, just before her departure, "I am to go abroad for a year—for two, for three, if I wish. I think that is the bribe which has been offered me. One must always be bribed, you know."

As she stood at the window watching the carriage drive away, Agnes was conscious of a depression which was very hard to bear. The brightness of her own atmosphere seemed

to have become heavy,—the sun hid itself behind the drifting, wintry clouds,—she glanced around her room with a sense of dreariness. Something carried her back to the memories which were the one burden of her present life.

"Such grief cannot enter a room and not leave its shadow behind it," she said. And she put her hand against the window-side, and leaned her brow upon it sadly. It was curious, she thought, the moment after, that the mere sight of a familiar figure should bring such a sense of comfort with it as did the sight of the one she saw approaching. It was that of Laurence Arbuthnot, who came with a business communication for Mrs. Merriam, having been enabled, by chance, to leave his work for an hour. He held a roll of music in one hand and a bunch of violets in the other, and when he entered the room was accompanied by the fresh fragrance of the latter offering.

Agnes made a swift involuntary movement toward him.

"Ah!" she said, "I could scarcely believe that it was you."

He detected the emotion in her manner and tone at once.

"Something has disturbed you," he said. "What is it?"

"I have seen Bertha," she answered, and the words had a sound of appeal in them, which she herself no more realized or understood than she comprehended the impulse which impelled her to speak.

"She has been here! She looks so ill—so worn. Everything is so sad! I——"

She stopped and stood looking at him.

"Must I go away?" he said, quietly. "Perhaps you would prefer to be alone. I understand what you mean, I think."

"Oh, no!" she said, impulsively, putting out her hand. "Don't go. I am unhappy. It was—it was a relief to see you."

And when she sank on the sofa, he took a seat near her and laid the violets on her lap, and there was a faint flush on his face.

THE little dinner, which was the first occasion of Senator Blundel's introduction to the Amory establishment, was a decided success.

"We will make it a success," Bertha had said. "It *must* be one." And there was a ring in her voice which was a great relief to her husband.

"It will be one," he said. "There is no fear of *your* failing when you begin in this way." And his spirits rose to such an extent that he became genial and fascinating once more and almost forgot his late trials and uncertainties. He had always felt great confidence in Bertha.

On the afternoon of the eventful day Bertha did not go out. She spent the hours between luncheon and the time for dressing with her children. Once as he passed the open door of the nursery Richard saw her sitting upon the carpet, building a house of cards, while Jack and Janey and Meg sat about her enchanted. A braid of her hair had become loosened and hung over her shoulder; her cheeks were flushed by the fire; she looked almost like a child herself, with her air of serious absorbed interest in the frail structure growing beneath her hands.

"Wont that tire you?" Richard asked.

She glanced up with a smile.

"No," she said, "it will rest me."

He heard her singing to them afterward, and later, when she went to her dressing-room, he heard the pretty lullaby die away gradually as she moved through the corridor.

When she appeared again, she was dressed for dinner and came in buttoning her glove, and at the sight of her he uttered an exclamation of pleasure.

"What a perfect dress!" he said. "What is the idea? There must be one."

She paused and turned slowly round so that he might obtain the full effect.

"You should detect it," she replied. "It is meant to convey one."

"It has a kind of dove-like look," he said.

She faced him again.

"That is it," she said serenely. "In the true artist spirit, I have attired myself with a view to expressing the perfect candor and simplicity of my nature. Should you find it possible to fear or suspect me of ulterior motives—if you were a Senator, for instance?"

"Ah, come now!" said Richard, not quite so easily, "that is nonsense! You have no ulterior motives."

She opened her plumy, dove-colored fan and came nearer him.

"There is nothing meretricious about me," she said. "I am softly clad in dove color; a few clusters of pansies adorn me; I am covered from throat to wrists; I have not a jewel about me. Could the effect be better?"

"No, it could not," he replied, but suddenly he felt a trifle uncomfortable again, and wondered what was hidden behind the inscrutable little gaze she afterward fixed upon the fire.

But when Blundel appeared, which he did rather early, he felt relieved again. Nothing could have been prettier than her greeting of him, or more perfect in its attainment of the object of setting him at his ease. It must be confessed that he was not entirely at his ease when he entered, his experience not having been of a nature to develop in him any

latent love for general society. He had fought too hard a fight to leave him much time to know women well, and his superficial knowledge of them made him a trifle awkward as it occasionally renders other men astonishingly bold. In a party of men, all his gifts displayed themselves; in the presence of women he was afraid that less substantial fellows had the advantage of him—men who could not tell half so good a story or make half so exhilarating a joke. As to this special dinner he had not been particularly anxious to count himself among the guests, and was not very certain as to how Planefield had beguiled him into accepting the invitation.

But ten minutes after he had entered the room he began to feel mollified. Outside, the night was wet and unpleasant, and not calculated to improve a man's temper; the parlors glowing with fire-light and twinkling wax candles were a vivid and agreeable contrast to the sloppy rawness. The slender, dove-colored figure, with its soft, trailing draperies, assumed more definitely pleasant proportions, and in his vague, inexperienced, middle-aged fashion he felt the effect of it. She had a nice way, this little woman, he decided; no nonsense or airs and graces about her; an easy manner, a gay little laugh. He did not remember exactly afterward what it was she said which first awakened him up, but he found himself laughing and greatly amused, and when he made a witticism he felt he had reason to be proud of, the gay little peal of laughter which broke forth in response had the most amazingly exhilarating effect upon him, and set him upon his feet for the evening. Women seldom got all the flavor of his jokes. He had an idea that some of them were a little afraid of them and of him, too. The genuine mirth in Bertha's unstudied laughter was like wine to him, and was better than the guffaws of a dozen men, because it had a finer and a novel flavor. After the joke and the laugh the ice was melted, and he knew that he was in the humor to distinguish himself.

Planefield discovered this the moment he saw him, and glanced at Richard, who was brilliant with good spirits.

"She's begun well," he said, when he had an opportunity to speak to him. "I never saw him in a better humor. She's pleased him somehow. Women don't touch him usually."

"She will end better," said Richard. "He pleases her."

He did not displease her, at all events. She saw the force and humor of his stalwart jokes and was impressed by the shrewd business-like good nature which betrayed nothing. When he began to enjoy himself she liked the

genuineness of his enjoyment all the more because it was a personal matter with him, and he seemed to revel in it.

"He enjoys *himself*," was her mental comment, "really *himself*," not exactly the rest of us, except as we stimulate him, and make him say good things."

Among the chief of her gifts had always been counted the power of stimulating people, and making them say their best things, and she made the most of this power now. She listened with her brightest look, she uttered her little exclamations of pleasure and interest at exactly the right moment, and the gay ring of her spontaneous sounding laugh was perfection. Miss Varien, who was one of her guests, sat and regarded her with untempered admiration.

"Your wife," she said to Amory, in an undertone, "is simply incomparable. It is not necessary to tell you that, of course, but it strikes me with fresh force this evening. She really seems to enjoy things. That air of gay, candid delight is irresistible. It makes her seem to that man like a charming little girl—a harmless, bright, sympathetic little girl. How he likes her!"

When she went in to dinner with him, and he sat by her side, he liked her still more. He had never been in better spirits in his life; he had never said so many things worth remembering; he had never heard such sparkling and vivacious talk as went on round this particular table. It never paused or lagged. There was Amory, all alight and stirred by every conversational ripple which passed him; there was Miss Varien, scintillating and casting off showers of sparks in the prettiest and most careless fashion; there was Laurence Arbuthnot, doing his share without any apparent effort, and appreciating his neighbors to the full; there was Mrs. Sylvestre, her beautiful eyes making speech almost superfluous, and Mrs. Merriam, occasionally casting into the pool some neatly weighted pebble, which sent its circles to the shore; and in the midst of the coruscations, Blundel found himself, somehow, doing quite his portion of the illumination. Really these people and their dinner-party pleased him wonderfully well, and he was far from sorry that he had come, and far from sure that he should not come again if he were asked. He was shrewd enough, too, to see how much the success of everything depended upon his own little companion at the head of the table, and, respecting success beyond all things after the manner of his kind, he liked her all the better for it. There was something about her which, as Miss Varien had said, made him feel that she was like a bright, sympathetic little girl,

and engendered a feeling of fatherly patronage which was entirely comfortable. But though she rather led others to talk than talked herself, he noticed that she said a sharp thing now and then, and he liked that, too, and was greatly amused by it. He liked women to be sharp, if they were not keen enough to interfere with masculine prerogatives. There was only one person in the company he did not find exhilarating, and that was a large, brown-faced fellow, who sat next to Mrs. Merriam, and said less than might have been expected of him, though when he spoke his remarks were well enough in their way. Blundel mentioned him afterward to Bertha when they returned to the parlor.

"That Colonel, who is he?" he asked her, "I didn't catch his name exactly. Handsome fellow, but he'd be handsomer if——"

"It is the part of wisdom to stop you," said Bertha, "and tell you that he is a sort of cousin of mine and his perfections are such as I regard with awe. His name is Colonel Tredennis and you have read of him in the newspapers."

"What!" he exclaimed, turning his sharp little eyes upon Tredennis, "the Indian man, I'm glad you told me that. I want to talk to him." And an opportunity being given him, he proceeded to do so with much animation, ruffling his stiff hair up at intervals in his interest, his little eyes twinkling like those of some alert animal.

He left the house late and in the best of humors. He had forgotten for the time being all questions of bills and subsidies. Nothing had occurred to remind him of such subjects. Their very existence seemed a trifle problematical, or, rather, perhaps, it seemed desirable that it should be so.

"I feel," he said to Plane-field, as he was shrugging himself into his overcoat, "as if I had rather missed it by not coming here before."

"You were asked," answered Plane-field.

"So I was," he replied, attacking the top button of the overcoat. "Well, the next time I am asked I suppose I shall come."

Then he gave his attention to the rest of the buttons.

"A man in public life ought to see all sides of his public," he said, having disposed of the last one. "Said some good things, didn't they? The little woman isn't without a mind of her own either. When is it she receives?"

"Thursdays," said Plane-field.

"Ah, Thursdays."

And then they went out in company.

Her guests having all departed, Bertha remained for a few minutes in the parlor.

Arbuthnot and Tredennis went out last, and as the door closed upon them she looked at Richard.

"Well?" she said.

"Well!" exclaimed Richard. "It could not have been better!"

"Couldn't it?" she said, looking down a little meditatively.

"No," he responded, with excellent good cheer, "and you see how simple it was, and—and how unnecessary it is to exaggerate it and call it by unpleasant names. What we want is merely to come in contact with these people, and show them how perfectly harmless we are, and that when the time comes they may favor us without injury to themselves or any one else. That's it in a nutshell."

"We always say 'us,' don't we?" said Bertha, "as if we were part-proprietors of the Westoria lands ourselves. It is a little confusing, don't you think so?"

She paused and looked up with one of her sudden smiles.

"Still I don't feel exactly sure that I have been—but no, I am not to call it lobbying, am I? What must I call it. It really ought to have a name."

"Don't call it anything," said Richard, faintly conscious of his dubiousness again.

"Why, what a good idea!" she answered.

"What a good way of getting round a difficulty—not to give it a name! It almost obliterates it, doesn't it? It is an actual inspiration. We won't call it anything. There is so much in a name—too much, on the whole, really. But—without giving it a name—I have behaved pretty well and advanced our—your—whose interests?"

"Everybody's," he replied, with an effort at lightness. "Mine particularly. I own that my view of the matter is a purely selfish one. There is a career before me, you know, if all goes well."

He detected at once the expression of gentleness which softened her eyes as she watched him.

"You always wanted a career, didn't you?" she said.

"It isn't pleasant," he said, "for a man to know that he is not a success."

"If I can give you your career," she said, "you shall have it, Richard. It is a simpler thing than I thought, after all." And she went upstairs to her room, stopping on the way to spend a few minutes in the nursery.

(To be continued.)

---

## IN THE GARDEN.

I WALKED among the roses:

They were crimson and damask red.

"How perfect in bloom!" "how beautiful!"

Of this one and that I said.

Yet the rose that most my fancy

Delighted, least flaunting of all,

Least forward, hid in the hedges,

And was neither fair nor tall.

It bent its head so lowly

Through its blushing, I could see;

Then lifted it up so radiantly,

I was sure, in its love for me.

And leaning over to pluck it,

"Come hither," I cried, "sweet rose!

Thou surely of all in the garden art

The dearest to me that grows.

"Though others be tall and handsome,

And thou but a modest thing,

I'd choose thee for my diadem,

Though I were a crowned king."

So said I in my passion,

So in my eagerness said:—

The rose, in the hedges blushing,

Again bent down its head.

I leaned the more to pluck it,

Made glad by that dear sign;

But another behind me the rose had seen,

And its blushes were not mine.

## ARTISTS' MODELS IN NEW YORK.

A MODEL CRITIC.

WITH the rapid growth of New York as an art-center, the demand for, and supply of, living models have increased proportionately. Time was, when the American artist, returning from the schools of Europe where there are trained and experienced models, found himself quite at a loss for the material embodiment of his ideas in the shape of a professional sitter. He was obliged to resort to that process, jocularly defined, in studio language, as evolving an object from the inner consciousness, or to speak plainly, painting from memory and imagination. This evolution from the inner consciousness undoubtedly had a paralyzing effect upon American art, since it is a process successfully employed only by great geniuses. Realism, to which American art inclines, demands careful study of the model. As the artistic colony in New York became a recognized factor of the population,

professional models followed as a natural consequence. It is little more than ten years since models were something of a rarity even at the Academy of Design. Some three or four were regularly engaged for the various classes and were paid at the rate of a dollar and a half an hour. With the appointment of the present director of the model department, a new order of things was instituted. By means of advertising and by exploring the by-ways of the great city, a number of models were brought together, untrained and inexperienced, but still suited to the purpose. The fee was temporarily reduced to seventy-five cents an hour, and competition rose high between the trained models and the inexperienced. Since that time, the supply of models has been constantly increasing, and to-day is fairly equal to the demand. They lack the experience and training of the for-

eign model, and it is rare to find one of either sex who has any of the grace or *chic* which makes of the Paris model a natural artist. They are also destitute of that dramatic instinct without which it is impossible to throw life or spirit into a pose. Few persons, outside of the charmed circle of art, realize the absolute power exercised by the conditions of the model over the brush of the artist. A stupid, awkward, or restless model will stultify

constantly increasing in numbers, it is fair to suppose that, with this nucleus, before many years have passed, trained and skilled models will be as easily procured in New York as in Paris.

The models of New York may properly be classed as a part of the floating population. Every few seasons, a new set of faces appears at the studio doors in search of employment. Most of these applicants are persons out of

A LAY FIGURE.

the execution of a clever or charming idea. When a New York artist stands in need of a model, he has only to send to the Academy of Design or the Art-Students' League, on the books of which professional models are registered. The Academy has a list of some thirty models who pose for the nude figure as well as in costume. There are others who pose only for the draped figure. The average fee is fifty cents an hour. This is increased or lessened according to circumstances, such as special contract with the artist or class, or the varying demand for the model. Among these professional models are a few who have been trained to their occupation from childhood. These are chiefly foreign or of foreign parentage. One family, in particular, of mixed German and Italian blood, furnishes models of various ages and both sexes. This family serves as a stand-by through all the vicissitudes of the model-market, and as models are

work, who take this means of bridging over a gulf of consequent impecuniosity. In New York many trades and professions have their dull seasons, and at such times, many able and willing men and women are left stranded on the shore of literal starvation. Instinct sends them to the studios. Most artists have known the discipline of poverty, and unless success has hopelessly imbedded them in selfishness, they keep a warm corner of their hearts for these waifs blown by adverse winds to their studio doors. It is difficult to believe that the sturdy realism of New York life should offer such suggestions of romance as are presented by the procession of models which, in the course of a winter, passes in review before the eyes of the artists. Most of them, especially the female models, pose under fictitious names. They come no one knows whence and vanish when necessity no longer demands that they shall

eke out a livelihood in this precarious fashion. The tragedy which treads upon the heels of comedy in the great city's life, finds pitiful exemplification in the brief summing-up of the list of female models on the Academy's books, "Married women whose husbands cannot support them, or women unable to procure other employment." Many of them are educated and refined. One adds to the small income derived from copying law papers by the opportunities given her to pose in the Academy. Another case cited was that of a young lady, who, having married a foreigner of position, discovered that he had a wife in his own country. Left penniless by her husband and her friends, she supported herself by posing. A touching episode was offered by the case of an English actress who went out to Canada with her husband in search of professional employment. The husband fell ill and died, leaving the wife unprovided for and with a child to support. Unable to procure an engagement, at a time when the financial depression of the country affected theatrical matters, and having found her way to New York, she became a model attached to the Academy. It often happens that a pretty face looks down from the wall in a New York spring exhibition, of which only this is known—that its owner, passing under an assumed name, applied at the studios for employment, and, after earning the money she needed, carried her beauty and her reticence back into the obscurity they came from, leaving the artist who had perpetuated the one and respected the other to speculate upon her identity, and perhaps at some later day to meet her in an entirely different sphere of life. A rounded arm or throat, a tapering hand, a head of curling golden hair, have temporarily fed and clothed many a young woman. When the genius shall be born who will reconcile the opposing elements of New York life in fiction as Balzac did those of Paris, it would not be strange if he

AN AWKWARD MODEL.

should find some magnificent type of heroine in some anonymous beauty of the New York studios. Many of the professional female models have become such because they found they could earn a better living by posing than by working in shops, book-binderies, factories, in domestic service, or at the needle. I know of a French model who supports herself and a relative comfortably by posing. She formerly gave lessons in languages, and barely managed to exist. Another model, who is noted for her stately presence and superb physique, is greatly in demand, and commands three dollars a day. But the average fee of a model is fifty cents an hour when the engagement is made by the hour, or two dollars a day when the engagement is made for the day. For a morning or afternoon session, whether of two or three hours, the model receives only one dollar, unless there is a special agreement to pay more.

Foreign models occasionally come to New York on speculation, having exalted ideas on the subject of the gold to be picked up in the streets of the New World. There is a colony of Italian models in Crosby street, of the conventional type. They came from Paris to New York with magnificent ideas concerning the model-market. They began by asking a dollar and a half an hour, but finally condescended to accept twenty-five cents for the very few occasions upon which their services were required. American artists have rather outgrown the conventional Roman subject, so much in favor some years ago. With the increase of realistic tendencies and broad, rugged treatment, the Italian

EARNING HIS LIVING.

AN ITALIAN FAMILY.

model has been relegated to the region of artistic "prettiness," so heartily disliked by the younger school of American art. These Italian models haunt the studios in groups. When mysterious, thumping noises are heard on the silent stair-ways the artist is prepared for the loud, imperious rapping on his door which follows. Opening the door, he finds an entire family of Italian models grouped in the fashion of the Piazza di Spagna, smiling, bowing, and gesticulating in the conventional model manner. But, alas for them! Their day is over. Paris and Munich have driven out Rome. The neat old dame who sits in the portrait class of the League, with smooth white hair, good, patient face, and every-day dress of dark green and brown, is nearer the heart of the American art-student of the period than the insipid prettiness of the Roman *contadina*. Old women and old men are rather in demand as models in New York, now that strong and realistic types are preferred to ideal ones. Several of these models are known at the Academy as having posed for years. There is one old man, well known to the studios, whose head of snowy hair and long white beard cause him to be much sought after, particularly by artists recently from Europe. I saw him not long since, mounted on a posing platform in a studio, with his fine old head outlined against a tawny wall, bare-legged, the folds of his stockings simulating the leather folds of an antique boot. There was a staff in his hand, a gourd by his side, and about his body was draped a Spanish muleteer's cloak, orange, blue, and white. He was standing for a St. Joseph, in a water-color of the "Flight into Egypt." There was a reminiscence of Velasquez in the model and the picture.

Sometimes, an artist, upon answering the

knock at his studio door, sees before him a model whom he has known in Europe. He is obliged to be chary of demonstrations of sympathy, or the draught on his friendship will be heavy. An old model from Paris appeared not long since in New York,—a stout, military looking person, with a large mustache and pointed beard. A tradition hung over him to the effect that he had once been a sculptor. An artist of charitable and imaginative mind took him in and employed him as a water-color subject in a military costume, which gave him the look of a sturdy Fleming of the six-

teenth century. An artist of cynical soul dubbed him an old humbug, and refused to aid him on the basis of artistic brotherhood. One lent him a hat too old and shabby to be worn by a respectable artist in the streets of New York, too good to be the spoil of the studio. The understanding was, that when the hat was fairly worn out, it should be returned to the studio, and exchanged for another held in readiness. The pretext of showing the hat brought the old model to the studio door so often, that the artist, whose consideration for him had been based on a former acquaintance in Paris, greatly regretted having revived this friendship of the *atelier*. The vague romance associated with the models in Europe gives place in America to a practical estimate of their value as posing subjects. The New York

ONE OLD MAN.

model is not generally encouraged to tell his or her history. The opportunities of posing afforded to the official models in the classes of the Academy and the League, are so few in comparison with the number of models clamoring for employment that the artists in charge of the matter are obliged to use much kindly diplomacy in selecting the types required from the list of registered names. Sometimes models of absolutely unavailable

adorned, and resides in an inland city. Another temporary model was the son of a prominent artist in another city. Many studies of Arabs executed in New York during the past few years have had for their model a negro attached to the Academy, whose head and figure offered a perfect type of that race. A prosperous manufacturer of picture frames in an interior town, having failed in business, became a model in New

DO YOU WANT A MODEL, SIR?

personalities present themselves at the Academy, only to be disappointed at the refusal of their amateur services. Among the Academy models some time since, was the son of a banker in Wall street who had failed during a financial crisis. Later, the young model obtained a position in a down-town bank, but such was his pride in his physique and his interest in art that he continued to pose in the evening classes. Another model, valued for his fine muscular development, was a blacksmith by trade. Another was a house-painter, who, during the winter months, when all of his trade are thrown out of employment, supported himself in this fashion. Still another, also noted for his fine development, was a German athlete. One model, well-known in his day at the Academy, was a half-breed Indian employed as coachman in a wealthy family. In his leisure hours he posed at the Academy and became a popular model, but one day his employer discovered his artistic bias and forced him to desist. He has since returned to the equine sphere he

York. This might be regarded as an instance of retributive justice, since it is well-known that the mortal enemy of the impecunious artist is the prosperous, heartless, and dunning frame-maker. Imagine the grim delight with which a young knight of the brush, who had suffered the pangs of unpaid bills for frames, would avenge the wrongs of himself and his brethren on the person of a fallen frame-maker who sued for employment at fifty cents an hour.

A few artists in New York have their models acting also as domestics or studio-retainers. This is a foreign custom imported by artists who have received their schooling abroad. Under these circumstances, a sort of comradeship arises between the artist and his faithful model, which has its pathetic as well as its grotesque side, since the remuneration of the model is apt to depend upon the successes or failures of the artist. There is a colony of young artists in New York which possesses a retainer known to the world as "Sammy"—a youth of muscular type with

blonde mustache and hair and a fresh complexion. His face and figure fit him for all spheres of model life. One day, he poses as a stalwart fisherman, in a pea-jacket, a disreputable hat, and high sea-boots. Another week, in a dress-suit borrowed for the occasion, he figures as a ball-room gallant with one arm encircling the waist of a bald-pated lay-figure, arrayed in silken robes, likewise borrowed, into whose glass eyes he gazes with an expression of the deepest tenderness. He has even appeared as a bold horseman seated astride a wooden chair, which was placed on a table, tightly clutching two pieces of clothes-line for reins, with his body inclined at the angle necessary to imply a furious galloping on the part of his fiery steed, and his coat-tails spread out and fastened to the wall behind to illustrate the action of the wind. In addition to his accomplishments as a model, this young man does everything an artist's henchman can be expected to do, in the line of general usefulness. There is another model much in favor,

AN EQUESTRIAN MODEL.

FALLING FROM A HORSE.

particularly among illustrators, on account of his gentlemanly appearance. His well-shaped head, black mustache and clean shirt-front, can be adapted to almost any artistic exigency. When not engaged in posing, he finds employment as a porter, for his excellent education and musical accomplishments are of small service to him in the competitive bread-struggle of New York. Not long since, he entered the matrimonial state, espousing a widow with a pretty little daughter, seven or eight years old. The child entered the model field under the auspices of her step-father. Being a picturesque child, with long, chestnut hair, she soon became a favorite model for illustrations designed for juvenile magazines.

These child-models are much sought after by artists. Those on the lists of the schools do not always meet the wants of the painter. Advertisements for pretty little children to serve as models are often seen in the morning papers, and are doubtless viewed by the unenlightened and ignorant as the device of some hideous ogre, some Croquemitaine of the metropolis, seeking what he may devour in the shape of tender nurslings. The initiated person, familiar with the *coulisses* of New York art, sees at a glance that the advertisement is only the last resort of some unhappy artist. The introduction of Christmas cards has greatly increased the demand for child-models. Then the "high art" picture books for children, imitated or reproduced from

London publications, have set the fashion of mediæval or "Queen Anne" types in the illustration of native juvenile books and magazines. The good old picture-book of the past, with its broad classic illustrations by Gilbert and Cruikshank which laid no particular stress on individuality of face or dress, and was satisfied with simply pleasing, would hardly be tolerated to-day by these ambitious workers in the realm of æsthetic quaintness who

such matters to a degree that would astonish a Paris artist. Happy the artist whose women-friends or relatives are able to help him avoid the *baroque* developments of female attire which characterize so many of our native canvases, especially in genre subjects. I do not refer to the fashion of costuming known familiarly and satirically as "high art," for that, however abnormal, is the result of forethought and consistent

A MARINE MODEL.

make careful individual studies of child-faces and costumes from the living model. The magazines, also, aim at absolute fidelity and care in their illustrations of the letterpress in their pages. This realistic tendency in book-illustration is constantly increasing, and as a natural consequence the demand for individual types of models keeps pace with it.

Yet the fact remains that models are still an artistic luxury in New York. Few young artists can afford to employ models for any length of time for pictures that are painted on speculation and must take their chances in the crowded art-market of New York. Many a young painter is forced to content himself with the suggestions given him by a few sittings, and relies on his imagination and his inventive faculty to help him out. Then comes in the question of costume. A model may be everything, personally, that is desirable, and yet not possess the costume required by the artist. A female model with a tasteful wardrobe can find numerous engagements and command her own prices. Few artists in New York possess any costumes at all, and still fewer own modern female dresses, or have other than the usual masculine crudity of idea as to how they should be worn. Consequently they are entirely at the mercy of their models, and helpless in

reasoning,—a logical development of our century,—but simply to those fortuitous combinations of shape and color which spring from instinctive vulgarity of taste or ingenuous ignorance.

Sometimes an obliging female relative will lend an artist a handsome gown for his Exhibition picture, with many cautions as to paint from palette and brush. Sometimes, he repairs to the theatrical costumer and hires a vile concoction of gaudy colors and cheap material at a ruinous rate. Sometimes his model makes a gown to fit herself of some common, inexpensive fabric, say, for instance, blue silesia. By that mysterious and convenient agency known as *chic* it will appear on the walls of the Exhibition as the richest of blue satin. The artist buys half a yard of blue satin and studies the effects of the folds, then applies the same combinations of light and shade to the silesia gown on his model. The properties and methods of the studio are not unlike those of the stage: magnificent results are produced from humble materials. To use *chic*, in artistic parlance is to produce effects by means of the imagination and by means of analogy—as, for instance, to create from one model's face a dozen of different ages, or by a few skillful strokes to transform the cloth garment on the model into a fur one on the

STUDIO OF AN ANIMAL-PAINTER.

paper or canvas, or to make a straw hat over into a beaver. Examples might be multiplied indefinitely of this very handy development of artistic creativeness.

The artists of New York are unanimous in the opinion that an agency for the hire of costumes exclusively for studio use is one of the absolute necessities of the artistic growth of the metropolis. I have heard of a model who contemplates establishing such an agency, but she is hampered by want of capital. The initiative must come from the artists themselves. Certainly New York art, and consequently American art, would be greatly the gainer by this apparently trifling circumstance.

Many artists prefer picking up their models in a chance way, believing that the types so secured will be more original and realistic than those whose poses have been reduced to method by Academic practice. One artist whose name is associated with the reproduction on canvas of the small street Arab of New York, gathers up his models from their native element of mud, thereby preserving all their delightful *gamin* characteristics. When he first undertook his researches, it was with difficulty that he was able to make the audacious bootblack and the dauntless newsboy enter his studio. Fear and horror seized them upon the very stair, and they struggled for escape. But a few of the boldest of the tribe having undergone the operation of having their "picters took," the report of the

wonders and beauties, not to say the commercial advantages of the studio, spread abroad, and the market became overstocked with small boy models. It is said that upon one occasion, the artist, being unable to overcome their embarrassment in posing, bethought himself of the expedient of inciting them to a fight, in order to throw some spint into their attitudes. An artist of my acquaintance was searching for a model in the streets of New York. Crossing Union Square, he saw the very type of face he required. The owner of the face was seated on one of the benches in an attitude of cheerful expectancy. The artist accosted the old man and asked if he would pose. He readily consented, went to the studio at the appointed time, was employed, gave satisfaction, and became a sort of retainer at the studio. His massive white head and large white beard met with favor in æsthetic circles. By degrees, items of his personal history came to light. He had been a gold-digger in California in the early days of the mining excitement. He claimed to have experienced fifteen shipwrecks in the capacity of a sea-captain. Left an orphan at an early age, he had been educated by a physician, and had acquired some knowledge of medicine. Fate threw him among the Indians of the far West, presumably on his way from the gold-diggings, and he became a medicine-man. He was learned in natural philosophy, and possessed a mineralogical cabinet

and also a singular collection of roots, each twisted by nature into the shape of one of the letters of the alphabet. He painted shells skillfully, and had an ambition to go round the world in a canoe. This remarkable person also wrote poetry and was a Yankee. It needed only a master-brush to make this same representative Yankee as classic as a Millet peasant. By far the best models, from the point of view of originality, are those captured by chance. A model—a tramp—picked up in the street not long ago, fainted after a few moments of posing. He had seemed overjoyed at the prospect of earning fifty cents. He revived, insisted upon completing his task, received something over the fee promised from a suspicion on the part of the artist that his feebleness was the result of hunger, and went his way. Such episodes as this often occur among the experiences of a searcher after models. When an athletic model is required, the painter sometimes applies to circus-performers, heavy-weight men, boxers, and pugilists. They frequently appear on canvas as gladiators, Greek wrestlers, and Roman senators.

The New York streets offer a variety of picturesque types, which for artistic value are not surpassed by those found in any European city. The deficiency in color and conventional picturesqueness is atoned for by the strong realism and robust distinctiveness of character to be found in the surging humanity of this many-sided American city. The artistic exponent of American life lies in the reproduction of the very types that pass under the studio windows, in their daily round of work or pleasure. The great masters of foreign art, whether ancient or modern, have always found their models close to their own door-stones and hearth-fires. The same must be true of American painters before we can claim for ourselves a nationality in art, remembering the while that the familiar is not necessarily the vulgar.

New York artists, in advertising for models, frequently find themselves the heroes of romantic or humorous adventures. Upon one occasion, an advertisement for a nude model inserted in a morning paper by two young artists, was answered by a palsied old woman, who, twenty-five years before, had once posed for some forgotten artist. Sometimes a young artist with a taste for intrigue amuses himself by answering the advertisement of his brother-painter. This results in much mystification and the enjoyment of a practical joke. Male

models have been procured upon occasion from the Young Men's Christian Association. The birds and animals in Central Park unconsciously do duty as models and are reproduced in illustrated books and magazines. Bird and animal fanciers frequently allow artists to make studies from their stock-in-trade.

Animal painters frequently have studios out of town, in which they can study from cows, sheep, and horses with a freedom and ease hardly afforded by a sixth-story New York atelier. Live stock of a minor kind for model purposes can, however, be comfortably quartered in some of the studios. A family of serious-minded kittens recently sojourned for months under the heraldic eaves of the old University Building and posed conscientiously for its board. Country dogs have been known to visit artistic New York and to pay their way by their services as models. Young alligators, turtles, macaws, parrots,—all these have I seen under conditions highly creditable to their appreciation of artistic and domestic exigencies.

The useful and protean lay-figure should not be forgotten,—that model who amid all the changes of artist-life remains ever true to its master. In one studio it lies upon a couch, clothed in spotless draperies of unbleached cotton, as an early Christian bearing the palm of martyrdom. In another, it appears as a young woman of fashion attired in a Parisian costume, seated at an imaginary piano with cotton gloves over its sawdust fingers, striking inaudible chords, and gazing into space with an inspired air. In another, it is seen as a bold *bravo* of mixed nationality, wrapped in a heavy cloak with a Turkish fez over one eye, and the rosy baldness of its head concealed by a flowing wig.

It does not come within the scope of this article to enter upon the question of study from the nude model which has given rise to so much argument during the last few years. In the life-classes of the New York art-schools the discipline is most rigid. The monitor of the class is the only person who holds communication with the model, and in the case of a female model a mask is sometimes worn over the face. New York possesses an abundance of crude material in the way of models, and it is fair to suppose that a few years more will see the establishment of a complete and perfected system of accomplished and trained models, of those realistic types most valued by American artists.

Charlotte Adams.

## GEORGE WILLIAM CURTIS.

MR. CURTIS is known to the American public as author, journalist, and statesman,—for, although he has never held a political office, he has made a profound study of statesmanship, and possesses a knowledge of public affairs second to that of no other man in the country; but his greatest and best work has been achieved in the field of journalism. Starting out on his youthful career as the author of several charming books of travel, and afterward drifting into literary engagements with the New York "Tribune," "Harper's Weekly," and other journals, he was at an early age, and in common with thousands of earnest young men in the North, driven by conviction to take part in the great moral revolution which culminated in the war for the Union and the abolition of slavery in the United States; and throwing himself with fervor into this new field of activity, he abandoned a profession, in which he might have attained high honors, for the one in which he has achieved his great reputation as a leader and teacher of men. It will be interesting to trace the steps by which he came into his chosen career of work.

Mr. Curtis was born in Providence, Rhode Island, February 24, 1824, but he was partly of Massachusetts descent, his father having been born in Worcester, in that State, of which an ancestor was the first settler. His mother was the daughter of James Burrill, Jr., at one time Chief Justice of Rhode Island, and afterward United States Senator. In 1830 he went to boarding-school at Jamaica Plain, near Boston, where he remained for four years. Pleasant reminiscences of his school-days there are found in the early chapters of his novel, "Trumps," narrated with a freshness and enthusiasm which remind the reader of "Tom Brown at Rugby." Meanwhile he lost his mother; and in 1839, his father, who had married again, removed with his family to New York, and, desirous that his son should pursue a mercantile career, placed him, after a year's study with a private tutor, as a clerk in a German importing house in Exchange Place.

But mercantile life was not agreeable to the youth. His tastes were decidedly literary, and in the course of his reading he became deeply interested in the transcendental movement, in which so many of the best and purest minds of New England were at that time engaged. Accordingly, after about a year of

uncongenial drudgery in the importing house, he went to Brook Farm, in company with his elder brother, who shared in his tastes and aspirations. It is unnecessary to repeat the story of failure and disappointment which led to the breaking down of that amiable experiment; but the incident of his taking part in the endeavor to create an ideal society, is interesting as showing the early tendency of Mr. Curtis's mind. He is still called an idealist by those who use the word as a term of reproach, as though it were folly in the youth to believe that society may, in time and by persistent effort, be organized on a higher and purer basis than at present, and still greater folly in the man to retain such optimistic views. The millennium may be far away; but its coming will not be hastened by deriding the principles whose application in social and political life may make it possible, at some distant period; and men who endeavor to bring society into harmony with those principles are prophets and apostles of the Utopia that is to come.

Mr. Curtis and his brother remained at Brook Farm until 1844, and they then passed two years in Concord, Massachusetts, studying and farming. Here Mr. Curtis became very intimate with Emerson, Hawthorne, and Henry Thoreau, forming warm friendships with them which were broken only by death. In his "Homes of American Authors" he has printed some interesting notes of his intercourse with the philosopher, the romancer, and the hermit.

In 1846, Mr. Curtis determined upon making an extended tour in the old world, which, at that time, was a more eventful and important undertaking than it is now, when the "Atlantic ferry" will take you across in a little more than a week. In August of that year he sailed from New York for Marseilles in a passenger packet. The voyage occupied nearly fifty days. From Marseilles he went by steamer to Leghorn, and from that city to Pisa, where he lingered awhile to admire the wonders of the Leaning Tower, the Cathedral, the Baptistery, and the Campo Santo. From Pisa he passed on through the luscious vintage to Florence. The winter was spent in Rome. In the spring of 1847 Mr. Curtis visited Naples and other portions of southern Italy, then made his way slowly northward, back to Florence, where he remained some time, finishing the summer by a long and delightful

sojourn in Venice, in the congenial society of Kensett, Hicks, and other American artists.

In the autumn Mr. Curtis traveled through Lombardy to Como, and over the Stelvio through the Tyrol and Salzkammergut to Vienna, reaching Berlin in the middle of November. The spring of 1848 found him in Dresden, Prague, and again in Vienna, whence he sailed down the Danube to Pesth, returning to Switzerland for the summer.

Mr. Curtis traveled through Switzerland with all the delight of leisure, and not with the modern American frenzy, which counts as lost time every hour consumed in passing from place to place. In the same manner he studied the cities, the people, and the art of Holland,—who, indeed, could hurry through Holland?—and, in the autumn, sailed from Malta to Alexandria.

Mr. Curtis was fortunate in visiting the land of the Pharaohs when the spirit of modern progress had scarcely begun its devastating work within the shadow of the Pyramids. The destruction of the picturesque is surely not an evil necessarily attendant upon social, political, and industrial progress; but progress is very apt, when suddenly aroused, to play sad havoc with things which might better be preserved than destroyed. Were there not quarries of stone in Egypt that temples old as human traditions must be despoiled to build new cities? Doubtless the railroad and the steam-boat are great conveniences for people who are in a hurry, but they have unmade the Egypt of history and the imagination. They had not done so when our Howadji looked upon the Pyramids and sailed slowly up the Nile to the second cataract. The sacred river still flowed

"through old hushed Egypt and its sands  
Like some grave, mighty thought, threading a dream,"

and the effect of that hushed and dreamy life upon his imagination found delightful expression in his "Nile Notes," which are full of the flavor and perfume of the East. Ten years afterward they could not have been written. Stephens visited the Nile still earlier; but he was a man of merely dry observation. He had no enthusiasm, no imagination, and the record of his journeyings is as dull as a ledger in comparison with the Howadji's dreamy musings and charming descriptions.

A journey across the desert by way of Gaza to Jerusalem, of which he wrote an account in "The Howadji in Syria," ended Mr. Curtis's Eastern travels. He spent the early summer of 1850 in England, and returned home in August. His pen had not been idle during his wanderings. Besides his journals, he had written letters for the

"Courier and Inquirer," of which Mr. Henry J. Raymond was then managing editor, and for the New York "Tribune," where his friend, Mr. Charles A. Dana, held the same position. On his return, he entered upon an active literary life. He became musical critic and editorial writer on the "Tribune," and wrote out his "Nile Notes," which were published in 1851 by the Harpers. In the autumn of that year he wrote a series of picturesque traveling letters to the "Tribune," from the Catskills, Saratoga, Trenton, Niagara, Newport, and Nahant, which were published in 1852 as "Lotus-Eating," beautifully illustrated by his friend Kensett. In the same year, "The Howadji in Syria" was published, and Mr. Curtis wrote some sketches of social life for "Harper's Monthly."

The establishment of "Putnam's Monthly," in 1853, opened a new field to Mr. Curtis, who, in conjunction with Mr. Parke Godwin and Mr. Charles F. Briggs, assumed the editorial management of that periodical, which was destined to a brilliant though brief career. Within the first year of its existence he wrote the papers on Emerson, Hawthorne, Longfellow, and Bancroft, in the series on "The Homes of American Authors." To this magazine Mr. Curtis contributed "The Potiphar Papers," a brilliant satire on certain phases of New York society, and "Prue and I," a series of delightful sketches, rather than a story, which was published in 1857. When the magazine passed into the hands of Messrs. Dix and Edwards, Mr. Curtis and Mr. Frederick Law Olmsted became connected with the firm, and were involved in its failure. Considering himself morally, if not legally, responsible for a portion of the indebtedness, Mr. Curtis refused to avail himself of the technicalities of the law, and set himself to the work of paying the creditors. He devoted himself diligently to literary work. The amount of labor he performed was literally enormous. Besides filling the "Easy Chair" of "Harper's Magazine," in which he had just taken his seat, and writing "The Lounger" in "Harper's Weekly," he delivered a long series of lectures, sometimes speaking a hundred nights in a season, and traveling, almost without rest, from place to place at the insatiable call of managers and committees. No man was ever more popular as a lecturer. The charm of his manner was irresistible; he had not only something to say which the people wanted to hear, but knew how to say it with the grace and ease which belong to the true orator. One of the most popular of his lectures was that upon the perfect soldier of chivalry, Sir Philip Sidney. Scarcely less popular were his Lowell lectures upon the

modern English novelists, which were repeated in New York, Brooklyn, and other places. The physical and mental strain involved in this labor was so excessive that many people wondered that he was willing to undergo it. A few only of his immediate friends knew that the proceeds of all his lectures during a period of almost ten years, and a part of his salary as editor, were devoted to the liquidation of the debt from which the law, but not his high sense of moral responsibility, would have absolved him.

During these years the slavery question had gradually absorbed public attention, and had become the paramount theme in the press, the pulpit, and the lyceum. In his Newport loungings Mr. Curtis had noted the effect produced upon Northern society by the slave power, and his attention had been called to the necessity of combating the evil influence by every popular means. Accordingly in all his lectures, like many of the lyceum speakers at that time, he discussed the subject with great freedom and force. The lecture lyceum, indeed, did much to arouse and enlighten public opinion on this vital question, and to prepare the way for the great revival of anti-slavery feeling in the North which followed the personal assault upon Charles Sumner in 1856. It is necessary to recall these times in order to form a just estimate of Mr. Curtis, and his career in public affairs. He was one of a large number of young men who felt, when that assault took place, that there were more imperative duties than the delights of dalliance in the primrose paths of literature. In the year just mentioned he delivered a college address at Middletown upon the "Duty of the American Scholar to Politics and the Times," in which the situation and the impending crisis were discussed from an anti-slavery point of view. He went upon the stump for Fremont, in that year, speaking in New York, New England, New Jersey, and Pennsylvania, and entered actively into politics on Staten Island, where he lived, and where for many years he was Chairman of the Republican County Committee.

Mr. Curtis was a delegate to the second National Convention of the Republican party, which assembled at Chicago on the 16th of May, 1860. It will be remembered that the construction of a "platform" was a labor of considerable difficulty. There were still many Republicans who wished to conciliate the border states, and when Mr. Joshua R. Giddings moved in convention to add to the first resolution the "life, liberty, and pursuit of happiness" clause from the Declaration of Independence, the opposition was loud and determined. The motion was lost

by a large vote, and Mr. Giddings, who had urged its adoption in the most eloquent and impressive manner, proposed to withdraw from the convention; but Mr. Curtis took an early opportunity to renew the motion in a slightly modified form. There were again loud cries of opposition. Mr. Curtis asked whether the party was prepared at its second National Convention to vote against the great charter of American liberty, and cautioned the delegates to beware how, there in the broad prairies of the West, they receded from the position which the party had occupied at Pittsburg, and refused to repeat the words of the Fathers of the Revolution. His eloquent periods acted like magic on the convention. The amendment was adopted unanimously amid wild excitement, the great multitude rising and giving round after round of applause. "Ten thousand voices," says a contemporary report, "swelled into a deafening roar, and for several minutes every attempt to restore order was hopelessly vain. The crowd of people outside took up and echoed the cheers, making a scene of excitement and enthusiasm unparalleled in any similar gathering." It was a great popular triumph, and was of vital service to the party, not only in retaining the influence of Mr. Giddings and his followers, but in swelling the enthusiasm which greeted the platform and the candidates.

It was a noteworthy event in the history of American journalism when, in December of 1863, Mr. Curtis became the political editor of "Harper's Weekly." He had been conducting a department called "The Lounger," begun in the autumn of 1857, which consisted at first of essays in the lighter vein on social and literary topics, very much in the manner of the "Easy Chair." After the beginning of the war Mr. Curtis frequently introduced subjects of a national and political character in this department; but his field was comparatively restricted. From the moment, however, that he took his seat in the editorial chair, his discussions assumed a wider scope, embracing all the great issues before the country. Thoroughly equipped for his new position by mental training and political experience, and in full sympathy with his audience, he made "Harper's Weekly" a power in the Republican party. He was hampered by no office restrictions. The publishers knew the secret of a real responsibility, and, giving him their confidence, gave it unreservedly. There was, of course, entire harmony of principle and purpose between Mr. Curtis and his publishers; and while there were also, of course, occasional differences of judgment as to men and measures, there was never any

interference with the course pursued by Mr. Curtis, nor any attempt to dictate the tone of the paper. This unrestricted independence gave Mr. Curtis a commanding influence in Republican councils and over his readers. He won, and has kept the enthusiastic personal support and admiration of his audience, as no other editor has succeeded in doing, with the single exception of Horace Greeley. The relations between Mr. Curtis and his readers are, in fact, almost personal in their nature, and he has never seriously entertained proposals, however brilliant and tempting, that would interrupt those relations. Thus, although he could serve as a Regent of the University, and as non-resident Professor at Cornell University for four years, he declined, in 1869, upon the death of Mr. Henry J. Raymond, who had previously asked him to become assistant editor, an invitation to the chief editorship of the New York "Times."

No other man has done more than Mr. Curtis to create and maintain a healthy popular sentiment on the subject of Civil Service Reform. In "Harper's Weekly," and in his public addresses, he has expounded and advocated this important measure with a persistency which has drawn upon him the wrath and ridicule of those who are pleased to style themselves "practical" politicians. "Sentimentalist" and "visionary" are among the mildest names applied to him by his political opponents; and he has been accused frequently of treachery to party allegiance because of the outspoken manner in which he has exposed and denounced obnoxious measures within the party. But Mr. Curtis acknowledges no party allegiance, in the sense that "machine" politicians understand the term; his only allegiance is to right, to high principle, to honor. He has the loftiest conceptions of the duty of the citizen. He holds that it should be the aim of every man, not only to keep himself pure, but to assist in the purification and elevation of politics; that it is the duty of every respectable citizen to take part in civil affairs, and to keep them out of the control of the baser elements of society. Between "sentimental" politics like this, and "practical" politics, which implies pandering to those baser elements, there can be no room for choice. As Charles Sumner once said, in his imperious way, to one who asked him to consider the other side of the slavery question: "Sir, in a matter of this sort there is no 'other' side!"

That the views which Mr. Curtis holds will win in the end admits of no doubt. Many a failure may yet be in store for their advocates, but, unless free institutions are destined to go

under, Civil Service Reform must ultimately triumph. Mr. Curtis was not discouraged by its failure under President Grant's administration. He accepted the Chairmanship of the Civil Service Commission, in 1871, with sanguine hopes of success. The President was sincere and earnest in his desire to thus signalize his administration; but, in 1873, becoming convinced that, yielding to the pressure of "practical" politicians, General Grant had changed his views, Mr. Curtis resigned, and the next year the President formally abandoned the project. It had been well for the President, and for the Republican party, had he listened to wiser counsels. Even those who have always sneered at "Sunday-school" politics begin now to discern the signs of the times; and the President's recent recommendations in his annual message, and the various bills hurriedly introduced in Congress, favoring reform in the Civil Service, show that the views which Mr. Curtis advocates have taken a stronger hold on the public than was dreamed of by his opponents.

Mr. Curtis has never accepted a political office, although often pressed to do so. By Mr. Seward he was offered the Consul-Generalship to Egypt; President Hayes urged him to accept the post of Minister to England, and afterward that of Minister to Germany; but he could not be tempted away from his editorial position. Once he accepted the nomination for Representative to Congress, knowing that his district was hopelessly Democratic, and that there was no prospect of his election. In 1867 he served in the State Constitutional Convention, in which he was chairman of the Committee on Education. He frequently took part in the debates, and made an elaborate speech in favor of the extension of the franchise to women,—a measure of which Mr. Curtis has been for years a consistent advocate.

Mr. Curtis was married in 1857 to a daughter of Mr. Robert G. Shaw, the eminent philanthropist, recently deceased. For many years he has resided in West New Brighton, Staten Island, except during the summer months, when he seeks rest and relaxation in a pleasant, old-fashioned country home in the village of Ashfield, Massachusetts.

His devotion to journalism and political affairs has prevented Mr. Curtis from pursuing authorship as a profession, if we are to regard authorship as the writing of books; but although he has put forth no volume since the publication of "Trumps," the readers of the "Easy Chair" in "Harper's Magazine," and of "Manners Upon the Road" in "Harper's Bazar," will recognize in him the most charming essayist of the day. The delicate,

graceful humor of these papers, the purity of style, the wide range of culture and observation which they indicate, but which is never obtrusive, give them a distinctive character of their own. The "Easy Chair" is the first part of the magazine to which the reader turns. The author of "Trumps," "The Poti-

phar Papers," and "Prue and I," could hardly have failed as a novelist, had he chosen to pursue that path of literature; but we will not regret his choice, for while we have many novelists, where shall we look for another name like his in the field of American journalism?

THE LADY OF THE EAST.

(ON A DRAWING BY JOHN LAFARGE.)

WHO art thou, Lady of the East,  
Whose day of eyes and night of hair  
The daughter of a king, at least,  
Proclaims, so brightly, darkly fair?  
Thy life is a perpetual feast,  
With but a single shadow there.

What is it, Lady? Some sweet thing  
Which once was thine, but now is fled?  
Thy lute hath lost its golden string?  
Thy rose its freshest odor shed?  
The bird thou lov'st has taken wing,  
And to another sings instead?

What is it, Princess, that hath cast  
This sudden sadness on thy brow?  
The shadow of what loving Past?  
The memory of what broken vow?  
Girlhood hath gone from thee at last,  
And thou art perfect woman now.

I see thee as thou standest there  
With those mysterious eyes of thine,  
And all that midnight length of hair,  
Like Dis's pall on Proserpine:  
I only know that thou art fair;  
I only wish that thou wert mine!

What Earth's first women were, thou art,  
Glorious and gracious to behold,  
With greater steadfastness of heart,  
Though cast in less heroic mold;  
And yet with tears that sooner start,  
And smiles that were not known of old.

Thou hast no need to wear a crown,  
So royal in thyself art thou:  
And whether Fortune smiles, or frowns,  
Thou hast the same unruffled brow;  
Content if only men bow down  
And worship thee—as I do now.

*Richard Henry Stoddard.*

## MY GARDEN.

Oh my garden full of roses,  
Red as passion and as sweet,  
Failing not when summer closes,  
Lasting on through cold and heat :

Oh my garden full of lilies,  
White as peace, and very tall,  
In your midst my heart so still is  
It could hear the least leaf fall :

Oh my garden full of singing,  
From the birds that house therein —  
Sweet notes down the sweet day ringing  
Till the nightingales begin :

Oh my garden where such shade is,  
Oh my garden, bright with sun,—  
Oh my loveliest of ladies,  
Of all gardens, sweetest one !

*Philip Bourke Marston.*

## THE LED-HORSE CLAIM.\*

A ROMANCE OF THE SILVER MINES.

BY MARY HALLOCK FOOTE,

Author of "Friend Barton's Concern," "A Story of the Dry Season," etc.

### XI.

#### THE HONORS OF THE CAMP.

A TELEGRAM to the home-office, conveying the news of the fight and its result, was immediately followed by Hilgard's formal resignation.

This step was not taken from any consciousness of mistaken or excessive zeal, but from the personal aspect of the situation. Hilgard was like one stretched on a bed of pain who fancies that if he could get up and move around, the pain would be more endurable. He longed for anything rather than continuance of the present. His letter of resignation was accompanied by a brief statement of the circumstances that had led to the fight, and which had made it, so far as the Led-Horse was concerned, inevitable. The answer to his telegram prepared him for the prompt acceptance of his resignation. It was carefully worded and evidently intended as an official comment on his action. It was as follows:

*"Officers of company deplore unhappy tragedy of twenty-second. They repudiate measures requiring sacrifice of life for property. Less violent policy would better represent company."*

The administration in the East, while conceding discretionary power to the executive in the West, was keenly sensitive to any responsibility which might attach to itself through the exercise of that power.

"They don't repudiate the mine," Hilgard said to himself, bitterly. "Their scruples won't prevent their pocketing the dividends after

they have washed their hands of the men who saved their property."

For himself he did not care; it seemed but a grimace of that fate which had first dealt him its cruelest blow; but it hurt him to think of West. The only elaborate part of his letter had referred to West's share in the discovery and the quenching of the plot. He had taken a chief's pride in the loyalty and courage of his adjutant, and he commended him earnestly to his successor. Perhaps some recognition of his service, the kind of service that has no price, would come later. In the meantime he suppressed the telegram. He was ashamed to read it to the man who had said, "I reckon I could hold the drift alone!"

"They think it's a kind of Border-ruffianism," Hilgard said to himself; "they don't consider it legitimate mining."

It could not add to his hopelessness, but it embittered it somewhat, to find himself credited with the principles and classed with the very men he had sacrificed his life's happiness to defeat.

That element of the camp of which the Shoshone policy was the exponent accepted Conrath as its martyr. Gashwiler would have been a far less interesting figure in death. He and Conrath were both jumpers; but Gashwiler was known to be a professional jumper, while Conrath could claim the distinction of an amateur. Gashwiler was not young and handsome, not supposed to come of a good eastern family. Gashwiler's family was a subject of general indifference. He was not particularly free with his money.

\* Copyright, 1882, by Mary Hallock Foote. All rights reserved.

There were no ladies of fashion in the camp who would be likely to exchange reminiscences of his attentions to themselves, or compare their respective degrees of intimacy with the hero of the hour. Even the sober, thoughtful citizens, who would have dismissed Gashwiler's removal with the unperplexed sentiment that he had got his deserts, found a certain pathos in the fate of his young chief, cut off by an act of wild justice, at the beginning of his career.

Few stopped to think what that career was likely to have been. The more picturesque portion of the population of the camp was ready to say, "Poor fellow," in the general consciousness that the compassionate epithet might eventually apply nearer home. Of such frail clay were they themselves fashioned.

A delay, inexplicable to Conrath's friends, in the reply to their telegram to his father, roused a good deal of feeling among them. It was hastily assumed that Conrath's family had "gone back" on him. The facts of the case were, that when the telegram reached New York, his father was on shipboard between that city and Havana, where his wife had been ordered by her physician to spend the winter. The silence was certainly far from paternal. The camp was sensitive on the point of its relations with the east, especially in the event of death. Whatever their indifference or faithlessness to their eastern ties during life, the men of Conrath's rank on the frontier confidently expected those ties to contract in the extreme moment, and restore them to their early associations.

Without waiting for the silence of Conrath's father to be explained, the Shoshone partisans rose in wrathful championship of their insulted comrade, and said:

"If *they* can't bury him decently, damn him, we'll bury him ourselves!" The case of the living sister could wait on that of the dead brother.

It was on this honorable errand Gashwiler had come, when he encountered Hilgard in the first strong agony of his bereavement.

Gashwiler did not see Miss Conrath, but he had a long and exciting argument with Molly, who protested that her mistress should not be disturbed on this or any other business. She had met Cecil in the passage, after her parting from Hilgard, and, with a sure instinct, the girl had known that the hour of her young mistress's extremity was come. She indignantly repudiated, in her mistress's name, the offered honors to the dead.

"Wouldn't ye leave her even the body? Sure, *she'll* never sit behind that hearse—trailin' through the streets along with the lot of you, an' your music, an' your mil't'ry! She's not proud of his dyin', that *she'd* want

the whole camp to be throopin' after 'im. The least ye can do is to leave him to her now!"

But Molly could not prevail alone against the resolute sympathy of Conrath's constituency. All she could do was to soften the proposition by a little merciful deception, and present it as a decent, kindly offer to give the chief of the Shoshone appropriate burial at the hands of his fellow-Masons and comrades of the militia regiment to which he had belonged. Cecil gave her helpless consent, with the condition that all the expenses should be referred to her father. She was too far prostrated in body, as well as in spirit, to know more of the last scene in the tragedy of her life, than such dreary echoes as penetrated the darkened seclusion of her chamber.

Conrath's body was borne out of the house and conveyed to the camp, where it lay in state in the unfinished hall of the new Masonic temple, to be gazed upon by the multitude. It was subsequently enshrined in a plumed hearse, drawn by eight horses, fed on hay at one hundred dollars a ton. It was preceded by the regiment of militia, keeping step through the miry snow of the street, with guns reversed, to the measures of the Dead March. The band which furnished the music was attached to one of the principal variety theaters, and, in the intervals of its regular performance, was often required to assist at funerals, where the camp publicly honored some favorite actor in its social dramas, on his exit from the stage. The Masonic society marched behind the hearse in full regalia, followed by the fire companies and the populace. The latter had turned out promiscuously, on foot, or mounted on "livery horses" of uncertain gait and temper, and might be relied on to appear at any point in the procession, according to its caprice, joining the ranks of the Masons, the militia, or the firemen, and keeping up a current flow of conversation on topics more or less relevant to the occasion. The cortège moved on slowly along the principal streets of the town, and out through its straggling suburbs to the cemetery.

The ladies who joined in this public tribute were easily accommodated in three or four carriages. In the first of these sat Mrs. Denny. A prevalent theory of Conrath's death was that there had been bad blood between the two young superintendents from other than business causes, and Mrs. Denny enjoyed a temporary supremacy among the ladies of Conrath's preference as the heroine of this rumor. Hilgard's fate relented toward him in this one instance, and spared him the knowledge of this romantic fiction of the camp, which joined his name with Mrs. Denny's.

The cemetery was a grim, untended spot, an acre of the primitive fir-forest, sloping westward toward the valley, and exposed to the winds that blew across from the snow-covered peaks. The fire and the ax had passed over the forest, and the nakedness of the land was left as the inheritance of that peaceful community which had pitched its low tents on the bleak slope. A few stumps and stark, blackened pine-trunks, a few young, slight trees, the sole mourners of the forest, supplemented the scant memorials raised to the human dead. Unpainted boards marked alike the graves of those who awaited at the hands of distant friends removal to a more permanent resting-place, the graves of the poor and the unknown, and the graves of those, whose place of rest was of less importance to the general public than its finality. The camp grave-yard, like the camp itself, was peripatetic. The city was at that time reserving the money it might have spent on its adornment, in contemplation of its removal to another spot.

The heavy, soft snow had sunk and melted under the high glare of the sun, and lay in patches, like linen spread to bleach; offering a grotesque, irreverent suggestion that the dwellers in those sunken mounds might have risen in the night and washed their earth-stained cerements in readiness for the pending order to "move camp." The funeral procession, invading this desolate inclosure, took nothing from its haggard loneliness. It was impossible to associate the place with human love and reverence, or even with humanity's last, enduring rest.

Conrath's body was lowered into the alien soil. His final allotment of it was small, and was grudged by none. Here no locator encroached upon his neighbor's claim, and the original boundary lines were kept inviolate. A brief stillness fell upon the multitude, diverse and disunited as the stones of a river bed, except in the wave of sentiment which had brought them there; and then the words were spoken, of a common humility and a common hope.

The militia company, drawn up by the side of the grave, fired a volley over it. The second volley scattered badly, and the crowd, recovering from its momentary reflectiveness, echoed the failure with jeers of derision. The mounted mourners had become exalted, during the ceremonies, to a pitch of solemn enthusiasm which could only vent itself in the racing of their horses back to the camp; and the militia company reported at its captain's head-quarters before nightfall, and drank to Conrath's repose, in a keg of whisky opened for the purpose.

Hilgard had considered the spectacle of his victim's last honors, from the sidewalk of the principal street. The moving crowd, keeping pace with the procession, shoved against him, and occasionally pointed at him as an object of interest only second to that concealed from public view in the flag-draped coffin.

That night was Hilgard's last in the camp. At two o'clock of the chill, wan morning, in company with Godfrey, he was on his way to the new railroad station, which had lately superseded the stage office. The empty streets were covered with a light, pure renewal of the previous snows.

"What a ghastly hour for a train to leave," the doctor said, as they walked shiveringly the length of the platform, printing their progress on the untrodden snow. "We're recording ourselves at a great rate on these sands of time. Time here is eternity in the rest of the world. The shipwrecked brother will have to hurry up if he wants to profit by our foot-prints."

A truck passed them, with Hilgard's trunk piled among the others, eastward bound.

"You'll take all that's left of my youth with you, my boy."

"No, doctor; you are younger than I am now."

Godfrey stopped and looked earnestly at Hilgard.

"You're morbid, George. You're taking a bigger load on your shoulders than belongs to you. Try to look at it simply, and remember that poor Con didn't know how to live, anyway. He carried too much wick for his candle; he never could have stood a draught. Fate has been kinder to him than to you."

"Doctor, I can't talk about it!"

"Well, you'd better. It's better to handle a trouble pretty freely, and secularize it, so to speak, before it masters your common sense. I suspect you're hiding a deeper hurt—I won't touch it, boy; only just let me say: Don't think that everything ends here. If you spoke to her now, you spoke too soon."

"She hasn't heard from her father yet," Hilgard said after a pause. "Is there no one to take care of her but that bedlam crew?"

"She *has* heard—she heard to-day. Her father's coming for her, and the minister's wife has found her out. She's a friendly little soul, with a lot of children." And then he added, "Remember, George, you can count on nature in the long run. I don't mean to flatter you, but did you ever ask anything of a woman and want it very much, and not get it?"

Hilgard flushed angrily.

"Do you call that flattering me? It is not a question of women, and it's not open to discussion."

"I'm done, boy—I'm done—only, just

remember this: The worst thing that can happen to a man is to get some things, the best things, too easily."

"You've been my friend in a place where I haven't many," Hilgard said, relenting.

"You've had plenty of my kind. I tried to be your friend once, in a way that would have made you furious if you had known, but I didn't succeed."

"I don't know what you mean."

"I don't suppose you do. It's a pity I didn't succeed. However,— Well, take care of yourself, boy! My feet are confoundedly damp."

Hilgard looked after the stout, stooping figure, shuffling away through the chilly streets, and the dull ache in his breast included older failures, and more hopeless ones, than his own. The world seemed full of them.

As he turned he saw West, who had ridden Peggy down from the mine, and stood near the post where she was hitched, waiting for Hilgard's recognition.

Peggy's toilet had been carefully attended to. The smoke from her silky sides rose in the cold air. It might have been the sickly gleam of the station lamps that gave West a pale, dragged look.

Hilgard slipped his hand under Peggy's mane and patted her warm neck.

"You'll see that they take good care of her, West."

"I will, sir. Peggy and me'll leave the camp together."

"I don't mean anything of that sort. We haven't, either of us, any money to invest in sentiment."

"I know it, sir," said West, turning red. "But a man can fool himself with his own money, if he wants to. Peggy's all the Led-Horse I want! I'll take her for my two months' pay, if they'll call it square!"

"You mustn't do it, West! She isn't worth half of it. I've used her hard, poor old girl! She was too light for my weight." He slid his hand down her fore leg, which she lifted obediently. "Her feet are all banged up. She needs a six weeks' run in the valley."

Peggy was smelling around Hilgard's pockets.

"Prospecting for sugar, Peggy? The sugar's in my other clothes. West, I wish you were going along."

"I wish so, too, sir."

"If I should find another job pretty soon, with decent pay, would you come with me? I don't want to interfere with your chances here."

"I aint takin' any chances here," said West, grimly. "They'll be havin' a new deal all round, when the next boss comes out. I'm going to quit before I'm kicked out."

"You're just as well out of it. It's an ugly camp. Gashwiler is not done with you."

"I expect not. Maybe I aint done with him."

"You'd better get out of it, West! You're too good a man to be fooling with that kind of thing."

"Yes," said West. "They've got a notion in this camp that *fight's* all there is of me; but you know better than that, sir!"

"I should think I did. Well, look out for yourself!"

They shook hands silently.

As the train moved out of the depot, West stood with his arm across his saddle, his head hanging down.

"There aint a man on top o' ground I'd put up more on than him; I wouldn't wonder if he'd know it some day," he muttered to himself, and, remounting Peggy, he rode away, through the snow-glimmer, under the dark, starlit sky.

Hilgard, looking from the car-window on the long grade descending toward the valley, saw the shrunken old moon crawl up above the notch of the Pass. A light glowed from the Led-Horse shaft-house, but the neighboring light across the gulch was out.

## XII.

### ON THE DOWN GRADE.

THE glittering snows of the Range melted into gray, soft showers as the eastward-bound train reached the valleys at its foot. The valleys opened and widened until, like rivers entering the sea, they were lost in the effacing levels of the plain.

At that season of dearth the brown plains of Colorado and Kansas were swept bare as threshing-floors, where the feet of wandering herds beat out the desert harvest, and the winds met at the winnowing, mocking the sterile crop and scattering it in wild eddies, mingled with the dust of the arid trails.

In a single night of travel the naked, titanic plains were changed for the rich savannahs of eastern Kansas, green with miles of sprouting wheat. For eyes tired with dust-laden winds and glare of lofty snow-fields, there was rest in this breadth of fertile country, dimly seen through the rain-mist which was gathering and trickling against the car-windows. To Hilgard's homesick gaze it looked like the "lap of earth."

The rains continued. The deep, narrow runs that go winding and looping through the woods of Missouri were filling their dry, summer channels from the low clouds. It was bright, windy weather crossing the rolling prairies of Iowa and the level prairies of Illinois. Chicago was gray and chill with

the lake fogs at evening; but morning in the valley of the Genessee was red,—red with autumn woods, and the broad, low light of the sun shining through haze.

The "limited express" hurled itself into the stillness of the landscape, giving it a dizzy, panoramic movement; the woods marched like processions with banners along the horizon; fields of standing corn, barns, fences, villages, reeled past; young girls in doorways, groups of school-children, or men at work in the fields, waved a greeting to the train, and were left behind; and, long after they had gone their way, the figures and gestures remained transfixed on the vision, like an instantaneous photograph.

On that last day of his homeward journey, Hilgard watched the yellow twilight reflected in the upper reaches of the Hudson. The trains dashed past the lights of riverside hamlets and ferries, past little fleets of sloops, creeping with the tide round a bend of the river, and lazy communities of canal-boats trailing behind the urgent propeller; past country-seats, looking out from wooded knolls and farm-houses sheltered in the hollows, it came clanging into the dingy depots of the river cities. The familiar life roused him, like the pang of returning consciousness, from the dream-like succession of days and nights, set to the monotonous, rhythmic jar of the car-wheels pounding on the rails.

He entered New York with the daily incoming throng of summer tourists, returning from the sea, from the Islands of the St. Lawrence, from the mountains and lakes,—from camping, yachting, hunting, and dancing. He registered his name at a hotel opposite one of those small, sunny parks where summer in the city lingers longest, and appeared duly before a meeting of the Board of Directors of the Led-Horse. The directors found the situation an unexpected one; it was curious, it was even picturesque, and it implied an un hoped-for degree of prosperity in the future of the Led-Horse. Hilgard took his questioning very quietly. When the gentlemanly directors, finding, on reviewing the circumstances that, in point of sentiment, a small deficit remained on their part, proposed its settlement with a check, Hilgard replied:

"Gentlemen, you have paid me my salary as superintendent. I have simply been your superintendent, nothing more."

Hilgard had expected to lose no time on his return in looking up a new situation, and getting afield again; but he had not been prepared to find that the story of the fight in the drift had preceded him. The adventure met him everywhere among his acquaintances. It excited a certain enforced

admiration, but it impressed the Eastern business mind as something excessive; as pitched not quite on the key of daily life.

Hilgard had known little of his native city, since at twenty he had gone to the western frontier under the auspices of a government topographical survey. There were links of old acquaintanceship and of family that still held, in spite of his absences and wanderings, but he hesitated, in his sick and sore self-consciousness, from meeting familiar faces and subjecting himself to friendly questioning.

He thought he would go down to that quiet midland village where his half-brothers were at school. He had seen very little of them since their infancy, but they were endeared to him, not only for the sake of his mother and theirs, but through grateful memories of their father, who had been his model of manhood. Captain Norton's heroic and untimely death at sea had been more of a conscious loss to his step-son than to his own baby-boys. The twice-widowed mother, whose beauty, if it had brought her more than the common share of love, had not saved her from more than an equivalent of sorrow, did not long survive this last blow.

The thought of these two lads, and of their claim on his future, was, perhaps, the only one at this time that Hilgard could dwell upon in security from pain; and yet day after day found him still in the city.

A deadly weariness, like nothing he had known, an apathy, as of premature age, had crept into the marrow of his bones, and taken from him his native instinct of resistance. He often found himself shivering in the soft, fall sunshine. His thoughts seemed to swoon in the vacuum of his mind. He wondered indifferently if he could be ill; he had never counted illness among the chances of his life, but he would have welcomed it, if he could have believed it would come quickly and end surely all future chances.

One evening, before the level sunset light had faded from the house-fronts, he was sitting on one of the benches in the little park, with his face turned away from the passers along the walks. He was meditating on that balance-sheet of sentiment between himself and the Led-Horse, and reviewing the events of the summer with a sickening doubt of his own action. People who paused to take a seat on the bench beside him, stared at him intently and passed on. Beautiful women and young girls, rustling by in rich fall costumes, looked back at him and whispered together. Little children, swinging from their nurse's hands, regarded him curiously; the gaunt shadows of the leafless trees that were short on the asphalt walks, wheeled and lengthened softly

over the turf. The sun dropped below the roofs; the shadows were diffused, and the after-glow mounted to the rows of upper-windows fronting the square. Gray twilight came down, and the myriad gas-jets started into life through all the purple vistas of streets, rising to meet the long, bright lanes of sky. A four year-old child, loitering behind a white-capped maid, paused beside Hilgard's bench and laid a hand on his knee.

"What is the matter? Why don't you go home?"

The childish treble pierced Hilgard's dull mood, but he had no answer for the question. The maid returned in angry haste and hurried the child away.

Hilgard got upon his feet, stung by this involuntary tribute to his condition. Had he then become an object of such public commiseration that even the babes pitied him, and counseled him out of their wisdom of the nursery.

Mounting to the floor of his room he noticed, with vague surprise, that the motion of the elevator made him giddy. He staggered as he stepped into the corridor and apologized mechanically to a lady whom he had jostled.

She appeared to be a newly arrived traveler, waiting for the call-boy with her hand-luggage to show her to her room. She had a sensitive face, of a type we instinctively refer to pictures of a by-gone generation of faces. She looked at Hilgard earnestly, as he lifted his hat and muttered his apology, and with a slight, nervous blush, appealed to him in her momentary annoyance.

"I think I have mistaken the floor my room is on. The boy was to meet me at the elevator with my things and show me to fifty-six."

"Fifty-six is on this floor, madam,—I am going that way."

The lady hesitated, as if she felt under some obligation to wait for the call-boy; and then followed Hilgard along the hall. He tried to keep the number in his mind; the succession of white doors, with gilded numerals on them, swam before his eyes; the hall seemed endless, and the floor to rise and sink under his feet like the deck of a ship. He stopped and steadied himself against the wall.

"Why, here it is! thank you very much!" the lady said, in a tone of relief. At that moment a door on the opposite side of the hall unclosed, and the shock of a sudden heart-breaking recognition roused Hilgard like a blow in the face. Cecil Conrath had opened the door of fifty-six, and stood the width of the corridor away from him looking into his face with the blank gaze of a stranger.

The little lady made an exclamatory rush forward and the door was shut. Hilgard stood a moment staring at the number outside it, and then went to his own room. He made an effort to light the gas, groped about helplessly and sank down in a chair, the blood heavily surging in his veins. It ebbed wave by wave, and his life seemed ebbing with it, in slower and slower pulsations.

The servant coming in a few minutes later with a pitcher of ice-water, found him, in the dim light that streamed into the room from the transom, lying back in his chair, white and senseless.

### XIII.

#### NUMBER FIFTY-TWO.

THAT part of his journey to the mountain camp which had reference to his daughter, had not given Mr. Conrath much uneasiness beforehand. He thought of her as little more than a child, to be petted into forgetfulness of the shock she had suffered. He did not know how fully Cecil might be acquainted with the circumstances of her brother's death, and he avoided any allusion to the subject; at the same time he resented her unyouthful silence, and the absence of all appeal on her part to the paternal refuge.

Cecil was not aware of the reproachful power of her grief. The effort by which she had set every strained and quivering nerve to its silent endurance had left her no strength for self-analysis or for comprehension of another's phases of feeling. As for help in her trial, she would sooner have asked the prayers of the church for one whose burden was heavier than she could bear, than have appealed to that automatic relation which was all she had ever known of fatherhood.

When Mr. Conrath proposed to find a suitable escort for her on her homeward journey, and to remain himself a week longer in the camp, for the purpose of investigating an interest his son was said to have had in some presumably valuable, though undeveloped, mining properties, Cecil gave a listless assent. It was arranged that she should travel in company with a lady experienced in railway journeys, opportunely going east, as far as Chicago, and be met in New York by her mother's sister, Miss Esther Hartwell. At the hotel selected by Mr. Conrath they were to await his return and his subsequent plans for Cecil's future home.

Home!—the very word seemed to mock the fragmentary, wistful existence which had been her life since early childhood.

Mr. Conrath's enforced stay in the camp was prolonged from day to day, while Miss Esther silently repined at her life of idleness, with her fall sewing yet undone, in a city full of men and women, all overworking or overplaying—while Cecil listened to every footstep along the hall, and paled or flushed expectantly, growing daily more restless with the haunting thought of Hilgard near, yet never seen.

Ten days had passed, and Hilgard had been sinking deeper, day by day, in that rift of oblivion into which he had fallen. The tide of movement in the city set southward in the morning and northward at night, through the shrill, echoing channels of its streets. There were inquirers for him among Hilgard's acquaintances, but they answered each other that he had gone out of town, probably, on that visit to his brothers, which he had mentioned among his earliest intentions. He lay, drifting fast toward the crisis of his strength.

"Cecil, do you know we have a case of fever in our hall?"

Miss Esther had gathered the information from scraps of talk in the elevator during the day's ascendings and descendings, and confirmed it through the medium of one of the chamber-maids. "It is only two doors from us,—fifty-two. Nobody comes to see him, Ellen says, except the Doctor; and he has a hired nurse."

Miss Esther Hartwell was from the country, and classed hired nurses with baker's bread and shop-made underclothing, and other desolations which properly belonged with the homeless existence of people who lived in hotels and boarding-houses.

"It's been running more than a week, now," Miss Esther continued; "they say he has typhoid symptoms, if it isn't the real thing. It seems as if I couldn't sit here, day after day, with my hands folded!"

Miss Esther was not literally sitting with her hands folded; on the contrary, her active habits were asserting themselves on a circuit of the room, for the purpose of softly dispersing, with a hare's-foot brush, the faint gray dust-films which had settled on the ornaments and carvings. The puffs of hair laid against her temples looked as if a faint gray film had settled on them too, but it had come gradually, and would not be brushed away until the finger of time should obliterate the gentle picture, of which it was now an essential part. It would be as impossible to think of Miss Esther without her soft, prim side-puffs, as without her gold eyeglasses, with their slender, worn rims, or the delicate depressions around her mouth and nostrils.

Cecil was standing at the window, with her back to her aunt, her elbows resting on the low sash, her head bowed between her hands until her forehead touched the cool window-pane.

Miss Esther was accustomed to Cecil's long silences; she thought the girl brooded too much, but she remembered her own youth, and youth's passionate preoccupation with its own troubles. She had not expected from Cecil much demonstration of interest in that forlorn sick-room, which appealed so strongly to her own experienced sympathies.

"I've known cases," Miss Esther meditated, aloud, "where they slipped away just at the turn, for want of some one who wouldn't give up hope. There are always plenty who will say, 'Oh, let him rest—let him draw his last breath in peace!' but then is the time not to think of rest."

Miss Esther shut the brush away in the drawer of a side-table, and stood with her back against it, still wrestling with the helpful impulse, of which she was half-ashamed, as we are apt to be, of gratuitous impulses of that kind. Her eyeglass fell, and tinkled softly against the buttons of her dress.

"Have you thought of offering to help nurse him, Aunt Esther?" Cecil asked.

"Anywhere but here I shouldn't stop to think about it,—I should go right in!" Miss Esther replied with energy. "After all, suppose he *is* a stranger," she argued with her own doubts,—"*he's* our neighbor in one sense. I'm ashamed to pass that door, and never even ask if there is anything I can do."

Cecil came and stood beside Miss Esther, half-embracing her, and crushing her firm young cheek, in which a sympathetic glow had begun to brighten, against Miss Esther's side-combs.

"You are good enough to do things you feel like doing, without stopping to think. You would do it at Little Rest?"

"At Little Rest!" Miss Esther repeated,—this isn't much like Little Rest! Here, it is the first law for every one to mind his own business. I can't get it out of my mind, Cecil, that he is the same young man I met in the hall the night I came. He looked so strange! I said to myself then, either he's stricken with some sickness or ——" Cecil looked at her aunt fixedly, while the arrested blush faded from her face. ——"*or else, he's been drinking!*" Miss Esther concluded in an undertone, burdened by the gravity of this last hypothesis.

"He might have been sick or dying; but he was not *that*!" Cecil said. She stood before Miss Esther, and put out her hands with a piteous gesture.

"Will you go to him now! Don't stop to

think any longer. What does it matter where we are? Ah—*go!*” she entreated in her sudden unaccountable excitement.

“Why, Cecil, do you care so much?” Miss Esther was utterly bewildered by the girl’s mood, but she had ever a gentle construction for all moods but her own, and found in this only an occasion for self-reproach. She took the young girl into her arms and let the convulsed face hide itself against her shoulder.

“Your heart is sore, poor child; too sore to bear anybody’s pain. I haven’t understood you; I thought you were wrapped up in your own trouble!”

“This—this is my trouble!” Cecil confessed helplessly.

“Don’t make too much of it, dear. I’m sorry I told you. After all, he *is* a stranger!”

“I hope he is; but, you *must* find out his name!”

Miss Esther had left the room and arrived at the neighboring door of number fifty-two, scarcely conscious of the steps which had taken her there, but once inside that door, face to face with an extremity of need, which she recognized at a glance, her perturbation was stilled by that active sense of power the true nurse feels in the presence of such need.

On her return to her own room, an hour later, she found Cecil lying on the bed, her eyes shut, her clasped hands close huddled beneath her chin.

Miss Esther softly drew up the coverlid over the motionless figure.

“I’m not asleep,” Cecil said, opening her eyes. She kept them on Miss Esther’s face, intently searching its expression. “What is his name?” she asked.

An intuition had come to Miss Esther during her absence which made it hard for her to answer. She sat down by the bed and laid her head by Cecil’s on the pillow. The girl did not repeat her question, but her hand wandered with a beseeching touch toward the face beside her own. Miss Esther took the hand and held it fast while she said, in the same hushed voice she had used in the sick room:

“It is a strange thing. He is that—Hilgard!”

The imprisoned hand closed quickly within her own and then relaxed. Cecil turned her face away.

“Did you know him, Cecil?”

“Yes.”

“Child, what can there be between him and Harry Conrath’s sister?”

“Nothing; but I may wish him not to die.”

Cecil lay, dull-eyed and silent, while Miss Esther stroked her unresponsive hand. Sud-

denly she withdrew it, and, rising on her elbow in the bed, demanded:

“What have you heard about him?”

“I have heard only what your father wrote me.”

“My father will never know the whole story; he knows—only one cruel thing!”

Cecil sank back on her pillow again, pressing her hands hard over her eyes.

“It is no use! I could never make you understand—no one will ever understand! Oh, why are men put in such places?”

She tossed her arms wide apart upon the bed, turning a look of suffering past all concealment upon the woman who was nearest to her.

“I love him,” she whispered, in all that was left of her choked utterance. “I could not take happiness from him—but now—now I may go to him! Now I can be merciful.”

“Hush, my poor child! Mercy is not in your hands,” Miss Esther said. “He is very young—he is very sick,” she added, simply, as if in further extenuation.

“But he was *not* to blame!” Cecil started up again and slipped from the bed to the floor, beginning, with trembling hands, instinctively to coil up her loosened braids. “I am going to him. It cannot do any harm. He shall know—” She stopped, arrested by a new and sickening doubt. “Aunt Esther, have you told me all?”

“My dear, there is not much to tell. He is very low. You must not expect him to know you. It is the same to him who comes or goes.”

Cecil received this blow in silence. She wavered in restless circles, like a broken-winged bird, around the room, and settled despairingly at last at Miss Esther’s knee.

“You will help him just the same, now you know who he is?”

“Help him? Why, Cecil, what kind of a woman do you think I am?”

“Oh, I know! I am talking wild! It is only I who can do such things. I let him go away that night without a sign. You saw he needed help. It was cruel to shut the door in his face.”

“Why, if you mean that night in the hall, I shut the door, Cecil. I remember——”

“Wont you go back to him now?” Cecil interrupted. “You have been a long time away. It will do no good for me to go, but I must—I must see him!”

Miss Esther yielded reluctantly to Cecil’s desire. The relation between Hilgard and her niece seemed too unreal, and, under the late circumstances, too unnatural to be admitted. Miss Esther, as Cecil had guessed, only knew concerning Hilgard the one fact

of the fatal conjunction of his name with that of her nephew. Mr. Conrath had written only enough to forestall rumor. He had neither defended his son nor accused Hilgard, but the simple fact of his death left Conrath master of sympathies that were already his by the tie of kinship, and had never been alienated by intimate knowledge of his character.

But Cecil's grief was not to be gainsaid. It was the more impressive from the silence that had preceded this sudden outburst of its smothered pain.

The two women went together along the corridor to the door of the sick-room. Miss Esther met the nurse, who admitted them with a few words of explanation, while Cecil, heeding no one, stared with dread into the gloom of the cool, shaded room.

The tenant of fifty-two lay sunk on a white, thinly-clad bed, the lines of his long form showing beneath the folds of the coverlid, like a carved effigy on a tomb. One hand, stretched by his side, stirred slightly, but the profile outlined against the swell of the pillow was as immobile as a death-mask. Cecil went to this figure and covered on the floor beside it, sparing her shrinking sight not one detail of the change. She crept close to the bed and laid her white cheek in the hollow of its dry, wasted hand. Her breath came in hard, tearless sobs. She gazed within the parted lids, where a dull, sightless glimmer remained. There was no recognition, no need for her to shrink where there was no importunity, to resist where argument and appeal had ceased. His estate was less than her own. The ruined tenement which had been his house of life was void and silent, welcoming no one, disputing no intrusion.

Though she had judged and sentenced him, she had held him blameless. She worshiped the steadfastness with which he had turned back to his barren post of duty in the face of a young man's last temptation. Who would ever understand, in the world of peace and order, that wild summons which had forced an instant's choice upon him! and where would peace and order be found, if there were no men to obey when such a summons came! And she had made him feel that they were forever aliens by this deed.

"My brother," she whispered, "my two brothers! God judge between you, and let me call you both mine!"

A small clock on the mantel ticked breathlessly, as if hurrying on the moments to the long silence on the threshold of which she knelt. In that sudden collapse of hope which youth can know, she felt that he was already gone. She could not conceive that a change so terrible might not be final.

Miss Esther went to her and with gentle insistence drew her away. At the door Cecil looked back as one who has laid the last flower on the bosom of the dead.

Miss Esther watched for the doctor's evening visit, and, when his examination of the patient was over, she proffered her help for the night-watch in a low-voiced conversation with him outside the sick-room door. Her quaint earnestness was mingled with a practical efficiency which the doctor recognized and readily availed himself of. At the close of their talk he alluded to the young lady visitor of whom the nurse had told him.

"A friend of the patient's?" he asked.

"She is my niece, doctor," Miss Esther replied. The doctor did not fail to note the evasion and her flush of embarrassment.

"The patient is a relative of yours, did I understand you to say, or of your niece?"

"He is not a relative, Doctor; I have no excuse for offering my help——"

"Except the best of excuses, madam,—that your help is needed. Mrs. Wren inferred that our patient and the young lady were not strangers to each other; does she propose to offer her assistance, too?"

"No, doctor—the patient is not a stranger to us, but my niece has no idea of helping to nurse him."

"Well, you know, it mightn't be altogether a bad idea. There might be circumstances that would make her presence, at least, a most fortunate thing for the case. I confess I counted on more resistance on the patient's part to the progress of the disease. There would be no need for volunteers by this time, if the case had developed as I expected. With his physique and at his age I didn't anticipate the least trouble. I'm inclined to think there has been some shock or strain that's telling against him now. The fact is, it struck me from the first that he wasn't particularly anxious to get well."

Miss Esther was silent a moment, and then, as the doctor appeared to wait for her to speak, she said:

"From what I know of him I shouldn't think he would be."

"But *why* shouldn't he? As far as one can judge by the outside of a man, he is well fitted to live."

"Oh, Doctor, there has been trouble!" Miss Esther admitted desperately.

"I supposed so. He appears to have something on his mind. It's often a very obstinate feature—the mind, you know. Mrs. Wren said the young lady appeared to be a good deal affected by the patient's condition. Was it with a particular interest in him

she came in to see him? It's—well—a little unusual, you know, unless there's some previous relation. This trouble you speak of—is it a common trouble—I mean a mutual trouble?"

"Yes, Doctor," Miss Esther replied, blushing with a sense of the responsibility imposed upon her. "It is partly mutual—that is—I'm not really in her confidence, but he is a great deal to her. I am sure of that. It's a terrible shock to her to see him like this. I don't know what influence she has over him."

The doctor smiled, as if to lighten Miss Esther's sense of the awfulness of her disclosure.

"Those things are often reciprocal, you know, madam. Is your niece's name Cecil, by the way?"

Miss Esther assented in surprise.

"The patient has mentioned that name. He wanders a little at times—can't get the number fifty-six out of his mind." The doctor glanced casually up at the door opposite.

"That is the number of our room," Miss Esther explained.

"Well, madam, if there is no serious objection—I wish the patient could see your niece, quietly you know, when he seems to be conscious. It may be another chance in his favor."

"I don't see what my niece can do for him, doctor—except deceive him," said Miss Esther, with shrinking conscientiousness.

"Our business, madam, is to get him well. He must take care of himself afterward."

About nine o'clock Miss Esther began her night toilet in preparation for watching instead of sleeping. She took out her tortoise-shell side-combs and rolled up her puffs into little flat rings against her temples and fastened each with a hair-pin. She substituted a warm wrapper for her rustling dress, and drew on a pair of noiseless knitted shoes. She wound her watch, and gave it a little shake before trusting to its good faith; then, in the silence of her own room, she murmured to herself the first verses of the psalm beginning: "Except the Lord build the house, they labor in vain that build it; except the Lord keep the city, the watchman waketh but in vain." And, in the familiar words, she commended her labors of the night to the source of all her modest courage.

There was one more duty to perform. She went to the bed where Cecil lay in a stupor of hopeless grief.

"Cecil, my dear, the doctor thinks we may need your help. Not to-night, perhaps, but you must be ready. You must not go to bed without food, if it's only a glass of milk. And you need not waste your strength

mourning for that young man while he is living. Better save it to help him keep alive!"

Miss Esther had seldom spoken to better purpose, but she did not wait to see the effect of her words.

Morning, when it came, found the watchers hopeful.

Limp as sea-weed forsaken by the tide, Hilgard lay waiting for the returning wave of life to uplift and outspread the dragged filaments of his consciousness. The tide was creeping back; at dawn it floated him off into a sleep like that of a new-born babe, from which he woke scarcely less weak than one, to rest his eyes on the face of Cecil Conrath.

During his waking hours, all that first day of hope, his large-eyed gaze followed her with a mute surmise. She was always silent, but there was a mysterious joy in her face which puzzled him; he could not connect it with himself. The appeal in his eyes grew sharper with his strengthening pulse, until, wearied with this fair, unanswering apparition of a forbidden hope, he turned away from it, and tears of baffled weakness stole from under his closed lids. Cecil laid her cool touch upon his wrist, and held it there until he turned his head toward her again, and lifting his eyes, faintly formed the words:

"Why did you wish me to live?"

She withdrew her hand, but steadily meeting his eyes, with that primal question in them, answered,—

"Because I could not die, too."

He continued to gaze at her, as if pondering her words, and trying if their meaning would stretch to the limit of his reviving longing. Cecil bent her head low, to hide the wild-rose color that bloomed suddenly in her cheeks.

"You are going to get well, for my sake," she said.

This was Cecil's deception.

No renunciation could have been quieter or more absolute in intention than hers, when she resolved that the way should not be left open for Hilgard's love to follow her when she left him again.

Her father returned, and robbed her meek sacrifice of its dignity by making it no longer voluntary.

Mr. Conrath felt no sympathy for any form of practical Christianity which took the women of his family into the sick-rooms of pilgrims and strangers. He found an absolute incompatibility between Miss Esther's spirit of promiscuous helpfulness and her chaperonage of his daughter. But, when the name of the patient transpired, Mr. Conrath permitted himself a vigorous use of language in characterizing this feminine crusade. He was under

"SHE DOUBTED LONG ON THE EVE OF HER DEPARTURE."

no illusions as to the part his son had taken in the collision between the *Led-Horse* and the *Shoshone*: the facts made it undeniably hard for Conrath's father to be magnanimous, since he was scarcely in a position to forgive Hilgard for defending the trust in his keeping from his son's rapacity.

Cecil was at once called upon to decide between two alternatives, either of which would remove her at once from her undesirable proximity. The choice lay between Havana and her stepmother's company and her grandmother Hartwell's house at Little Rest. Without hesitation, Cecil chose to go down into the country with Miss Esther to Little Rest.

She doubted long on the eve of her departure,—watching the night through, in weary tossings,—whether to go away without a sign, or trust herself to one last expression of her love to soften the fact of her desertion.

When Hilgard arose the next day from one of his long, restoring sleeps, a familiar perfume stole luxuriously upon his languid senses. The nurse brought to his bedside a bunch of long-stemmed, heavy-headed roses, and a note which had lain neighbor to them long enough to borrow a hint of their fragrance. But it

carried its own sting, keener than the sharpest of their healthy thorns. It was hastily written in pencil, in the hand Hilgard had seen once before when Cecil had bidden him to that forlorn tryst in the gulch.

The words of the note had been the result of Cecil's native necessity to be honest. "If it does harm," she had said to herself, worn out with self-conflict, "I cannot help it. I will give up everything, but he shall know that I love him." She wrote:

"My father has returned, and we leave town to-day. You must get well. I shall know, though I never see you, that your life will justify my love and faith. You need not try to find me. We are not for each other in this world."

Cecil's love had not enlightened her very deeply concerning the character of her lover, if she could imagine him restored to what he had been when she had first seen him, and yet passive under the gentle proscription. It served, however, as the tonic which his will required. It stung him into a passionate resolve to get control once more of that good servant, his body, with which he had so lately been willing to part company.

(To be continued.)

## FREDERICK LOCKER.

FREDERICK LOCKER. [FROM A PEN-AND-INK DRAWING BY GEORGE DU MAURIER.]

"PATRICIAN rhymes" is the apt phrase Mr. Stedman coined to characterize that kind of *vers de société*, nameless in English, which is more than mere society verse. It describes Mr. Locker's poetry more accurately than Mr. Austin Dobson's, for example, or Mr. Calverley's, since, as a rule, he confines himself more strictly within the circle of "good society," of Mayfair, and of fashion. Mr. Locker is the *du Maurier* of song, and his "London Lyrics" are as entertaining and as instructive to the student of Victorian manners as Mr. du Maurier's "Pictures of English Society." Mr. Locker has succeeded Praed as the laureate of the world, and he ignores the

flesh, and is ignorant of the devil, just as Praed did, and just as society itself endeavors to do. But Mr. Locker's range is wider than Praed's, whose success lay almost altogether in his songs of society; Praed was out of place when he ventured outside of Mayfair and beyond the sound of St. George's in Hanover Square; while Mr. Locker's Pegasus pauses at the mouth of Cité Fadette as gracefully as it treads the gravel of Rotten Row. The later poet has wider sympathies than the elder, who, indeed, may be said to have had but one note. The "Vicar" is a beautiful bit of verse, but its touch of tenderness sets it apart from all Praed's other work,

MR. LOCKER. [FROM AN ETCHING BY JOHN E. MILLAIS, R. A.,  
PUBLISHED BY E. MOXON & CO.]

which is brilliant with a hard and metallic brilliancy. Praed dazzles almost to weariness; his lines stand out sharply like fireworks at midnight. More brilliant than Praed no poet well could be. More pleasing Mr. Locker is, and gives a higher pleasure. He has wit like Praed, but far more humor; and the soft radiance of humor never tires the eye like the quick flashes of wit. With broader humor, he has a broader humanity, and a finer individuality. In short, the difference between the two may be summed up in favor of the younger man, by saying that Mr. Locker can write Praedesque poems,—compare “The Belle of the Ball-room,” for instance, and “A *Nice* Correspondent,”—while it may well be doubted whether Praed could have emulated Mr. Locker’s “To My Mistress” and “At Her Window.”

Of course, it is easy to say that Mr. Locker continues the tradition of Prior and Praed; it is easy also to see that, in two respects, at least, the progression shows the progress of the age. One improvement is in the form used by the poet; the other in the feeling, the temper of the poet himself. Praed contented himself with putting his best work into the eight-line stanza, now a little worn from overwork :

“Our love was like most other loves;  
A little glow, a little shiver,  
A rosebud and a pair of gloves,  
And ‘Fly not yet’—upon the river;  
Some jealousy of some one’s heir,  
Some hopes of dying broken-hearted,  
A miniature, a lock of hair,  
The usual vows—and then we parted.”

In this meter, Mr. Locker and Mr. Austin Dobson, in England, and Mr. Saxe, in America, have written verses that Praed might not

disown; but though the metal was theirs, the mold was Praed’s. Mr. Locker’s best work has not gone into any one form; he has wisely varied his meter; he has invented of his own, and he has borrowed from his neighbor. “A *Nice* Correspondent” is Swinburnian in its rhythm, and “To My Grandmother” repeats the measures of Holmes’s “Last Leaf,” a delightful meter, lending itself easily to intricate harmonies, and not to be attempted now by meaner hands :

“This Relative of mine,  
Was she seventy-and-nine  
When she died?  
By the canvas may be seen  
How she looked at seventeen,  
As a Bride.

“Beneath a summer tree  
Her maiden reverie  
Has a charm :  
Her ringlets are in taste;  
What an arm! . . . what a waist  
For an arm!”

Is not this the perfection of daintiness and delicacy? Is it not delightful—this mingling of sly fun and playful banter? And this brings us to the second quality, in which Mr. Locker and Mr. Dobson are plainly superior to Prior and Praed—in their treatment of woman. Prior thought of women with little feeling, and he wrote of them with little respect; however much he might pretend to worship a dame or a damsel, he kept a keen and unkind eye on her failings. At all times his tone toward women is one of good-natured contempt, often ill-concealed. With Praed, a complete change had come in the attitude; he is avowedly a friendly critic, and yet his verse catches no tinge of warmth from his friendliness. Though he may have felt deeply, he lets his skepticism

TAIL-PIECE TO THE PRIVATELY PRINTED EDITION OF “LONDON LYRICS.” [DRAWN BY KATE GREENAWAY.]

MR. THACKERAY READING "THE ROSE AND THE RING" TO MISS STORY. [DRAWN ON WOOD BY RICHARD DOYLE.]

and his wit hide his feeling until we are well-nigh forced to doubt whether he had any feeling to hide. The lively beauties who figure in Praed's glittering verse are far more true to life than the French fictions of Prior, but the ladies of Mr. Locker and Mr. Dobson are quite as charming and indubitably more natural. They are true women, too, not mere figments of the fancy; they are the result of later and deeper observation; and they have far more variety from the given prototype. Prior wrote of women at large, and Praed rang the changes on the "Belle of the Ball-room." Now, Mr. Locker has a gallery of girls, all fresh and ingenuous young maidens. Prior did not respect women; Praed admired them coldly; Mr. Locker has a warm regard for them, and a manly respect, and, also a demure humor which sees into their wiles and their weaknesses quite as sharply as did Prior or Praed.

Having set forth thus some of the things which Mr. Locker, the poet, is and is not, it may be well to give a few facts about Mr. Locker, the man. He was born in 1821. His father, Edward Hawke Locker, was in the public service, and took a warm interest in literature and art. His grandfather, Captain W. Locker, R. N., was an old friend of Lord Nelson's; and both Collingwood and Nelson served under him. Mr. Locker composed little until late in life, or at least, until he was thirty; and he found great difficulty, so he wrote to a friend, "in persuading editors to have anything to say to my verses; but Thackeray believed in me, and used to say: 'Never mind, Locker, our verse *may* be small beer, but at any rate it is the right tap.'" Thus encouraged, Mr. Locker wrote

on, and in time editors began to relent. In 1857, he gathered his scattered poems and put them forth in a single volume as "London Lyrics." As edition followed edition, he has added the few poems he has written of late years, and has dropped those of his earlier poems that he thought unworthy. The latest published edition—the eighth, I think it is—is scarcely any heavier than the first. Later than this, however, is a little book, beautifully printed and beautifully bound, which Mr. Locker has recently given to his friends, and which contains a special selection of his very best work, made by Mr. Austin Dobson, who has prefixed this friendly little sextain:

"Apollo made, one April day,  
A new thing in the rhyming way;  
Its turn was neat, its wit was clear,  
It wavered 'twixt a smile and tear;  
Then Momus gave a touch satiric,  
And it became a 'London Lyric.'"

Besides putting his own *vers de société* into a book, Mr. Locker made a collection, under the title of "Lyra Elegantiarum," of the best specimens in English of the *vers de société* and *vers d'occasion* of poets no longer living. Of this a new and revised edition was published in 1867; it is a model of what such a selection should be; and it was ushered in by an essay of the editor's—all too brief—on the art of writing *vers de société*. In 1879, Mr. Locker published a most amusing little volume of "Patchwork," containing bits of rhyme and bits of talk, with here a jest and there a joke, excerpts from his commonplace book, and enlivened with a few of the anecdotes he is wont to tell so effectively. For the lyrist of London is no recluse; he is a man of the world, even more than he is a

man of letters. His little breakfasts recall those of Rogers, whose kindness to young authors Mr. Locker also shows. He is connected by marriage with the Poet Laureate, and with the late Dean of Westminster; and he knows most of the celebrities of to-day as he knew those of yesterday. It is a pleasure to hear him tell of Rogers, of Luttrell, and of Thackeray. In life as in literature he has both humor and good humor. Although satiric by nature, he is thoroughly sympathetic and generous. Well-to-do in the world, he has been able to indulge his liking for the little things in art which make life worth living. His collections of china, of drawings, of engravings, are all excellent; and his literary curiosities, first editions of great books and precious autographs of great men, make a poor American wickedly envious. He is a connoisseur of the best type, never buying trash or bargain-hunting, knowing what he wants, and why he wants it, and what it is worth; and his treasures are freely opened to any literary brother who is seeking after truth.

In studying Mr. Locker's pictures of English society, we cannot but feel that the poet has drawn his lines with the living model before him. It is in the distinctively London-town lyrics—in "The Pilgrims of Pall Mall," in "The Rotten Row," in "At Hurlingham," in "St. James' Street," and in "Piccadilly,"

"Piccadilly! Shops, palaces, bustle and breeze,  
The whirring of wheels and the murmur of trees,  
By night or by day, whether noisy or stilly,  
Whatever my mood is, I love Piccadilly."

—it is in these that Mr. Locker most shows the influence of Præd, which is decidedly less apparent in the less local poems,—in "A Garden Lyric," in "On an Old Muff," in "Geraldine," and in the sportive and bright-some lines on "A Human Skull."

"A human Skull, I bought it passing cheap;  
No doubt 'twas dearer to its first employer!  
I thought mortality did well to keep  
Some mute memento of the Old Destroyer."

"Time was, some may have prized its blooming skin;  
Here lips were woo'd, perhaps, in transport tender;  
Some may have chuck'd what was a dimpled chin,  
And never had my doubt about its gender."

"It may have held (to shoot some random shots)  
Thy brains, Eliza Fry! or Baron Byron's;  
The wits of Nelly Gwynne, or Doctor Watts—  
Two quoted bards. Two philanthropic sirens."

"But this, I trust, is clearly understood,  
If man or woman, if adored or hated—  
Whoever own'd this Skull was not so good,  
Nor quite so bad as many may have stated."

Besides the playful humor of these poems, two things especially are to be noted in them—individuality and directness of expression.

VOL. XXV.—55.

Whatever influence you may think you see here of some other poet, Horace, or Béranger, or Gautier, or Thackeray—and the very variety of these names shows the poet's versatility—you cannot doubt that these poems are of a truth Mr. Locker's own, stamped with his seal, marked with his image and superscription. Here plainly is a man with a character of his own, looking at life through his own eyes, now laughing with hearty gayety, again smiling a sad smile.

"*'I still can laugh'* is still my boast,  
But mirth has sounded gayer;  
And which provokes my laughter most  
The preacher or the player?  
Alack, I cannot laugh at what  
Once made us laugh so freely;  
For Nestroy and Grassot are not,  
And where is Mr. Keeley?"

Quite as noteworthy as the individuality of the poet is his studied clearness. There is never an inversion or an involution; the verse is as straightforward as prose, and as easy to be "understood of the people." The rhythm flows freely; the rhymes are neat and novel, and never forced; and the manner never intrudes itself to the injury of the matter. But Mr. Locker is not like Théophile Gautier, that Benvenuto Cellini of verse, nor like the cunning artificers of Gautier's school,—poets who polish a poor little idea until they can see themselves in it. That he is ever going over his work with the file, any one can see who will compare the first stanzas of "Geraldine and I" and of "A Garden Lyric," but he never overweights his verse with a gorgeous setting, from selfish delight in the skill of his workmanship. Indeed, Mr. Locker sometimes has carried his search for simplicity of statement almost too far. But so many poets nowadays are as hard to understand as a Greek chorus, that we ought to be thankful to one who takes pains to be clear, and direct, and unaffected.

Affectation, indeed, is always a stumbling block in the path of the maker of *vers de société*; but in "London Lyrics" there are no traces of any slip. The poems are as simple and honest as the verse is direct and clear. Nowhere is affectation more easy than in addressing childhood; and, with the exception of Victor Hugo and Longfellow, perhaps, no poet of our day has written of children as often as Mr. Locker. He has made a "Rhyme of One," and "Little Dinky," a rhyme of less than one (she is twelve weeks old). He has written "To Lina Oswald" (aged five years), and to "Geraldine" (who is fifteen); and "Gertrude's Necklace" belonged to a maiden not much older. And all these poems to the young reveal the subdued humor and

MR. LOCKER'S BOOK-PLATE, DESIGNED BY H. STACY  
MARKS, A. R. A.

the worldly wit we have seen in the others written for their elders and betters, their pastors and masters, and they have even more of delicate tenderness and of true sentiment tainted by no trace of sentimentality. Thackeray, too, was fond of the young, and when he was in Rome, in 1854, he used to read the newly written chapters of "The Rose and the Ring" to an invalid daughter of Mr. W. W. Story. When the book was published he sent a copy to this young lady with an odd little sketch. This is the incident Mr. Locker versified and Mr. Doyle illustrated:

"And when it was printed, and gaining  
Renown with all lovers of glee,  
He sent her this copy containing  
His comical little *croquis*;  
A sketch of a rather droll couple,  
She's pretty, he's quite t'other thing!  
He begs (with a spine vastly supple)  
These are Mabel's roses.  
She will study *The Rose and the Ring*."

One of Mr. Locker's songs has a lyric grace and an evanescent sweetness, recalling Herrick or Suckling:

#### AT HER WINDOW.

Beating Heart! we come again  
Where my Love reposes;  
This is Mabel's window-pane;  
These are Mabel's roses.

Is she nested? Does she kneel  
In the twilight stilly,  
Lily-clad from throat to heel,  
She, my Virgin Lily?

Soon the wan, the wistful stars,  
Fading, will forsake her;  
Elves of light, on beamy bars,  
Whisper then, and wake her.

Let this friendly pebble plead  
At the flowery grating;

If she hear me, will she heed?  
*Mabel, I am waiting.*

Mabel will be deck'd anon,  
Zoned in bride's apparel;  
Happy zone! oh, hark to yon  
Passion-shaken carol.

Sing thy song, thou tranced thrush,  
Pipe thy best, thy clearest;  
Hush, her lattice moves, O hush—  
*Dearest Mabel!—dearest.*

Is not this a marvel of refinement and restraint? It is as purely a lyric as the song of the thrush itself. Especially in poems like this is it that Mr. Locker is wholly other than Praed, with whom people persist in linking him. He has at once a finer vein of poetry and a broader vein of humor. Perhaps, after all, humor is Mr. Locker's chief characteristic,—a gentle humor always under control, and never boisterous or burly, yet frank and free and full of mischief,—the humor of a keen observer, who is at once a gentleman and a poet. What, for example, can be more comic in conception, or more clear-cut in execution than this?—

#### A TERRIBLE INFANT.

I recollect a nurse call'd Ann,  
Who carried me about the grass,  
And one fine day a fine young man  
Came up and kissed the pretty lass.  
She did not make the least objection!  
Thinks I—"Aha!"

*When I can talk I'll tell mamma!*  
And that 's my earliest recollection.

It is in this quality of humor mainly, and in the fact that his verse is more individual than impersonal, that Mr. Locker's gifts differ from those of Mr. Austin Dobson, who is like Dr. Holmes in many things, and especially in that he dares not "write as funny as he can." At least he so impresses me. A comparison of Mr. Locker's work with Mr. Dobson's would, however, lead me too far afield, and, at best, comparisons are futile. Criticism is nowadays the tenth muse, and I am sure that Mrs. Malaprop would say that comparisons do not become that young woman. Suffice it to state that Mr. Frederick Locker and Mr. Austin Dobson stand each on his own ground, at the head of the poets who sing of English society as it is. Mr. Locker is the elder, and it was to him that Mr. Dobson dedicated his "Proverbs in Porcelain," in these lines:

Is it to kindest friend I send  
This nosegay gathered new?  
Or is it more to critic sure,  
To singer clear and true?  
I know not which, indeed, nor need:  
All three I found—in you.

*J. Brander Matthews.*

## EVILS OF OUR PUBLIC LAND POLICY.

THE cry of agricultural distress which has been heard for the last seven or eight years in the British islands, is finding an echo, faint, perhaps, but audible, in some of the older portions of the United States. The latest illustration of this fact is seen in connection with the fall in the price of fat cattle in the East, consequent on the successful shipment of dressed beef from the Western plains; and Western competition, in one form or another, is the thing most commonly complained of as a cause of diminished prosperity. An intelligent Maryland farmer recently said to me that this competition is felt by the farmers of his vicinity in everything they produce except the most perishable products, but chiefly in grain and hay. A resident of Loudon county, Virginia, informs me that grain culture has ceased to be profitable there. Beyond the Alleghanies, at least as far west as Ohio, complaint is heard of the diminished profits attending the fattening of stock.

It is needless, however, to multiply illustrations, since the existence of an agricultural depression more or less serious in the Eastern part of the country, appears to be pretty widely recognized. As one indication of this I may cite a writer in the agricultural columns of the New York "Weekly Tribune," who says it must be acknowledged "that Eastern farms are degenerating; that there is not apparent the thrift and energy of earlier days; that farm buildings, through lack of painting, indicate reduced incomes," and "that farm mortgages have increased in size and number." This writer appears to have a theory of his own as to the cause of this lack of prosperity, for he says that "Eastern farmers are slow in adopting needed reforms in methods," and that "many do not realize the rapid changes of the times, the results of the development of vast fertile territories," and of "the shifting of controlling centers of production,"—in other words, of Western competition.

It seems entirely probable that Eastern farmers, like most of their fellow men, are not so quick as even they themselves might wish in perceiving what is for their own advantage, and in learning how to adapt themselves to changing circumstances. Hence the advice tendered them by experienced agriculturists, as to the adoption of improved methods of farming, may be both acceptable and useful.

There is, however, a matter of a different kind which appears to me to be worthy of their attention. The exceptionally rapid

development of Western agriculture has not been a purely spontaneous phenomenon; nor has it been due so largely, as is supposed by certain writers, to the cheapening of transportation. That, of course, has been a circumstance favorable to agricultural development in the West, but the cheapening of transportation has itself been the consequence mainly of an agricultural development due to other causes. In the report on the internal commerce of the United States for 1880, by Joseph Nimmo, Jr., Chief of the Bureau of Statistics, it is shown (pp. 6 and 7) that while the charges per ton of freight on three of the leading trunk lines were reduced sixty per cent. between 1868 and 1880, the increase during the same interval in the quantity of freight transported was more than two hundred per cent.

The fact that other causes than cheapened transportation have been actively at work in promoting the development of Western agriculture is sufficiently patent; and what more especially concerns the farmer is that one of these causes is the course pursued by the Government with respect to the public domain. So far as the farmer's interests suffer from the action of the Government, they suffer from a cause subject in part to his own control; and he may fairly raise the question whether that action is, on the whole, so wise and beneficent that, notwithstanding the harm it does him, he ought to acquiesce in its continuance.

Within the last twenty-one years grants of land, almost equal in aggregate area to the thirteen original states of the American Union, have been made to States and corporations—in the main directly to the latter—for the purpose of hastening the construction of railroads in the public-land States and territories. These extraordinary premiums to railroad builders for making the public domain accessible in all its parts,—together with the premiums for settlement upon it offered by our practice of parting with valuable land gratuitously, or at a merely nominal price, or permitting its gratuitous use without title, in unlimited quantities as grazing grounds,—have operated as immense subsidies devoted to the rapid extension of agricultural and pastoral industry over new ground;\* the Western

\* This, too, while our protective tariff was largely based on the assumption that the tendency of our people to agricultural pursuits was already too great and needed counteracting by special inducements to engage in the manufacturing industries.

farmer or stock-raiser, in practically receiving his land for nothing, being placed at a great advantage over his Eastern competitor, whose land usually represents a large investment of capital.

It is possible, however, to conceive of a public-land policy thoroughly liberal to the actual settler, of which the Eastern farmer would have no occasion to complain. Under such a policy the public lands would have been scrupulously reserved for those whose labor was to make them fruitful, and not given away in large quantities even for so desirable an object as the construction of the transcontinental railroads; though at the time when the Pacific Railroad acts were passed it might have been well enough to provide for some assistance to such enterprises out of revenues to be derived from the public domain. It would have been the aim of the Government to allow to each settler a sufficient amount of land for his personal needs, limiting the quantity as near as practicable by his power to cultivate it without hired labor, and granting no more than this unless at its full commercial value.\*

A homestead law rests upon a sound and beneficent principle, if it merely relieves the settler from paying tribute for the privilege of applying his own labor and that of his family to the utilization of the gratuitous bounties of nature. Whatever goes beyond this in giving public land, or the free use thereof, to individuals, involves the principle of pauperism; which can never be more odious or less excusable than when the recipient of public charity is far above the need of it, as, for example, are the great stock-raisers of the Western territories, whose capital returns them from thirty to fifty per cent. per annum, or even more, in consequence of the advantage they have in being allowed to use Government pasturage without compensation.

Under such a policy as has been roughly outlined—supposing it to have been practicable in the past, as it certainly will be in the future—the course of settlement in the West would have been quite different from what it has been. Few persons would have cared to advance far into the wilderness and live for years in comparative isolation, for I am supposing the existence of a system which would not have offered them any inducement to do so,—a system under which no present

sacrifice of the advantages of society and the conveniences of civilized life would have enabled them to reap future profit on monopolized land at the expense of later comers. There would always have been free land to be had, in proper quantities, just across the line of previous settlement, within reach of roads and bridges, school-houses, churches, stores, and market towns. These advantages, as a rule, would have very much more than counterbalanced any superiority of soil to be found at a distance in an isolated situation, and settlement would consequently have progressed with something of the regularity of spreading waters, flowing round some of the least desirable lands as these flow round the higher ones, but compactly covering all that were adapted to advantageous use.

Favored by the comparative density of population, the mechanical and manufacturing industries would promptly have taken root in the new soil, keeping nearly abreast with the development of agriculture, and furnishing so large a local demand for its products that there would have been comparatively little left for shipment to the Eastern markets. In short, under such a policy there would have been a symmetrical development of the industries of the newly settled districts, and but little, if any, derangement in those of the older communities. Population in the West might have increased in numbers even more rapidly than it has done, but being less preponderantly agricultural or pastoral, it would have interfered far less with the interests of agriculture in the older States. That some such policy should be promptly adopted is a matter of great interest, not only to the Eastern farmer, but to the nation as a whole.

The policy actually pursued has for its worst effect the concentration of the richest lands and mines, the best town sites, and the most valuable water privileges in the hands of a comparatively small number of the early occupants of the country, leaving these to drive as hard a bargain as they please with those who may arrive on the ground somewhat later. A region comprising hundreds of millions of acres, still belonging to the Government, has been brought largely into use for pasturage purposes, in which no communities can be said to have been formed, the population—such as there is—consisting almost exclusively of men without families employed in herding. In the great wheat country of Dakota there is a somewhat similar state of things, the large farms, thousands or even tens of thousands of acres in extent, being worked by hired men, varying in numbers according to the season, and having no per-

\* In view of the fact that no price could at present be obtained bearing any just relation to the future appreciation of the lands disposed of, and for other important reasons which need not here be discussed, this value should, in my opinion, be paid in the form of an annual rent, the Government retaining its title to the lands, but giving to the settler a sufficient security of tenure to justify him in making permanent improvements.

manent footing upon the land. The more extensively the Western country is converted into such farms, the more seriously will its settlement interfere with the interests of Eastern agriculture. In this connection it is worthy of note that while the number of farms of more than 1,000 acres fell between 1860 and 1870 from 5,364 to 3,720, it rose between 1870 and 1880 from 3,720 to 28,578. During that decade the total number of farms in the country increased by fifty-one per cent., while the number of farms comprising more than 1,000 acres increased in the same period by six hundred and sixty-eight per cent. A portion of the increase in the number of these large farms was probably due to the division of farms of several thousand acres into two or more of more than one thousand acres each, but in the main it undoubtedly represents a tendency to a rapid growth of the system of large farming. In the West, I think, this is especially the case, and it is in that section that the percentage of increase in the number of large farms has been greatest. While it seems to be the fact that the system of large farming is attended by important and desirable economies in the processes of agriculture, the modicum of advantage derived from these economies by the public will be purchased far too dearly, if it is only to be had by permitting gigantic monopolies of the soil, under which the lion's share of all the benefits derivable from the system in question must fall into the hands of a few persons.

It is to be hoped that, under favorable provisions of law, agricultural coöperation may afford a wholesome substitute for monopoly as a means of securing the advantages connected with farming on a large scale. The prominent part played by railroad grants in promoting the formation of the great farms of the North-west indicates that the interests of Eastern agriculture would be subserved by an enforcement of the forfeitures incurred by various railroads—*forfeitures* under which grants having an aggregate area considerably exceeding that of the German Empire are now subject to the will of Congress, and might be restored to the public domain, if there were a public sentiment on the subject sufficiently strong, and if it were manifested with sufficient clearness, to stir that body to action.

Another consideration which has favored large acquisitions of land is the commutation feature of the homestead law. This allows a money payment of two hundred dollars to be substituted for four and one-half years of the prescribed five years' residence, and renders it easy for a capitalist to acquire

numerous homestead tracts at the nominal price of \$1.25 an acre, by hiring men to make a pretense of settling on them, who, at the end of six months, can take out patents and transfer the titles to their employer. The pre-emption, timber-culture, and other settlement laws are successfully abused for a like purpose, and there is, in fact, a general laxity—partly in the laws themselves and partly in their administration—which makes our public land the easy prey of the monopolist.

In large portions of the pasturage region the laws appear to be openly defied, many of the "cattle kings" proceeding in the most high-handed manner to fence in vast tracts of Government land, barring up public roads which run across their illegally appropriated ranches, and, at the point of the rifle or revolver, forbidding intending settlers to exercise their rights under the laws of the country.

But, apart from abuses and violations of law, our public-land laws are themselves far too liberal to the settler; that is, they are liberal to the settler of the present, at the expense of the settler of the future. In an official document submitted to Congress, in February, 1880, it was pointed out that, under existing laws, 1120 acres of public land may be taken by one person; and although this may not often be practicable, it is practicable in many cases to take up 480 acres: 160 as a homestead, 160 under the preëmption law, at \$1.25 an acre, and 160 under the timber-culture act, for the trifling labor of planting and caring for ten acres of timber—a labor which might well be exacted of every homestead settler in the regions wherein timber-culture is desirable, and one which the settler might profitably perform on his own account, even though it were not required.

Not only in the interest of the farmers of the older States, but on broad national grounds, we need a public-land policy radically different from our present one. What its general character should be, I have already endeavored to indicate, and, in the brief space now remaining to me, I can only add that it should be based on an intelligent recognition of the evils which land monopoly has entailed upon more densely peopled countries in both modern and ancient times; that it should take account of the fact that our own country must soon be as densely peopled as any of these; and, finally, that its guiding principle should be, "The land for its inhabitants, now and always." On our present public-land policy we might fitly affix as a motto the reckless and ill-omened sentiment: "After us the deluge."

*Edward T. Peters.*

## THE JEWISH PROBLEM.\*

THE Jewish problem is as old as history, and assumes in each age a new form. The life or death of millions of human beings hangs upon its solution; its agitation revives the fiercest passions for good and for evil that inflame the human breast. From the era when the monotheistic, Semitic slaves of the Pharaohs made themselves hated and feared by their polytheistic masters, till to-day when the monstrous giants Labor and Capital are arming for a supreme conflict, the Jewish question has been inextricably bound up with the deepest and gravest questions that convulse society. Religious intolerance and race-antipathy are giving place to an equally bitter and dangerous social enmity. This scattered band of Israelites, always in the minority, always in the attitude of *protestants* against the dominant creed, against society as it is, seem fated to excite the antagonism of their fellow-countrymen. Intellectually endowed, as M. de Lavelaye has remarked, with "a high ideality and a keen sense of reality" they may be said broadly to represent Liberalism and Revolution in Germany and Russia, Conservatism and Capital in England and America. Liberty they must and will have, but when this is once obtained, their energy is transferred to the aim of fortifying and preserving it.

Before attempting to reach a conclusive estimate of their actual character and situation, it is necessary to review briefly their history since the Scriptural age, where ordinary readers are content to close it. It is a mistake to suppose that the first dispersion of the Jews dates from the destruction of Jerusalem. Several centuries before the birth of Jesus, finding their little Fatherland too narrow for them, they planted colonies abroad, which spread the fame of Jewish culture and energy over all the civilized world of the day. These Jews were no usurers and chafferers. Every conceivable trade and occupation flourished among them. Of these, the lowest and most despised were those of the camel and ass-drivers, the scavenger, the sailor, the shepherd, and the petty shop-keeper. Usury and the taking of interest were strictly prohibited. Agriculture, cattle-raising, and commerce formed their chief occupations in the valley

of the Euphrates. Nearda and Nisibis, which were natural strongholds, were the principal seats of the eastern settlement. On the opposite side of the river, Palmyra, on the caravan road, had a large Jewish population. The name of the Jewish Queen Zenobia is familiar to all. With the extension of the Parthian Empire, the Jews spread their colonies as far as India. Alexander the Great, in his Asiatic campaigns, became acquainted with them and was favorably disposed toward them. Many of them served in his armies and shared the dangers, fatigues, and glories of his mighty wars. In all the States founded by him he granted them, equally with the Greeks and Macedonians, the rights of citizenship, religious freedom, and exemption from taxes during the Sabbatical year. Under the later Macedonian kings they enjoyed the same privileges, and Egypt became a second Judea. They inhabited two out of the five quarters of Alexandria, and outside of Egypt they dwelt in the Libyan Valley as far as the boundaries of Ethiopia. The Macedonian princes regarded them as the most trustworthy and honorable subjects, whose intelligence and industry made them indispensable to the welfare of the State, and whose courage and endurance rendered them highly desirable as soldiers. In Antioch, the third city of the Roman Empire, they possessed a magnificent synagogue, and received a State pension for the maintenance of their worship. Ptolemy I. (Soter) intrusted them with the most important fortification on the Nile delta; Ptolemy II. (Philadelphus) had the Penta-teuch translated into Greek; Ptolemy VI. (Philometer) confided the administration of his kingdom and the command of his armies to two Jews; Ptolemy Lagi sent a number of them to Cyrene to consolidate his forces among the Cyrenaic towns. Thus they played an important rôle in the history of the Ptolemies, partly as soldiers, partly as statesmen, partly, also, as the most efficient general agency in maintaining civil order and the strength of the nation. It is unnecessary to follow them over Asia Minor, into all the cities of European Greece, and of the Roman Empire, where they had communities and synagogues. We see them as agriculturists,

\* For my brief review of the history of the Jews from the third century before the Christian Era to their emancipation during the French Revolution, I beg to acknowledge my indebtedness to a pamphlet written by a German Christian, entitled "A Vindication of the Jews" by Dr. C. L. Beck, published in Leipzig, 1881, from which I have freely quoted. E. L.

merchants, and soldiers, showing no trace of the tendency to sordid occupations which is said to be innate in their character and essential to their social institutions.

In the year 70, Jerusalem, the soul of their national life, was destroyed by Pompey. From this period dates the singular, the unique phenomenon of a landless, denationalized people, dispersed over every country of the globe, and yet bound together by a purely spiritual tie—an idea—in the most enduring, subtly woven, and indissoluble union that the world has ever seen. Thenceforth their patriotism, as well as their religion, consisted in guarding intact against the corruptions of the outside world the sublime idea of the unity of God, and the just and lofty ordinances of the Mosaic code. "Our Messiah," says Johann Jacoby, "is Truth, which is undermining, with ever-increasing force, ancient prejudices and mediæval statutes, and which sooner or later will emancipate us."

The last efforts of the Jews to regain their national seat was made between the years 132-135, when Bar-Kochba preached a war against the Romans, and the people rose in insurrection, only to be vanquished and to lose forever their independence. Jerusalem was a ruin, Palestine a waste, and the fate of the Jews was sealed. But they did not go forth at first among strange nations, who merely tolerated them, and from whom they had to beg or else resort to the meanest employment for subsistence. They were received as brothers by the communities of their co-religionists, honorably established in all civilized lands. The Romans gave them the rights of citizenship, admitted them to the army, permitted them to intermarry with Roman families, and appointed them to any high official position requiring shrewd insight, a clear mind, and a strong will.\*

During the first century of Christianity the Jews lived on the friendliest terms with the Christians, their religious systems having sprung from a common root, while the only difference of opinion between them concerned the question of the Messiahship. It was left for a later age, when the facts of the case were less clear in the world's memory, to hold the Jews guilty of the crucifixion. The Romans designated them as the "better sort of Christians." Modern historians (Christian no less than Jewish) agree that the wide diffusion of Judaism was one of the chief elements in the rapid propagation of Christianity. The

Christians of the first century after Jesus were already divided into two sects, viz: Jewish Christians, and Pagan or Hellenistic Christians. The former were scarcely to be distinguished from the Jews proper. They regarded Jesus as a great and holy man, descended in a perfectly natural manner from King David; and they strictly observed the Jewish law, on the authority of Jesus himself, who said, "I am not come to destroy (the law) but to fulfill." Their motto was the verse, "Blessed are the poor, for theirs is the kingdom of heaven;" hence they derived the name of Ebionites (poor). They were to be found in Jerusalem, Galilee, Capernaum, and other parts of Syria, especially in Antioch, where the name of Christian was first adopted. They founded colonies, the greatest of which was that of Rome.

The Pagan Christians were the followers of Paul and his disciples, Timothy and Titus, and they dwelt chiefly in the seven cities of Asia Minor: Ephesus, Smyrna, Pergamos, Thyatira, Sardis, Philadelphia, and Laodicea, as well as in Greece, Macedonia and Thessaly. They regarded Jesus as the veritable Son of God, and worshipped him accordingly, they rejected the Jewish law, the observance of the Sabbath, and holy days, etc. The gradual crystallization of the huge organism of the church, and the curious blending of Judaism and Paganism in its rites and ceremonies, originated among the Hellenistic Christians. Thus, the Jewish ceremonies of baptism and the evening-meal or communion supper were retained, and to these was attached a mystic significance thoroughly in accord with the Greek temper of mind. Between the Jews and the Ebionites subsisted perfect cordiality and free intercourse; between the Jews and the Pauline Christians, on the other hand, existed from the beginning mutual repulsion and contempt. In proportion as the Ebionite Christians inclined more and more decidedly to the tenets of the Hellenistic Christians, they naturally widened the distance between themselves and the Jews, until all semblance of unity was lost.\*

In the year 339 A. C., the Emperor Constantius passed a law prohibiting the possession by Jews of Christian slaves, emancipating any slave who had embraced Judaism, and confiscating the entire property of the Jew who had had his slaves circumcised. As society was then constituted, the flourishing communities

\* Strabo, the historian, says: "The Jews have penetrated into all the towns, and it is not easy to find a spot on the earth which has not received this race, and is not under its domination."

\* For a succinct account of the schism in the Jewish Church, which resulted in the establishment of Christianity, see Graetz's "History of the Jews," vol. iv., chap. 5. He calls the Epistle to the Hebrews the "farewell" letter of Jewish Christianity to the Mother Community.

of the Jews could only be maintained with the help of slave labor, and thus their material interests were radically injured. The second blow was aimed at their dignity, their manly pride. In many a war they had fought for Rome; now, however, the army was no longer Roman but Christian. In the year 418 they were excluded from military service. Moreover, the Christian state shut them out from official posts, which they had honorably filled in Pagan Rome. These few measures summarily reduced their position from one of equality to one of marked inferiority. From this time dates a certain coolness in the mutual relations between Jews and Christians, to be followed by a breach which the growing power of the priests did its utmost to widen, and then, by the frightful tragedy of centuries, of which the main cause was the fanaticism of ignorant and brutal men, elevated to the rank of princes of the church. The unscrupulous priests represented Christ, the Son of God and man, as the victim of Jewish crime, and inflamed the hearts of believers with burning hatred. The storm began in Byzantium, under the Emperors Zeno Isauricus, Justinian I., Heraclius and Leo Isauricus. The Jews were slaughtered and burned, and the mob rapaciously plundered them. Fearful restrictions and persecutions ensued under the immediately succeeding emperors, and no law, no imperial promise held good in favor of the Jews. The church wanted money, money, money; more than all taxes, tithes, and begging could supply. But she was obliged to spare her own devotees, and so the infidel Jew became a convenient and helpless victim of pillage. "That this," says Schleiden, "was the only motive and aim of Jewish persecution is proved by council decrees, statutes, and events themselves." "The breath of the clergy was never wanting," says Dean Milman, "to fan the embers of persecution." "The Jews are the slaves of the Church," was the axiom formulated by Thomas Aquinas. Peter the Venerable, Abbot of Clugny, in a letter to the King of France, denouncing the Jews, begged to condemn them mercifully not to a general massacre, but in pure charity only to general pillage.

In vain did a few right-thinking princes, a few reasonable Popes come forward to protect the unhappy race; the priesthood proved stronger than prince or pontiff. Not only were the Jews held accountable for the crucifixion, but the priests goaded on the people with the wildest fables. They affirmed that the Jews bought or stole Christian children in order to kill them for Passover. Frederick II. tried to shield them against this monstrous charge; the Republic of Venice, in a

State document, represented it as a baseless lie, and several Popes did the same. Nevertheless in many places the horrible superstition exists to-day.

They were forbidden to own real estate; their marriages were illegal without the blessing of a Christian priest; in certain countries they were not permitted to have more than one child; no Christian could be indicted for a crime against a Jew; the right of emigration was denied them; they were literally chained to the soil, and became thralls of the proprietors. Add to all this, periodic riots, massacres, and expulsions. They were, moreover treated as property, bought and sold like objects of merchandise by subjects and sovereigns.\*

"The Jew was only treated as a source of revenue; and, till almost his life-blood was drawn, it would be difficult to satisfy the inevitable demands of a needy and rapacious master. He was granted away, he was named in a marriage settlement, he was bequeathed; in fact, he was pawned, he was sold, he was stolen." ("Milman," Vol. III., p. 172.)

The Jew was usually forced to wear a badge or a peculiar costume, and, in some places, branded on the chin in order to make him a more conspicuous mark for Christian contempt and hatred. He was imprisoned in Ghettos, where he forgot the use of his mother-tongue and exchanged it for a Hebrew jargon which serves as a theme of amusement to the Jew-haters of to-day and as a convincing proof that German Jews are no Germans. After being robbed of his lands, he was excluded from all trades and all manual occupation. One alone remained open to him—and this one was *forced upon him by law*—usury. The first Jew who lived by lending money on interest was the learned Rabbi Jacob Tam, of France, whom crusading hordes had plundered in 1146. He complained bitterly of the necessity that forced upon him such an occupation: "We have been left no other branch of industry to support life and to pay the onerous taxes imposed upon us by our landed seigneurs." Bernard de Clairvaux admonished his followers, during the second crusade, against persecuting the Jews, because, if the Jews

\* A recent writer, Mr. W. Cunningham, in his "Growth of English Industry and Commerce" remarks that, in the Middle Ages in England, "the Jews had no rights or status of their own; they were the mere chattels of the king, all that they had was his. \* \* \* Their transactions were all registered in the Exchequer; debts due to them were really due to the king, and they might not accept composition for payment, or grant a secret release. As a matter of fact, therefore, the king had indirectly a monopoly of the money-lending of the country, so that the expulsion of the Jews by Edward I. was a permanent loss of revenue to the crown."

were not there, he said, "Christian usurers would deal more hardly by the people than the Jews did." In 1430 the Florentines be-took themselves to the Jews of their city, who accepted lower rates of interest, in order to escape the extortions of Christian usurers. Centuries before the reproach of usury was raised against the Jews, organized bands of Christian usurers, under the name of Lombards, Etruscans, Florentines, Cahorsins, Ultramontanes, marched through Europe under the protection and recommendation of the Roman Curia, in order to enrich it by means of fraudulent loans and usury.

Of course only the wealthier Jews could lend money; the mass of the people were sunk in the deepest misery and condemned to labors which the Christians shrank from with loathing, to labors that degrade men and stamp upon them the mark of the Helot, the slave. "As if all powers of earth had sworn," says Dr. Graetz,—"and indeed they had so sworn,—to exterminate the Jewish race from the circle of humanity, or to change it into a brutalized horde, even so did they attack it."

If it be supposed that I am drawing too dark a picture of Christian atrocities, and too partial a presentment of the innocence of the victims, I can only say that I have spared my readers the bloodiest and most revolting scenes in this hideous tragedy, and refer them for these to the pages of the Rev. Dr. Milman, Dean of St. Paul's. According to him, every great mediæval institution, was, in turn, a cause of anguish to the Jew. The Crusades were the signal for relentless carnage, pillage, and violation. We read of eight hundred Jews in one place, thirteen hundred in another, at the same time ruthlessly massacred, and of Jewish parents everywhere slaying their children and themselves to escape the tortures of the fanatics. Shortly after the accession of Philip Augustus, a golden crucifix and other ecclesiastical treasures having been found in possession of a Jew, the following Sabbath, when the Jews were peacefully assembled at worship, their synagogues were surrounded by royal troops and they were all dragged to prison. The upshot was the entire confiscation of their property, and the publication of a royal edict commanding them instantly to leave France. Twenty years later they were readmitted to the kingdom, and, as Milman says, "forgetting all past injuries, *in the steady pursuit of gain*," they returned under infamous restrictions only to be again plundered and expelled.

This "love of gain" is the single indictment urged occasionally against the Jews by Dean Milman, whom an unflinching study

of history evidently smote with the horror which all humane hearts must experience in reading the unvarnished record of Jewish persecutions. And even this accusation is unsupported by facts. The Jews did not select the vocation of usury; it was enforced upon them by law, and whenever they were left to a free development they chose other occupations in preference. Then again the love of money which Dean Milman confesses was the Christians' main motive in murdering, torturing, and robbing, was only natural in a race to whom wealth was the sole possible barrier—and that an inadequate one—against the brutality of despots and mobs. The devoted nation literally had no resting-place for the sole of their feet; if exiled from France, it was only to be slaughtered in England or Germany, in Spain or Italy. Therefore, when they received permission to reënter their former home, it is scarcely charitable to suppose that the "love of gain" prompted their return among the people who, however cruel, spoke their own language, and whom despite every injustice, they still recognized as fellow-countrymen.

After the Crusades, came the insurrection of the peasants, the "Pastoureaux," armed bands of shepherds marching through France, "driven by the sternest fanaticism," says Milman, "to relentless barbarities against the Jews." The latter appealed to King and Pope in vain. Five hundred of them being besieged in Verdun, where they had taken refuge, the shepherds set fire to the gates; "the desperate Jews threw their children down to the besiegers in hopes of mercy, and slew each other to a man." When this sort of horror was quelled then followed the plague, for which the Jews were held responsible, and, as the chronicle says, "they were burned without distinction."

But the heart sickens at these endless narratives of blood and fire. Let us turn to the other side and see what excuse is offered for the crime. The charges against the Jews are summed up in the story of Agobard, Archbishop of Lyons under Charlemagne. "Jealous of the enviable opulence of this alien people" (I quote Milman's words) he endeavored to prevent all communication between them and his flock, and issued several obnoxious Episcopal edicts. The Jews, who enjoyed a high degree of toleration at that time, appealed to the Emperor for redress. Agobard was summoned to state his grievances, and thereupon drew up a petition in which he accused the Jews of "cursing daily Christianity and Christ in their synagogues, and of insufferable pride in vaunting the royal favor; he complained that they went

freely in and out of the royal palaces, that the highest persons solicited their prayers and blessings, and that they boasted of gifts of splendid dresses to their wives and matrons from royal and princely donors." He complained also that "Jewish preachers had more hearers than Christian preachers, and were held by the uninstructed to be the better of the two." The only two charges of any weight made by him were that the *Jews sold to the Christians meat unclean to themselves*, and that they stole Christian children to sell them as slaves. He wound up with a long theological argument proving the wisdom and justice of persecuting the Jews. The ignominious contempt with which the Bishop and his petition were received proved the grave charges which are maintained by ignorant bigotry to this day to have been even then without foundation. Throughout the whole of Milman's volumes, so black with the perfidy and cruelty of his own sect, this petition of Agobard's is the one formal arraignment made against the Jewish people, and the Rev. Dean evidently considers it as ridiculous as did the Emperor Charlemagne.

It has been remarked with bitter truth that "if the Jews under the fearful tortures they have endured, had become a nation of idiots, they would only have formed a fitting monument to the brutality with which through the ages they have been wantonly persecuted."\* Let us leave, however, these revolting pages for a brighter side of their history; and before narrating their tardy emancipation, within the present century, and its brilliant results, let us glance at the one sunny spot which shines forth amid the mediæval darkness. While the rest of Europe was buried in superstition and barbarism, the dominion of the Moors exempted a large part of Spain from the influences of the Church. Here the intellectual and moral development of the Jews had free scope, and we find them consequently engaged in all branches of productive industry,—silk-merchants, dyers of purple, glass-manufacturers, as well as superintendents of the noble colleges founded by the Saracens, scholars, doctors, poets, statesmen, and philosophers. They were, according to Draper, the "leading intellects of the world." Their beneficent influence reached upward to the South of France. Fauriel, in his history of Provençal poetry, says:

"History has never sufficiently acknowledged the influence of the Jews in the Middle Ages, upon the culture of Europe in general, and especially upon that of Southern France. Their medical schools, as well as their schools for the promotion of a knowledge of oriental languages, were of the highest importance."

\* "Nineteenth Century." February, 1881.

Milman tells us:

"Their commerce was unrestrained, except by a limitation enforced upon Charlemagne rather by the irreverent covetousness of the clergy, than by the misconduct of the Jews. \* \* \* From the ports of Marseilles and Narbonne their vessels kept up a constant communication with the East. In Narbonne they were so flourishing, that of the two prefects or mayors of the city, one was always a Jew. The most regular and stately part of the city of Lyons was the Jewish quarter. The superior intelligence and education of the Jews in a period when nobles and kings, and even the clergy could not write their own names, pointed them out for offices of trust. They were the physicians, the ministers of finance to nobles and monarchs." (Vol. III, pp. 142, 143). "They rose even to higher dignities." (Pp. 144, 145).

Space forbids more than a passing mention of the illustrious Jews who, under a benign rule of tolerant enlightenment, adorned the annals of their race in Spain: Samuel ha-Nagid, the "Prince" (died 1055), nominally prime-minister, but virtually little less than Regent of Granada, under two successive kings, for thirty years; Moses ben-Ezra and Jehuda ha-Levi, poets of the first rank, from whom Heine drew a large part of his inspiration; Ibn-Gabirol, better known by his Spanish name of Avicbron, poet and philosopher, in whose works may be found the germ of Spinoza's system, and whose sublime poems have been incorporated in all Jewish rituals, side by side with the hymns of the Psalmist and the prophecies of Isaiah; last and greatest of all, Maimonides, the physician of Saladin, "the glory of the West, the light of the East, the Eagle of the Synagogue, the Second Moses,"—such men as these shed luster upon humanity.\* And these are only the most eminent from a long and splendid list, for which I refer my readers to Graetz's "History of the Jews."

To a later period, that of Ferdinand and Isabella, belonged another great Jew, Don Isaac Abarbanel, scholar, philosopher, and minister of finance. On account of his indispensable services, his unblemished character, and his profound learning, he was made the single exception in the decree expelling the whole Jewish nation from Spain. He threw himself at the sovereigns' feet, and offered the fortune of a prince to redeem his unhappy nation; but when this was refused, he himself declined to profit by the royal favor, and voluntarily went forth to misery and exile with his co-religionists.

The details of this expulsion of the Jews from Spain, at the instigation of the priests of the Inquisition, are harrowing beyond

\* Maimonides may be held as the founder of Rationalism, the first who endeavored on broad principles to establish the harmony of reason and religion." Milman, p. 160.

description. "They had no alternative," says Milman, "but baptism or exile. For three centuries their fathers had dwelt in this delightful country, which they had fertilized with their industry, enriched with their commerce, adorned with their learning. Yet there were few examples of apostasy or weakness; the whole race (variously estimated at from 300,000 to 800,000) in a lofty spirit of self-devotion determined to abandon all rather than desert the religion of their fathers. They left the homes of their youth, the scenes of their early associations, the sacred graves of their ancestors. \* \* \* They were allowed four months to prepare for this everlasting exile. \* \* \* Their property they might sell, but the market was soon glutted, and the cold-hearted purchasers waited till the last instant to wring from their distress the hardest terms. \* \* \* Incidents which make the blood run cold are related of the miseries which they suffered." Dying with cold, hunger, squalor, and thirst, they yet were refused admission to the inhospitable towns where they attempted to land—Genoa, Rome, Fez, etc. Some were disembarked, naked and destitute on the coasts of Africa, and were devoured by wild beasts; some plunged into the sea and "sunk like lead"; thousands were sold into slavery. The King of Portugal, Joam II., son-in-law of Ferdinand and Isabella, appointed a day for them to quit his kingdom, and in the meantime issued a secret order to seize all Jewish children under fourteen years of age, and disperse them to be baptized. "Great God of Mercy!" exclaims Dean Milman; "this was in the name of Christianity! Frantic mothers threw their children into wells and rivers—they destroyed them with their own hands."

For fully three centuries there remained in Europe no spot of refuge for the luckless race, until the French Revolution, breaking a million chains, brought with it also their emancipation. Wherever the French rule was established, the Jews were accorded full rights of citizenship, but almost a century was needed to complete their enfranchisement throughout the rest of Europe—nor is it to-day completed.

And in what condition emerged from the darkness this people who, as we have seen, might reasonably be expected to come forth "a nation of idiots"? "A few decades of freedom," says Johann Jacoby, "were sufficient to efface the inherited traces of an oppression lasting two thousand years." Only thirty years after their emancipation in Holland, Ritter J. D. Mayer, Judge of Instruction in Amsterdam, bore public witness to their unimpeachable conduct under the new administration, and concluded: "Facts prove

that even where nothing has been done, either by the government or in any other way, for the moral elevation of the Jews, mere social equality has ennobled them and will ennoble them gradually more and more."

In England they were emancipated in 1829, gained admission to the Bar in 1833, and to Parliament in 1858. Sixteen years later, a man of Jewish birth and characteristics, if not of Jewish creed, became for the second time, Prime Minister of England, and during six years was leader of the proudest aristocracy of Europe. To-day, fifty years after the Jews' admission to the English bar, the Master of the Rolls is Sir George Jessel, a Jew both by race and creed, reputed the greatest equity lawyer in England.

"The German Jews," says a recent writer in the *"Revue des deux Mondes,"* "so long oppressed and repressed, held in tutelage and bondage, treated like pariahs or like cattle, now obtained complete civil and political emancipation, and, as soon as emancipated, they became a power, to the huge displeasure of a great many persons who had conscientious or interested motives for disliking them. \* \* \* They form an insignificant minority in Germany, and yet they already preponderate in the municipal councils of the largest cities of Prussia. They have taken possession of journalism. \* \* \* The place they occupy in the universities, at the bar, in all the liberal professions is entirely disproportioned to their numbers. As soon as the doors of Parliament were opened to them they distinguished themselves in it."

"In the Italian Parliament," says M. de Lavelaye, "there are three or four more Jewish deputies than there ought to be in proportion to their numbers; a certain proof that they succeed by reason of their talent, since they reach the highest positions in despite of prejudice."

Let us examine how far facts go toward proving the oft-repeated assertion that no Jew can be a patriot. As we have seen, the French Revolution bestowed upon him liberty,—but when the French troops invaded Germany all the Jewish communities sprang to arms and emulated the Christians in their zeal for the fatherland. Whole Jewish regiments were formed, a great many Jews were promoted to the rank of officers and gained high distinction in the field. Yet a few years later when the conservative reaction set in, the Jewish veterans were excluded from the reward and honors offered to their Christian brethren in arms.

\* G. Valbert, better known in America by his real name Victor Cherbuliez, March, 1882.

When the Hungarian War of Independence broke out, Jews fought side by side with Christians, and "the precious vessels of the synagogues, the silver caskets that contained the *Thora*, were sacrificed with the same cheerful devotion upon the altar of patriotism as that wherewith the Catholics offered their holy reliquaries and the chimes of their cathedrals." \* "By what means," asks the Talmud, "should a man be revenged upon his enemy? By conferring on him many benefits." But after every benefit conferred by the Jew upon his persecutors, the reaction against him (what Milman calls "the singular dread of his dangerous superiority") revives with fresh violence. Thus six years after the conspicuous Jewish efforts for German freedom in 1812, the position of the Jews was legally restricted in 1818, and rendered worse than it had been before the emancipation. In the Roumanian War of Independence the first gun captured from the Turks was taken by a Jew who was decorated on the field for his services, and yet immediately after the war the Roumanian persecution began. Theories are stronger than facts. Whenever the Jews in any nation have sealed their patriotism with their blood and their gold, as on either side in the Franco-Prussian war, in our own civil war, and in the Russo-Turkish war, the wave of prejudice has swept back, and the old accusations of alienism, narrowness, and sectarianism are reiterated.

Even in America, presumably the refuge of the oppressed, public opinion has not yet reached that point where it absolves the race from the sin of the individual. Every Jew, however honorable or enlightened, has the humiliating knowledge that his security and reputation are, in a certain sense, bound up with those of the meanest rascal who belongs to his tribe, and who has it in his power to jeopardize the social status of his whole nation. It has been well said that the Jew must be of gold in order to pass for silver. Since the establishment of the American Union, Jews have here enjoyed absolute civil and political freedom and equality, and until the past few years, a large and in some places almost entire immunity from social prejudice. Their toleration, it is now asserted, has failed to produce beneficial results; on the contrary they have degenerated, rather than improved, under these favorable conditions. While I admit the fact that America has no such brilliant list of Semitic names as the Europe of to-day can show, I find nothing to support the theory of the

degeneracy of the race. Being subjected to the same influences as are the Christians who surround them, they simply evince the same proclivities. In this commercial country and commercial age they have been known chiefly as thriving merchants, tradesmen, and bankers who have enjoyed, as a rule, a high degree of credit and respect. If they have not surpassed, neither have they fallen behind, their competitors of other sects. They have been good citizens, furnishing, as statistics prove, proportionately fewer inmates to the prisons and fewer numbers to the proletariat than their neighbors of other descent. They have shared all national burdens and sorrows, fighting the battles of the Revolution and of the Union, grudging neither life nor money to the fortunes of the Republic. They are the prominent patrons of all musical enterprise—the only general division of art which has attained nearly as advanced a state of cultivation here as in Europe. The leader of free religious thought, and an indefatigable promoter of the better education of the poor in New York is a Jew—Felix Adler. The race is represented in every liberal profession, in the army, the navy, and the house of Congress.

And yet here, too, the everlasting prejudice is cropping out in various shapes. Within recent years, Jews have been "boycotted" at not a few places of public resort; in our schools and colleges, even in our scientific universities, Jewish scholars are frequently subjected to annoyance on account of their race. The word "Jew" is in constant use, even among so-called refined Christians, as a term of opprobrium, and is employed as a verb, to denote the meanest tricks. In other words, all the magnanimity, patience, charity, and humanity, which the Jews have manifested in return for centuries of persecution, have been thus far inadequate to eradicate the profound antipathy engendered by fanaticism and ready to break out in one or another shape at any moment of popular excitement.

## II.

EVEN so cursory a review of historic facts as I have condensed into the foregoing pages suffices, I think, to establish the chief points I desire to maintain, viz: that the Jews are naturally a race of high moral and intellectual endowments, and that such superficial peculiarities as may not infrequently be found among them to-day which excite the aversion of Christians, are the lingering traces of unparalleled sufferings. The mere survival of the Jew, despite every provision made for his extermination, evinces the vitality of a singularly well-equipped organization, while the

\* Dr. A. Schütte's "History of the Hungarian War of Independence."

elasticity with which he rebounds as soon as the strain of adverse conditions is removed, is without parallel. "Naturalists will tell you," says Emile de Lavelaye, "if, in the struggle for life, one race surpasses others, it is because it is endowed with some superiority. This is evidently the case with the Jews. A philosopher would discover still another cause. 'Like creed, like people,' says Quinet. Now, detach from the Mosaic creed the customs enforced by the necessities of climate, and there remains a splendid Deism, without superstition, without anthropomorphism, and in the Prophets are sentiments of equality, charity, and fraternity which Christianity tried to realize, and which answer so perfectly to the needs of humanity, especially in our own epoch. Pascal saw in the continuance of the Jewish people in the midst of persecution, a miracle and a proof of the Divine curse. When we consider the influence they actually exert at the present moment, and the power which the future seems to reserve for them, we can more readily believe in the fulfillment of the Messianic doctrine held by the chosen people themselves, who hope some day to reign over all the kingdoms of earth. Darwin would grant them the palm."

The insatiable thirst of the Jews is not for money, as calumniously asserted, but for knowledge. In those districts of Poland and Russia where they are refused admittance to the schools, they have had books of natural science and Darwinian treatises translated into Hebrew in order to follow the intellectual movement of the age. In the Russian universities, where they have been granted admission under onerous restrictions, they already largely outnumber the proportion of Christian students. The first use they make of their freedom invariably is to embrace all methods of higher instruction, and to strive toward a more complete intellectual development. It is assumed by Christian historians that the Jews, with their inflexible adherence to the Mosaic Code, are, as a people, a curious relic of remote antiquity, a social anachronism, so to speak, petrified in the midst of advancing civilization. This assumption is without foundation; the Jews are, on the contrary, most frequently the pioneers of progress. The simplicity of their creed enables them more readily and naturally to throw off the shackles of superstition and to enlarge the boundaries of free speculation than any other sect. Considering their religion from the highest standpoint, their creed to-day is at one with the latest doctrines of science, proclaiming the unity of the Creative force. No angels, saints, or mediators have any place in this sublime conception,

arrived at intuitively in a pre-historic age by the genius of the race, and confirmed by that modern scientific research which has revolutionized the thought of the world. The modern theory of socialism and humanitarianism erroneously traced to the New Testament, has its root in the Mosaic Code. The Christian doctrine is the doctrine of consolation; the kingdom of heaven is held out as a glittering dream to suffering humanity. Poverty exalted into a mission, the vocation of the mystic, the spiritualist, the idealist, enjoined equally upon all, a vision and an ecstasy offered to the hungry and the needy; what provision is here made for the world as it is? On the other hand, the very latest reforms urged by political economists, in view of the misery of the lower classes, are established by the Mosaic Code, which formulated the principle of the rights of labor, denying the right of private property in land, asserting that the corners of the field, the gleanings of the harvest belonged in *justice*, not in *charity*, to the poor and the stranger; and that man owed a duty, not only to all humanity, but even to the beast of the field, and "the ox that treads the corn." In accordance with these principles we find the fathers of modern socialism to be three Jews—Ferdinand Lassalle, Karl Marx, and Johann Jacoby.

As an example of the difficulties that impede the progress of religious reform among the Jews, it may be stated that when a large number of Prussian Israelites first founded a German "Temple" in Berlin, in order to put an end to obsolete rites and sighing after Jerusalem, and to introduce German hymns, a German ritual, and an organ accompaniment, the government interfered, and prohibited such services as "Deistical sectarianism." Preaching in the German tongue was especially forbidden, in the avowed fear that the Jews might thereby succeed in converting Christians.

The melancholy and disgraceful fact being established that, in these closing decades of the nineteenth century, the long-suffering Jew is still universally exposed to injustice, proportioned to the barbarity of the nation that surrounds him, from the indescribable atrocities of Russian mobs, through every degree of refined insult to petty mortification, the inevitable result has been to arouse most thinking Jews to the necessity of a vigorous and concerted action of defense. They have long enough practiced to no purpose the doctrine which Christendom has been content to preach, and which was inculcated by one of their own race,—when the right cheek was smitten to turn also the left. They have proved themselves willing and able to assimilate.

late with whatever people and to endure every climatic influence. But blind intolerance and ignorance are now forcibly driving them into that position which they have so long hesitated to assume. *They must establish an independent nationality.*

Neither we nor our immediate descendants can hope to see humanity at that point of perfection where the helpless and submissive victim will, as such, be respected. Existence continues to be a struggle in which the fittest can survive only through the energetic assertion and constant proof of superiority. The idea formulated by George Eliot has already sunk into the minds of many Jewish enthusiasts, and it germinates with miraculous rapidity. "The idea that I am possessed with," says Deronda, "is that of restoring a political existence to my people; making them a nation again, giving them a national center, such as the English have, though they, too, are scattered over the face of the globe. That is a task which presents itself to me as a duty; \* \* \* I am resolved to devote my life to it. *At the least, I may awaken a movement in other minds such as has been awakened in my own.*" "Revive the organic center," says Mordecai with still more eloquence. "Let the unity of Israel which has marked the growth and force of its religion be an outward reality. \* \* \* When our race shall have an organic center, a heart and brain to watch and guide and execute, the outraged Jew shall have a defense in the court of nations, as the outraged Englishman or American. And the world will gain as Israel gains. For there will be a community in the van of the East which carries the culture and the sympathies of every great nation in its bosom; there will be a land set for a halting-place of enmities, a neutral ground for the East as Belgium is for the West. Difficulties? I know there are difficulties. But let the spirit of sublime achievement move in the great among our people, and the work will begin."

I am fully persuaded that all suggested solutions other than this of the Jewish problem are but temporary palliatives. Could the noble prophetess who wrote the above words have lived but till to-day to see the ever-increasing necessity of adopting her inspired counsel, though her own heart would have been lacerated by "the hideous obloquy of Christian strife," yet she would have been herself astonished at the flame enkindled by her seed of fire, and the practical shape which the movement projected by her in poetic vision is beginning to assume. Highly significant in this connection are the labors of the "Alliance Universelle Israélite" and the recent Jewish conference held in Berlin

on April 23, 1882, where the chief cities of Germany, England, France, and the United States were represented, where such men as Lasker, Professor Derembourg, Sir J. Goldsmid, professors, privy-councilors, and members of the Imperial Diet took prominent part, and where a vast Jewish system of mutual coöperation and aid was organized. "The result of the present Russian persecution," says the "American Hebrew," "has been to knit Jew to Jew as never we have been knitted since the dispersion." From the princes of European finance to the most wretched despoiled refugee who steps from the steerage of the emigrant steamer upon our soil, every true Jewish heart to-day burns with the same sentiment of patriotism and of sympathy. Mr. Laurence Oliphant's scheme for the colonization of Palestine has been too thoroughly and clearly defined in his own interesting volume, the "Land of Gilead," and has attracted too much attention from the press of Europe and America to need more than brief mention here. Strongly impressed with the advisability on political, commercial, and philanthropic grounds, of establishing a Jewish colony in Palestine, Mr. Oliphant started three years ago on an exploring expedition through the land east of the Jordan. The result of his travels was to intensify into an ardent faith his conviction of the practicability and desirability of the plan. In commenting upon it in the "Nineteenth Century" of August, 1882, he writes:

"The idea of a return to the East has seized upon the imagination of the masses and produced a wave of enthusiasm in favor of emigration to Palestine, the force and extent of which only those who have come in direct contact with it, as I have done, can appreciate."

How politic and rational, as well as humane, is his suggestion, is proved by the fact that it met with cordial encouragement from princes and statesmen, among others the Prince of Wales, the Prince and Princess of Schleswig-Holstein, the Prime-Minister of England, the French Minister of Foreign Affairs, and the Grand Vizier of Turkey, Khairreddin Pasha. Committees were organized, and Palestine Colonization Societies were formed. All over Russia, Roumania, Poland, Galicia, and Bulgaria, thousands of Jewish families registered themselves as ready to start, a fund of over £2,000,000 was raised, and official agents were appointed all over Turkey, when suddenly the whole movement was paralyzed by the Sultan's ordinance prohibiting Jews from settling in Palestine.

Every Israelite who entered the Ottoman Empire was obliged to sign a paper binding

him not to establish himself in the Holy Land, and thus the enterprise for the moment is at an end. Nevertheless it has afforded conclusive proof of two vital points hitherto generally denied, viz: first, that a very large majority of the Jewish people earnestly wish to be restored to the land of their forefathers, and second, that the Jews not only evince no natural repugnance to agricultural labor, but, on the contrary, enthusiastically proclaim their desire to pursue it. Says Mr. Oliphant in his letter of August 4, 1882, to the "Jewish Chronicle" (London):

"The impetus has been given, and though the movement has been checked, nothing can now retard its final accomplishment; on the contrary, the temporary political obstructions now existing will merely have the effect of damming a flood which will burst forth with greater violence when they have been removed."

Eternally grateful as all Jews must be to such Christians as George Eliot and Laurence Oliphant, they neither should nor need seek outside of their own ranks their guide or their spokesman. They who in our own generation have led the Conservatives of England, the Liberals of Germany, the Republicans of France, can surely furnish a new Ezra for their own people.

While a few years ago the most enlightened Jews, yielding to the indolent apathy of comparative security, would have ignored or ridiculed the vision of a Restoration, to-day it is no exaggeration to say that whenever two Israelites of ordinary intelligence come together, the possibility, nay the probability, of again forming a united nation is seriously discussed. "Already," as Mr. Oliphant says, "the alternatives loom in the near future,—either of race-extinction by marriage in countries which are too civilized to attempt it by massacre, or of separation as a young nationality."

There is something absolutely startling in the world's sudden awakening to the probable destiny of Israel. To judge from the current literature of the day, as represented by the foremost European periodicals, it has been reserved for Christians to proclaim the speedy advent of that Jewish triumph for which the Jew has hoped against hope during his prolonged agony of twenty centuries. In all such questions as this, that which is agitated to-day, is formulated and acted upon on the morrow, or as Emerson put it, "the aspiration of this century is the code of the next." Again and again has history repeated this

process. Where so many minds are considering how best to overcome the obstacles, the problem must sooner or later be solved, and when the hour strikes, the man will not be missing. The question is not one of narrow sectarianism; indeed it is scarcely any longer a religious one. Jews who are fully emancipated from the yoke of dogmas have this national sentiment not less, but rather more, fully than do the bigots and zealots who are necessarily men of inferior intellect.

A young Russian Jew of the former stamp expressed to me, in a recent conversation, views of such significance on this subject that with them I may fitly close my paper, for they sum up the desires and ambitions of the nation.

"The mission of the Jews throughout history has been to protest against corruption and despotism in religion and morals. The religious mission of the Jew belongs to the past: it is no longer necessary to preach the unity of God. But the moral mission remains unchanged: he has still to protest against narrowness, corruption, and materialism. As for his mixing with Christians, I have no fear nor objection in regard to it; he can but mix in blood; the genius of the Semitic race cannot be adulterated, but flows through history pure and distinct as the waters of the Rhone through the Rhine. \* \* \* The racial tie binds Jews together even though they discard all religion. What they need is to be once more consolidated as a nation. They are essentially an original people, borrowing neither thoughts, emotions, nor manners of the nations around them. (From this statement I exclude American Jews, who have lost color and individuality, and are neither Jew nor Gentile.) Let them organize with sufficient strength under a competent leader, and establish their central government,—whether in Palestine or South America, East or West, is a matter of indifference. Thus only can they command respect from other nations. But I would not have all Jews congregate in a single community: their fate and their purpose is to be separated. They are to serve as the connecting link between hostile peoples, and to advance the glorious cause of our common humanity. In their midst is to be found every type of mind which a perfect community needs. They are the greatest hero-worshippers in the world; except in matters of religion, they can be more easily swayed and kindled to enthusiasm by an appeal to their imagination than any other people. Let the hero arise to lead. Such things have been seen before and shall be seen again. I am no dreamer; I speak of facts. In their present wretched condition the Jews have grown old, they have lived too long. But a new life will be instilled into them by such an achievement; and once more incorporated as a fresh and active nation, they will regain youthful vigor and power."

No, the nation is not dead that in its class of destitute outcasts produces men filled with so haughty a pride, so high a patriotism, and so indomitable a sense of election for a lofty mission as breathe through these literally-quoted words of a Russian pariah.

*Emma Lazarus.*

## A RECEPTION BY PRESIDENT LINCOLN.

IN an old memorandum book, written during the war, I have some notes of an interview between President Lincoln and several visitors which occurred in the winter of 1862-63, when I had several opportunities, in company with a former college-mate, Dr. P. D. Gurley, then Mr. Lincoln's pastor, of meeting the President. About twice a week, after the official and other privileged visitors had taken their departure, the doors of the President's reception room would be thrown open to whomsoever might be waiting without. Happening to be there on one of these occasions, I entered with about a score of these expectants; and curious to observe the character and process of this informal audience given to the people, I stationed myself in a corner near the President, where I could see and hear all that was going on. The notes referred to were jotted down soon after the interview.

President Lincoln's appearance is too well known to need particular description. The tall, thin, wiry form, which no burdens seemed able to bend, and no amount of labor to deprive of elasticity; the calm, rugged, honest face, grave and deeply melancholy when in repose, yet wont to be lighted up under the influence of some humorous sally—these are familiar to the world. He was clad plainly, but becomingly, in a black broad-cloth suit, nothing in all his dress betokening disregard of conventionality, save, perhaps, his neat cloth slippers, which were doubtless worn for comfort. He was seated beside a plain, cloth-covered table, in a commodious arm-chair.

The first to get the President's eye and ear was a dapper, smooth-faced, boyish-looking little person, intent apparently on obtaining a clerkship in one of the departments. Encouraged by a friendly nod and smile and a "Well, what can I do for you?" which seemed to show that he was not quite unknown, nor seen there for the first time, the youth approached the President, and spoke *sotto voce*, as if afraid that some one else would hear a syllable he had to say.

"Well," said Mr. Lincoln, "I will consider the matter and see what can be done," with a manner that implied that nothing further need be said and that this closed the interview. The applicant, however, did not seem to understand it so, but continued to press the matter in earnest half-whispers until inter-

rupted by the President with an emphatic "Yes, yes, I know all about it, and will give it proper attention." This ended the colloquy. The young man vanished, and was succeeded by an older man in military dress, wearing lieutenant's shoulder-straps, who desired to be appointed colonel of a colored regiment. The experiment of employing colored troops had not yet been fully tested, was, in fact, hardly begun, and its success may have been doubted, at this time, by Mr. Lincoln, as by many others. In answer to the request he said, "The whole thing amounts only to a colonelcy for the applicant, as, should a regiment be raised, in six months there would be a colonel without a negro left in the command."

"But my purpose is not that," said the lieutenant, "it is to serve the 'cause, not myself."

"That may be your purpose," said the President, "but the certain *effect* none the less will be what I have described." And as further argument seemed unnecessary the would-be colonel took his leave, with a countenance indicating anything but satisfaction at the result of his patriotic overture.

He was followed by a sturdy, honest-looking German soldier, minus a leg, who hobbled up to the President on crutches. In consideration of his disabled condition, he wanted some situation about Washington, the duties of which he might be able to discharge, and he had come to the President, hoping that he would provide the desired situation for him. On being interrogated as to how he had lost his leg, he answered that it was the effect of a wound received in battle, mentioning the time and the place.

"Let me look at your papers," said Mr. Lincoln.

The man replied that he had none, and that he supposed his word would be sufficient.

"What!" exclaimed the President, "no papers, no credentials, nothing to show how you lost your leg! How am I to know that you lost it in battle, or did not lose it by a trap after getting into somebody's orchard?" This was spoken with a droll expression which amused the bystanders, all except the applicant, who, with a very solemn visage, earnestly protested the truth of his statement, muttering something about the reasons for not being able to produce his papers. "Well, well," said the President, "it is dangerous

for an army man to be wandering around without papers to show where he belongs and what he is, but I will see what can be done for you." And taking a blank card from a little pile of similar blanks on the table, he wrote some lines upon it, addressed it, and handing it to the man bade him deliver it to a certain Quartermaster, who would attend to his case.

Then a striking scene occurred. A person apparently of sixty years of age, with dress and manner which showed that he was acquainted with the usages of good society, whose whole exterior, indeed, would have impressed people who form opinions from appearances, approached the president, asking his aid in some commission project, for the success of which Mr. Lincoln's favor was regarded as essential. The President heard him patiently, but demurred against being connected with or countenancing the affair, suggesting mildly that the applicant would better set up an office of the kind described, and run it in his own way and at his own risk. The man plead his advanced years and obscurity as a reason for not attempting this, but said that if the President would only let him use his name to advertise and recommend the enterprise, he would then, he thought, need nothing more. At this the eyes of the President flashed with sudden indignation, and his whole aspect and manner underwent a portentous change. "No!" he broke forth, with startling vehemence, springing from his seat under the impulse of his emotion. "No! I'll have nothing to do with this business, nor with any man who comes to me with such degrading propositions. What! Do you take the President of the United States to be a commission broker? You have come to the wrong place, and for you and every one who comes for such purposes, there is the door!" The man's face blanched as he cowered and slunk away confounded, without uttering a word. The President's wrath subsided as speedily as it had risen.

A white-haired, gentlemanly-looking person, in company with his daughter, who seemed quite young and was certainly very pretty and prepossessing, though she had a shy, bashful, and even frightened look, met with a most courteous and friendly reception. The gentleman said he had no business to transact and would not trespass on the President's time, that he had come simply to see and salute him, and to present his daughter, who had longed to have this honor before returning to their distant home. Mr. Lincoln greeted them very cordially, rising and shaking hands with them, and with the frank, bland, and familiar manner which made strangers feel

unconstrained and at ease in his presence, he chatted pleasantly, even playfully, with them for some minutes, to the evident delight of both visitors. When they were about to go away, he politely escorted them to a door opening into the hall, and different from that through which the visitors entered, and dismissed them with charming courtesy.

Going back to his chair, he found a gentleman from the "land o' cakes and brither Scots," with letter of introduction in hand, awaiting an audience. Being pleasantly received, the visitor, after some preliminaries, proceeded to say that he had but recently come from Scotland, and had called to present, in the name of numbers of his Scotch friends (mentioning Dr. Guthrie in particular), congratulations and greetings on the issuing of the Emancipation Proclamation. He said that the great act met with warmest sympathy among his countrymen, and all trusted and prayed that the President would stand firm in maintaining the principles it promulgated. "Well," replied the President, "I am inclined to remain firm, but do not say I will, certainly, though all others should fail, as Peter once said and repeated with so much confidence, and only saw his folly and weakness as the cock crew—yet, God helping me, I trust to prove true to a principle which I feel to be right, of which the public sentiment approves, and which the country is prepared to support and maintain. Tell this to your friends at home with my acknowledgments for their sympathy and good wishes."

When this visitor had withdrawn, an immense specimen of a man presented himself. Broad-shouldered, robust, with thews and sinews to match his great height, and withal an honest, good-natured countenance—all seemed to mark him as belonging to the hardy yeomanry of the West. He sidled up awkwardly to the President, seeming almost afraid to accost him, but after some hesitation contrived to say, that being on a visit to Washington, he simply wanted before leaving to see the President, and have the honor of shaking hands with him. He found a kindly reception, and after some introductory civilities, Mr. Lincoln ran his eye curiously over his huge caller, surveying him from head to foot, and then saying with a humorous look and accent it would be hard to describe, "I rather think you have a little the advantage of me in height; you are a taller man than I am."

"I guess not, Mr. President," replied the visitor, with the self-abnegating air of one who seemed to regard any claim on his part, of possessing an *advantage* over the Chief Magistrate, as an offense little short of treason—"the advantage cannot be on my side."

"Yes, it is," was the rejoinder, "I have a pretty good eye for distances, and I think I can't be mistaken in the fact of the advantage being slightly with you. I measure six feet three and a half inches in my stockings, and you go, I think, a little beyond that."

The man still demurred, insisting very respectfully that the precedence in the matter lay on the President's side.

"It is very easily tested," said the President, and rising briskly from his chair and taking a book from the table, he placed it edgewise against the wall, just higher than his head. Then, turning to his doubting competitor for the nonce, he bade him "Come under." This the man did not do at once, pausing, with flushed face and irresolute look, as if not certain how far he might venture to trust the lion in his playful mood,—his countenance the while wearing a bewildered, half-frightened, and yet half-smiling expression that was really comical to see.

"Come under, I say," repeated the President, in a more peremptory tone, and then the visitor slowly complied. "Now straighten yourself up, and move your head in this way,"—suiting the action to the word. This being done, Mr. Lincoln added, "Now you hold the book, and be sure not to let it slip down a hair-breadth, and I will try." Planting himself accordingly underneath the book, and moving his head from right to left, it was found that he fell a trifle short of the other's measurement. "There," said he, "it is as I told you. I knew I couldn't be mistaken. I

rarely fail in taking a man's true altitude by the eye."

"Yes, but Mr. President," said the man, his courage, amid the merriment of the company, beginning to return, "you have slippers on and I boots, and that makes a difference."

"Not enough, to amount to anything in *this* reckoning," was the reply. You ought at least to be satisfied, my honest friend, with the proof given that you actually *stand higher* to-day than your President."

With this scene the reception, which had lasted about an hour, came to an end.

This brief interview, medley that it was, and stripped of ceremony, served the better to reveal the man in his true character, and to set forth the salient traits that fitted him for his great position and work, and endeared him so greatly to the popular heart. It showed how easily accessible he was to all classes of citizens, how readily he could adapt himself to people of whatever station or degree, how deep and true his human sympathies were, how quickly and keenly he could discriminate character, and how heartily he detested meanness and all unworthy arts and appliances to compass a selfish or sordid end. It showed the playful vein, whose ebullitions were as spontaneous as water bubbling from a fountain, and finally it showed the strong confidence he reposed in the convictions and heart of the people, with a trust that never faltered in the truth and ultimate triumph of the great principles he was bravely advocating.

*C. Van Santvoord.*

#### TO-DAY.

"O HEART, tired out with pain to-day,  
A thousand years to come  
Thy pain will all have passed away,  
Thy crying shall be dumb:  
As gayly bird-wings o'er the river  
Shall gleam with life that once was thine,  
As if this pulse, with pain a-quiver,  
Still leaped, with gladness half-divine:  
To thee, to all, it is as one  
When once thy restless years are done."

Oh, vain to turn upon your heart,  
And think to still it so!  
It cries back unto all your art,  
With pleading, "Ah, no, no!  
For gladness dies as well as sorrow;  
Then let me live, since I must die.  
Ah, quick, for death will come to-morrow—  
Quick, ere my years in vain go by!  
Because to-morrow I am clay,  
Give me my happiness to-day!"

*Milicent Washburn Shinn.*

## TOPICS OF THE TIME.

### Thieves—and Robbers.

HE who takes by stealth what belongs to another is a thief: he who takes, by violence what belongs to another is a robber. The robber is popularly supposed to disappear, with other predatory animals, before the progress of civilization; but this is a superficial judgment. The force that unlawfully deprives men of their property passes through many transformations, but no force is more persistent. Men are plundered nowadays in America far more frequently and flagrantly than in England in the days of Robin Hood; there are men among us beside whose robberies those of the brigands of Italy and Greece and the Bedouins of the desert are mere pleasantries. Of all the triumphs of invention none are more wonderful than those by which the hard-earned gains of millions are forcibly conveyed to the vaults of the robber-princes. No business is more highly organized, more strenuously pursued, more successfully managed than the business of robbery. Yet, under all this elaboration of method, it is robbery, nothing worse nor better.

The peculiarity of the modern method of robbery is the employment, by the robbers, of the State as their enforced agent and accomplice. Sometimes, but not often, they organize their clients and retainers into armed bands and seize the coveted booty, combining to have the State confirm possession. But the force on which they prefer to rely is the quiet and resistless force of the laws and the courts. By artfully contrived legal schemes they constrain courts to do their bidding. The judges may be unwilling instruments, yet they are bound to sanction, impartially, the working of legal processes. But what shall we say when weak or corrupt judges hasten to legalize schemes by which great corporations are wrecked or rehabilitated as suits the purposes of the conspirators?

Of the gigantic fortunes now held in this country, not a few have been gotten by legal robbery. Twenty years ago our millionaires could be counted almost on the fingers of four hands. To-day their enumeration would carry us into thousands. Since the new system of robbery was perfected, about twenty men have amassed fortunes, which, taken together, exceed the debt of the nation. Twenty years ago many of these men were poor. Some of the new millionaires have grown rich honestly, but some of them have led a raid upon the production and the accumulated wealth of the country. So Napoleonic in its boldness and success has been the method of the master robbers, that rich men of better instincts have been dazzled by it, and have adopted it openly and independently, or have lent indirect coöperation and social credit to the robber chiefs and have shared in the plunder. Men of honorable reputations, who have been crowned with public honors, have countenanced these crimes as affording the surest way of adding to their unsatisfying fortunes of ten, twenty, or even thirty millions. It is by no

means our purpose to throw discredit upon the pursuit of wealth. Honest production and the honest gains of wealth that is employed in the service of society are the bulwarks of civilization. But we do say that examples of private greed are sapping the sources of public honor; examples of gigantic and countenanced robbery are undermining the foundations of public morality and corrupting the national character.

Our legislators have failed to see, or, for private and corrupt reasons, have winked at the fact, that the laws which were made to fit old-fashioned ideas of honor and morality instead of protecting the public, are the strength and the protection of dishonest men. The old code of commercial honor is lost sight of in the complex transactions of stock-jobbers, who remain out of sight while their work is being done by conscienceless factors; by lawyers skilled in discovering loop-holes in the law and in juggling with the law; by lobbies with money at the doors of legislatures; by paper shares and paper promises to pay; by cipher messages and spies, and by abusing the facilities of stock exchanges.

It is well that our legislators are making at least the show of inquiring into the methods by which the public is robbed in the interest of stockholders, and they, in turn, are robbed by corporate managers; by which wholesale robbery is cloaked with legal forms of "consolidation," "reorganization," "receiverships," and "watered stocks"; by which men may safely conspire to pervert the natural course of production and trade, and rob the public by the artifice of "corners"; by which a man is allowed to control rival or double systems of railways, and with impunity array one against the other, as suits his varying purpose, thereby despoiling the public with the ease of a gambler playing with marked cards.

What have the people to say about these practices? They do not appear, as yet, to have anything to say. The robber princes are held in high esteem. They go about to the colleges, some of them, and Doctors of Law and Doctors of Divinity grovel at their feet; if any Mordecai has refused to bow down before them, his name has not been reported. Men whose riches have been increased by spoiling their neighbors are held up as shining examples for the imitation of our youth. So long as teachers of morality silently indorse such iniquities, it is not to be expected that the people will cry out against them. But the day is sure to come when plain men will clearly see that no one man can get with clean hands, in an ordinary lifetime, a hundred million dollars; that such an enormous pile, so suddenly collected, must be loot, not profit. That will be a day of reckoning, indeed, for the robbers and for the judges and the legislators and the public teachers who have been their accomplices.

Meantime these facts are to be kept in mind,—that we have among us a class of men who, in their rapac-

ity, are bent on enriching themselves by forcibly seizing the property of their neighbors; and that they have learned how to use for this purpose the organized force of the State. Some means must be found of putting a stop to them. Unless this be done speedily, the respect for law on which social order rests will not long survive.

#### The British Strawberry.

THERE was a time when it did not do for a foreigner to speak disrespectfully, even in his own country, of anything American; of our rivers, lakes, waterfalls, skies, statesmen, manners, voices, liberties, or strawberries. We had the provincial supersensitiveness to criticism. But we have been getting bravely over the weakness lately. We can, on occasion, abuse ourselves roundly; and we can listen, without ruffling, to the tarest things that are said against us by others. If you see in an American paper a truculent reply to a foreign criticism of America, ten chances to one, it is written by a foreign-born writer. The eagle does indeed sometimes spread its wings and tail feathers in prominent places—in Congress for instance; but the emitted scream is not the old-fashioned genuine Yankee scream; it is nowadays pretty sure to be known by its brogue.

At one time, we have said, the whole country possessed the provincial supersensitiveness to criticism. After that, for many years, this supersensitiveness was most marked in our Southern States. For obvious reasons, the foibles of provinciality lingered later there. The North is no longer supersensitive. The South, with the extinguishment of slavery, and the recovery of and advance in prosperity, yearly (we may almost say daily),—loses its supersensitiveness. The Southern States have wheeled into the line of human progress; its citizens are more and more serious, busy, well-informed, independent. Calamity and prosperity have, alike, been good school-teachers to them. They are becoming citizens not merely of the South, but of the Union, and of the world. A few years ago, Mr. George W. Cable, for having an opinion of his own about his own country, would have been strung up to a lamp-post in that native city of his which now is proud to do honor to his genius and to his manly independence of character.

No one can know better than the editors of *THE CENTURY* how generously hospitable is the English public to American literature, art, and opinion. Curiously enough, however, the supersensitiveness to criticism of which we have spoken, while gradually fading out in America, seems lately to have been developed in certain quarters of "the mother country." A singular instance of this state of mind is noticeable in the remarks that have been made abroad on certain essays in the November number of *THE CENTURY MAGAZINE*. Mr. Howells, in his essay on Mr. James, ventures to express his views as to a change in the manner of writing novels. In the course of his argument, he gives it as his opinion that a different kind of novel-writing has come into vogue; a kind different in form from that of Richardson and Fielding, Dickens and Thackeray, and without certain of their peculiarities; a kind derived from

Hawthorne, George Eliot, and the better modern Frenchmen, like Daudet. (He might have said derived also very largely from the Russian Tourguéneff.) Mr. Howells says that Mr. James is "shaping and directing American fiction, at least." But he asks "will the reader be content to accept a novel which is an analytic study rather than a story, which is apt to leave him arbiter of the destiny of the author's creations?"

There was something in Mr. Howells's way of saying this about the current novel that roused the ire of many readers and critics in both America and England. Mr. Howells's attitude toward Dickens and Thackeray was misunderstood by many—as he has himself explained in a note to a English friend, quoted in the London "Athenæum"; as he may possibly explain more fully in an article which he intends to write on the genius of those two great masters of fiction. Mr. Howells, we say, has been very severely criticised for what he was supposed to mean, in both American and English papers,—in American not less than in English,—the difference being that in England the expression of a purely literary opinion by a novelist, on the art of novel-writing as it now exists, was taken to be a "spread-eagle" attack by an American on those purely British institutions, Charles Dickens and William Makepeace Thackeray! The critics of the London press forgot to notice that in fixing the derivation of the modern novel—especially the American—the name of only one American was given, that of Hawthorne (see "English Men of Letters" series)! while as an unconscious offering to the equal demands of British and French sensitiveness, Mr. Howells did not fail to mention George Eliot and the fiction of France!

So sensitive have some of our good English friends become that they at times appear to lose their literary insight, and sense of humor as well. We are willing to submit to any fairly constituted international Peace Congress the question whether Mr. Warner's article on "England," in the same number of *THE CENTURY*, is not a good-natured, frank, mainly serious, partly humorous, literary essay. Along with its earnestness of statement is the dry humor and exaggeration of the same author's "My Summer in a Garden" and "Back-log Studies." The fact is that Mr. Warner was principally moved to write this essay on England by a cordial friendship for English people and a hearty admiration of the country. But he wrote judicially, not gushingly, not sycophantishly. He wrote with admiration and enthusiasm, but with discrimination. He did not merely marshal forth a series of complimentary and superlative phrases; he criticised, sometimes solemnly, sometimes in the spirit of fun. But listen again to this, O insatiate London critic: "This little island is to-day the center of the wealth, of the solid civilization of the world!" "For any parallel to her power and possessions you must go back to ancient Rome!" "And we must add to all this that an intellectual and moral power has been put forth from England clear around the globe, and felt beyond the limits of the English tongue." In the midst of such praise of England, Mr. Warner pauses to pay his attentions to his own country; and in doing so he makes one of the most

biting criticisms of America that have been made by native or foreigner this many a long year. "What educating influence," he says, "English fiction was having upon American life" Congressmen "have not inquired, so long as it was furnished cheap and its authors were cheated of any copyright on it." This is bad enough, but it is not the statement to which we referred; only Americans can know with what shame we read the bitter and degrading avowal that follows,—that these same Congressmen, after all, "represent us intellectually and morally a good deal better than we sometimes like to admit!"

In this essay then Mr. Warner not only praises England, but abuses his own country. What more can an Englishman desire! Ah, but he gives the other side of the shield also; he does not shrink from praising "Knickerbocker's History of New York" and "The Biglow Papers,"—both notoriously products of the new world; nor does he on occasion shrink from dispraising the English shop-keeper, and the British strawberry. As the two American books named above have long ago been adopted in England itself as creditable parts of modern "English literature," we do not think the rub is there. From the criticisms we have read, and the letters we have received, it is evidently this last offense that most deeply rankles in the British bosom. And there can be no doubt that Mr. Warner has spoken with extreme disparagement either of the British strawberry, or the manner in which it is served (we are ourselves not quite sure which). We are sorry that we cannot help him or ourselves out of this difficulty. We fear it cannot be explained away, as Mr. Howells can perhaps explain away his "attack" upon Dickens and Thackeray. There it stands in the November number of *THE CENTURY MAGAZINE* in all its vagueness, and in all its certainty, a flagrant and continuing example of American "spread-eagleism,"—and of the lately developed English super-sensitiveness to American criticism.

P. S.—We have just received advices from England, sent since the arrival there of the December number of the magazine. Mr. James's paper, "The Point of View" has made all right again!

#### Law-making at Albany.

THE political complexion of several of the State legislatures which assembled at the beginning of the new year has been changed since their last session. But the conviction is growing, among reflective people, that some change more radical than a change of political complexion is needed to secure intelligent and honest legislation, and equally to secure a diminution of ignorant, or dishonest, or meddlesome, or superfluous legislation. In fact most of the State legislatures have fallen into public contempt. The newspapers express moderate expectations of the incoming legislature, and speed the parting legislature with hootings. There is no easier road to popularity for a governor than to treat the collective wisdom of the law-making body with ostentatious contempt, and to make a free and even "slashing" use of the veto power which is theoretically vested in him for rare emergencies.

An examination of the work done by the last legislature of New York certainly tends to confirm the disesteem of legislative wisdom expressed by the newspapers and by the governors. In mere volume, legislative activity has diminished since ten years ago, when the annual "out-put" of new laws was nearly a thousand. The increasing freedom with which recent governors have used the veto power partly accounts for this diminution, which in the last legislature was further accounted for by a dead-lock which prevented the passage of any distinctly partisan law. Nevertheless, it is still true of the legislature of New York, as was wittily said by the author of "The Commonwealth Reconstructed," that "it exhibits the natural fecundity of low organisms." There is no printed record of bills introduced, and it is perhaps a nice question whether the presumption is in favor of bills which passed both houses, or of those which failed in one house or the other. But at any rate there will be a popular presumption in favor of those which the governor allowed to become laws; and of these "Laws of New York" for the session of 1882 there were passed and have been published four hundred and eight, or between two and three for every legislative day.

The most cursory examination shows that the title, "Laws of New York," is in most cases a misnomer. Leaving out amendments to the codes (14), acts merely formal, such as releases of title and legalizations of informal official acts (35), grants and alterations of charters (58), and regulations merely local (198, or almost half of the whole number), and leaving out also appropriations and what are strictly mere bureau regulations of executive departments (64), the number of what are on their face laws of the State is reduced to sixty-four, less than one-sixth of the total volume. Not all of this select fraction are really laws. If we came upon a law providing, for instance, that all red-haired, one-eyed grocers doing business in cities of more than 15,000 and less than 20,000 inhabitants might do something not permitted to other citizens, we might be sure that the object of the statute was to benefit some individual grocer contemplated by the framer of the bill. There are bills in which the private purpose is not much more artfully disguised. Chapter 290, for example, provides in a large and general way that "any corporation" which has sold any of its real estate may, notwithstanding any prohibition in its charter, buy any land of equal value adjoining its own. Of course this is special legislation, and that it has to be granted in general terms makes it the more ridiculous, and is very likely to make it the more mischievous. Another bill of the same kind is chapter 349, which provides that a horse railroad may make use of five hundred feet or less of the track of another horse railroad in order to get from its own track to its car-house, New York and one street in Brooklyn being specially excepted. Some of these special laws can scarcely be said to be disguised. Here, for example, is chapter 216, which provides that a student at law who has been prevented from completing his course of study, "by reason of his necessary absence from such university while a member of the legislature," shall be entitled to admission to the bar on passing his examination. Here the one-eyed, red-haired grocer of our parable stands confessed. The

implication that making laws may be a satisfactory substitute for studying them shows the concurrence of the legislature in the general belief that service in the State legislature is merely an apprenticeship.

Of these sixty-four laws, there are only two which can fairly be said to have excited much public interest, or to have been enacted in answer to a public demand. These are the bill to legalize primary elections, of which the aim is doubtless good, although it is doubtful whether the means provided are sufficient to attain it, and the Railroad Commission Bill, of which much the same is to be said. The subject which seems to have excited most attention in the legislature itself seems to have been the manufacture and sale of oleomargarine, and the treatment of this subject furnishes a characteristic illustration of the capacity of the legislature for its work. The object of all the bills on the subject introduced was the same, to prevent the sale of oleomargarine as butter, or of cheese adulterated with lard as unadulterated cheese. It ought not to be a great strain upon the human intellect to draw a single clear and sufficient act to effect this purpose. But it seems to have been beyond the assembled wisdom of the legislature. So the legislature passed four laws. The first and second (chapters 214 and 215) became laws on the same day, and presumably passed the scrutiny of the same intelligent committee. Chapter 214 makes the coloring of oleomargarine and lard cheese, in imitation of butter and cheese respectively, a misdemeanor punishable by a fine of not less than \$50 nor more than \$200, or by imprisonment for not less than thirty nor more than ninety days, or by both. Chapter 215 repeats chapter 214, with variations, prohibiting the imitation in color even of butter artificially colored ("with or without coloring matter"), and takes in "keepers of hotels, restaurants and boarding-houses" (what, by the way, is the legal definition of a "boarding-house"?) as well as makers and dealers, and makes the penalty a fine of not less than \$50 nor more than \$200, half to go to the informer and half to the poor, or an imprisonment of not less than ten nor more than thirty days. Thus the State of New York, by two laws passed on the same day, prescribes two different penalties for the same offense. But the wisdom of the legislature did not stop here. Chapter 238 provides that every person who manufactures for sale, or offers for sale, or exports to a foreign country any substance in semblance of butter and cheese "not the legitimate product of the dairy," shall brand the same "oleomargarine butter" or "imitation cheese," as the case may be, "in Roman letters not less than one-half inch in length." If he does not he is liable to a fine of \$100, with costs, for each offense, besides being subject to a prosecution for misdemeanor, punishable by a fine of not less than \$50 nor more than \$200, or by imprisonment for not less than ten nor more than twenty days, or by both. This ought to settle the wretch, but the legislature returns to the charge with unabated fury in chapter 246. "Any person who shall hereafter sell, either at wholesale or retail, any oleomargarine, butterine, suine, or other substance not butter, and represent the same to be butter, shall be fined not less than \$25, or be imprisoned for thirty days or less, or both." And then, as a second section, follows this mysterious but delightful addition: "The sale by any person of

such oleomargarine, butterine, suine, or other substance not butter, representing the same to be butter, shall be deemed presumptive evidence of the guilt of such person."

This is a fair enough exhibition of the manner in which the legislative intellect grapples with a "giant evil." Four separate, and, in some respects, incongruous acts are passed in addition to those already on the statute book, to attain a purpose which might have been fully attained by a single act. And this illustrates the manner in which the statute books become choked with rubbish. It must not be supposed that all, even of these general laws, are really of general application. To one law, for example, making public property all drains and ditches dug before 1872, which have since been maintained at the public cost, there is a considerable exception of fourteen counties; and a bill was passed excepting fifteen counties from the operations of the County Treasurers' Act. This facility of exception is a great promoter of reckless legislation. A legislator who imagines that his constituents will not like a law dispenses himself from the necessity of examining it by proposing that his county shall be excepted, and the exceptions sometimes apply to more of the people of the State than the rule; and there are instances of bills that have been passed with every county of the State exempted from their operation except the county of the mover. In truth, the notion of a law, in Hooker's sense or in Bentham's, seems never to have entered the minds of the makers of laws for the State of New York.

It is, however, in bills professedly local that this lawlessness of law, this literally "unprincipled" character of legislation, is most manifest. It is in these also that the "jobs" of a session are to be looked for, while a very moderate degree of skill suffices to conceal them from an investigator unacquainted with the local circumstances. It will surprise most readers to learn, however, that local regulations actually make changes in the substantial rights and remedies of citizens in different parts of the State. Chapter 119 discloses the existence of a special mechanics' lien law in Onondaga County. Chapter 171 amends an act of 1871 in relation to "persons who abandon or threaten to abandon their families in the County of Kings." Even if, at the date of the original law, there was so general an upheaval of the social fabric in Kings County as to demand that its heads of families should be put under bonds to live with their families, the domestic morality of that region must since have been so nearly assimilated to that of the rest of the State as no longer to require a keen and special terror of the law. There are many laws of 1882 exempting particular places from the operation of general laws. There are seven laws extending the time for the payment of taxes in districts not known to have been devastated by pestilence or famine, and two enforcing the collection of taxes in other districts. There is a law relating to arrests without process in Schenectady, which, if it is good for Schenectady, is manifestly good for all other places in the State. There is a comic act requiring a person whose leg is about to be broken by a defective bridge or sidewalk in Schenectady to give twenty-four hours' notice of his danger to "the superintendent of streets," in order to make the city liable

for damages. One wonders what is imagined to be the function of a superintendent of streets in Schenectady.

These one hundred and ninety-eight measures, constituting nearly half in number and more than half in volume of the work of the last legislature, are a mighty maze, and quite without a plan. It is impossible to classify them according to any principle, since they betray none; and all but impossible to classify them according to the objects sought to be attained, so miscellaneous are they. The most noticeable thing about them is the triviality of their subject-matter. When there is no question of politics, any importunate legislator seems to be able to "get through" whatever any important constituent desires to be got through. Almost complete local self-government in some cities and villages is contrasted with almost complete wardship to the legislature in others. Cherry Valley is authorized to spend money for certain specified purposes, "and for any other improvements which a majority of the trustees may deem proper," while Utica must have a special law to build an engine-house, and Lockport a special law to buy \$1000 worth of hose, and the village of Sherburne a special law to spend \$250 on a survey for a water supply. There is a general law for villages, it appears, but the existence of the rule is only made manifest through the multitude of the exceptions. Special laws were passed last session for fifty-four cities and villages. In almost every bill it is evident that the legislature can know nothing about the merits of the case, but must pass it on trust, because it is believed to be approved by the people concerned. And why, in the name of all that is rational, should it not be left to the people concerned to say what they will do with their own?

A bill was introduced into the legislature of 1881 containing a proposition to amend the constitution of New York by restricting the legislature to the passage of laws applicable to all cities or incorporated villages alike, and restricting local self-government only by providing that a direct popular vote should be required to increase the debt of any municipality. If this proposition had become part of the organic law, 198 laws, or half the annual out-put would last year have been saved; 42 more, if executive officers, or courts, were given the power of correcting informalities in local offices, of granting formal releases of title, and the former of making their own bureau regulations; and 58 more, if all charters were granted under general laws. If the power of passing special laws of these several kinds had been taken away from the legislature, three-fourths of its work for the past session would have disappeared, and when you examine the treatment by the legislature of the remaining bills, the subject-matter of which is clearly within the province of a legislature, the question what is the public use of the legislature at all, presents itself as a "question of urgency." For assuredly there was not a single law passed by the legislature of 1882, the postponement of which for a year could have brought any public mischief. Not only the constitutional convention, the real legislature of the State, but the municipal commission, and every other body which undertakes in earnest to effect any important improvement in State affairs, finds one of the first conditions of success to be the restraint of legislative activity, and the putting of

an artificial check upon "the natural fecundity of low organisms." If we cannot attain millennial sessions of such a body, it seems that the mild palliative of biennial sessions, which would afford a fair chance of cutting down the birth-rate one-half, might be applied without the least danger of bringing on any public calamity. The clear saving every other year of \$373,000—\$340,000 for compensation and mileage to members and officers of the legislature, and \$33,000 for contingent expenses—though the most direct, is one of the least of the advantages that might reasonably be expected from that change.

#### Free Art.\*

IF a dangerous fallacy is in vogue and has obtained a powerful influence over many minds, the first step in the direction of its extinction is to find a clear and uncompromising statement of it. We are, therefore, much pleased to find a statement in the recent report to Congress of the Tariff Commission that "the advance in the duties on works of art" was "made for the encouragement of original American art." This was undoubtedly the view of the case taken by the politicians of Congress in making the present rates; and this view of the case was undoubtedly imposed upon our national legislators by those American artists who worked for a "protective" art tariff, with the intention of making a "corner" in art in the new world for their own especial benefit and that of their friends and cronies. As these gentlemen, or their survivors, are probably anxious to have their share in the matter now quite forgotten, we will name no names. Let us try to forget this, with many another shady episode of the Dark Ages!

But if it is fortunate to find a fallacy boldly and clearly announced, it is still more fortunate to find its opposing truth put with equal bravery and distinctness. A few days before the Tariff Commission report was made public, the public heard a better gospel announced in a resolution of the Society of American Artists which was passed unanimously November 7, 1882, in words as follows:

RESOLVED: That the attention of the present Tariff Commission and of Congress should be called to the fact that, whereas the United States of America is the only leading nation in the world that has not inherited the works of art of any great epoch of the past, it is, at the same time, the only nation that puts a penalty, by means of a tariff, upon the importation of works of art, both ancient and modern, and that, in the opinion of this society, all works of art should be excepted from the payment of duties, both in the interest of art in general, and of American art in particular.

WILL H. LOW,  
Secretary.

WYATT EATON,  
President.

It is not necessary for us to call attention to the fact that the Society of American Artists contains a considerable part of the artistic talent of the country. Its membership is not confined to the juniors of the

\* See "Art and the Stupidities of the Tariff," by Dr. Holland, "Topics" for February, 1881. Also "Communications," in the same number.

profession, but it includes in its ranks most of the older men whose art is abreast with the times. It can be truthfully said of this society that in its own exhibitions and elsewhere it has greatly helped to redeem American art from the stigma of ignorance and provinciality. It is largely—of course not exclusively—upon the members of this society that the future of our art depends; it is largely from its membership that the Academy is now wisely recruiting its own ranks. The decided utterance of such a society cannot fail to have great weight. It is to be hoped that the Academy, as a body, will now add its testimony on the side of culture and enlightenment. We are sure that many of its better-educated and more liberal-minded members will be glad to bear individual testimony in favor of removing the penalty inflicted upon all persons who presume to bring art works into the United States. As we go to press we learn that the Boston Art Club has put itself right on the record on this vital question, and we have no doubt that similar action will be taken by art societies throughout the United States.

There were formerly two points urged in favor of a "protective tariff" on art-works. One was that foreign artists could live at home on less money, therefore could "produce" pictures at less expense, and had, therefore an unfair advantage in competition with the "home producer." One would think that such an argument as this, an argument confounding art with manufacture, pictures with potato-mashers, or whatever it is that the tariff "protects," must have emanated from the brain of a Congressional representative of some "manufacturing district." On the contrary, we have never known this insult to the profession to be given forth except from the lips of some venerable and well-to-do National Academician!

The other argument advanced is an insult, not so much to our artists as to the intelligence of the country at large, and of picture buyers in particular; namely, that unless the public are "protected" by a tariff on works of art, the country will be overrun with painted and sculptured rubbish from the old world, the idea being that good pictures will not be bought when bad ones can be had! This, we believe, is not only the most degrading argument yet advanced in favor of a tariff, and a high tariff, on art works, but it is the most humorously illogical. If a buyer knows enough to buy good pictures, is he going to buy rubbish simply because the country is flooded with it? And if a man likes bad pictures, either dear or cheap, will he be under the necessity of sending to Europe for them? We should say rather that if the extinction of the tariff does have the effect of making the country swarm with painted rubbish from Europe, the only distinctive thing in the way of modern art would be a picture painted by a native artist. Even a commonplace American painter, under such circumstances might have a better show than ever before.

If the Society of American Artists, who have done themselves so much credit by passing unanimously the resolution quoted above, were asked to explain their position more fully, they would probably say that art is not manufacture; that true art can flourish in no community where taste is not cultivated and keyed up by the contemplation of the best works of art, either in the original or by reproduction; that artists them-

selves especially need the example and stimulus furnished by the art productions of other hands and lands, both ancient and modern; and that every barrier against the free introduction into a country of art works, either in the original or in reproduction, is a barrier against the advance of art.

If the society had been asked for fresh examples of injury it might, perhaps, have referred to several conspicuous "modern instances," not only of the inhospitality and hardship of the tariff, but of its actual detriment to the cause of art and to the dissemination of interest in and taste for art productions. No one will deny the good accomplished by the visit to this country of such eminent and able artists as Mr. Seymour Haden and Mr. Hubert Herkomer. One need not make any undue claims as to the value of their specific teachings in order to insist upon the great good to artists themselves, and to those interested in art, of the independent and clearly expressed views of strong men like these. The very presence of such artists along with the contemporaneous public exhibition of their works, serves as a stimulus to our own artists, and an instruction to the public. But see how our great, rich, powerful, and supposedly hospitable country treats Mr. Herkomer! It lays violent hands upon all the drawings, etchings, paintings, he brings over—not for sale, but to let us look at merely—it lays violent hands upon them, and after keeping them in its possession for we know not how many anxious days, mulcts the unfortunate artist in a good round sum of hundreds of dollars. Mr. Seymour Haden, having been apprised in time of the abomination of our desolations of imported art, prudently refrained from bringing over those valuable works of art with which it was his desire to illustrate his American lectures on original engraving. He estimated that he would have to pay to the United States Government (a government whose annual surplus is one hundred and forty-five millions of dollars) the sum of five thousand dollars cash for the privilege of fully illustrating and elucidating his lectures on art to American audiences!

The American tariff on works of art is without precedent in the civilized or barbarous world of to-day. Other governments exert themselves to obtain works of art from abroad, and to hold fast those which conquest, purchase, or native genius has given them. The one great country of the world that has neither inherited nor produced great works of art is the one country of the world that, through the short-sighted selfishness of a passed, or passing, generation of artists, and the proverbial ignorance and stupidity of its legislators in all æsthetic matters, sets up a troublesome barrier against the admission of art works to any part of its enormous domains! And it does it by means of a law which in effect discriminates in favor of the rich, and against the poor man,—who might be content with a photograph, a plaster cast, an engraving, or an original not made costly by an excessive impost. The Tariff Commission has openly declared that the present duties are for the protection of home artists. Every American artist who avowedly or tacitly consents to the tariff as it is, and who refuses to join in the movement now started for its entire abrogation, should be down on the records, and descend to history, as an obstructionist, as a child of darkness, and not of light.

## COMMUNICATIONS.

### Judicial Oaths and Affirmations.

EDITOR OF THE CENTURY MAGAZINE.

SIR: Archdeacon Paley, in his "Moral and Political Philosophy," said that in no country are the words of an oath worse contrived to convey its meaning or impress its obligations than in England; the accusation applies with equal justice to most of our States, where the same form still prevails. The concluding words of the oath upon which all the other words are understood to depend are "So help me God"; and their meaning, as defined by the principal writers upon the subject, is that the swearer thereby invokes the vengeance of the Almighty, and renounces His pardon if what he swears to be not strictly true. The tendency of such an oath, as usually administered, must be, if no worse, to confuse the mind of the person taking it as to its true meaning, to impair the reverence which is due to the sacred name of Deity, and thereby to defeat the very object for which an oath is designed. The force of the sentence quoted is said to lie in the word *so*, meaning *upon condition* of my speaking the truth, or performing the promise, and not otherwise may God help me or save me. An ancient form had the additional words *at thy holy dome*; that is, so help me at the last day, or day of judgment. The Latin words known to have been used as early as the sixth century, whence the English form was taken, ran thus: *Sic me Deus adiuvet et hæc sancta Evangelia*. With the latter clause, which is now omitted in the English form, originated the custom of kissing the Gospels. This oath was imitated from the pagan form of the ancient Romans, wherein the juror held a stone in his hand and invoked a curse upon himself, should he swear falsely.

Thus, it will be seen that the idea of a curse or imprecation has been attached to the words from the earliest times, and an imprecation of some sort appears indeed to have been an essential feature of every ancient form of oath with which we are acquainted. But the primitive Christians, who interpreted literally the command of their Master, "Swear not at all," refused to utter any imprecation, and for judicial purposes under the Christian emperors of Rome there was substituted a form of religious asseveration as *in the presence* of God. When, however, priestly power began to flourish, and the Church fell away from its pristine purity, oaths of cursing or imprecation were again introduced, and thus became imported into the customs of England. Although, by the common law, no special form of oath was requisite, yet, by the practice of the Courts, an oath concluding with the imprecatory words before referred to was universally tendered to witnesses and jurors who professed a belief in the Deity. But as there were some who, upon conscientious grounds, refused to swear, it became necessary, in the interest of justice, no less than of humanity, that some provision should be made for those who were thus scrupulous. The first

British statute on this subject was enacted in 1696 [7 and 8 Wm. 3., Ch. 34] for the benefit of the people called Quakers, and provided that instead of an oath they should be permitted to make a solemn affirmation or declaration in these words: "I, A. B., do declare, in the presence of Almighty God, the witness of the truth of what I say." By subsequent legislation, the privilege was extended to the sects called Moravians and Separatists, and in the case of the Quakers all appeal to the Deity was stricken from the required form. Yet the evidence of those persons who refused to take an oath was not admitted in criminal cases for still a century later. All such disability is, however, removed by the Common Law Procedure Act, and under it all persons, without distinction of sect, who shall satisfy the court or officer of his conscientious scruple, may affirm without any appeal to the Deity, subject, however, to the penalties of perjury in case of a false affirmation.

In this country, nearly all the States have passed similar acts, substituting a solemn affirmation in all cases where the person is conscientiously scrupulous of taking an oath. In some of the States, no question of conscience is raised, but the taking of the one or the other is a mere matter of choice. In many of them also, when forms of oath in certain cases are prescribed by statute, words of imprecation have no place in such forms. In the Federal Courts, and in all proceedings under the general laws of the United States a solemn affirmation may be taken by any one in lieu of an oath. These changes show that with us and in England, the oath is no longer deemed essential in order to bind a man to veracity.

According to Lord Hardwicke, all that is necessary to an oath is an appeal to the Supreme Being, as thinking Him the rewarder of truth and avenger of falsehood. And Lord Coke himself, although generally esteemed somewhat narrow in his conception of an oath, inasmuch as he considered that none but a Christian was qualified to take one, yet was so far advanced as to define its essential feature to be simply "calling Almighty God to witness" the truth of the testimony. The design of an oath is now understood to be, not to call the attention of God to man, but of man to God. Not to call on Him to punish the wrong-doer, but on man to remember that He will. In this view, the imprecatory words become totally unnecessary, and for a believer in the Deity a solemn affirmation taken as in His presence expresses all that is required in an oath.

In France, there is no appeal in words to the Supreme Being, but the person whilst making his declaration, holds up his right hand, which action is understood to imply an oath. Formerly an exception to this form was made in the case of the clergy, who instead of raising the hand placed it upon the breast. Recent action in the Chamber of Deputies in that country; the discussions growing out of the Bradlaugh case in the British Parliament, and the com-

ments thereupon which have from time to time appeared in the public journals on this side the water, indicate a growing sentiment in Christian communities against the use of any oath.

Of the evil tendency of the imprecatory clause so lightly taken in the multiplicity of oaths used among us, no argument can at this day be needed to convince any thoughtful person. If then, the evil of a custom which has so long had a hold upon our institutions be acknowledged, some may ask, what is the remedy? My answer is that, there are three. (1) Let every conscientious person without regard to sect, invariably refuse to take an oath in the form objected to, and claim his right, which, as we have seen, is now almost universally accorded, of substituting an affirmation. (2) Let the judges of our courts having authority to prescribe rules for the qualifying of witnesses and jurors strike from the oath the imprecatory words in all cases within their respective jurisdictions. (3) Let the legislatures of each of our states when assembled, pass an act definitely prohibiting the use of such words in every form of oath, or providing for an affirmation (subject for its violation to the penalties of perjury) to be taken in lieu of an oath by every one without distinction. The first of these remedies is a very simple one. If it were generally availed of the second and third would speedily follow, and the form of oath now so common would come to be looked upon with just abhorrence. Yours truly,

*Benjamin P. Moore.*

BALTIMORE, MD., Dec. 10, 1882.

#### Vandalism in "Saint Sophia."

EDITOR OF THE CENTURY MAGAZINE:

SIR: AMONG the multitudes of tourists who almost daily visit the mosque of Saint Sophia, in Constantinople, there are probably few who do not carry away with them a number of fragments of the colored glass used in the Byzantine mosaic with which this ancient edifice is profusely decorated. The youth who has undertaken to supply the increasing demand for these interesting mementos, is usually found in the gallery against the rear wall of the mosque, and any one may

purchase as many fragments as he desires at the expense of a few piastres. It must be that the methods resorted to in obtaining a sufficient supply of this commodity have not come to the knowledge of the traveling public, else the great majority would hardly make themselves even indirectly responsible for the most outrageous vandalism which it has been my fortune to encounter.

Our guide, an intelligent and apparently honest fellow, who most certainly was not interested in misrepresentation in this instance, informed us at the conclusion of our visit to the mosque that the bits of mosaic purchased by foreigners in the building had not fallen from the vault on account of some defect in the cement as represented, but had been rubbed off by the persevering application of a bamboo rod in the hands of a small boy!

Comment upon the irreparable injury which will surely be caused by the continuance of this nineteenth century iconoclasm seems hardly necessary, but tourists might somewhat delay the work of destruction by discouraging the advances of the pious Mahometan who thus ingeniously combines religious duty and worldly advantages. Yours truly,

*J. S. Seymour.*

BLOOMFIELD, N. J., December, 1882.

#### The Supreme Court of the United States: A Correction.

EDITOR CENTURY MAGAZINE:

SIR: In the December number of your magazine, on page 175, the author of that very valuable and interesting article, "The Supreme Court of the United States," is made to say: "In 1799 President Adams, on the recommendation of a Senate Committee, sent a commission to France to negotiate a treaty. Oliver Ellsworth, Patrick Henry, and William Van Murray were the commissioners." The fact is that Ellsworth, Henry, and Van Murray were appointed, but Patrick Henry having declined the appointment, William R. Davie, of North Carolina, was named in his stead and served with the commission.

Yours truly,

*W. R. Davie.*

LANDSFORD, CHESTER CO., S. C.,

Dec. 7, 1882.

## LITERATURE.

#### Leland's "Gypsies."\*

COMPARED with "The English Gypsies and their Language" and "Anglo-Romany Ballads," the latest publication from Mr. Leland on his favorite hobby is more a collection of short essays than a connected work. As Liszt became inspired by the music of Hungarian gypsies, so the study of Romany words and ways appears to breed in a man a very pleasant species of monomania. In the case of Mr. Leland it results

in bright, agreeable literature of a light sort, and incidentally in not a little solid information which ought to lose nothing in the eyes of serious persons, because it happens also to be picturesque. Whether Mr. Leland's firm belief that the history of the gypsies has been traced will be always gospel; whether it be true beyond peradventure or not that they are descended from a certain tribe of Hindostan which still has representatives in India,—the pictures he draws are fascinating, and the book, like those that went before, may be hailed as a fresh and stirring addition to the literature of the subject. Mr. Leland's enthusiasm is

\* The Gypsies. By Charles G. Leland. Boston: Houghton, Mifflin & Co. London: Trübner & Co.

infectious, and the reader finds it hard to put himself in the shoes of the farmer whose small livestock have mysteriously disappeared, or of the buyer of a horse who finds his purchase going lame before the gypsy is out of sight. Marian, in Gay's "Shepherd's Week," takes the rustic view of these light-fingered gentry:

"Last Friday's eve, when as the sun was set,  
I, near yon stile, three sallow gypsies met;  
Upon my hand they cast a poring look,  
Bid me beware, and thrice their heads they shook;  
They said that many crosses I must prove,  
Some in my worldly gain, but most in love.  
Next morn I missed three hens and one old cock,  
And off the hedge two pinner and a smock."

The tendency of Mr. Leland's books, however, is to make one feel that community of goods should be allowed in the case of people who are so wholesome physically, so kindly in their social relations, and so honest among themselves. Not that he directly states that their morals are of a high grade, but he gives one that impression. He is never tired of telling how he watched a mountebank at a fair, followed him to an inn, and then astonished him by talking gypsy to him. It seems to afford him unending pleasure, especially in the instances where the gypsy, though he understands, pretends not to, thereby acting closely like Indians and other savages, who show great repugnance to intrusion on their secrets, and need to be very slowly approached before they will give an alien their confidence. And it is not the English or American gypsy alone whom Mr. Leland pursues: Russian, Austrian, Welsh, Egyptian, and Syrian gypsies are bagged by the same methods, and made to yield some new words or add some new light to the vexed problem of their common origin. The chapter on Russian gypsies is perhaps the most attractive of all. On reading of the irregular part-singing of these gypsies, without notes and without a leader, apparently without any concerted action or training for a special piece, one thinks of the music of such Hungarian gypsies as were lately in New York:

"And I listened to the strangest, wildest, and sweetest singing I had ever heard,—the singing of Lurleis, of sirens, of witches. First, one damsel, with an exquisitely clear, firm voice, began to sing a verse of a love ballad, and as it approached the end the chorus stole in, softly and unperceived, but with exquisite skill, until, in a few seconds, the summer breeze, murmuring melody over rippling lake, seemed changed to a midnight tempest, roaring over a stormy sea, on which the *basso* of the *kalo shuresko* (the black captain) pealed like thunder. Just as it died away, a second girl took up the melody, very sweetly, but with a little more excitement,—it was like a gleam of moonlight on the still agitated waters,—a strange contralto witch-gleam; and then again the chorus and the storm; and then another solo yet sweeter, sadder, stranger,—the movement continually increasing, until all was fast and wild and mad,—a locomotive quickstep, and then a sudden silence—sunlight—the storm had blown away."

Mr. Leland is a lively writer, who by no means confines himself to the subject before him, but throws in side remarks, and vents his feelings on irrelevant matters with a raciness not at all displeasing. He may have had a sharp lesson for many Americans and other "Anglo-Saxons" in mind when he digressed thus:

"It is worth remarking that whenever a race is greatly looked down on by another from the mere stand-point of color, as in America, or mere religion, as in Mahometan lands, it always contains proportionally a larger number of *decent* people than are to be found among those who immediately oppress it. An average Chinaman is a human being far superior to a hoodlum, and a man of color to the white man who cannot speak of him or to him except as a 'naygur' or a 'nigger.' It is when a man realizes that he is superior in nothing else save race, color, religion, family, inherited fortune, and their contingent advantages, that he develops most readily into the prig and snob."

A singular fact recorded by Mr. Leland regarding the spread of the gypsy tongue is corroborated by various gypsies: it is that at present more pure gypsy is talked in the United States than in Europe. The same statement has been made in regard to the Irish, the purest form of the Keltic dialects. In "Shelta, the Tinker's Talk," Mr. Leland discusses the possibility of that lingo being a remnant of the language of the Picts and decides against it. Yet he says: "Shelta is perhaps the last Old British dialect as yet existing, which has thus far remained undiscovered." The chapters on American gypsies would alone entitle Mr. Leland to a good audience, even were there not much else in his book that is piquant and instructive.

#### Miss Phelps's "Doctor Zay."\*

It is now about fourteen years since "The Gates Ajar" introduced Miss Elizabeth Stuart Phelps, who was then a young lady of twenty-four, to something more than local fame. Since the success of that book, with its twenty editions in a single year, Miss Phelps has had a good share of public attention. The story was novel and striking rather than strong. Coming, as it did, from the bosom of orthodoxy, and flying in the face of current notions, it was bold in its conception of heaven. But boldness was soon discovered to be a constant factor in all the work done by Miss Phelps. It was an honest boldness that went with careful training and was under the control of a severe conscience. "The Story of Avis" was possibly bolder than "The Gates Ajar." It was certainly more ambitious, and took high, not to say haughty, ground in the illustration of the disabilities and the intellectual disfranchisement of women. It showed, moreover, singularly courageous, artistic independence. The novelty of the author's treatment of the new theme, the incisiveness of her attack on old prejudices, and the daring of her style, were more remarkable than the inworking, dramatic force of the story. The reader found himself at his wits' end in his effort to seize the substance behind the dazzling glow of her metaphor. Her male reader must have been not a little vexed at her choice of his champion. She had set up in conflict a man of straw and a woman of might, and the man naturally went down. Still, what complaint could be made? The thesis which she had undertaken to prove, was precisely this: that a woman of metal might sometimes be pitted against a man of straw, and that, in just this case, the world had

\* Doctor Zay. By Elizabeth Stuart Phelps. Boston; Houghton, Mifflin & Co.

denied her the natural use of her weapons. The novelist had chosen her theme and her method of treatment, to both of which she had a right, and it was left to the unleavened critic to admire the beauty and mental force of the heroine, and to feel deep disgust for the wayward obliquity of the hero, while he felt secure in his conviction that the situation, while possible—nay, even common—was uninteresting in a novel. The novel had been made the vehicle of a brilliant discussion of an important social question.

The story of "Doctor Zay" has the same fine points, and is written with even a greater sincerity of moral earnestness. It is an admirable presentation of the difficulties that hedge in a large-minded, ambitious woman with a "career." Doctor Zay, the heroine, is so intensely in earnest that she undertakes a tilt against the laws of nature and the archery of love, in favor of Hahnemann and a career. The tilt, being unnatural, is of course unsuccessful: it is destined to be so from the start. The elementary forces in both Mr. Yorke and Doctor Zay are against the latter in a fight against love. The author, however, as in "The Story of Avis," gives the heroine many strong points in the contest. She has beauty, presence, energy, mental breadth, and moral strength, with long study abroad to back them up. The hero has inherited indolence and aimlessness, and, in addition to this inheritance, is literally knocked on the head at the start, and then thrown under the doctor's care, whose treatment, in the way of nervous excitation, is, perhaps inevitably, anything but homœopathic. These are his disadvantages. He is compelled to fight with a woman's weapons, while she is cleverly provided by the author with those of a man,—in which matter the author clearly has a right to her own way, although one might be inclined to lift the eyebrows a little, at the happy combination of so much beauty and vigorous strength with ten years of hard work in college, medical school, and hospital, with night and day practice in a country village, with thirty and odd visits a day to be made over rough country roads, and a continual strain of office practice besides,—with measles, small-pox, delirium tremens, drowning experiences, surgery, midwifery, and large draughts on the sympathetic nature. At any rate, the tables are fairly turned on the hero, and this is a part of the novelty and force of the plot. He is handicapped, Miss Phelps would probably say, as a woman is handicapped in her struggle for life. Doctor Zay's almost masculine sternness rarely yields him a point. His almost feminine irritability gives him many a slip. The novelist keeps her grasp on the characters firm, and attends closely to the narrative in its narrowest lines. The material is meager, with no wealth of those rich additions which we find in the more genial writers; but the figures which appear are vigorous. There is some irony and serious grotesqueness, but no wit, and only a modicum of humor. There is some formal landscape drawing, but too ornate to be natural, too fanciful to leave a pleasing impression, and the author's expression, whether in describing a dress, a face, or a scene in nature, is apt to be forced and rather technically precise than suggestive. Her vocabulary is not large, and she has a fondness for certain words, quite equal to that of the early transcendentalists. "Fine," "splendid," "implacable," "inscrutable," do more than their share of service. These,

however, are mannerisms, that belong to an intense nature, and intensity and originality are Miss Phelps's strongest points. She has moreover maintained a high ideal of love in marriage, and she expresses better than any other of our writers of fiction the intellectual heights and energies of women. There is a strong breeze out of the Puritan quarter in all her books, and it is thoroughly stimulating.

#### L'Art. Volume XXX.\*

It is remarkable what a monopoly "L'Art" possesses in the United States to the exclusion of other publications of the kind in Paris and in London. For instance, the "Gazette des Beaux-Arts" is a much older and at one time was a stronger, if not an abler magazine. "L'Art" won its way primarily by its boldness in taking liberal views of art and becoming the champion of the younger and the neglected among artists. It also enlisted fresher and brighter writers; it offered a more sumptuous page, and in that way pleased not alone its readers, but the authors who wrote and the artists who designed for it. There is more than people think in the gratification of the auctorial eye and the reflection that good writing will be handsomely placed before the public. The magazine was also popularized in other ways; a greater variety of topics and a more liberal view of what could be held art made the *menu* more catholic. Finally "L'Art" has made a specialty of trying to reach English and American readers. Good as it was a few years ago, and good as it still remains notwithstanding the loss of several writers of mark, it would be a mistake to imagine that there are not excellent things to be found in the "Gazette des Beaux-Arts." It is stronger than "L'Art" in archæology, and the papers have often a weight and solidity that approach at times to the "Revue des Deux Mondes." The vice of the "Gazette" is the official flavor which pervades it, a flavor that is often taken for official, be it said, when really it is merely conservative. Perhaps it would do "L'Art" no harm, but spur it on toward better things, and certainly it would be to the advantage of those who prefer their art criticism through French mouths, if the "Gazette" had more foot-hold in America. Another side of many matters would be presented; only, to encourage the reading of the "Gazette" appears at the present speaking something like treachery toward a new-found friend. After years of complete silence, during which "L'Art" appeared to think that America had no art—a great mistake, whatever sweeping grumblers here may say of it—it began to notice in fine print the fact that painting was beginning to exist in the United States. It asked for and got certain very mediocre notices of exhibitions and sales. But of late years enterprising youths from this side of the Atlantic have been grappling with French artists in French schools and with French methods, and the results have startled Paris. For some time, there was comfort in the undeniable truth that the Americans were not original. But when they began to flavor

\* L'Art. Revue Hebdomadaire Illustrée. Huitième Année. Tome III. Paris and London: Librairie de l'Art. New York: J. W. Bouton.

their imitative work with originality the taste of the critic was fairly hit. At least the unsparing and unscrupulous art-critic of the "Figaro," after many years of spiteful flings at the United States, appeared disposed last year to relinquish the attack. And now "L'Art" comes out in favor of American artists with a fervor which can almost be called indiscriminating. Paul Leroi's characterization of Mr. Knight's work is very good. Of him it is correct to say, "he has much taste, draws with elegance and certainty, composes a picture well, and paints it well, yet with some dryness. I only wish he would get up and stamp around just a little bit; it might turn out that his style would become more obscure; that day he would reach perfection, and that is not so bad a goal to reach." One can also applaud the very mild praise of Henry Mosler and William Dana, and the discrimination which will have none of Mr. Bridgeman's imitative Oriental scenes while it admires his Normandy picture, "La Plantation du Colza," which appeared recently in New York. But it is difficult to follow M. Leroi's admiration of Charles Sprague Pearce, or agree with his one-sided attack on paintings by Whistler. It is to his credit that he brands as absurd the idea that Sargent's "El Jaléo" is unseemly, or, as the critics in Paris appear to have said, libidinous. Though it may seem ungrateful in Americans to quarrel with praise, yet longer reflection will convince that over-praise does more harm than good, and that if, as has often been the case in "L'Art," second-rate American work is flattered, a double injury is effected. On the one hand foreigners are but little impressed with a criticism that proves forced when the art-objects are considered; on the other, native artists are tempted once more to throw away their artistic consciences and strive for temporary fame by the broad way of French art—which may lead them, as aliens, to destruction. It is better to be attacked than praised for second-rate work.

Van Horne's "Life of Thomas." \*

AFTER years of laborious study, Mr. Van Horne has at length completed and given to the world his "Life of Thomas." He was selected for the task by Thomas himself, who was more than usually solicitous concerning his biography, for he had a deep-rooted conviction that he had not received his deserts during his life-time, and he looked to "time and history" to do him justice. Whether the choice of biographer was fortunate or not time itself must decide. He has given us a book which is full of ardent, rather than discriminating, praise, which seeks to exalt Thomas by discrediting his commanders and colleagues, and which records, with evident satisfaction, many incidents and statements which the neutral observer may perhaps think would best have been passed over in silence or omitted altogether. For instance, when, at the close of the war, Mr. Stanton told Thomas, with many compliments, that he had always had great confidence in him, Thomas replied: "I am sorry to hear you make this statement. I have not been treated as if you had confidence in me." It is a question whether Thomas's constant dissatisfaction throughout the war and to the day of his death with his position, his rank,

and his promotion was not the principal defect in a character otherwise remarkable for its force, its purity, and its strength. Far from taking this view, the biographer would have us believe that this was an evidence of greatness, and the subject is again and again referred to for the purpose of showing that this dissatisfaction was well founded, and was due to gross injustice on the part of the government. This may be called the main feature of the book, and next to this is the vehement denial that Thomas was ever slow or sluggish:

"No general, in chief or subordinate command, was ever more quick or judicious in his dispositions, or more forceful in fighting an enemy. \* \* \* Thomas was not over-cautious at Nashville or anywhere else. He was bold always, without being rash, and cautious, without being timid. No general was more cautious when there was need of caution, and no one ever bolder or more forceful when the time for action came."

This idea is frequently repeated in different words, now and then supplemented by the assertion that Thomas was the greatest general of the war. Much of this might fairly be characterized as hyperbole; but Thomas's services were so very great, his ideals of duty were so high, and his whole career was so worthy of respect and admiration, that it is not difficult to pardon much to an enthusiastic biographer. And a book which tells the story of his life so fully is entitled to a hearty welcome.

Campaigns of the Civil War. VIII.—The Mississippi.\*

It is safe to say that three-fourths of those who have professed any knowledge of the campaigns which resulted in the opening of the Mississippi have generally given undue prominence to minor events, and almost wholly ignored the essentially important; indeed, this campaign calls up in most minds a confused jumble of gunboats and batteries, bayous and swamps. We know that Vicksburg was taken and the river opened, and that is about all. This book, however, is a properly proportioned narrative of the series of operations, and its perusal gives a complete exposition of the difficulties and the solution of the problem.

The author indicates in his introduction the general scheme of operations, and enables us to understand it in its simplicity; states clearly the object of the gathering of the mighty forces in the West, and the essential value to both contending parties of the possession of the great river. The several defensive lines of the Confederates, the causes which led to their adoption, and the movements which brought about their successive loss, are next clearly delineated and explained. Then follows a clear account of the campaign terminating in the battles of Iuka and Corinth, which resulted in placing the Confederates on the defensive for the retention of Vicksburg.

The first of the three series of operations undertaken for the capture of the city was a combined movement on the part of Grant and Sherman, the former moving by the Mississippi Central Railroad, and the latter from Memphis by the river route. Such coöperative movements rarely succeed, and this resulted in failure. The brilliant raids of Forrest and Van Dorn against Grant's long line of communications forced him back, and the

\* The Life of Major-General George H. Thomas. By Thomas B. Van Horne, U. S. A. New York: Charles Scribner's Sons.

wide separation of the two commands prevented Sherman from becoming aware of the changed circumstances in time to countermand his order to assault at Haines's Bluff. The second series, known as the "Bayou Expeditions," comprised every possible attempt by the river route, and were all attended with complete failure. The author clearly narrates the difficulties encountered, the hardships endured, and the pertinacity with which each new venture was tested to the utmost in the vain attempt to reach solid ground within striking distance of Vicksburg. The third and final effort was the campaign in the rear of the city, the account of which given in Chapter V. is especially commendable, and full of graphic interest. We see Grant, bold, aggressive, self-reliant, against Pemberton, timid, undecided, deferring to councils of war. The author makes a happy analysis of the characters of Pemberton and Johnston, and brings out unconsciously the unmistakable military talent of Grant. He well says "that the deeds of these eighteen days challenge comparison with the most brilliant campaigns of history."

Although Lieutenant Greene was not a participant in the events he so graphically describes, he has had access to the fullest official data, and has visited the fields of operation and verified disputed points by personal inspection. To a sound knowledge of strategical and tactical principles he unites a happy faculty of lucid description and a technical acquaintance with the vocabulary of his profession,—all of which, together with the excellent maps, containing every reference of the text, and the quite complete appendices, make the volume all that could be desired in so small a compass.

#### Ballard's "Solution of the Pyramid Problem."\*

COLLECTORS of paradoxes have suffered for the last few years from a remarkable dearth of circle-squarers, and there is danger that their occupation would have shrunk to small dimensions had it not been for a fair supply of solutions of the pyramid problem. Mr. Ballard, who has written the latest volume on this subject, is chief engineer of the Central and Northern Railway Division of Queensland. Twenty-three years ago, on his way to Australia, he saw the pyramids of Gizeh. He watched them carefully as the train passed along, and he immediately felt a strong conviction that they were built for the purpose of land-surveying. "Here," he exclaimed, "be the theodolites of the Egyptians!" The entombment of their kings may have been one of the "exoteric" objects of the builders of the pyramids, but they must have had firmly planted in their minds before they built them the intention of using them as a great system of landmarks for the re-adjustment of boundaries destroyed or confused by the annual inundation of the Nile. It would be a hard-hearted reviewer who should withhold from Mr. Ballard the credit which he claims on account of the difficulties under which he has worked; to have discovered and described the main secret of the pyramids with no other aids than a "glimpse at them three and twenty years ago, and the meager library of a nomad in the Australian wilderness" is certainly to deserve the esteem and gratitude of all future generations of men.

Mr. Ballard rests his theory upon the establishment

of a number of what he calls primary triangles (by which he means right-angled triangles whose sides are proportional to whole numbers) in the ground plan of the pyramids of Gizeh. Taking a distance between two pyramids as hypotenuse, he constructs a right-angled triangle with base and perpendicular parallel respectively to the sides of the pyramids, and he finds that such triangles sometimes turn out to be "primary" triangles. He does not make known upon what authorities he depends for his measurements, but it is evident that the great work of Lepsius is not contained in his meager library. By measurement of the ground plan of these pyramids ("Denkmaler aus Egypten und Æthiopien," Abt. I., Bl. 14) it appears that the triangle which has Mycerinus and the Great Pyramid at its acute angles has sides which fail by twenty-eight and eighteen meters respectively of being in the ratio of three and four to an hypotenuse of five. Mr. Ballard seems also not to be aware that the pyramid which forms the basis of his theory, alone of all the pyramids, has sides which are not in the directions of the cardinal points, but differ from them by more than four degrees.

From his primary triangles, inaccurately measured, he determines a new cubit of 20.22 inches, which he supposes to have been derived from the division of a second of the earth's circumference into sixty parts. It has not occurred to him (what was early recognized by Mr. Petrie in his valuable and striking "Inductive Metrology") that long lengths are of very little value in determining units of measure, and his firm conviction that exoteric knowledge (by which he means knowledge of the outside of pyramids) is of far greater value than esoteric knowledge, prevents him from being influenced by the fact that the oldest and most accurately worked instance of the Royal Egyptian cubit, which gives a length of 20.627 inches, is found in the King's Chamber of this same Great Pyramid.

Surveying was done in Egypt, according to Mr. Ballard, by means of small models of the Gizeh group of pyramids. The north and south line was determined at any point by bringing the model group into even line and even light and shade with the original group, which could be done with great accuracy when the highly polished surfaces of the pyramids were lighted up by a brilliant Egyptian sun. The only argument that Mr. Ballard finds in support of his theory—slight as that may seem—is that the pyramids were constructed on a ground plan composed of "primary" triangles, in order that the plan of the model groups might be laid down with greater ease, but he does not himself show very great confidence in the accuracy of the measurements upon which his one argument depends. He urges with great warmth the recasing of the pyramids with thin sheets of shining metal, in order that the traveler in Egypt may be properly struck with the force of his idea.

#### Linton's "Wood-Engraving in America."\*

In this volume, as in his previous pamphlet on wood-engraving, Mr. Linton does not attempt to give us what we so greatly need—a history of his art from

\* The Solution of the Pyramid Problem; or, Pyramid Discoveries. By Robert Ballard. New York: John Wiley & Sons.

\* A History of Wood-Engraving in America. By W. J. Linton. Boston: Estes & Lauriat, 1882. Quarto, pp. 71.

the earliest to the most recent times. He deals with wood-engraving in America only. Still, as the recent renaissance of the art has been due to American workmen, he has, after all, the most interesting part of the subject beneath his pen. It is difficult to give an accurate idea of the book he offers us. It is interesting because written by Mr. Linton; but it is not what such a history should be. It is, indeed, not a history at all, except in its earlier pages. As he approaches the last dozen years,—with their innovations, their experiments, their partial and temporary failures, and their superb successes,—Mr. Linton becomes controversial in tone and episodic in treatment. Instead of keeping to a more or less narrative form, and describing the growth of new schools and of recent changes in aim and method, he darts at the subject here and there, picking out a work for praise or blame and an artist for criticism or commendation, in rather a hap-hazard and disjointed fashion. From the first chapters we may get a good idea of the beginnings of the art in America, with much biographical information never before put in print; and if the reader has already made up his own mind upon modern work and workmen, the paragraphs of the later chapters will amuse, instruct, and enrage him, in rapid alternation. But to one who knows nothing of the subject Mr. Linton will not make it very clear—even from his own point of view. What that point of view is need hardly be explained at length. Mr. Linton, as every one knows, is an old engraver of great ability, brought up on the best English traditions of an earlier day and passionately devoted to those traditions and to the aims and methods which they have induced in him. To accuse him of conscious unfairness would be unjust. But it is not unjust to say that while endeavoring to give every man his due, even when that man's ideas are in opposition to his own, his own are of so set and narrow a sort that they hamper him in every judgment.

The most serious fault of the book, however, is that Mr. Linton does not place himself at the proper point of view when discussing much of our recent work. He fails to recognize the facts that we have been passing through a period of development; that no vital development in its earlier stages can be aught but experimental; and that works which may be more or less faulty in themselves, may nevertheless be most praiseworthy as tentative essays. It was open to him, of course, to have passed whatever judgment he saw fit upon this new movement—to have pronounced no new departure necessary, to have boldly affirmed what he everywhere suggests—that absolute excellence in wood-engraving had already been attained with certain traditional aims and means, and that no aims and means of other sorts can ever produce results as good. This, if a narrow, and perhaps mistaken, would have been a recognizable platform from which consistent arguments might have proceeded. But Mr. Linton does not take any such definite stand, does not show that novel results have been desired, or describe what they are or what the novel means essayed in their production, does not judge essays as essays—successful or unsuccessful, as the case may be. Mr. Closson, for example, whom Mr. Linton admires, and Mr. Juengling, whom he condemns, have had a common and a novel aim in view all through their work. But both the fact and

the nature of this common aim Mr. Linton disregards. The reward of our engravers who have experimented so widely and so boldly, and of those who have encouraged them all through their cause, has come in the blossoming of a novel art,—for such it may indeed be called,—which is the admiration of the world and the most original and national æsthetic product America has as yet to show. But as a school they get no reward in Mr. Linton's pages. Their combined efforts are not explained. Experiments long ago reprobated or improved upon by their authors are held up to scorn as final and necessary results of what he thinks false and unsound ways of working, and when a cut is praised Mr. Linton either compares it with older things with which it has, probably, no real affinity, or insists upon calling it exceptional, though it may in truth be eminently *characteristic* of the newer school. Many of his criticisms are acute, just, and suggestive in themselves considered, but in the way he states them, and in the conclusions he seems to draw from them, are harmful and misleading.

The real history of wood-engraving in America is still to be written. Every year will supply its writer with fresh material and cause him, perhaps, to recast or modify certain opinions he may hold to-day, for our men are still experimenting and are daily doing new work in the most versatile and surprising ways. But even considering the time when Mr. Linton's book was written, and how quickly material has grown beneath his hand within the last few months, he can hardly be said to have written "up to date." And even considering that he judges chiefly the work of a few years back, he cannot be said to have judged it quite fairly. As has been said, the chief complaint against him is not that he is out of sympathy with modern aims,—this fact pertaining, perhaps of necessity, to the nature of his whole life's work,—but that he does not recognize those aims distinctly or state them clearly, and that in criticising individual works he qualifies the praise he is sometimes forced to give in a vain effort to reconcile *all* praise with his ideas as to how good wood-engravings ought to be produced.

#### Abbey's Illustrations of Herrick.\*

THE handsome volume which contains Mr. Abbey's drawings made to illustrate poems by Herrick, has been years in the making. As the separate pieces were turned out by the artist the public had preparatory views of them in "Harper's Magazine," of which, for a long time past, they have been the most valuable and attractive artistic feature. When they are all brought together, we find less reason to be bothered by their faults and more reason to be impressed by their virtues. As the production of one hand (for Mr. Alfred Parsons's occasional masterly decorative bits do not impair the unity of the work) it would be difficult to find a recent parallel for this book. It recalls only the best things of the kind that have hitherto been done—such as in England, Blake's books, and the volume of Tennyson's poems illustrated by the Pre-raphaelite artists; in America, Mrs. Richardson's "Songs from the Old Dramatists," with La Farge's illustrations. More in the line of the present book would have been Mr. La

\*Selections from the Poetry of Robert Herrick, with Drawings by Edwin A. Abbey. New York: Harper & Brothers.

Farge's illustrations of Browning's "Dramatis Personæ," which, as a whole, was never completed, though the several designs are well-known in the art-circles of New York and Boston.

As we have spoken of what seem to us faults in Mr. Abbey's work, let us say what we have to on this point, and go on. When he passes into work of a certain kind of imaginativeness, of a kind which we can best indicate as *La Fargean*, he is apt to fail. He has power and range enough to make it quite unnecessary that he should try this, and he really does not often try it. Again, he has carried his method of antique lettering occasionally to the point of affectation. This is a difficult problem to handle, and we do not care to lay too much stress upon the matter. An illustration of what we object to will be found on page 177, where one of the best drawings in the book is somewhat interfered with by a lot of rather nonsensical titivating beneath it. If we should, in addition, point to certain drawings which seem to us not quite up to Mr. Abbey's standard, the artist would probably reply with truth that the fault was mainly the engraver's; for although the engraving, on the whole, is to be greatly praised, on the other hand certain designs have evidently been put into the wrong hands.

After this there is nothing but praise to be given to Mr. Abbey's work. His pictures are not sledge-hammer attempts to knock into the reader the most obvious meanings of the poems. The artist has penetrated into and enjoyed the spirit of his originals. The poem serves as a suggestion to the artist's invention, and the result is a picture which not only intensifies but, we may almost say, expands the meaning of the verse. His landscapes are as full of freshness and truth, as his figure subjects are of character and grace. One hardly knows which most to admire, such a landscape-drawing as that on the fifth page, or the series of figure designs which accompany the following "Beucolick." This little "Beucolick" series alone should be enough to give an artist a reputation. A quick and masterly touch, refinement and grace of style, the faculty of characterization,—in a word, the power to enter into and reproduce the gay and tender spirit of an exquisite poem,—these are the qualities here shown by Mr. Abbey; qualities which, indeed, are apparent in almost every design in this remarkable volume. Such a volume, it should be said, could not have been produced, with all its costly beauties of engraving and typography, without the hearty coöperation of liberal and appreciative publishers.

The preface—itsself a most graceful prose idyl—is written by the one man in England who should have been selected for the office, Mr. Austin Dobson.

#### Bacon's "Parisian Art and Artists." \*

If the present volume made professions of any great profundity or thoroughness of treatment, it would be a delusion and a snare. Its modest claims save it from harsh criticism, and enable the critic to say, by way of praise, that in English it would be hard to find anything which gives a better idea of the exterior of the current art movement in Paris. In this sense

the work has historical value. There are doubtless notable omissions, and there is an unprofitable flippancy of style; still reportorially, and therefore historically, the book is worth while; and especially worth while for the numerous excellent reproductions of sketches and studies by a large number of the most prominent Parisian painters of the day. Parisian, in the sense employed in this book, does not mean French; it means the whole body of artists of all nations residing and working in Paris. Thus the work includes a notice, among other Americans, of Mr. John S. Sargent, whose "El Jaléo," was so prominent in the last Salon. A remarkably clever sketch by him of a rehearsal in the Cirque d'Hiver is reproduced, opposite page 202. Mr. Bacon is himself a well-known American artist in Paris, and he tells here many things which will be of special interest to artists. The work is fuller in its present form both as to pictures and letter-press than when it appeared serially in this magazine.

#### Stevenson's "New Arabian Nights." \*

A FEW months ago an English book made its appearance in this country, handicapped with the name of "New Arabian Nights." It was, for a time, no more warmly welcomed than might have been the "New Rabelais," or "A Nineteenth Century Nibelungen Lied," or "Robinson Crusoe" with all the modern improvements. Then, by and by, one or two of the chorus of indolent reviewers glanced at the first page, read the second, and of a sudden found themselves *bolting* the rest of the book, and finding stomach for it all, even as in boyhood they swallowed whole the indigestible "Radcliffe." But this new feast had a fine literary smack to it, and it assimilated readily to the mental system. These reviewers found a chance to say of the book a good word in a general way to the public, and a good word in a particular way to their friends, and "New Arabian Nights" passed from hand to hand until it came about that a large and steadily widening circle of readers was asking if Mr. Robert Louis Stevenson had written any more books like this, or if he were likely to write more. For the "New Arabian Nights" turned out to be no new "Arabian Nights" at all; but a very different and surprising something which is much more easily read at full length than described in a few words.

On the face of it, the book is a collection of short stories, each differing from each, every one distinct and singular, yet all linked together by the adventures of one central character, who is half Monte Cristo and half Haroun Al Raschid up to the last page, where in an unexpected fashion he leaves you laughing at him, laughing at yourself, and wondering how long his inventor has been laughing at you both.

This is the book on the face of it. But then, in fact, you cannot speak of the book on the face of it, for under the face is a fascinating depth of subtleties, of ingenuities, of satiric deviltries, of weird and elusive forms of humor, in which the analytic mind loses itself. It would be possible to give a synopsis of the series: to tell how Prince Florizel of Bohemia, accompanied by his Master

\* Parisian Art and Artists, by Henry Bacon. Illustrated. Boston: James R. Osgood and Company.

\* New Arabian Nights. By Robert Louis Stevenson, London: Chatto & Windus. New York: Henry Holt & Co.

of the Horse, Colonel Geraldine, wander in disguise about London, meeting with many strange haps and mishaps; how from being a mere spectator, the Prince becomes an all-important agent in the affairs of others, always supernaturally successful, ubiquitous, all-powerful, brave, gracious, wise, and kingly,—the ideal prince, the charming, incredible cavalier apology for the monarchical principle. It would be possible to give an idea of the many delicate touches by which this character is created and vivified before the reader's very eyes. It would be possible to show how the flavor of the original "Arabian Nights" is caught and kept by the mere suggestion of an imitation of the style and language. It would not be difficult to show how the "Story of the Young Man with the Cream Tarts" leads into the "Story of the Physician and the Saratoga Trunk," and that in turn into the "Adventure of the Hansom Cabs," the three together introducing us to the Suicide Club and gratifying us with its complete and final dissolution; how the Rajah's Diamond glitters through the "Story of the Band-box," the "Story of the Young Man in Holy Orders," the "Story of the House with the Green Blinds," and the "Adventure of Prince Florizel and a Detective"; how it exerts a baleful influence upon the lives of many people who in the ordinary course of things would have no single interest in common; how Florizel appears at just the moment he is wanted, and puts all things right by virtue of his royalty and his conversational powers, and how, in the end, having served his turn, as the author remarks, he is hurled by a revolution from the throne of Bohemia, "in consequence of his continued absence and edifying neglect of public business," and now keeps a cigar store in Rupert street, London, much frequented by other foreign refugees. "He has an Olympian air behind the counter," says Mr. Stevenson, "and although a sedentary life is beginning to tell upon his waistcoat, he is probably, take him for all in all, the handsomest tobacconist in London."

But were all this told at far greater length, it would give but a vague notion of the characteristic power and charm of the work. Of course, the passage just quoted is clearly a piece of exquisite fooling—a piece of keen satire, too, this upsetting of one's *deus ex machina* when one has done with him. But there is more behind it than fooling or satire. Any one who reads the "Nights" and the four stories that are bound with them must be struck by the author's versatility, his power of picturesque description, his skill in drawing character with half a touch, and his all-pervading humor.

Yet it seems to us that the qualities we have indicated do not give the key-note of Mr. Stevenson's genius, or whatever one may please to call a faculty one of the most original that we have met since the appearance of Bret Harte. The new author has a power that is strongly akin to the dramatic. He juggles with his readers and with his characters. He dresses up a puppet and tells you it is a man, and you believe it, and hold your breath when the sword is at the puppet's breast. Then he holds up the stripped manikin and smiles maliciously. With him, men and ideas are but literary properties, to be used as he sees fit, for this or that effect. In "The Pavilion on the Links" he offers

you an ordinary English magazine story of the "sensation" sort, very well done. And if one's blood must be curdled, 'twere well the curdling were done *secundum artem*. "A Lodging for the Night" gives an episode in the life of François Villon, told with a realism that is at once brutal and poetic; it is the strongest piece of work in the book. It is followed by "The Sire de Malétroit's Door,"—another mediæval French theme, handled, this time, in the pure romantic style. And then there is an odd little conceit, where laughter comes near the line of tears, to end one of the brightest, boldest, most stimulating books that modern fiction has given us.

It is worth noting here that the two French stories mentioned above seemingly owe their being to Théodore de Banville's "Gringoire." They are not thefts; they imply merely a reversion to the fundamental ideas of the Frenchman's work, and a re-creation from those bases. This is neither blameworthy nor unnatural, for Mr. Stevenson is, as we all have found out now that we have made his acquaintance, a critic and a scholar, an essayist and a traveler, whose brilliant and original work has made him only a local reputation these many years. "An Inland Voyage," "Travels with a Donkey in the Cévennes," "Virginibus Puerisque," "Edinburgh, Picturesque Notes," and a volume called "Familiar Studies of Men and Books," which has a pungent flavor to the jaded palate of the most wearied student of over-biographed writer-folk and their over-criticised works,—all these, with a delightful and suggestive little "Gossip on Romance," in the first number of Longman's new English magazine, are to be had by those who, having read the "New Arabian Nights," will want something more by Mr. Stevenson.

#### "Tunis: The Land and the People." \*

WHILE the French consular agents were spinning the web that has bound the ancient Regency of Tunis to France, the Chevalier de Hesse-Wartegg was visiting the large Tunisian cities and making a wide circuit in the interior. Shortly after the French entry into Tunis he was enabled, therefore, to lay before his German countrymen a picturesque and valuable account of the land and the people whose acquisition, it was supposed, would help to allay French sensitiveness over the loss of Alsace and Lorraine. For good reasons probably, the German edition of the clever volume made almost no allusion to the political history of the annexation. But in a paper contributed to this magazine for March, 1882, the Chevalier gave some interesting inside facts, from a German point of view, which showed that the French were inspired to make the move, and were supported in it, by Prince Bismarck. The work before us is a translation of the German edition, which contained several maps, that, unfortunately, are missing from the American book; and while the latter is an accurate and interesting translation, it is not always idiomatic, and does not do full justice to the vivacity and charm of style of the original. But the reader will find abundant reward in the matter.

\* Tunis: The Land and the People. By the Chevalier de Hesse-Wartegg. With twenty-two illustrations. New York: Dodd, Mead & Co.

The author was indefatigable in his search after characteristic scenes and information, and in recording incidents, to all of which he was greatly assisted by the cordial reception given him at court. His book is a curious picture of a state which has brought down to us something most nearly approaching the traditions and customs of the Middle Ages and the best feature of which is seen in the admirable chapter on the Bey's court of justice, where the ruler presides in person and gives to each man his due in patriarchal fashion. Another aspect is shown in the corruption, lawlessness, and ignorance of the governing class, the beggarly condition of the army and navy, the wretched poverty of the people, and the wasted resources of the country. Rapid improvement is expected to follow the execution of the plans of the French, and the present Bey, Sidi Ali, though he is probably of little consequence in the government, is reported to be awake to the advantages of modern ideas. We learn from the book that Tunis has several good sea-ports, or ports that could be made good, while Algiers and Tripoli are poorly off in this respect. Sfax, at the time of the French bombardment, was the most prosperous sea-port in the Regency; and Kerwan, the holy city of the interior, where the beard of the Prophet is entombed, is the only Tunisian town that makes any pretension to cleanliness and the other municipal virtues; it is the seat of Mohammedan learning, where most of the written copies of the Koran are made. The only notable school in Tunis is the College Sadiki at the capital, which is modeled after a European gymnasium, is conducted principally by foreign professors and is crowded with students. A fair acquaintance with the Koran, which is taught to classes of boys at the mosques, is generally regarded in Tunis as a liberal education. Women have much less freedom than in Constantinople or Cairo, and only a small proportion of the better class of women can read or write. The chapters on the provinces are instructive reading, and represent the country to be parched and sterile, producing little more than is required by the native population. Water is scarce and the scarcity is attributed to the destruction of the forests which several centuries ago covered the mountains. It is now hard to realize that the dry and withered Tunis of to-day was once the fertile Africa of the Romans.

Dr. Ellis's "Life of Edwin H. Chapin. D. D."\*\*

DR. CHAPIN left no material for his biography,—no letters nor journal; and his wife, whose memory was naturally to be relied upon, died before she could be consulted. Dr. Ellis can hardly be blamed, if, under such circumstances, his book must be ranked among the too large class of uninteresting and un-instructive biographies; although we think he may be blamed for attempting, under such circumstances, to write it at all. It is an extended laudation of Chapin's eloquence and general goodness, thinly interspersed with miscellaneous incidents and anecdotes gathered from the recollection of all sorts of people who had known or heard of him. It is surprising, however, that even the poverty of his material should have

induced Dr. Ellis to dwell at so much length upon some of the petty facts and incidents which he thought it necessary to record. Chapin's unfortunate habit of composing his sermons late on a Saturday night after a week spent in a lecturing tour, the exact amount of cash earned by each particular lecture upon its frequent repetition, the peculiarities of his chirography, his habit of punning, the trivial details of his summer vacations, even his difficulty in securing a suitable set of false teeth, are all dwelt upon as essential features of the career which the book attempts to describe, and indicates, we fear, some more serious defect in its writer than want of literary tact. The biography of a great pulpit orator ought not to be written at all, unless for the purpose of revealing something of the man's real inner life. Mediocrity in the pulpit creates no curiosity about the preacher's inmost intellectual and spiritual processes, because we feel instinctively that mediocrity is a self-disclosing thing, and has no mystery of personality behind it. Genius, on the contrary, in the very act of kindling some theme which illumines and reveals to an audience their own heart and conscience, hides the orator's inmost self. Much of the charm of eloquence lies in the interest which it excites in reference to the speaker's own hidden nature; and a biography, like the one before us, which fails to satisfy this most justifiable kind of curiosity must prove a disappointment to every thoughtful reader. How satisfying and instructive, for instance, is such a life as that of Dr. Bushnell written by his daughter, whose admirable use of her father's letters reveals those deeper qualities of his character which were hidden by the theological tumult aroused by his genius. What an exquisite revelation of the inmost convictions and struggles of a great spirit is made in Père Chocarne's life of the great Lacordaire, whose astonishing eloquence in Notre Dame fifty years ago set all Paris wondering what sort of hidden experience lay behind those wonderful orations against the rationalism of the day.

Dr. Chapin was undoubtedly a great orator, but we hardly think one of the greatest. His published sermons show the admirable qualities of clearness and pictorial symmetry, but nothing of the quality of the *seer*,—nothing of that insight which, in Phillips Brooks's discourses, opens up the common experiences of men until they are seen to be revelations of the laws of elemental spiritual life. Dr. Ellis labors hard in his analysis of the sources of Chapin's eloquence, in order to show that it was of the very highest type; and he especially insists in ranking it higher than Mr. Beecher's. But the truth is, eloquence, in all degrees of it, is an essentially mysterious power: it is the soul conquering with the weapons of ideas and words, and no description of the weapons can reveal the secret of its victoriousness. We feel grateful, however, to Dr. Ellis for calling especial attention to the fact that Chapin always preached upon great themes,—themes drawn from the spirit of Christianity rather than from the conflicts of theology. That he should have succeeded for twenty-five years, in a busy city like New York, in interesting large audiences in what is great in the moral life of humanity, constitutes the supreme fact of his career, and is the only fact in his biography which gives us a glimpse into the interior life of the man.

## HOME AND SOCIETY.

### Old Valentines.

FOR a long time past it has seemed that the festival of that immortal go-between, St. Valentine, has been elbowed to the rear among our social observances, his perennially smiling visage turned to the wall, as it were, like a first wife's portrait, while a hundred little loves-in-waiting stand by with torches all unlit. One must rest content to rank among persons of a certain age in recalling the sweet stir once produced in a household by the anniversary of this legendary saint. Ah! then, from dawn till evening, what a flutter in the dovecote! what sickness of hope deferred until the mail disgorged its treasures! what radiance of blushing triumph when it did! Then pretty Dorothy stole away to her bedroom, clasping close the contents of her apron-pocket, and Sally and Betty took refuge among the pickle-jars in the store-closet, to exchange their dimpling confidences unobserved.

Woful works of art were those love-tokens in which Sally and Betty took delight! Within their gilt-edged borders sat die-away maids and bachelors, clasping hands under the chaperonage of an apoplectic Cupid, who held aloft a pair of hearts skewered upon his shaft. Beneath were amatory stanzas of the skim-milk school. Or else, when the envelope was removed, there was revealed a sort of golden bird-cage, which, on being pulled like a door bell, brought to view an altar where Hymen stood expectant. Again there was a screen of tinsel and lace-paper inscribed with this delicious mystery, "Within you will find my love." Needless to say that on lifting this, the maiden saw—a mirror! Over such sweet and transparent devices were showered rhymes like those still to be found nestling in the colored papers of mottoes distributed at juvenile parties, and composed off-hand, presumably, by the confectioner's young men.

A better period in the annals of valentine lore was that in which original stanzas, both strong and sweet, were the vehicles by which love was declared. Such a time we should like to see return. A fair sheet of paper, bearing in honest characters the expression of genuine sentiment, whether poetical or otherwise, would outweigh, in the balance of a sensible girl's opinion, a ream or two of printed prettiness. For an example, we may look far back upon the calendar of the merry saint, and there find attributed to an immortal pen the daintiest of old valentines, which, it is supposed, was addressed to Anne Hathaway:

"Is there inne heavenne aught more rare  
Than thou sweete nympe of Avon fayre,  
Is there onne earthe a manne more trewe  
Than Wylly Shakespeare is toe you?

"Though fickle fortune prove unkynde,  
Still doth she leave herre wealth behynde  
She ne'ere the heart canne forme anew,  
Nor make thy Wylly's love unnetrewe.

"Though age with withered hand do stryke  
The form most fayre, the face most bryghte,  
Still doth she leave unnetouched ande trewe  
Thy Wylly's love and freynshyppe too.

"Though death with neverre faylinge blowe  
Doth manne and babe alyke brynge lowe,  
Yette doth he take naughte but his due,  
And strykes notte Wylly's heart still trewe.

"Synce thenne not fortune, death nor age  
Canne faythfulle Wylly's love asswage,  
Thenne doe I live and dye forre you,  
Thy Wylly syncre and most trewe."

To cast lots for one's valentine, who was, by the same token, to remain chained to the chariot-wheel of his enslaver for the ensuing year, was a custom of the seventeenth century, observed both in France and England. That this fashion was not altogether popular, we gather from more than one chronicler of the day,—were, indeed, one's knowledge of human nature in all ages to leave a doubt on the subject! Another custom demanded of a young lady practicing it on St. Valentine's eve a variety of occult devices, among them that of eating a hard-boiled egg, shell and all, with salt in place of the yolk, just before going to bed. Then, without quenching her thirst, the maiden sought her pillow on which was pinned four bay-leaves. Of course she was to dream of her valentines, and an artless votary has thus recorded her success, in a letter to her friend: "Would you think it, Mr. Blossom was the man? I lay abed and shut my eyes all the morning till he came to our house; for I would not have seen another man before him for the world!" Pepys, who is nothing if not practical, confides to his journal for February 14, 1667, the following prudent comment on his fortune for the day: "I am this year my wife's valentine, and it will cost me five pounds. I find that Mrs. Pierce's little girl is my valentine, she having drawn me, which I was not sorry for, it easing me of something more which I must have given to others." Elsewhere, Mr. Pepys refers to the fact that one of Miss Stuart's valentines (the Duke of York) "did give her a jewel of about eight hundred pounds." Touching old valentines of a later date, we copy one from a paper yellow with age and crackling at the touch. It was found in the lacquer dressing-box of a belle of by-gone days, wrapped in a bit of saffron lace, and faintly scented with vanilla bean. The lady to whom the lines were penned had lived and died single:

### HER VALENTINE.

"This merry maiden, radiant, rare,  
With winsome ways and debonair,  
When sweet she smiles on me, I swear  
That Eden's light is resting there  
Upon those lips so ripe, so fair!  
To look upon her face, old Care  
Would cease to carp and court Despair,  
Would give up dole, his trade forswear,  
Don sunny looks, make Joy his heir.  
What wonder, then, that I should dare  
Her praise to sing, her colors wear,  
Her valentine myself declare?  
This merry maiden, radiant, rare!"

*Constance Cary Harrison.*

### Careless Speech.

CONVERSATION as a fine art has fallen much into neglect. We seem to be relapsing into a belief that speech is merely a medium of exchange, and that, so long as the meaning is clear, it matters little if the vehicle be crude. But it is a mistake to think that we can use language with slap-dash incoherence, and con-

vey our thought unimpaired. The relation between thought and expression is so close that one cannot be independent of the other; and this connection is so vital that, when an idea becomes extinct in a language, the word that expressed it withers and falls away, unless the word happen to find employment in expressing a new idea.

Clear thinking is, of course, the first step toward clear speaking, but inaccuracy in the use of language arises less from vagueness of thought than from a carelessness of speech, content to hit somewhere in the neighborhood, but never piercing the bull's-eye, of the thought. A crusade against the stupidity of thought that lies at the root of much stupidity of expression, is too hopelessly Quixotic to attempt. There is a fitness about a poor or infirm thought going badly clothed; but there are plenty of people who do think, and yet who express themselves in a manner so stumbling as to distort completely their meaning. Not realizing the beauty and richness of the language that is open to us, we yet insist on limiting ourselves to a certain class of rough Saxon words, making them do yeoman service, and forcing upon them a mass of work for which they are entirely unfitted, until under this burden they lose even their primitive strength.

An extreme development of the evil of careless speech is the indiscriminate use of extravagant adjectives, so common among school-girls, who, with smiling prodigality, expend the resources of the language upon mental trifles. The injustice to the listener from this inaccuracy of speech is obvious. However, this is slight beside the greater injustice done to the language itself, in which we have only a life interest, and which we must pass on to the generations following us. We have no right to abuse the language we have inherited, for the traces of our rough handling will surely endure.

*Louise Herrick.*

#### Family Records.

"THE family Bibles of past generations," Mr. Francis Galton has said in an English review, "served as registers of family events. Births, illness, marriages, and deaths were chronicled on their fly leaves, and those ponderous tomes fulfilled an important function in this incidental way. But they are now becoming generally replaced by more handy volumes, and the family register is disappearing with the old family Bible." Mr. Galton goes on to make a plea for an improved substitute for the fly-leaves usually found between the Old and New Testaments. As a special student of sociology, he knows the high importance to science of exact family records. The substitute which he wishes to see adopted generally is at once too costly and too complicated to be attempted by many. He notes that the disappearance of the family Bible almost exactly coincides with the invention of photography, and with the recognition of "the hereditary value of what are called life histories"; and he then suggests that the present seems to be a good time to urge the opening of a new form of family register. He advises the use of a thin quarto volume, solidly bound, and having leaves of tough paper. A pair of pages should be given to every member of the family. Down one side of each page may be placed a line of photographs, showing both the full

face and the profile, and taken at regular intervals from birth to death. In the opposite spaces the happenings of his life may be recorded. Thus every pair of facing pages would reveal the changes of countenance and the events in the life of one member of the family.

Surely this suggestion, or some modification of it, is worthy of adoption in American families, for in this country the young are constantly breaking away from the old homestead and striking out for themselves, and even whole families not infrequently make a complete transfer from the East to the West. Nowhere is there so much difficulty and confusion in gathering up the threads of family history as there is here. It would be well if some sort of family record were kept in every household. Mr. Galton's plan requires, at the beginning, nothing more than the purchase of a stout blank-book and the ruling of a few lines; or if even this is too much trouble, recourse may be had to the more elaborate "Family Record Album," containing a comprehensive system of blanks classified on a new plan. It has family pages for the names of the members of the family. It has genealogical pages for the descent of the family as far as it can be traced in a direct line. It has tabular pages, one for each person, for the setting down of all the leading particulars of his or her birth—parentage, time and place of birth, weight and height at birth and at various times, dates of vaccination, naming, walking, talking, learning to read, write, swim, etc., going to school or college, entering on trade, business or profession, marriage, residences, diseases, accidents, travels, and death. It has biographical pages for other special and personal details. It has heirloom pages, on which to keep the record of the interesting things about the house, and of their history, in so far as they have any. It has domestic economy pages for the record of the manner of living, house-rent, expenditure, and income, etc., from year to year. It has travel pages to record the incidents and dates of any sojourn away from home, of any member of the family, and it has miscellaneous pages for all the other manifold things to be thought of.

A convenient substitute for the formal family record is a family scrap-book. This would agreeably supplement the record, if there were one. By a family scrap-book is meant a book devoted solely to the collection of those printed paragraphs in which the name of the family appears. First of all in importance are the marriages and deaths; and if there is an English branch, there may also be birth notices to insert. Then there may be the chance newspaper paragraph announcing the taking of a prize at the county fair; or the description of the fire which burned half the house; or the report of the decision of the Supreme Court in that everlasting lawsuit. These may go in, side by side, with the inaccurate paragraph on your neat after-dinner speech, and that other on your wife's table at the church fair. A place may also be found for the few lines which remark on your son's departure for the village to enter college, and also for the straggling verses he sent home shortly after for insertion in the "poet's corner" of the local newspaper. If you travel by water, some newspaper is likely to print a list of the passengers, and even this deserves its place on the pages of the family scrap-book.

*Arthur Penn.*

## Old Children.

ONE can no more help loving children than he can help liking rose-buds. But I meet with some children whom I cannot love without considerable effort. These are the old children. Their wise looks and sedate and dignified ways are appalling. They seldom laugh, and their smile is a sickly, sneering, sardonic smile. They never romp, but step staidly, and with a gravity of deportment which would become an octogenarian.

These poor, little, old children, withered and hard and dry before their time, are the legitimate fruits of certain forms of the child-culture of to-day. We were not used to have them. In days not remote, children were children in tastes, feelings, manners, and occupations; the spring of life lasted twenty-one years and longer. Our boys were buoyant and sportive, and the rippling laughter of our girls was as sweet music. But now, too many of our girls are fine ladies, and our boys sedate gentlemen. The jacket of jean, frock of flannel, and bowl of porridge, have passed away and with them have passed healthy, hearty, happy child-life. With our artificial modes of life and premature development of mind, we are in danger of abolishing that out of which come all valor, heroism, and worth whatsoever—a *healthy childhood*. Our children are in school, when they ought to be at play; at the ball, when they ought to be in bed; promenading in stiff, fine clothes, when they ought to be frisking with the lambs in the meadows, as blithe and gay as lambs, and knowing as little of fashionable life. Books, fashion, and, I may add, business, are what make old children.

Our girls are clamoring for "higher education," and we think we give it to them when we extend the range of their school studies. I met a child the other day who knew "enough for a professor," I was told, but she was wearing six strengthening plasters, and could not look you in the face. Men have, in every age, played the fool for knowledge; have got it at the cost of wisdom, health, happiness, and virtue; but no previous age has equaled ours in madness of this sort. I would not give a girl that knowledge which might put a single wrinkle in her face. A formal walk or game of croquet sandwiched between six hours of study and six of fashionable life, will not go far toward developing the physical well-being of our girls.

The premature placing of our children in mercantile relations, or the inculcation of what has been termed "shop-keeper's philosophy," is another of our expedients for abolishing youth. We begin by giving the child one of those fool-invented toys, called "banks,"—an invention which has done harm enough to counterbalance the good of all other toys,—and persuade him to shut up in it all his penny-gleanings, as if they were angels' gifts, instead of spending them as soon as acquired, as a healthy child is sure to do. Such a toy is a practical object-lesson in avarice. Visiting once at the house of a Christian minister, I found that each of his children had his little bank in which he deposited every penny that came into his hands. A beggar stopped to ask an alms. I said: "Why do you not give some of your money to the poor old blind man?" The answer was: "We don't give our money to tramps; we're going to keep it and make more money with it." When I see the best years of childhood monopolized by the acquisition of a

trade or profession, I feel like telling parents that such treatment is wicked, and uncalled for even by avaricious calculation. The shallow utilitarianism so prevalent among men of business is attributable, in a great measure, to the premature entrance of boys into commercial relations. Ignorant of poetry, nature, and history, they base their theories of human nature upon what they see of Dick, Tom, and Harry. There is no ideal in their lives, nor aught of nature, and they transmit the plague. If we would prevent our children from becoming dry, withered, and callous in mind and in heart, we must prevent them from coming too early in contact with the tricks of trade, and the heart-hardening principles which rule over the commercial world.

Another aging influence is to be found, as I have already intimated, in the high and fast living in which we indulge our little ones. We exhaust them by a system of profusion, luxury, and dissipation. The breakfast of life should be frugal, for dinner must be an improvement on it. To what serious consequences are we bringing our children when we give them a high-seasoned morning feast and a table of dainties? It is sad to see how many of these old boys and girls there are, who, at the age of fifteen years, or thereabout, have gone into chronic *ennui*, and are surrounded with appliances for their instruction and diversion which would have bewildered their grandparents at their age. He is the promising lad who cares not to consult a thermometer before going out; who would as lief be kissed by the north wind as by any lass in Christendom; who would willingly exchange all the overcoats in the world for a pair of skates or a sled; who takes to the water like a duck, to the mud like an eel, and to the sun like an "American citizen of African descent."

O. O'B. Strayer.

## A Bar to Social Evenings.

HAS there ever been a time when—at least outside of our cities—it was not considered an essential of hospitality to offer food to a guest? It is the savage instinct of hospitality, and civilized nations have pampered it into an imperious custom. Among savages it is well enough. These livers "from hand to mouth" are often half famished; and, naturally, "after the famine, the feast." There is no expense, and the trouble is not to be considered. Hunting game is only sport to the men, and the simple manner of living gives the women of a tribe very little else to do or think of besides manual labor and preparing food; the children take care of themselves. In warm countries they do not even have to be provided with clothing, and in colder latitudes their garments are of the simplest kind. But where women have to make a great variety of under and over garments, with seams and gussets and bands, ruffles and pockets, button-holes innumerable, thin summer wear, and thick winter wear for two, three, or four children, who are all the time growing out of said clothing, with no seamstress, probably, and only one servant to do the housework, it will be readily understood that the company entertainment is the straw that often breaks the housekeeper's back.

The expense of a simple refreshment is the smallest part to consider when persons wish to have their

friends come in often to spend a social evening. It is the care and extra work which make it impossible for the average family to entertain guests as its members would like. How often it prevents the informal sending to the neighbors to "Come this evening and have a dance," or to "Come and help us act charades." It has broken up many a "sociable" and given the death-blow to the good-fellowship of a whole neighborhood, filled with pleasant people who would have enjoyed one another very much and would have done one another a world of good.

It is a trouble to both mistress and maid to supplement all their various labors with the frequent preparation of even such a simple entertainment as sandwiches, coffee, and cakes. An extra amount of bread must be mixed, twice molded, and properly baked. A ham must be prepared, and boiled, and nicely cut into thin slices—a process that requires some skill and a good deal of time. The coffee must be roasted, ground, and then prepared with a nervous nicety that is somewhat wearing. The materials for the cakes must be collected from store-rooms and closets; and what a time of anxiety it is until the cakes come out of the oven! and then, though they look all right, there is the possibility that in cutting our loaves, with the eyes of our guests upon us, we may find them streaked with dark lines! But even this is not all. Perhaps the most arduous part, and decidedly the most disagreeable, is the cleaning up after the cooking and after the guests.

When we give large parties, much more than this is cheerfully borne; for the thought and the labor begin a long time before the event, and, usually, extra help is hired. But we are not now considering large parties. We want to meet our friends frequently. Cannot we do so without this interminable eating? We would not eat after our supper (or dinner) if we

had remained at home. Why should we find it necessary when we go out? If we "drop in" at a friend's house for an evening we do not expect it or think of it. But if this same friend asks us to come to hear some music, or to look at some new engravings, or to do anything whatever, we look for something to eat in the progress of the evening. "She invited us," we say, "and, of course, there will be refreshments of some kind." Why "of course"? We don't need them,—often we would prefer to do without them,—and certainly we should be clearer in our minds in the morning if we were to do without them. Still the senseless custom goes on.

The surprise parties of a few years ago, which were so mercilessly condemned, arose out of a genuine feeling of friendliness, due to the naturally gregarious habits of mankind. After a day of housework, sewing, and "bother," after office hours are over, when the little folks are in the land of dreams, while Bridget or Dinah is quiet in the kitchen, with sewing, or a visitor, a yearning arises in our souls for some sort of recreation. And there is a need for it, too. But the surprise parties were a mistake for the same reason that we hesitate to accept the general invitation, "Come and spend an evening with us some time!" We do not go because the very evening we fix upon may be the most inconvenient one of the whole season to our hosts. But, were it not for those bugbears, "sandwiches and coffee;" or, "oysters and ice cream," instead of this vague, unmeaning phrase, one might give the specific invitation: "Come this evening, or next Wednesday evening!" for they would have nothing to think of in the meantime, in relation to the visit, but the pleasure of their friend's society.

## THE WORLD'S WORK.

### Test for Fire-damp in Mines.

THE inflammable gas known as fire-damp has been made the subject of long study, and many plans have been tried to obviate, as far as possible, its destructive explosions when set on fire. It appears it can be removed by proper ventilation whenever it collects in dangerous quantities. Whenever it is known to be present in the mine, any method of indicating its presence in advance, or before it can become dangerous, would therefore be of value. Among the plans that have been proposed to accomplish this is a comparatively new one, that has the merit of indicating above ground or at the mouth of the pit the presence of the gas in the mine. On the roof of the galleries, where the gas may be known to collect, is placed a hollow ball of wire gauze. This is placed, by means of wires, in electrical communication with a bell at the mouth of the mine. The ball is supported by a suitable bearing, in such a way that, when free, it will revolve by its own weight, but is ordinarily kept in position by a plug of fusible metal, so that it cannot move. Upon the

ball are arranged pins, or teeth, in such a position that when the ball is released by the melting of the fusible plug the teeth alternately make and break the electric circuit, and the signal sent to the station above indicates the number or position of the ball in the mine. Within the ball is a piece of spongy platinum, connected by a second wire with the station at the mouth of the pit. When it is desired to ascertain if gas has collected in the mine, say just before the men go to work, a current is sent through the second circuit, and the platinum sponge is raised to a white heat. If the air is pure, nothing happens. If gas has gathered in explosive quantities, the heat of the platinum sets it on fire, and there will be a small explosion inside the wire gauze ball. This will give heat enough to melt the fusible plug, and the ball will be released. It will by its own weight, or by means of a spring, make a revolution, and the teeth will cause the signal to sound at the station above. At the same time, the burning of the gas is limited to the ball, as the flame will not pass the wire gauze, and all danger of extensive explosions of the gas are avoided. While this system has not, as far as can be learned, been tried

on a large scale, it has the merit of pointing the way in which it is quite possible to make these gases report their presence before they can become a source of danger. Something of this kind has long been needed, and this design has apparently much to recommend it.

#### New Photographic Process.

THE ordinary black-and-white photograph has the defect of being merely black and white, since all the colors of nature, from which it is taken, are lost. It seems hopeless to look for any photographic process that will give colors in the negative, and the attention of artists and inventors has been given wholly to efforts to find a method of coloring the photo-print by hand. The most obvious plan is to paint the silver print, and this is very largely done; but the result is never wholly happy, for the photograph is simply smothered and painted out of sight. Attempts to put the color on the back of a film have given better results, but even this has not been wholly successful. Recently a still different plan has been followed. In this process a negative is taken in the usual way, and a note is made of the chief colors of the subject, the dress, hair, and flesh tints of the portrait, or the grass, ground, water, etc., of a landscape. The negative may be retouched or not, as seems desirable, the only requisite being that it should be a good one. From this negative is taken a light silver print; that is, a print made with a very short exposure, so that only the main outlines of the picture are secured. This print is then painted roughly by hand, according to the colors of the subject, as described by the note made at the time the negative was taken. These colors are in the form of thin, transparent washes, and are laid on in broad masses, and without regard to the shading. For instance, in a portrait, the hair is given one color in a single mass, the flesh tints merely cover the face, hands, etc., and the colors of the dress are spread evenly over the whole of the costume. In a landscape, the foliage receives a coat of green, the soil a coat of brown or yellow, the sky blue, and so on. This work is simple, but at the same time, in a flower-piece, or an elaborate interior, or a copy of a painting, there may be room for considerable artistic skill. The colored print is then treated with certain chemicals, which fix the colors and make it possible to spread over the print a freshly sensitized silver film. The negative is then replaced in the printing frame, and the print is laid face-down over it. Care is taken to see that the print is exactly under the negative, and is properly "justified." An exposure is then made, and a new print is secured exactly over the first print. This second print is then toned and fixed in the usual way. The finished print is now a double photograph, with a film of color between the two. Wherever the second print is thin or white, the color shows through. Wherever the shades are deep or black, the color is blotted out. By this placing of a second print over a colored print all the detail of the original negative is secured; the picture shows gradations of light and shade, and the color is preserved, and yet smoothed and softened. The process will, no doubt, prove of value in business, because it gives pictures in their true colors, and pictures that may serve as

samples of goods offered for sale. The pictures examined included colored portraits from life, copies of oil paintings, pictures of china and colored glassware, toys, carpets, and fabrics of all kinds.

#### Improved Signal System.

AS THE number of trains increases upon a railroad there always appears a proportionate increase in a certain class of accidents. These are rear collisions, or the running of one train into another in front of it. To prevent such accidents, one system divides the line into short sections or blocks, and forbids any train to enter a block till some signal has been given that the preceding train has left the block and the line is clear. The method of making these block signals has been the subject of much study, and a great number of signaling systems, both mechanical and electrical, have been tried. Some of these have already been described here. One thing now seems to be sought for in preference to anything else: to make the system self-reporting and wholly independent of human agency; that is, the passing train must cause the signals to be displayed, and without calling upon the aid of any flagman or signal or telegraphic operator. While a number of systems do this in greater or less degree, it appears to be accomplished by a new system in a manner that is worthy of notice. The idea upon which it is based is to enable the passing train to break an electrical circuit, this breakage causing all the signals, whether by sign or sound, to be made. The train also closes the circuit on leaving the block, and restores all the signals to their normal condition, thus showing that the line is clear. To accomplish this the section is provided with a single wire supported on poles, a suitable battery, and a number of signal targets, lamps, etc. If the section is a single line without switches, a target is placed at each end of the section and facing in both directions. If there is a crossing there is a target, bell, or some other signal there also. At each end of the section are placed under the rail two circuit-breakers, close together. On the entrance of a train either going forward or backing, the first breaker is operated by the weight of the first pair of wheels. This breaks the electrical circuit, and all the banners in every target in the section are displayed. In a second or less the first axle crosses the second circuit breaker and the circuit is closed again, and all the signals would be withdrawn were it not that the next pair of wheels arrives at the first breaker and resets the apparatus. Thus, so long as the train is passing, there is an alternate breaking and making of the circuit. This affects all the signals, and they quiver or hesitate, but so rapid is the alternate breaking and making of the circuit that practically they do not appear to move, but remain at "danger." When the last axle crosses the breaker the signals come to danger till the train leaves the section. At this end there is also the same momentary hesitation, but it is not apparent in the targets (except by very close observation), and, as the last axle leaves the section, the circuit is closed, and every signal is put to rest or "safety," and the line is reported clear. Simple as this device is, it has the merit of displaying the signals at both ends of the section at the same time, so that a train on the same

track coming in the opposite direction is warned in time. The signals remain at danger from the time the first axle enters the section till the last axle leaves it. If the train breaks in two and leaves a car behind no other train can enter the section from either direction till it has been removed. If the car left behind should bodily leave the line the signals would still remain at danger, and if it ran back into the rear sections, it would display every signal in advance, even if left wholly unguarded. If, for any reason, the circuit is broken by the breaking of a wire, or fall of a tree, or the failure of the battery, the signals would be displayed at danger at each end of the section. It will be seen that this closed circuit plan may be operated free from human agency. The train and even an obstruction affecting the circuit in any way causes the signals to be made. Besides this, the movement of every switch-rod may break the circuit and cause every signal to be displayed so that the entrance of a train from a branch or siding automatically closes the block. In like manner the departure of a train upon a branch and the closing of the switch may place the main block clear in both directions at once, and at the same time display the signals on the branch. By a different arrangement of the targets the entrance of a train upon the main section where there is a branch may cause a danger signal to be displayed on the branch, so long as the train is on the section. In the working model examined, which, as far as the targets are concerned, was of the full size, the movement of the signals appeared to be prompt and regular. The manner in which the banners in the targets are displayed is very simple. The round disk of red cloth is cut in halves, each half being supported by a rod pivoted near the top. The top of the rod is connected by a short link with a lever pivoted at the lower end carrying the armature of the electro-magnet. When the circuit is closed the armature is drawn to the magnet, and this by means of the lever draws the rod carrying half the banner to such a position that it is hid by the sides of the target. There being two banners and magnets, the entire signal is drawn apart out of sight so long as the circuit is closed. Any break, from whatever cause,—the arrival of a train, the movement of a switch, or any failure or break-down,—releases the armature and the banner drops down by its own weight, and the danger signal is given. This system appears to be adapted to the most complicated lines, and to be at once simple and inexpensive. It leaves nothing to be done by trackmen, switchmen, or train-dispatchers, and if, for any reason, it fails, the signals are placed at each end of the section at danger. If now there is a rear collision it is the following engineer's fault; and, to prevent every accident, it would seem that our railroad companies should place a pilot or lookout on the engine whose sole duty it could be to look out for signals. This has been suggested elsewhere, and it deserves attention.

#### New Pulverizing System.

THE tendency in all work having to do with ores, minerals, phosphates, fuels, etc., is to employ the materials in as finely divided a state as possible. This has led to the introduction of a great variety of attri-

tion mills, disintegrators, and pulverizers, each having greater or less merit in its respective field. The invention of the sand-blast led to experiments with blasts of air or steam as a means of breaking up or disintegrating minerals. It was found that if a powerful jet of air, carrying particles of quartz, ores, or other minerals, was thrown against a hard surface, that the minerals could be dashed or broken to pieces very rapidly. The only difficulty was to get some substance hard enough to stand the impact of the particles driven against it, and it was not till a wholly different plan was tried that the work appeared to be successful. This new system has now been tried upon a commercial scale, and in actual operation appears to work in a satisfactory manner. The novel feature of the system is to have two jets of air or steam, both laden with the minerals in the form of coarse powder, and to place them in line facing each other. The particles thrown forward by one jet would meet those from the other, and they would be crushed and shattered by dashing against each other. The manner in which this novel idea has been carried out is simple and inexpensive. The ore, minerals, stone, phosphates, or other materials, are first crushed to a coarse powder; for the apparatus is not designed as a rock breaker, but a pulverizer for reducing powders to flour or impalpable "float." From the crashing rolls it is led by a spout into a hopper placed over the pulverizer. This hopper has two spouts or openings below that lead the material to two smaller hoppers on each side of the machine. At the bottom of each hopper is a brass nozzle or steam jet. Directly in front of it is a second nozzle or guide-way, there being a small space between the two. Practically these two nozzles form an injector. The two injectors are placed exactly opposite and facing each other, the ends being in an inclosed chamber between them. From the upper side of this chamber is a large pipe for conveying away the exhaust steam, and the floating powder and dust, and at the lower side is a spout through which the coarse particles that will not float in the steam may pass out of the apparatus. The large exhaust pipe leads to a dust chamber, where the powder settles while the steam escapes into the air above. In using this apparatus it is the custom to employ two, side by side, and to place an elevator between them. The coarser material that will not float away with the steam to the dust-room, is led through the spouts to this elevator, and may be raised to a bolting machine, or it may be returned to the apparatus and put through it again. In the plant examined in operation two pulverizers were in use at once, pulverizing crushed marble, and reducing it to flour. It will be seen that in this system no power is needed beyond that required for the elevator and the bolting machine. Air can be used in place of steam, if it is more convenient, as the process is the same—a jet to impel the particles one against the other. There is no hard surface to be worn out, as the particles meet in mid-air quite free from anything. The only wearing parts of the apparatus are the ends of the nozzles. These, for economy, are made of cast-iron, and can be replaced in a few moments and at small expense. The system has the merit of cheapness, and appears to have been thoroughly thought out and tested on a large scale.

**New Refrigerating Apparatus.**

THE increase in the demand for cold-air machines has naturally stimulated improvements in old, and the invention of new, refrigerating appliances. Among the more recent of these is one employing sulphuric acid as an absorbent of the vapor of water, the extraction of the vapor from a mass of water in a vacuum causing the lowering of the temperature. The idea is not new, for it is the basis of familiar experiments in school laboratories, yet its application on a commercial scale appears to be both new and quite successful. The plant consists essentially of a freezer, in which the ice is formed, an acid tank, through which the vapor of the water is drawn, and an air-pump for creating a vacuum. There is also an apparatus for condensing the acid when it becomes too heavily loaded with water. The freezers, of which a number may be grouped together with one acid tank, consist of cast-iron tanks of any convenient shape or size, according to the size of the blocks of ice that is required. There is a funnel closed by a stop-cock for admitting fresh water, and a hinged trap or door, at the bottom, for taking out the blocks of ice. The acid tank is a cylindrical vessel of iron, having a helix or stirrer inside for agitating the liquid whenever it is necessary. This tank is connected by pipes with the freezers, and over the top has a dome, which is connected with an air-pump. The operation of the machine is simple. The air-pump creates a vacuum in the dome over the acid, and indirectly, by means of the pipes, in the freezers. The water begins to evaporate, and the vapor pervading the pipes and tank is absorbed by the acid, the air partly freed from vapor being steadily drawn away by the air-pump. This evaporation and absorption of the vapor causes a lowering of the temperature of the remaining water, and it freezes into solid blocks in the freezers. The pump is then stopped, and the tanks are opened from below. The ice falls out, and the tanks are closed and again filled with water, when the process begins anew. The only pause in the work is the occasional removal of the saturated acid and the putting in a fresh supply. The acid is freed from water in a condenser, and may be used over again in the machine indefinitely. While this is the main idea of this refrigerating plant, it has many details, and requires a special kind of air-pump. Lead is used wherever it is necessary to protect the apparatus from the action of the acid, and ingenious appliances are added for preventing the ice from clogging the water-pipes that fill the freezers, and for releasing the blocks of ice when they are finished. In a small plant, demanding a six-horse-power engine and the services of two men besides the engineer, six blocks of ice, weighing six hundred weight each, can be made in one hour, or fifteen tons in twenty-four hours. The cost of production must depend on the price of coal and labor; but, so far as can be learned, it is as low as by many of the larger and more costly appliances now in use.

**New Telegraph Sounder.**

IN a new form of sounder for indicating by sound the dots and dashes of the Morse alphabet, bells have been substituted for the metal stops of the common sounder. The object of this is two-fold: to give two

tones of different pitch or quality in the same instrument, and to enable it to be used with either an alternating current or an intermittent current of the same polarity. The armature is in the form of a metal ball suspended on a vertical rod that is pivoted above and carries a metal hammer at the top. There are two coils, each having an iron stop or elbow at the top, and so arranged that the armature hangs between the two ends of these stops. By this arrangement the armature is free to swing between the coils, and may be drawn by the current to one or the other. Above the pivoted armature are two gong-bells, one on each side of the hammer, each being pivoted so that it may be brought nearer or drawn away from the hammer as circumstances require. When the apparatus is to be used for simply telegraphing by sound with a Morse current, the armature is drawn against one of the stops on the coils and the hammer is in contact with one of the bells. An interruption of the current causes the armature to move slightly, and the hammer strikes on the opposite bell, giving the long and short sounds of the code. When the vibrating needle system is to be used, and currents of continually varying polarity are to be employed, the armature rests quietly halfway between the coils. On the arrival of the current it is drawn to the right for one polarity and to the left for the other, and the opposite bells are struck. As the two bells have a different pitch or tone the signals of the code are indicated (long or short) by the difference between the bells. Besides this, in either method the pivoted arm supporting the armature is plainly seen to vibrate so that the messages may be read by sight as well as by sound (in a noisy place where the bells cannot be heard distinctly) as in the old needle instruments and one form of cable instrument. The new sounder is said to be very sensitive, and to work well on long lines and with feeble currents. It is now under practical experiment on an important telegraphic system. The only objection to such an apparatus that appears at first sight is the use of a sonorous bell, as the ringing, persistent sound would be troublesome. This objection appears to be met by making the bell of a soft metal that gives an agreeable but rapidly vanishing tone.

**New Methods in Tunneling.**

MUCH attention has been given during the past few years to the work of making tunnels for railroads, aqueducts, and subways. Many experiments have been made with a view to substituting machinery for the common system of drilling holes by hand or power tools, blasting out the rock and removing the broken material in cars. The aim in these experiments appears to be to make some kind of cutting tool that, when pushed up against the end or head of the tunnel, shall cut or tear down the rock in the form of dust or powder. In one machine this appears to be successfully performed. The apparatus is designed to be used in cutting a circular heading or advance tunnel of small diameter. If even a small opening is secured in advance, it is comparatively easy to enlarge the heading to the full diameter of the tunnel. The new machine is therefore designed to bore a round heading about 2.20 meters (84 inches) in diameter. It

consists essentially of a T-shaped cutting tool, having a cutting edge on top, and turning on its axis or stem. This cutter is laid down horizontally with the cutting edge toward the face of the rock, and by turning it around rapidly the face is gradually cut or shaved off in the form of fine dust. The stem carrying the revolving cutter is hollow, and rests on a sliding support, so that it can be pushed forward, or fed up to the work as it proceeds, by means of a hydraulic ram within the stem. The machine rests upon a suitable frame, and is operated by means of a pair of steam or compressed-air engines. When the cutting tool has advanced to the end of the stroke of the feeding system, the entire machine, motors and all, can be raised from the frame and supported by jack-screws. The frame, by means of the hydraulic ram, can then be dragged forward under the machine till it is in position for work again. The machine is then lowered upon the frame and the cutting is resumed. The apparatus is reported to work in chalk at a speed of one hundred revolutions a minute, with an advance of 0.8 of an inch a minute, or nearly 50 feet in 24 hours. The broken rock and dust from the cutting tool falls into a hopper that leads it to an endless belt carrying buckets, by which it is conveyed under the machine to the rear and dumped into a car.

#### Smoke Prevention.

THE general principles upon which all smoke-preventing or smoke-consuming furnaces must be built are now clearly understood. The formation of smoke may be prevented by adding a fresh supply of hot air to the fire just beyond the fire-box, or furnace proper. This has been accomplished in a number of ways already described here. One of the most recent and simple methods offered consists essentially of a pair of fire-clay cylinders, placed one within the other, and having a small annular space between them. This double cylinder is placed in the furnace just beyond the grate. All the products of combustion pass through the smaller central tube, or cylinder, thus imparting a portion of their heat to both cylinders. Fresh air is taken into the furnace through ducts under the fire-box and ash-pit, and through the annular space between the cylinders. In passing between the cylinders it is intensely heated, and is delivered hot into the combustion chamber, where it meets any unconsumed gases that may have escaped from the fire, and assists in burning them. The novelty of the invention consists simply in the use of the double cylinders as a means of heating the fresh supply of air needed for complete combustion.

### BRIC-À-BRAC.

#### The Song of Sir Palamede.

*"Came Palamede, upon a secret quest,  
To high Tintagel, and abode as guest  
In likeness of a minstrel with the king.  
Nor was there man could sound so sweet a string.*

*To that strange minstrel strongly swore King Mark,  
By all that makes a knight's faith firm and strong,  
That he, as guerdon of his harp and song,  
Might crave and have his liking.*

*\* \* \* \* \**  
*'O King, I crave  
No gift of man that king may give to slave,  
But this thy crowned queen only, this thy wife.'"*

SWINBURNE. *Tristram of Lyonesse.*

WITH flow exhaustless of alliterate words,  
And rhymes that mate in music glad as birds  
That feel the spring's sweet life among light leaves  
That ardent breath of amorous May upheaves  
And kindles fluctuant to an emerald fire  
Bright as the imperious seas that all men's souls desire:  
With long strong swell of alexandrine lines,  
And with passion of anapæsts, like winds in pines  
That moan and mutter in great gusts suddenly,  
With whirl of wild wet wings of storms set free:  
In mirth of might and very joy to sing,  
Uplifting voice untired, I sound one sole sweet string.

Love, that is ever bitter as salt blown spray,  
Yet sweet, yea sweet as wrath or wine alway,  
As red warm mouths of Mænads subtly sweet;  
Love, that is fleetlier than the wind's fleet feet  
Soft-shod with snowflakes; love, that hath the name  
And fury and force of swift bright shuddering flame:  
Fate, that is foe to love and lovely life,  
Yea foe implacable, and hath death to wife;  
Fate, that is bitterer than the salt spray blown  
And colder than soft snow yet hard as stone;

Fate, that makes daily fare of heart's desire,  
 Being found thereunto a devouring fire:  
 Death, that is friend to fate and fair love's fee;  
 Death, that makes waste the wolds of life with snow;  
 Death, harsh as spray of seas that wild winds blow:  
 Life, that is strangely one of all these three,  
 Being bitter as is the sharp salt spray of sea,  
 And thereto colder than the blown white rose  
 And soft brief blossom of unmothered snows,  
 And fiercer than the forceful feathered fire,  
 Fed as a flame with hope of heart and high desire:  
 All these I sing, and sound the same sweet string.

And as fresh-gathered leaves of bay I bring  
 Green praises to all dear dead lute-players,  
 Whom Plato's passionate queen holds fast as hers,  
 Yea all sad souls that have smiled and sinned and sung,  
 With whose gold-colored hairs and hoar this harp is strung.  
 And blame of the high great gods that do amiss,  
 Being cruel and crowned and bathed complete in bliss,  
 And careless if this world be out of tune,  
 And deaf to dithyrambs of bards that bay the moon:  
 And all perfections of all those I love,  
 Each bettering still the best and still above  
 The last this violent voice proclaimed the best,  
 And blown by stormy breath still starward o'er the rest:  
 And all large loathsomeness of all I hate,  
 Whose poisonous presence doth Caina wait,  
 And better it were that they had ne'er been born,  
 I being dowered with hate of hate and scorn of scorn,  
 And shrinking not to name them newts and snakes,  
 Lepers and toads and frogs and hooting owls and crakes:  
 All these with ease of measureless might I sing,  
 And sound, though sheer stark mad, the same sweet string.

And many a theme I choose in wayfaring,  
 As one who passing plucks the sunflower  
 And ponders on her looks for love of her.  
 Yea, her flower-named whose fate was like a flower,  
 Being bright and brief and broken in an hour  
 And whirled of winds: and her whose awless hand  
 Held flickering flame to fawn against the brand,  
 Till Meleager splendid as the sun  
 Shrank to a star and set, and all her day was done:  
 And her who lent her slight white virgin light  
 For death to dim, that Athens' mastering might  
 Above all seas should shine, supernal sphere of night:  
 And her who kept the high knight amorous  
 Pent in her hollow hill-house marvelous,  
 And flame of flowers brake beauteous where she trod,  
 Her who hath wine and honey and a rod,  
 And crowneth man a king and maketh man a slave,  
 Her who rose rose-red from the rose-white wave:  
 And her who ruled with sword-blue blade-bright eyes  
 The helpless hearts of men in queenly wise,  
 And all were bowed and broken as on a wheel,  
 Yet no soft love-cloud long could sheath that stainless steel,  
 Her tiger-hearted and false and glorious,  
 With flower-sweet throat and float of warm hair odorous:  
 These sing I, and whatso else that burns and glows,  
 And is as fire and foam-flowers and the rose  
 And sun and stars and wan warm moon and snows.  
 Who hath said that I have not made my song to shine  
 With such bright words as seal a song to be divine?  
 Who hath said that I have not sweetness thereon spread  
 As gold of peerless honey is poured on bread?  
 Who hath said that I make not all men's brains to ring,  
 And swim with imminent madness while I sing,  
 And fall as feeble dykes before strong tides of spring?  
 And now as guerdon of my great song I claim  
 The swan-white pearl of singers, yea Queen Fame,  
 Who shall be wed no more to languid lips and tame,  
 But clasp me and kiss and call me by my name,  
 And be all my days about me as a flame,  
 Though sane vain lame tame cranes sans shame make game and blame!

## Every Man his own Novelist:

SUGGESTED BY "EVERY MAN HIS OWN POET."

*Specimen Recipes.*

A NOVEL IN THE STYLE OF MR. WILLIAM BLACK.

TAKE one yacht, the Hebrides, an obstinate young lady, and one piper. Add to these a Highland laird and Colonsay; now, introduce a young man in a kilt and Oronsay, with a pinch of the Kyles of Bute and Ben Muich Dhal. Flavor to suit taste with Gaelic, border ballads, and Styornaway; cover with pathos and serve.

IN THE STYLE OF MR. ANTHONY TROLLOPE.

THIS is a dish always in season, but depending, like the omelette, on a certain amount of mechanical skill. The ingredients are simple: three English clergymen of slightly doubtful reputation, a county family, one Duchess, and a pair of purely conventional lovers. It is indispensable that the latter should at once quarrel gently, but, unless they positively curdle and refuse to mix, they should not betray any marked emotion. Stir in several Cabinet ministers and one impossible American; dilute to taste; garnish with one suicide, chopped fine, and sauce *mariage à la mode*.

MISS BROUGHTON.

THIS simple and innocent entrée is preferred by many to the cumbrous and heavy joints so popular with the last generation. It merely requires a willowy and somewhat vicious young woman, and an ugly and somewhat more vicious young man (guardsmen preferred) of middle age, with two wives living. Skewer and roast them together over a quick, passionate fire, and serve either hot or cold, as the heroine survives it or not. Vegetables in the shape of relations are sometimes added, but they are quite immaterial, and are generally skipped. Serve with an historical present platter, and molten lava kisses to give a finish.

"OUIDA."

TAKE one languid Greek god, with fair hair and the shadow of a crime. Flavor him with a ruined abbey, nothing a year, a palace on the Bosphorus, and turquois hair-brushes. Take also several Duchesses, to whom he makes love,—very languidly, or he will not do,—a Dalmatian gitana with a thirst for revenge, and one vivandière. After these become thoroughly mixed, introduce carefully a chapter on Ariadne at Naxos, one little wooden shoe, a gifted dog, and a plain mister to give a piquant flavor. Season with a bouquet of choice misquotations, and serve with a supreme expiation.

LORD BEACONSFIELD.

*A Pièce Montée.*

PROCURE, ready-made from the pastry-cook's, one Palladian palace, which may be filled at pleasure with allegorical figures representing the British aristocracy, the Rothschild family, the great Asiatic mystery, and Lord Beaconsfield. Powdered footmen should be sprinkled over the whole.

Augustus M. Swift.

Jennie's Woon'.  

YOUNG Davie was the brawest lad  
In a' the Lairnie Glen,  
An' Jennie was the bonniest lass  
That e'er stole hearts o' men;  
But Davie was a cotter's lad,  
A lad o' low degree,  
An' Jennie, bonnie, sonsie lass,  
A high-born lass was she.

Sae Jennie did the wooin' a',  
As weel the guidwives ken,  
The wooin' a', the wooin' a',  
O' Davie o' Lairnie Glen.

'Twas fair-time at Lairnie Glen,  
An' ilka lass maun gang;  
To mony a lad said Jennie, "Na,"  
For Davie thought she lang;  
They met at gloamin' on the brae,  
Ayont the gowany lea,  
Quoth Jennie: "Sin' ye ask me na,  
Winna ye gang wi me?"

Sae Jennie did the wooin' a', etc.

The mither cried: "Ye mauna, lass!"  
But Jennie did protest:  
"I canna break twa lovin' hearts,  
Na, na; I ken the best!"  
Sae, when he didna dare to speak,  
Jennie, with downcast e'e  
An' mony a blush, said, "Davie, lad,  
Winna ye wed wi' me?"

Sae Jennie did the wooin' a',  
As weel the guidwives ken;  
Ay, Jennie wooed an' Jennie won  
Davie o' Lairnie Glen.

Emma C. Dowd.

## Song of the Parsee Lover.

THY face is like the violet's  
That to the red rose lingers close,  
And he who looks at thee forgets  
The honeyed sweetness of the rose.

Oh, if the nightingale should come  
In quest of beauty so divine,  
I beg of thee to strike him dumb,  
And tell him all these charms are mine.

For thee I die, I disappear,  
I sink in Love's bewildering sea;  
That moment when thou art not near  
I ask the flying birds for thee.

About me coils thy conquering chain,  
Upon thy heart my heart is set;  
If thou art nigh I laugh at pain,  
Yet flounder helpless in thy net.

When, frantic, I thy favor sought  
To catch the chrism of a kiss,  
Thy shrewd reply, more quick than thought,  
Came in such roguish words as this:

"A kiss? Indeed! In ambush placed  
Behind my lips it hides. Ah, me!  
My mouth is locked. But do not haste:  
My loving mother holds the key!"

## THE END OF FOREIGN DOMINION IN LOUISIANA.

I.

### SPANISH NEW ORLEANS.

IN Jackson Square, New Orleans—the old Place d'Armes—one may yet stand on the spot where, in 1765, a motley throng of townsmen and planters, the Creoles of the Mississippi Delta, repudiated the barter of their country and their persons to the King of Spain. They were few in number and straitened in purse; but for years they had given their French rulers frown for frown, and in 1768 they took up arms against Spain's feeble show of authority, and drove it into the Gulf. They were the first people in America to make open war distinctly for the expulsion of European rule. But it was not by this episode that the Creoles were to become an American State.

In the following year they were overawed by the heavy hand of Spain, and bowed to her yoke. Ten years later, under her banner and led by the chivalrous Galvez, at Manchac, at Baton Rouge, at Mobile, and at Pensacola, they struck victoriously and "wiser than they knew" for the discomfiture of British power in America and the promotion of American independence and unity. But neither was this to bring them into the union of free states. For when the United States became a nation the Spanish ensign still floated from the flag-staff in the plaza of New Orleans where "Cruel O'Reilly" had hoisted it, and at whose base the colonial council's declaration of rights and wrongs had been burned. There was much more to pass through, many events and conditions, before the hand of Louisiana should be unclasped from the hold of distant powers and placed in that of the American States.

Through all, New Orleans continued to be the key of the land and river and of all questions concerning them. A glance around the old square, a walk into any of the streets that run from it north, east, or south, shows the dark imprint of the hand that held the town and province until neither arms, nor guile, nor counterplots, nor bribes, could hold them back from a destiny that seemed the appointment of nature.

For a while, under Unzaga and Galvez, the frail wooden town of thirty-two hundred souls, that had been the capital under French domination, showed but little change. But 1783 brought peace, Miró's able administration, new trade, new courage, "forty vessels [in the river] at the same time," and, by 1788, an increase in number to fifty-three hundred. In the same year came the great purger of towns—fire.

Don Vicente José Nuñez, the military treasurer, lived in Chartres street, near St. Louis, and had a private chapel. On Good Friday, the 21st of March, the wind was very high and from the south, and, either from a falling candle of the altar, or from some other accident or inadvertence, not the first or the worst fire kindled by Spanish piety flared up and began to devour the inflammable town. The people were helpless to stop it. The best of the residences, all the wholesale stores, fell before it. It swept around the north of the plaza, broadening at every step. The town hall, the arsenal, the jail—the inmates of which were barely rescued alive—the parish church, the quarters of the Capuchins, disappeared. In the morning the plaza and the levee were white with tents, and in the smoldering path of the fire the chimneys of eight hundred and fifty-six fallen roofs stood as its monuments. The buildings along the

immediate river-front still remained; but nearly half the town, including its entire central part, lay in ashes.

Another Spanish name stands as the exponent of a miniature renaissance. Don Andreas Almonaster y Roxas was the royal notary and *alferez real*. As far back as 1770 the original government reservations on either side the plaza had been granted the town to be a source of perpetual revenue by ground-rents. Almonaster became their perpetual lessee, the old barracks came down, and two rows of stores, of two and a half stories height, with broad, tiled roofs and dormer-windows, and bright Spanish awnings, became, and long continued to be, the fashionable retail quarter of the town.

Just outside the "Rampart," near St. Peter street, the hurricane of 1779—Galvez's hurricane, as we may say—had blown down the frail charity hospital which the few thousand livres of Jean Louis, a dying sailor, had founded in 1737. In 1784-86 Almonaster replaced it with a brick edifice costing \$114,000. It was the same institution that is now located in Common street, the pride of the city and State.

In 1787 he built of stuccoed brick, adjoining their convent, the well-remembered, quaint, and homely chapel of the Ursulines. And now, to repair the ravages of fire, he in

1792 began, and in two years completed sufficiently for occupation, the St. Louis Cathedral, on the site of the burned parish church. Louisiana and Florida had just become a bishopric separate from Havana. All these works had been at his own charge. Later, by contract, he filled the void made by the burning of the town hall—which had stood on the south side of the church, facing the plaza—erecting in its place the hall of the *cabildo*, the same that stands there still, made more outlandish, but not more picturesque, by the addition of a French roof. The Capuchins, on the other side of the church, had already replaced their presbytery by the building that now serves as a court-house. The town erected, on the river-front just below the plaza, a *halle des boucheries*—the "old French market." But, except for these two structures, to the hand of the old *alferez real*, or royal standard-bearer, belongs the fame of having thrown together around the most classic spot in the Mississippi Valley, the most picturesque group of façades, roofs, and spires in picturesque New Orleans.

But fate made room again for improvement. On the 8th of December, 1794—the wind was this time from the north—some children, playing in a court in Royale street, too near an adjoining hay-store, set fire to the hay. Governor Carondelet—Colonel

THE OLD BASIN, CARONDELET.

François Louis Hector, Baron de Carondelet, a short, plump, choleric Fleming of strong business qualities, in 1792, when he succeeded Miró, had provided, as he thought, against this contingency. But, despite his four *alcaldes de barrio*, with their fire-engines and firemen and axmen, the fire spread; and in three hours—for the houses were mere tinder—again burned out of the heart of the town two hundred and twelve stores and dwellings. The new buildings at the bottom of the plaza escaped; but the loss was greater than that of six years before, which was nearly \$2,600,000. Only two stores were left standing; the levee and the square again became the camping-ground of hundreds of inhabitants, and the destruction of provisions threatened a famine.

So shingles and thatch and cypress boards had cost enough. From this time the tile roof came into general use. As the town's central parts filled up again, it was with better structures, displaying many Spanish-American features—adobe or brick walls, arcades, inner courts, ponderous doors and windows, heavy iron bolts and gratings (for houses began to be worth

A FAÇADE.

breaking into), balconies, portes-cochères, and white and yellow lime-washed stucco, soon stained a hundred colors by sun and rain. Two-story dwellings took the place of one-story, and the general appearance, as well as public safety, was enhanced.

The people were busy, too, in the miry, foul-smelling streets, on the slippery side-walks and on the tree-planted levee. Little by little the home government, at the intercession of the governors—old Unzaga, young Galvez, the suave and energetic Miró,—had relaxed its death-grip. A little wooden custom-house, very promptly erected at the upper front corner of the town, had fallen into significant dilapidation, though it was not yet such a sieve but it could catch an export and import duty of six per cent. on all merchandise that did not go round it. The concessions of 1778, neutralized by war and by English blockade, had been revived, enlarged, and extended ten years. Moored against

the grassy bank of the brimming river, the black ships were taking in hides and furs, bales of cotton, staves, and skins of indigo for the Spanish market, box-shooks for the West Indian sugar-makers, and tobacco, bought by the Government; and were letting out over their sides machinery and utensils, the red wines of Catalonia, and every product of the manufacturer,—besides negro men and women, girls and boys, for sale singly or in lots on the landing.

On the other side of town, also, there was, by and by, no little activity. A lake and bayou business was asking room and a question of sanitation was demanding attention, and in 1794-96 the practical Carondelet

and final, as, during an inundation eighty years afterward, the present writer passed through its streets in a skiff, with the water as high as the gate-knobs.

By such measures it was that the Spanish king sought "to secure to his vassals the utmost felicity." This was much more than the possession of Louisiana afforded the king. The treaty of peace, signed in 1783 by Great Britain, the United States, France, and Spain, had made the new American power his rival. The western boundary of the States was fixed on the Mississippi from the great lakes to a point nearly

THE CABILDO OF 1792.

gathered a large force of slaves, borrowed from their town and country owners, and dug with pick and shovel in the reeking black soil just beyond the rear fortifications of the town, the "Old Basin" and canal that still bear his name. The canal joined the Bayou St. John, and thus connected ten thousand square yards of artificial harbor with Lake Pontchartrain and the sea-coast beyond. The lands contiguous to this basin and canal were covered with noisome pools, the source of putrid fevers, and, some years later, as Carondelet had urged from the first, the cabildo divided them into garden lots and let them out at low ground-rents to those who would destroy their insalubrity by ditching and draining them into the canal. They began soon to be built on, and have long been entirely settled up; but their drainage can hardly be considered to have been thorough

opposite the mouth of Red River, and the fortified points along that line, which had fallen so short a time before into the hands of Galvez, were required to be yielded up. Such was the first encroachment of American upon Spanish power in the great basin.

Another influence tending to turn the scales in favor of the States was a change in the agricultural products of the Delta, giving to the commerce of New Orleans a new value for the settlers of the West and the merchants of the Atlantic sea-ports.

## II.

### SUGAR.

THE planters of the Delta, on their transfer to Spanish domination, saw indigo, the chief product of their lands, shut out of market.

THE CABILDO OF TO-DAY (NOW THE SUPREME COURT).

French protection was lost and French ports were closed to them. Those of Spain received them only into ruinous competition with the better article made in the older and more southern Spanish colonies. By and by kinder commercial regulations offered a certain relief; but then new drawbacks began to beset them. Season after season was unfavorable, and at length an insect appeared which, by the years 1793-94 was making such ravages that the planters were in despair. If they could not make indigo they knew not what to do for a livelihood.

They had tried myrtle-wax and silk, and had long ago given them up. Everybody made a little tobacco, but the conditions were not favorable for a large crop in the Delta. Cotton their grandfathers had known since 1713. The soil and climate above Orleans Island suited it and it had always been raised in moderate quantity. M. Debreuil, a wealthy townsman of New Orleans and a land-holder, a leading mind among the people, had invented a cotton-gin effective enough to induce a decided increase in the amount of cotton raised in the colony. Yet a still better mode of ginning the staple from the seed was needed to give the product a decided commercial value. There was some anticipation of its possible importance, and certain ones who gave the matter thought had, in 1760, recommended the importation of such apparatus as could be found in India. In 1768 cotton had become an article of export from

New Orleans, and in the manifesto with which the insurgents banished Ulloa it is mentioned as a product whose culture, "improved by experience, promised the planter the recompense of his toils."

At the time of the collapse in the indigo production, the Creoles were still experimenting with cotton; but the fame of Eli Whitney's newly invented cotton-gin had probably not reached them. There must have been few of them, indeed, who supposed that eight years later the cotton-crop of Louisiana and export from New Orleans would be respectively 20,000 and 34,000 300-pound bales. They turned for a time in another direction. The lower Delta was a little too far south for cotton as a sure crop. They would try once more, as their fathers had tried, to make merchantable sugar.

On a portion of the city's present wholesale business district, near Tchoupitoulas street, this great staple had been first planted in Louisiana by the Jesuit fathers in 1751. They had received their seed, or rather layers, from St. Domingo. It had been grown in the town's vicinity ever since, but there only, and in trivial quantity. Nothing more than syrup, if even so much, was made from it until in 1758 M. Debreuil, the same who had experimented with cotton, built a sugar-mill on his plantation—now that part of the third district adjoining the second, on the river front—and endeavored to turn a large crop of cane into sugar.

Accounts of the result vary. Sugar, it

ETIENNE DE BORÉ. FROM A PICTURE IN THE POSSESSION OF HON. C. GAVARRÉ.

seems, however, was made, and for a time the industry grew. But the sugar was not of a sort to ship to the world's markets; it was poorly granulated and very wet, and for several years was consumed entirely within the province. In 1765 the effort was at length made to export it to France; but half the first cargo leaked out of the packages before the vessel could make port.

Then came the cession to Spain, and with it paralysis. The half-developed industry collapsed. But in 1791 the blacks of St. Domingo rose in rebellion. Refugees flew in every direction. A few found their way to Louisiana. They had been prosperous sugar-makers, and presently the efforts that had ceased for twenty-five years came again to life. Two Spaniards, Mendez and Solis, in that year erected on the confines of New Orleans, the one a distillery and the other a battery of sugar-kettles, and manufactured rum and syrup.

Still the Creoles, every year less able than the year before to make rash experiments, struggled against the misfortunes that multiplied around the cultivation of indigo, until 1794 found them without hope.

At this juncture appeared Etienne de Boré. He was a man of fifty-four, a Creole of the Illinois district, but of a distinguished Norman family; he had lived in France from the age of four to thirty-two, had served with the king's *mousquetaires*, had married a lady whose

estate was in Louisiana near New Orleans, and had returned with her to the province, and had become an indigo planter. The year 1794 found him face to face with ruin. His father-in-law, Destréhan, had in former years been one of the last to abandon sugar-culture. His wife and friends warned him against the resolution he was taking; but he persisted in his determination to abandon indigo, and risk all that was left to him on the chance of a success which, if achieved, would insure deliverance and fortune to himself and the community. He bought a quantity of canes from Mendez and Solis, planted on the land where the seventh district (late Carrollton) now stands, and while his crop was growing erected a mill, and prepared himself for the momentous season of "grinding."

His fellow planters looked on with the liveliest—not always with the most hopeful—interest, and at length they gathered about him to see the issue of the experiment in which only he could be more deeply concerned than they. In the whole picturesque history of the Louisiana Creoles few scenes offer so striking a subject for the painter as that afforded in this episode: The dark sugar-house; the battery of huge caldrons, with their yellow juice boiling like a sea, half hidden in clouds of steam; the half-clad, shining negroes swinging the gigantic utensils with which the seething flood is dipped from kettle

THE GATE-WAY OF THE CABILDO.

to kettle; here, grouped at the end of the battery, the Creole planters with anxious faces drawing around their central figure as closely as they can; and in the midst the old *mousquetaire*, dipping, from time to time, the thickening juice, repeating again and again his simple tests, until, in the moment of final trial, there is a common look of suspense, and instantly after it the hands are dropped, heads are raised, the brow is wiped, and there is a long breath of relief—"it granulates!"

The people were electrified. Etienne de Boré marketed \$12,000 worth of superior sugar. The absence of interdictions that had stifled earlier trade enabled him to sell his product to advantage. The agriculture of the Delta was revolutionized; and, seven years afterward, New Orleans was the market for 200,000 gallons of rum, 250,000 gallons of molasses, and 5,000,000 pounds of sugar. The town contained some twelve distilleries—probably not a subject for unmixed congratulation—and a sugar refinery which produced about 200,000 pounds of loaf sugar; while on the other hand the production of indigo had declined to a total of 3000 pounds, and soon after ceased.

## III.

THE CREOLES SING THE MARSEILLAISE.

THE Spanish occupation never became more than a conquest. The Spanish tongue, enforced

VOL. XXV.—60.

in the courts and principal public offices, never superseded the French in the mouths of the people, and left but a few words naturalized in the corrupt French of the slaves. To African organs of speech *cocodrie*, from *cocodrilo*, the crocodile, was easier than *caiman*, the alligator; the terrors of the calabozos, with its chains and whips and branding irons, were condensed into the French trisyllabic *calaboose*; while the pleasant institution of *ñapa*,—the petty gratuity added, by the retailer, to anything bought—grew the pleasanter, drawn out into Gallicized *lagnappe*.

The only newspaper in the town or province, as it was also the first, though published under the auspices of Carondelet, was the "*Moniteur de la Louisiane*," printed entirely in French. It made its first appearance in 1794.

Spanish Ursulines, sent from Havana to impart their own tongue, had to teach in French instead, and to content themselves with the feeble achievement of extorting the Spanish catechism from girls who recited with tears rolling down their cheeks. The public mind followed—though at a distance—

IN THE CABILDO.

the progress of thought in France. Many Spaniards of rank cast their lot with the Creoles. Unzaga married a Maxent; Galvez, her sister,—a woman, it is said, of extraordinary beauty and loveliness; Gayarré

w e d d e d

Constance de Grandpré; the intendant Odvardo, her sister; Miró, a de Macarty. But the Creoles never became Spanish; and in society balls where the Creole civilian met the Spanish

military official, the cotillon was French or Spanish according as one or the other party was the stronger, a question more than once decided by actual onset and bloodshed. The Spanish rule was least unpopular about 1791, when the earlier upheavals of the French revolution were regarded distantly, and before the Republic had arisen to fire the Creole's long-suppressed enthusiasm. Under Galvez in 1779-82 they rallied heartily under Spanish colors against their hereditary British foe. But when, in 1793, Spain's foe was republican France, Carondelet found he was only holding a town of the enemy. Then the Creole could no longer restrain himself. "La Marseillaise! La Marseillaise!" he cried in his sorry little theater; and in the drinking-shops—that were thick as autumn leaves—he sang, defiantly, "*Ça ira, ça ira, les aristocrates à la lanterne,*" though there was not a lamp-post in his town until three years later, when the same governor put up eighty.

Meantime Spain's hand came down again with a pressure that brought to mind the cruel past. The people were made to come up and subscribe themselves Spaniards, and sundry persons were arrested and sent to Havana. The baron rebuilt the fortifications on a new and stronger plan. At the lower river corner was Fort St. Charles, a five-sided thing for one hundred and fifty men, with brick-faced parapet eighteen feet thick, a ditch, and a covert way; at the upper river corner was Fort St. Louis, like it, but smaller. They were armed with about twelve eighteen and twelve-pounders. Between them, where Toulouse street opened upon the river front, a large battery crossed fires with both. In the rear of the town were three lesser forts, mere stockades, with fraises. All around from fort to fort ran a parapet of earth surmounted with palisades, and a moat forty feet wide and seven deep. "These fortifications," wrote Carondelet, "would not only protect the city against the attack of an enemy, but also keep in check its inhabitants. But for them," he said, "a revolution would have taken place."

This was in 1794. The enemy looked for from without was the pioneers of Kentucky, Georgia, etc. The abridgment of their treaty rights on the Mississippi had fretted them. Instigated by Genet, the French minister to the United States, and headed by one Clark and by Auguste de la Chaise, a Creole of powerful family, who had gone to Kentucky for the purpose, they were preparing to make a descent upon New Orleans for its deliverance; when events that await recital arrested the movement.

## IV

## THE AMERICANS.

CARONDELET had strengthened the walls that immured the Creoles of New Orleans; but, outside, the messenger of their better destiny was knocking at the gate with angry impatience. Congress had begun, in 1779, to claim the freedom of the Mississippi. The treaty of 1783 granted this; but in words only, not in fact. Spain intrigued, Congress menaced, and oppressions, concessions, aggressions, deceptions, and corruption lengthened out the years. New Orleans—"Orleans" the Westerners called it—there was the main difficulty. Every one could see now its approaching commercial greatness. To Spain it was the key of her possessions. To the West it was the only possible breathing-hole of its commerce.

Miró was still governing *ad interim*, when, in 1785, there came to him commissioners from the State of Georgia demanding liberty to extend her boundary to the Mississippi, as granted in the treaty of peace. Miró answered wisely, referring the matter to the governments of America and Spain, and delays and exasperations continued. By 1786, if not earlier, the flat-boat fleets that came floating out of the Ohio and Cumberland, seeking on the lower Mississippi a market and port for their hay and bacon and flour and corn, began to be challenged from the banks, halted, seized, and confiscated. The exasperated Kentuckians openly threatened and even planned to descend in flat-boats full of long rifles instead of breadstuffs, and make an end of controversy by the capture of New Orleans. But milder counsels restrained them, and they appealed to Congress to press Spain for the commercial freedom which they were determined to be deprived of no longer.

Miró, and Navarro, the intendant, did well to be alarmed. They wrote home urging relief through certain measures which they thought imperative if New Orleans, Louisiana, the Floridas, or even Mexico, was to be saved from early conquest. "*No hay que perder tiempo*"—"There is no time to be lost." They had two schemes: one, so to indulge the river commerce that the pioneers swarming down upon their borders might cross them, not as invaders, but as immigrants, yielding allegiance to Spain; the other, to foment a revolt against Congress and the secession of the West. These schemes were set on foot; a large American immigration did set in, and the small town of New Madrid still commemorates the extravagant calculations of Western grantees.

There had lately come to Kentucky a cer-

tain man whose ready insight and unscrupulous spirit of intrigue had promptly marked the turn of events. This was General James Wilkinson, of the United States service, a man early distrusted by President Washington, long suspected by the people, and finally tried for treasonable designs and acquitted for want of evidence which the archives of Spain have since revealed. This cunning schemer and speculator, in June, 1787, sent and followed to New Orleans a large fleet of flat-boats loaded with the produce of the West, and practicing on the political fears of Miró, secured many concessions. By this means, he made way for a trade which began at once to be very profitable to New Orleans, not to say to many Spanish officials. But it was not by this means only. At the same time, he entered into a secret plot with Miró and Spain for that disruption of the West from the East which she sought to effect. "The delivering up of Kentucky into his Majesty's hands, which is the main object to which Wilkinson has promised to devote himself entirely,"—so wrote Miró to the Spanish Secretary of State, January 8, 1788, and Wilkinson's own letters, written originally in cipher, and now in the archives of Spain, reduced to the Spanish tongue, complete the overwhelming evidence. "When this is done, \* \* \* I shall disclose so much of our great scheme," etc. "Be satisfied, nothing shall deter me from attending exclusively to the object we have on hand." "The only feasible plan"—this was a year later—"\* \* \* was \* \* \* separation from the United States, and an alliance with Spain." Such was the flat-boat toll paid by this lover of money and drink.

But, neither for the Kentuckian nor the Creole was an export trade more than half a commerce. Philadelphia partly supplied the deficiency, though harried by corrupt double dealings. Miró and Navarro favored and promoted this trade; but Gardoqui, the Spanish minister at Philadelphia, not sharing in the profits, moved vigorously against it, and there was dodging and doubling,—all the subterfuges of the contrabandist, not excepting false arrests and false escapes. The fire of 1788 gave Navarro excuse to liberate a number whom fear of the king had forced him to imprison, and to give them back their confiscated goods. Such was one branch of the academy that, in later years, graduated the pirates of Barataria.

The scarcity of provisions after the fire was made to help this Philadelphia trade. Miró sent three vessels to Gardoqui (who was suddenly ready to coöperate) for 3000 barrels of flour, and such other goods as the

general ruin called for. And here entered Wilkinson, and in August, 1788, received through his agent, Daniel Clark, in New Orleans, a cargo of dry goods and other articles for the Kentucky market, probably the first boat-load of manufactured commodities that ever went up the Mississippi to the Ohio. Others followed Wilkinson's footsteps in matters of trade, and many were the devices for doing one thing while seeming to do another. A pretense of coming to buy lands and settle secured passports for their flat-boats and keel-boats, and the privilege of selling and buying free of duty. A profession of returning for families and property opened the way back again up the tortuous river, or along the wild, robber-haunted trails of the interior.

So the Creoles, in their domestic commerce, were striking hands with both the eastern and western "American." As to their transatlantic commerce, the concessions of 1782 had yielded it into the hands of the French, and there it still remained. "France," wrote Miró in 1790, "has the monopoly of the commerce of this colony." It suited him not to mention Philadelphia or the Ohio. But war presently brought another change.

## V.

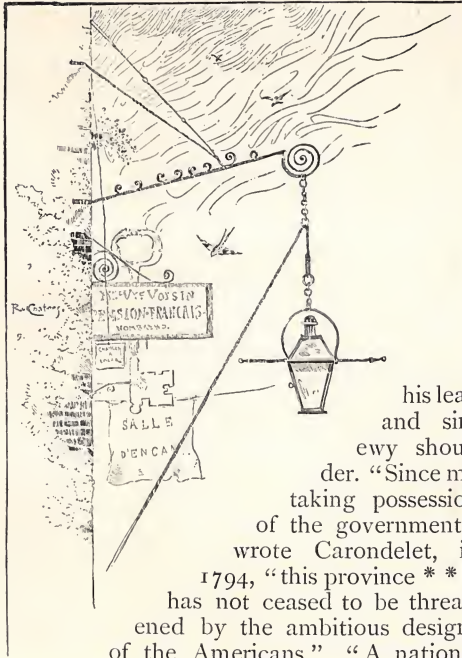

## SPAIN AGAINST FATE.

THE port of New Orleans was neither closed nor open. Spain was again in fear of Great Britain. The United States minister at Madrid was diligently pointing to the possibility of a British invasion of Louisiana from Canada, by way of the Mississippi; to the feebleness of the Spanish foothold; to the unfulfilled terms of the treaty of 1783; to the restlessness of the Kentuckians; to everything indeed, that could have effect in the effort to extort the cession of "Orleans" and the Floridas. But Spain held fast, and Miró, to the end of his governorship, plotted with Wilkinson and with a growing number of lesser schemers equally worthy of their country's execration.

Difficulties were multiplying when, at the close of 1791, Miró gave place to Carondelet. Some were internal; and the interdiction of the slave-trade with revolted St. Domingo; the banishment of Yankee clocks branded with the goddess of liberty; the baron's fortifications, etc., were signs of them, not cures. In February, 1793, America finally wormed from Spain a decree of open commerce, for her colonies, with the United States and Europe. Thereupon Philadelphians began to establish commercial houses in New Orleans.

On the side of the great valley, the Kentuckian was pressing with all the strength of

A CORNER.

his lean and sinewy shoulder. "Since my taking possession of the government," wrote Carondelet, in 1794, "this province \* \* \* has not ceased to be threatened by the ambitious designs of the Americans." "A nation," as Navarro had earlier called them, "restless, proud, ambitious, and capable of the most daring enterprise." Besides them, there were La Chaise, also, and Genet, and the Jacobins of Philadelphia.

It was to President Washington's vigilance and good faith that the baron owed the deliverance of the province from its dangers; not to his own defenses, his rigid police, nor his counter-plots with Thomas Power and others. These dangers past, he revived the obstruction and oppression of the river trade, hoping, so, yet to separate the Western pioneers from the union of States, to which they had now become devoted.

But events tended ever one way, and while Carondelet was still courting Wilkinson through Power, a treaty, signed at Madrid October 20, 1795, declared the Mississippi free to the Americans. New Orleans was made a port of deposit for three years, free of all duty or charge, save "a fair price for the hire of the store-houses." The privilege was renewable at the end of the term, unless transferred by Spain to some "equivalent establishment" on the river bank.

Still Carondelet held the east bank of the river, temporizing with the American authorities through his colleague, General Gayoso de Lemos, the Spanish commissioner for mak-

ing the transfer. He spent bribes freely, and strengthened his fortifications, not against Federal commanders only, but against the western immigrants who had crowded into the province, and against the renewed probability of invasion from Canada.

The Creoles, save a little patriotic singing and shouting, that cost six of them twelve months each of Cuban exile, remained, through all, passive. We have seen how they passed through an agricultural revolution. But they were no more a writing than a reading people, and what tempests of emotion they may have concealed while war was being waged against France, while the Gulf was being scoured by French privateers, and when one of these seized, and for eight days held, the mouth of the Mississippi, may only be conjectured. We know that Etienne de Boré escaped arrest and transportation only by reason of his rank and the people's devotion to him as a public benefactor.

Two years more passed. Carondelet gave place to Gayoso de Lemos. Wilkinson, who was in chief command of the American forces in the West, grew coy and cold. The encroachments of the double-dealing general's subordinates could be resisted by the Spaniard no longer, and in March, 1798, he abandoned by stealth, rather than surrendered, the territory east of the Mississippi, so long unjustly retained from the States.

All the more did the Creole city remain a bone of contention. On the close of the

IN THE CALABOOSE.

three-years' term named in the treaty of 1795, the intendant, Morales, a narrow and quarrelsome old man, closed the port, and assigned no other point to take its place.

But the place had become too important, and the States too strong for this to be endured. The West alone could muster twenty thousand fighting men. John Adams was President. Secret preparations were at once set on foot for an expedition against New

Italian "kingdom of Etruria." When Minister Livingston wrote, in November, 1802, the secret was no longer unknown.

On the 26th of March, 1803, M. Laussat, as French Colonial Prefect, landed in New Orleans, specially commissioned to prepare for the expected arrival of General Victor with a large body of troops, destined for the occupation of the province, and to arrange for the establishment of a new form of gov-

THE MARIGNY HOUSE, WHERE LOUIS PHILIPPE STOPPED IN 1798.

Orleans in overwhelming force. Boats were built, and troops had already been ordered to the Ohio, when it began to be plain that the President must retire from office at the close of his term, then drawing near; and by and by Spain disavowed her intendant's action and re-opened the closed port.

Meanwhile another eye was turned covetously upon Louisiana, and one who never moved slowly was about to hurry her fate to a climax.

#### VI.

#### NEW ORLEANS SOUGHT—LOUISIANA BOUGHT.

"FRANCE has cut the knot," wrote Minister Livingston to Secretary Madison. It is the word of Bonaparte himself, that his first diplomatic act with Spain had for its object the recovery of Louisiana. His power enabled him easily to outstrip American negotiations, and on the 1st of October, 1800, the Spanish King entered privately into certain agreements by which, on the 21st of March, 1801, Louisiana, vast, but to Spain unremunerative and indefensible, passed secretly into the hands of the First Consul in exchange for the petty

ernment. The Creoles were filled with secret consternation. Their fields, and streets, and dwellings were full of slaves. They had heard the First Consul's words to the St. Domingans: "Whatever be your color or your origin, you are free." But their fears were soon quieted, when Laussat proclaimed the design of their great new ruler to "preserve the empire of the laws and amend them slowly in the light of experience only." The planters replied that "their long-cherished hope was gratified, and their souls filled with the delirium of extreme felicity"; and the townsmen responded: "Happy are the colonists of Louisiana who have lived long enough to see their reunion to France, which they have never ceased to desire, and which now satisfies their utmost wish."

Governor Gayoso had died of yellow fever in 1799,—it is said shortly after a night's carousal with Wilkinson. He had been succeeded by the Marquis of Casa Calvo, and he, in 1801, by Don Juan Manuel de Salcedo. The intendant Morales had continued to hate, dread, and hamper American immigration and commerce, and in October, 1802,

had once more shut them out of New Orleans until six months later again discountenanced by his king.

In Congress debate narrowed down to the question whether New Orleans and the Floridas should be bought or simply swept down upon and taken. But the executive department was already negotiating; and, about the time of Laussat's landing in Louisiana, Messrs. Livingston and Monroe were commissioned to treat with France for a cession of New Orleans and the Floridas, "or as much thereof as the actual proprietor can be prevailed on to part with."

Bonaparte easily saw the larger, but unconfessed wish of the United States. Louisiana, always light to get and heavy to hold, was slipping even from his grasp. He was about to rush into war with the English. "They have," he exclaimed passionately to his ministers, "twenty ships of war in the Gulf of Mexico. \* \* \* I have not a moment to lose in putting it [his new acquisition] out of their reach. They [the American commissioners] only ask of me one town in Louisiana; but I already consider the colony as entirely lost." And a little later, walking in the garden of St. Cloud, he added to Marbois—whom he trusted rather than Talleyrand—"Well! you have charge of the treasury; let them give you one hundred million francs, pay their own claims, and take the whole country." When the minister said something about the rights of the colonists, "Send your maxims to the London market," retorted the First Consul.

The price finally agreed upon was eighty million francs, out of which the twenty million francs of American citizens' claims due by France were to be paid, and Louisiana was bought. Monsieur Marbois and Messrs. Livingston and Monroe signed the treaty on the 30th of April, 1803. As they finished, they rose and shook hands. "We

have lived long," said Livingston, "but this is the noblest work of our lives."

About the last of July, when Casa Calvo and Salcedo, Spanish commissioner and governor, had proclaimed the coming transfer to France, and Laussat, the French prefect, was looking hourly for General Victor and his forces, there came to New Orleans a vessel from Bordeaux with the official announcement that Louisiana had been ceded to the United States.

On the 30th of November, with troops drawn up in line on the Place d'Armes, and with discharges of artillery, Salcedo, fitly typifying, in his infirm old age, the decaying kingdom which he represented, delivered to Laussat, in the hall of the cabildo, the keys of New Orleans; while Casa Calvo, splendid in accomplishments, titles, and appearance, declared the people of Louisiana absolved from their allegiance to the king of Spain. From the flag-staff in the square the Spanish colors descended, the French took their place, and the domination of Spain in Louisiana was at an end.

On Monday, December the 20th, 1803, with similar ceremonies, Laussat turned the province and the keys of its port over to Commissioners Claiborne and Wilkinson. The French tricolor, which had floated over the Place d'Armes for but twenty days, gave place to the stars and stripes, and New Orleans was an American town.

Within a period of ninety-one years Louisiana had changed hands six times. From the direct authority of Louis XIV. it had been handed over, in 1712, to the commercial dominion of Anthony Crozat. From Crozat it had passed, in 1717, to the *Compagnie de l'Occident*; from the company, in 1731, to the undelegated authority of Louis XV.; from him, in 1762, to Spain; from Spain, in 1801, back to France; and at length, in 1803, from France to the United States, finally emancipated from the service and bargainings of European masters.

TRANSOM OVER DOOR-WAY OF PONTALBA BUILDING.

## A GOOD FIGHT FINISHED.

"Now we may call it finished," said my father, to one of his younger children, two days before his quiet departure from this life. He was standing in front of the fine pile of buildings of the Yale Theological Seminary, for which with his own hands he had broken the ground in 1870, and for which and in which his chief work had been done during these last twelve years. "Some time they may add a refectory for the other side of the quadrangle; but now that, at last, we have joined the two buildings with this library, we may consider it done."

I have no doubt that the satisfaction of seeing this important work approaching a successful conclusion, was an element in the happy content with which, for many weeks, he had been wont to lie down at night not knowing in which of the worlds he was to awake. So many great things for the good of the world, he had not only planned and hoped, but, "begun, continued and ended in God," as to make his career in this respect an exceptionally happy one.

The contrast rises in my mind, as I write, between his life and the short, sad, disappointed life of his own father. David Bacon was a visionary man. I like to use, in a noble sense, that word which it is common to utter with a sneer. The vision which he had was a vision of this world made better and happier through his willing toil and suffering: and to this heavenly vision he was not disobedient. Before the awakening of the modern spirit of missions, with no assurance of coöperation or support, he got himself up from his kindred and from his father's house, and, walking beside the horse that bore his only wealth—his bride of seventeen years old—went out into the wilderness of the North-west Territory to teach the knowledge of Jesus Christ to the savage Ojibbeways. There my father and his eldest sister were born. And when, after great hardships, the mission failed through the absolute cutting off of subsistence, the missionary put that heroic girl, his wife, with her two little children, into a returning wagon, and crept back by slow stages, fording the Alleghany river where now stands the city of Pittsburg.

All the way to Connecticut the visionary man was pondering a new thought of service to the world. He had noted the first dribbles of emigration flowing from New England into the "Western Reserve," and, seeing the scat-

tered families here and there in the wilderness, he had compassion on them as sheep having no shepherd. Looking back as well as forward, he thought of how New England had been settled by organized colonies, bringing with them the church, the school, the framework of government; and there grew upon his mind the vision of an exclusively Christian colony for New Connecticut. He went back alone into the forest and chose a goodly township of land. He made himself responsible, on the one hand, to the capitalists for his returns; on the other hand, to the colonist for the title to the land; and then he set himself to search Connecticut with a candle for the choicest material out of which to build a Christian community. Men laughed at "Bacon's Heaven," but his faith could bear laughing at. In advance of all his colonists, he went out into the forest where there was no road, and beside the Indian trail he built the log-cabin that sheltered his wife and little children. In that cabin, when the settlers had begun to arrive, family by family, in their canvas-covered wagons, the church was organized, and his baby daughter, the first-born child of the wilderness, was baptized. Things looked bright about him for a year or two; and then came the embargo and the war of 1812, arresting business, suspending payments, extinguishing emigration, and leaving him a bankrupt, helpless between the exactions of the Eastern capitalist, on the one hand, and the reproaches of the settlers on the other. He loaded up his wife and little ones once more into a returning emigrant wagon, came back to Connecticut, and died of a broken heart, "not having received the promise."

The boy left thus, at fifteen years old,—the eldest of seven children, to be the mainstay of the family, was not unlike his father in character. He had the same holy "enthusiasm of humanity," the same high hope of what the world was to become, the same faith in God that there was nothing wrong that could not be set right, and the same confidence that he could help to set it right. But what a difference between the two lives! One, a life in which noble plans and labors for God and man seemed to go out in darkness; the other, blessed through all its later years with the visible fulfillment of its best hopes, the consummation of its work.

When the story of this life comes to be told in detail, the biographer will dwell with

LEONARD BACON, D. D.

delight on many incidents of that heroic childhood in the wilderness; and of the successful struggles of the brave, fatherless boy to educate himself and the younger children. But this sketch is to be confined to the principal of those arduous public labors and controversies which were entered into and achieved in the sixty years of my father's public life.

The first and greatest of them was the Slavery Debate. It is a little difficult for us younger men to conceive the fact that, at the time of my father's entrance on public life, there was no Slavery Question. Questions incident to slavery, were, of course, emerging from time to time. But the Slavery Question was not yet; because, on the fundamental point of the morality of the slave system, men's minds were not divided. There were men enough, of course, who did not care whether it was right or wrong; and there were many more who did not see how it was to be got rid of.

But that the system was thoroughly bad and wrong was admitted with substantial unanimity, both North and South. In 1818, the General Assembly of the not then divided Presbyterian Church *unanimously* adopted a notable anti-slavery deliverance; and in no body was the thought, culture, and conscience of the South better represented than in that assembly. Within twenty-five years from that time, the mind of the South had been revolutionized. The justification of the system of slavery as there maintained had become an article of political and religious faith, and the Slavery Question was in the high tide of an agitation that nothing could repress until slavery itself had ceased. Several causes had combined to bring about this change. The introduction of Eli Whitney's cotton-gin had added to the value of every able-bodied field-hand, and created an ever-craving southern market for Virginia negroes. In 1831, the negro insur-

rection at Southampton, Virginia, followed by a panic of terror and ferocious vengeance on the part of the whites, gave rise, in the next year, to a memorable debate in the Virginia Legislature, on the abolition of slavery, and to a vote in which that measure failed of adoption, indeed, but with a large minority in its favor. This was followed by a reaction, and by the beginning of those cold-blooded justifications of the system of American slavery which soon became characteristic of the national, religious, and political literature. Moreover, the defense of the slave-system had now begun to be instigated, and the show of a successful defense made possible, by false positions, bad logic, and in some cases malignant passions, on the part of abolitionists. Societies were formed—a society of indignant philanthropists in New York, and a society of malignant philanthropists in Boston—which, differing and even quarreling on other points, agreed in these two: first, that the system of laws known as American slavery was wicked (in which they were entirely right); and secondly, that every man invested by those wicked laws with the absolute and awful power of a master, was *ipso facto* a man-stealer and a pirate; and in this they were mischievously and suicidally wrong. They not only exasperated and antagonized such good men at the South as were trying to do their best under an evil system while doing their best to remove the evil, but they invited at this point an easy refutation, and so prepared the way for the ready though illogical inference that, since anti-slavery men were wrong, therefore slavery must be right.

From his college and seminary days Leonard Bacon had been active and earnest in measures looking toward the abolition of slavery. But it was in the early years of his pastorate at New Haven that the slavery question arrived at the pitch of exasperation and entanglement above described. It was then that he took, and defined, and defended against all assailants, that true position on the subject of slavery which he held until slavery had ceased to be.

I once heard him say in debate on this subject, quoting the language of Richard Baxter during the civil war in England, "Where other men have had one enemy, I have had two." The wrath of fanatical defenders of slavery against him was perhaps less fierce than that of its fanatical assailants. Human nature is liable to no more acute paroxysm of rage than that of the rough-and-ready reformer, who, vaguely conscious that he has justice back of him somewhere, and a wrong before him if only he could hit it, is

interrupted in mid-torrent of denunciation by an invitation to discriminate.

Accordingly, when the Anti-Slavery party, writing on their banner their one characteristic tenet, "Slave-holding always and everywhere a sin," came clamoring to the doors of missionary societies and church assemblies, demanding condign excommunication for all slave-holders, and were met on the threshold by a resolute man with a flat denial of their proposition, they were at once outrageously angry. And then, being got between the jaws of a definition and severely pinched, they began to cry out against the injustice of being treated in that way, and declared that, when they said slave-holding is always sinful, they only meant the sinful kind of slave-holding. They formally "resolved, that by slave-holding, this, the [Anti-Slavery] Society understands the holding *and treating* of human beings as property." In short, they talked about slave-holding as a certain class of temperance reformers talk about "the traffic," meaning sometimes what they say, and sometimes meaning something else.

When asked, "Wherein do you differ from the Anti-Slavery Society?" Mr. Bacon answered, citing the above-quoted resolution:

"Just on this point: I utterly repudiate their definition of slave-holding. I deny that they have any right to make such definition. Their attempt to do so is a fraud upon themselves and upon the public. Such a definition is an abuse of words fit only to juggle with. It is the fountain-head of a perpetual stream of sophistry. Words have a meaning of their own which cannot be set aside by an arbitrary definition. Words, and especially such words as we have to do with in political and moral inquiries, are not like the arbitrary symbols of algebra, which bear any meaning we choose to put upon them for the particular operation in which we are using them. . . . No doubt the gentlemen of the society think they mean by slave-holding what the resolution says they mean. No doubt they think that by slave-holding they mean not only the holding of slaves, but the holding of them as property, and the treatment of them as property. No doubt they are perfectly unconscious of the transparency with which their cardinal sophism shines through the very language in which they wrap it up: 'Resolved, that by slave-holding we mean slave-holding and a certain kind of treatment.' This very series of resolutions shows that, in spite of their unanimous resolve, they do not mean what they intend to mean. . . . The fact is that by that word 'slave-holder' they understand just what other people understand by it, 'the master of a slave'; and then, from their arbitrary definition of slave-holding, they derive the irresistible corollary that every slave-holder holds his slaves as property, and treats them accordingly."

If the brunt of my father's argument, in the earlier stages of the slavery controversy was directed more against the so-called abolitionists than against the advocates of slavery, it was because he found that the cause of abolition was more endangered and damaged by the former than by the latter. In fact, he

did not consider the wrongfulness of slavery to be a subject of argument.

"To me it seems that the man who needs argument on that point cannot be argued with. What elementary idea of right and wrong can that man have? If that form of government, that system of social order is not wrong—if those laws of the Southern States, by virtue of which slavery exists there and is what it is, are not wrong, nothing is wrong. Such a book as Wheeler's 'Law of Slavery' leaves no room for any argument to prove that our southern slavery is wrong, if only the reader is gifted with a moral sense. It is therefore taken for granted in these essays, from first to last, that every man has rights, and that our American slavery—which denies all rights to some two millions of human beings, and decrees that they shall always be held at the lowest point of degradation—is too palpably wrong to be argued about. The wrong of that slavery, however, is one thing, and the way to rectify that wrong is another thing. The wrongfulness of that entire body of laws, opinions, and practices is one thing; and the criminality of the individual master who tries to do right is another thing. These essays treat chiefly of the way in which the wrong can be set right."

"These essays"—from the preface to which I have just quoted—had been written at divers times from 1833 onward, and were collected, in 1846, into a volume which has had a history. It is a book of exact definitions, just discriminations, lucid and tenacious arguments; and it deals with certain obstinate and elusive sophistries in an effective way. It is not to be wondered that when it fell into the hands of a young Western lawyer, Abraham Lincoln,—whose characteristic was "not to be content with an idea until he could bound it north, east, south, and west,"—it should prove to be a book exactly after his mind. It was to him not only a study on slavery, but a model in the rhetoric of debate. It is not difficult to trace the influence of it in that great stump-debate with Douglas, in which Lincoln's main strength lay in his cautious wisdom in declining to take the extreme positions into which his wily antagonist tried to provoke or entice him. When, many years after the little book had been forgotten by the public, and after slavery had fallen before the President's proclamation, it appeared from Lincoln's own declaration to Dr. Joseph P. Thompson that he owed to that book his definite, reasonable, and irrefragable views on the slavery question, my father felt ready to sing the *Nunc dimittis*.

I have dwelt so long on this part of my father's life-work, not only for the truth of the history, but for the moral lesson of the history, which is commonly enough perverted. When the struggle was over, and with hard tugging the car of progress had been got through the slough to the firm ground on the other side, the flies who had all along busied themselves with stinging the teamsters and

the horses, alighted together on the box and buzzed their mutual congratulations—"It was a long, hard pull; but we did it, didn't we?" In the general good-will and hand-shaking, no one was disposed to disturb their complacency; and indeed, in the latter days of the war, Mr. Garrison's course had been so rational and patriotic that people were disposed to be more than forgiving, and to remember rather the evil he had suffered than the evil he had done. It was not to be asked that praise so freely conceded by a good-natured public should not be cheerfully accepted by a class of people who had long been compelled to rely, in the matter of eulogy, on a system of mutual exchanges. Even the gentle and judicious Mr. Phillips should hardly be blamed for trying the effect of an aureole before his looking-glass, and posing thus as a meek but now glorified martyr. Humane people have no disposition to grudge a comfortable compensation of kind words and complacent assumptions to persons who have had a hard time not wholly by their own fault. Even when these persons take advantage of the general good feeling to give new vent to their ancient grudges, and repeat their obsolete obloquies upon better men, the disposition is strong to say, "Poor fellows! they can hardly help it, the habit is so strong; we need not mind it, for it really harms no one: injurious language has lost all meaning as they use it." But it begins to be evident that the public forbearance is working grave practical mischief. The moral which some people draw from the mistold story is this: that by sweeping denunciation, steady refusal to accept plain definitions and clear moral distinctions, and persistent pelt-ing with hard names, any point can be carried, if you will only stick to it long enough. In almost any assembly of crotchety people—long-haired men and short-haired women—over a scheme for the reconstruction of the solar system, you will hear the appeal to "Remember Garrison, how he began with nothing and a printing-press against the whole nation, and the whole Church, and how at last he succeeded in bringing everybody over to his side." It is really a matter of interest to public morals that the ingenuous youth of America should know the truth of this matter—that Mr. Garrison and his society never succeeded in anything; that his one distinctive dogma, that slave-holding is always and everywhere a sin, was never accepted to any considerable extent outside of the little ring of his personal adherents; that his vocabulary, which had no word but man-stealer and pirate for the legal guardian of a decrepit negro, or for one holding a

family of slaves in transit for a free State with intent to emancipate them, never became part of the American dictionary; that the sophistry with which he spent a life-time in trying to confuse plain distinctions had little effect except to give acrimony and plausibility to the defense of slavery; and that the final extinction of slavery was accomplished in pursuance of principles which he abhorred, by measures which he denounced, and under the leadership of men like Leonard Bacon in literature and the church, and Abraham Lincoln in politics, who had been the objects of his incessant and calumnious vituperation.

Another great conflict in which my father was conspicuously engaged from the beginning of it, and which he saw through to the end, was the famous Old School and New School controversy in the Presbyterian Church. In a threefold conflict,—between a rigidly conservative and a progressive theology, between exclusiveness and liberality in ecclesiastical administration, and between a Celtic and an English or New England element of membership,—it was natural enough that his sympathies should be with progress, liberty, and the Yankees. But how it was that he, a young man in another denomination and in a remote part of the country, should happen, at the crisis in the Presbyterian Church, to be a leader, and sometimes an official leader, of business and debate in its most intimate affairs, is worth explaining.

The triple cause of division, which already in the last century had occasioned a temporary rupture in the Presbyterian Church, began to work violently when, at the instance of the eminent Rev. Dr. James P. Wilson, young Mr. Albert Barnes, of New Jersey, was called to be his successor in the charge of the First Presbyterian Church in Philadelphia. A sermon by Mr. Barnes had lately been printed which enunciated the distinctive tenets of the New England "improved Calvinism" as against the Scotch theology; and this sermon became the occasion of a controversy that agitated session, presbytery, and synod, and at last, in 1831, reached the General Assembly, meeting in Mr. Barnes's own church.

Not long before this time, the rule had been adopted that "delegates from corresponding bodies" should be admitted to all the rights of membership in the General Assembly; and so it happened that, when a committee of ten was to be raised to consider the case of Mr. Barnes, Leonard Bacon, not thirty years old, from a Congregational church in Connecticut, was a member of it as well as of the judiciary committee. For many years he was the sole survivor of it. The position which he took on that commit-

tee and in the debates which went on in the Presbyterian Church until the disruption in 1838 and after it, was not without significance or consequence. But one incidental result was a delightful one to him: it brought him into a relation of warm personal friendship with a man whom he revered for his holiness of spirit, even more than for the qualities of his intellect—with Albert Barnes.

The "Old School and New School Controversy" was substantially one debate, whether in New England or outside of New England, in the Presbyterian Church. And, wherever it raged, my father was outspoken in defense of his own clearly defined opinions on the metaphysico-theological questions involved; but his most strenuous contention was in favor of liberty and against that ecclesiastical narrowness which necessitates schism. By and by the larger liberty prevailed; and, after thirty-one years of division, the Presbyterian Church was one again. In the church in Pittsburg where the reuniting had been achieved in 1869, my father was present as a member at the meeting of the General Assembly in 1878, when a tablet was unveiled in memory of that event. It had been forty years since the disruption—forty-seven years since the stormy meeting in which Mr. Barnes's sermon was impeached for heresy. It had been seventy-three years since, a little boy, Leonard Bacon crossed the unbridged Alleghany and threaded the woods where Pittsburg stands. There was a hush of deep respect in the crowded Assembly when he was called on for a speech upon the event commemorated in the tablet; and there was a profound sense of satisfaction in his heart as he responded:

"It was an event in which the stern, heroic spirit of John Knox held communion with the milder spirit of John Robinson, and in which the traditions of the siege of Derry were mingled with those of the *Mayflower*. It was fit that those two streams of nationality, which constitute the Presbyterian Church as we now have it in this country, should here meet and flow onward in a single stream. May the reunion be perpetual! It was asked at the time, and may be still, What was the meaning of it? It was not the result of diplomacy. It is deeper than that. It means that here, in the presence of this venerable Assembly, I may unchallenged pronounce the saintly name of Albert Barnes, and that means a great deal."

While my father's theological controversies were always for peace, they were always for peace through liberty. Never once, I believe, will he be found to have aimed at peace through an agreement to be silent about differences, or through a make-believe that there were no differences. And the peace that he lived to enjoy through his most happy old age was a stable one. He saw the once hostile theological schools of

Connecticut coöperating in fraternal emulation, and his bosom friend, Bushnell, canonized in the affections of Christian people wherever the English language is read, as saint and doctor of the Church.

I do not know of an important public question which has come up during these sixty years, in which my father was not a disputant. He was first, or among the first, to inaugurate the movement for cheap postage in America, and he followed it up by pertinacious criticism that refused to be put off with the delusive half-measures with which the friends of the reform were to be appeased. He fought, week after week, in many newspapers at once, as well as in public speech, against the folly of eternal greenbacks, not as a folly only, but as an immorality. And he lived to see it extinguished in the resumption of specie payment. Every political question was to him a moral question; but it was the distinctively moral questions in politics that kindled him to fervid heat. It was like him, that—when his children found him, in the early morning, in the brief and not ungentle pang that released him from this earthly life—there should be lying near him on his table an unfinished article against the Mormon iniquity, with his pen beside it, as he had left it the evening before.

He had inexpressible delight in seeing the fair fruitage of the seed that his martyr father had sowed in tears. Several times, in the course of his life, he went to Tallmadge, Ohio, and saw the glorious beauty realized that his father had beheld only in prophetic vision. On the last two occasions, some of his sons were with him. We stopped at Hudson and talked with survivors of the pioneers, about the events of the few months when the missionary had his family among them; and we went out to find the site of the log school-house, and heard one aged woman tell about that famous school exhibition when there was a dialogue out of the "Columbian Orator," between William Penn and Hernando Cortez on the Treatment of the Indians, and how little Leonard Bacon, as William Penn, carried off all the honors from big John Brown, who was in favor of severer measures. Poor John Brown!—how well Bacon remembered Brown's father, that could not speak for stuttering, except when he rose to pray in the prayer-meeting; and remembered John himself, and interceded tenderly with Governor Wise, of Virginia, to spare the old man's life, after the affair of Harper's Ferry!

And thence we drove down the straight road, due south, to Tallmadge. The people of the town came out with us in a multitude, the next day, to look for the site of the old log-cabin by the Indian trail.

My father was the first to find it. He knew it by the clear spring—overgrown now with weeds and bushes—that bubbled up in the old cellar. Behind was the hill-slope that they cleared the first season, building mighty fires; and he remembered the calcined bones of the rattlesnakes that they threw into the fires. In front was the forest of great trees—they stand there yet—through which ran the Indian trail. There, the first winter, it was great sport to the two little children to watch the browsing deer, and to rap on the window-pane, and see them turn their white tails and scud into the forest. It was less like sport to hear the howling of the wolves at night. Happily they were too young to know all it meant when the master of the house was gone, and the gangs of prowling Indians came to the door to ask for a drink; and when, at evening, the young mother tugged with all her strength to drag a heavy chest over the floor for a barricade.

A few months after our visit, when the citizens of Tallmadge sent my father a deed of the plot of ground containing the little ruin of his father's cabin, he felt somewhat as Abraham may have felt when he took the title-deed of the cave of Machpelah—all he ever owned in the land of promise. In the last June before he died, the Tallmadge people sent again for the son of their Founder, and escorted him with bands of music at the head of a procession of farmers' wagons a mile long, to the site of the old cabin, where, on the base of the ruined chimney, had been laid a noble boulder of granite, thus inscribed:

HERE  
THE FIRST CHURCH IN TALLMADGE  
WAS GATHERED IN THE  
HOUSE OF  
REV. DAVID BACON,  
JAN. 22, 1809.  
—  
JUNE 2, 1881.

It was a fitting incident in the closing year of my father's life. He returned from that pleasant, homely festival, well assured that when his children's children should come to show their children the scene of that heroic life in the wilderness, the spot would not have been lost from the memory of men.

My father's services to history were very great, though this part of his life's work bore less the mark of completeness than other parts. His earliest important work of history, "Thirteen Historical Discourses" (1839), was followed by multitudinous historical articles and discourses, many of them on commemorative occasions. By common consent,

he seemed to be recognized, in all his later life, as the historiographer of New England Puritanism. His latest important volume was "The Genesis of the New England Churches," which he would have been glad to follow with the Exodus, and so to complete a Pentateuch of Puritan history. His latest pamphlet, reprinted from the "New Englander" for November, he was sending out to his friends on the last day of his life: it was a beautiful painting of domestic life in New England a hundred years ago. And on his study-table, beside the unfinished article on "The Utah Problem," lay another, also unfinished, on the Antinomian controversy in New England two hundred and fifty years ago. My father had an individual, personal love for each one of the saints and heroes of New England history; but I am sure that it never occurred to him that he was one of them.

I have found, in a drawer of his table, some of his old college declamations, and am touched with the fervid warmth of the boy's hope and expectation that the conversion of the whole world to the faith of Christ was about to be achieved. This, after all, was the one inspiration, the one plan, the one conscious purpose of his life. He conceived it, measured it in its majestic magnitude, set himself about it as a thing to be accomplished. It possessed his mind when he was a boy of twenty in the theological seminary, and some of the best of his poetry was of that period and on that theme. It was then that he prepared the first collection of hymns for missionary meetings printed in America, in which his own verses were among the best and most enduring. His ordination to the ministry was to the work of an evangelist, that he might take up the work that had dropped from the fainting hands of his missionary father. And it was with reluctance that he yielded to the arguments and urgencies that demanded his services for the church at New Haven, which he served in the Gospel for fifty-six years. But he was reconciled to the change when he came to apprehend, as he did each year more and more distinctly, that the work of the Gospel and the Church in all the world is one work. He in his pulpit, amid the elms of New Haven Green and under the shadow of Yale College, was carrying forward the same great enterprise in which his seminary friend, Eli Smith, was toiling under the heights of Lebanon, and his protégé, Peter Parker, in the hospital at Canton. And they felt it as well as he. Missionaries, the world over, relied on him as a counselor and sometimes as an advocate. His most characteristic powers were never so conspicuous as in impromptu debate; and his

most memorable debates were made on the floor of the American Board of Foreign Missions. In New Haven, a monthly missionary meeting was held on Sunday evenings, in which several of the principal churches and their pastors united; and it was at those "monthly concerts" that he was accustomed to unroll, from month to month and year to year, the panorama of the whole world's current history—wars, diplomacies, revolutions, discoveries, councils, missions, revivals—in its bearing on the one controlling thought of his life—the advancing reign of Jesus Christ over the human race. There are many graduates of Yale College who will testify that the "monthly concert addresses" of Dr. Bacon were to them not the least important part of their liberal education.

"Here, then," some will say, "were an undertaking and a hope so vast that they must needs be disappointed. The life that is devoted to a project so immense as the conversion of the world to Christianity dooms itself to end in a consciousness of failure." I do not suppose that the expectations of my father in his boyhood, as to what he might live to see of the advancement of "the kingdom of righteousness, peace, and joy," were definite. They were rather infinite. But if any one had drawn before him the picture of the changes that should come over the face of the earth during the period of his active service as a minister of the Gospel, the daring faith of the young theological student might have staggered at the vision. The "American Board," mother of all our organizations for foreign missions, was then a feeble infant, whose little strength seemed, nevertheless, sufficient for all the work that it was possible to do in the existing condition of the world. Its first missionaries were repulsed from the shores of India by the authority of Christian England, and they might have explored the coasts of many a continent and the islands of many a sea with small chance of encountering a more cordial welcome. Sailing toward the Levant, the associates of his fervid prayer and song in the seminary lecture-rooms—Fisk, and Parsons, and Eli Smith—would have been warned away from every port of Europe, as if the Cross which they bore had been the yellow flag of pestilence; they found under the Crescent of Islam a contemptuous toleration that was more than Christendom would concede. My father had hardly completed twenty-five years of service as pastor at New Haven, when it became his good fortune to traverse the whole extent of the Turkish Empire in Syria, Mesopotamia, and Armenia, and witness everywhere the springing of the seed that had been sown through

all those years of hope deferred and heart-sickness, the harvest of which has since been ripening visibly before his eyes. Returning through Europe, he witnessed on every side the cruel exultation of the restored despotisms over the recent overthrow of the Revolution. He watched this triumphing of the wicked, and waited as they that watch for the morning; and presently "it passed away, and lo! it was not; he sought it, and it could not be found." Slavery and the slave-trade had sealed one continent against commerce and missions; and he lived to see slavery and the slave-trade extinguished, largely in consequence of his own labors, and to see the dark continent shot through with lines of light. I may not further dwell upon the often reiterated, but always amazing catalogue of the wonderful things wrought during this sixty years "in the name of the holy child Jesus." No eye scanned it more intently or more prophetically; no tongue or pen could sum it

up more eloquently than his. But I may speak of two names on the map of the world, which, in his youth and down to within the recent memory of his children, had been the symbols of hopeless heathenism and resistance to the Christian light, but which are now identified with the brightest hopes and triumphs of the universal church. Standing by unchallenged right with those who stood nearest to the coffin, in which his sons lifted that dear and noble form to carry it in great triumph to the burial, were two youthful faces whose Oriental tint and contour marked them, among the kinsfolk, as of strange lineage, but who loved to call him Father, and whom he had loved and cherished in his own home as his own children. No tears of a sincerer grief dropped upon his happy grave than those of the Christian young man from China, and the Christian girl from Japan, who had learned of the power of the Gospel through his words and prayers and holy life.

*Leonard Woolsey Bacon.*

---

"O WIND THAT BLOWS OUT OF THE WEST."

O WIND that blows out of the West,  
 Thou hast swept over mountain and sea,  
 Dost thou bear on thy swift, glad wings  
 The breath of my love to me?  
 Hast thou kissed her warm, sweet lips?  
 Or tangled her soft, brown hair?  
 Or fluttered the fragrant heart  
 Of the rose she loves to wear?

O sun that goes down in the West,  
 Hast thou seen my love to-day,  
 As she sits in her beautiful prime  
 Under skies so far away?  
 Hast thou gilded a path for her feet,  
 Or deepened the glow on her cheeks,  
 Or bent from the skies to hear  
 The low, sweet words she speaks?

O stars that are bright in the West  
 When the hush of the night is deep,  
 Do ye see my love as she lies  
 Like a chaste, white flower asleep?  
 Does she smile as she walks with me  
 In the light of a happy dream,  
 While the night winds rustle the leaves,  
 And the light waves ripple and gleam?

O birds that fly out of the West,  
 Do ye bring me a message from her,  
 As sweet as your love-notes are,  
 When the warm spring breezes stir?  
 Did she whisper a word of me  
 As your tremulous wings swept by,  
 Or utter my name, mayhap,  
 In a single passionate cry?

O voices out of the West,  
 Ye are silent every one,  
 And never an answer comes  
 From wind, or stars, or sun!  
 And the blithe birds come and go  
 Through the boundless fields of space,  
 As reckless of human prayers  
 As if earth were a desert place!

*Julia C. R. Dorr.*

## THE VILLAGE OF OBERAMMERGAU.

MOUNTAINS and valleys and rivers are in league with the sun and summer—and, for that matter, with winter too—to do their best in the Bavarian Highlands. Lofty ranges, ever green at base, ever white at top, are there tied with luminous bands of meadow into knots and loops, and knots and loops again, tightening and loosening, opening and shutting in labyrinths, of which only rivers know the secret, and no man can speak the charm. Villages which find place in lands like these take rank and relation at once with the divine organic architecture already builded; seem to become a part of nature; appear to have existed as long as the hills or the streams, and to have the same surety of continuance. How much this natural correlation may have had to do with the long, unchanging simplicities of peoples born and bred in these mountain haunts it would be worth while to analyze. Certain it is, that in all peasantry of the hill countries in Europe, there are to be seen traits of countenance and demeanor, peculiarities of body, habits, customs, and beliefs, which are indigenous and lasting, like plants and rocks. Mere lapse of time hardly touches them; they have defied many centuries; only now in the mad restlessness of progress of this the nineteenth, do they begin to falter. But they have excuse when Alps have come to be tunneled, and glaciers are melted and measured.

Best known of all the villages that have had the good fortune to be born in the Bavarian Highlands is Oberammergau, the town of the famous Passion Play. But for the Passion Play, the great world had never found Oberammergau out, perhaps; yet it might well be sought for itself. It lies 2,600 feet above the sea, at the head of a long stretch of meadow lands, which the river Ammer keeps green for half the year—at the head of these, and in the gate-way of one of the most beautiful walled valleys of the Alps. The Ammer is at once its friend and foe: in summer a friend, but malicious in spring: rising suddenly after great rains or thaws, and filling the valley with a swift sea, by which everything is in danger of being swept away. In 1769 it tore through the village with a flood like a tidal wave, and left only twelve houses standing.

High up on one of the mountain-sides, north-east of the village, is a tiny spot of greensward, near the course of one of the mountain torrents which swell the Ammer.

This green spot is the Oberammergauers' safety-gauge. So long as that is green and clear the valley will not be flooded; as soon as the water is seen shining over that spot, it is certain that floods will be on in less than an hour; and the whole village is astir to forestall the danger. The high peaks, also, which stand on either side the town, are friend and foe alternately. White with snow till July, they keep stores of a grateful coolness for summer heats; but in winter the sun cannot climb above them till nine o'clock, and is lost in their fastnesses again at one. Terrible hailstorms sometimes whirl down from their summits. On the 10th of May, 1774, there were three of these hailstorms in one day, which killed every green blade and leaf in the fields. One month later, just as vegetation had fairly started again, came another avalanche of hail, and killed everything a second time. On the 13th of June, 1771, snow lay so deep that men drove in sledges through the valley. This was a year never to be forgotten. In 1744 there was a storm of rain, thunder, and lightning, in which the electric fire shot down like javelins into the town, set a score of houses on fire, and destroyed the church. One had need of goodly devotion to keep a composed mind and contented spirit in a dwelling-place surrounded by such dangers. The very elements, however, it seems are becoming tamed by the inroads of civilization, for it is more than fifty years since Oberammergau has seen such hail or such lightning.

The village is, like all Tyrolean villages, built without apparent plan—no two houses on a line, no two streets at right angles, everybody's house slanting across or against somebody else's house, the confusion really attaining the dignity of a fine art. If a child were to set out a toy village on the floor, decide hastily to put it back in its box, sweep it all together between his two hands, then change his mind, and let the houses remain exactly as they had fallen, with no change except to set them right side up, I think it would make a good map of Oberammergau. The houses are low, white-plastered, or else left of the natural color of the wood, which, as it grows old, is of a rich dark brown. The roofs project far over the eaves, and are held down by rows of heavy stones to keep them from blowing off in wind-storms. Tiny open-work balconies are twined in and out capriciously, sometimes filled with gay flow-

ers, sometimes with hay and dried herbs, sometimes with the fire-wood for winter. Oberammergau knows in such matters no law but each man's pleasure. It is at each man's pleasure, also, where he will keep his manure-heap; and usually he elects to keep it close to the street, joining his barn or his house, or his neighbor's barn or house, at convenience. Except that there are many small sluices and rivulets and canals of spring water wandering about the village to carry off the liquidation, this would be intolerable, and surely would create pestilences. As it is, the odors are abominable, and are a perpetual drawback to the delight one would otherwise take in the picturesque little place.

There are many minute gardens and bits of orchard of all possible shapes, as many and as many-sided as the figures in the first pages of Euclid. I saw one, certainly not containing more than eight square feet, which was seven-sided, fenced and joined to two houses. Purple phlox, dahlias, and lilacs are the favorite outdoor flowers. Of these there were clumps and beds which might have been transported from New England. In the balconies and window-sills were scarlet geranium, white alyssum, and pansies.

The most striking natural feature of Oberammergau is the great mountain peak to the south-west called the *Kofel*. This is a bare, rocky peak of singularly bold contour. On its summit is set a large cross, which stands out always against the sky with a clearness almost solemn. The people regard this *Kofel* as the guardian angel of their village, and it is said that the reply was once made to persons who were urging the Passion Play actors to perform their play in England or America:

"We would do so if it were possible; but, to do that, it would be needful to take the entire village and our guardian spirit, the *Kofel*."

I arrived in Oberammergau on a Wednesday, and counted on finding myself much welcomed, three days in advance of the day of the play. Never was a greater mistake. A country cousin, coming uninvited to make a visit in the middle of a busy housewife's spring house-cleaning, would be as welcome. As I drove into the village the expression of things gave me alarm: every fence, post, roof, bush, had sheets, pillow-cases, or towels drying on it. The porches and grass-plots were strewn with pillows and mattresses; a general fumigation and purification of a quarantined town could not have produced a greater look of being turned wrong side out. This is what the cleanly Oberammergau women do every week during the Passion Play season. It

takes all the time intervening between the weekly representations of the play to make ready their bedrooms and beds.

I was destined to greater alarms and surprises, however. The Frau Rutz, to whom I had written for lodgings, and to whose house I drove, all confident, had never heard of my name. It became instantaneously apparent to me that I probably represented to her mind, perhaps, the eleven hundred and thirty-seventh person who had stopped at her door with the same expectation. Half of her house was being re-roofed, "to be done by Sunday"; all her bed-linen was damp, in baskets in the kitchen, and she and her sister were even then ironing for dear life to be done in time to begin baking and brewing on the next day. Evidently taking time by the forelock was a good way to come to a dead-lock in Oberammergau. To house after house I drove; to Frau Zwink's bird-cage, perched on the brink of a narrow canal, and half over it, it seemed. Just before me stood a post-carriage, at Frau Zwink's door, and as I stepped out two English ladies with bags, bundles, and umbrellas disappeared within Frau Zwink's door, having secured the only two available perches in the cage. The Frau came running with urgent solicitations that I should examine a closet she had, which she thought might answer.

"Oh, is she the lady of the house, and she barefoot?" exclaimed my Danish maid, aghast at the spectacle. Yet I afterwards heard that the Frau Zwink's was one of the notably comfortable lodging-places in the town. In another house were shown to us two small, dark rooms, to reach which one must climb a ladder out of the common living-room of the family. From house after house came the response, "No rooms; all promised for Saturday." At intervals I drove back to Frau Rutz's for further suggestions; at last she became gradually impressed with a sense of responsibility for our fortunes; and the mystery of her knowing nothing about my letter was cleared up. Her nephew had charge of the correspondence; she never saw the letters; he had not yet had time to answer one-half of the letters he had received. Most probably my letter might be in his pocket now. Friendship grew up between my heart and the heart of the Frau Rutz as we talked. Who shall fathom or sound these bonds which create themselves so quickly with one, so slowly with another? She was an Oberammergau peasant, who knew no word of my tongue; I a woman of another race, life, plane, who could not speak one word she could comprehend, and our interpreter was only a servant; but I think I do

not exaggerate when I say that the Frau and I became friends. I know I am hers, and I think if I were in Oberammergau, in need, I should find that she was mine.

By some unexplained accident—if there be such things—the best room in all Oberammergau was still left free: a great sunny room, with a south window and east windows; a white porcelain stove, an old-fashioned spinnet, a glass-doored corner-cupboard full of trinkets, old-fashioned looking-glasses, tables, and two good beds; and of this I took possession in incredulous haste. It was in the house of George Lang, merchant, the richest man in the town. The history of the family of which he is now the leading representative is identified with the fortunes of Oberammergau for a century past. It is an odd thing that this little village should have had its line of merchant princes: a line, dating back a hundred years, marked by the same curious points of heredity as that of the Vanderbilts or Astors in America, and the Rothschilds in Europe; men as shrewd, sharp, foreseeing, fore-planning, and executive in their smaller way, and perhaps as arbitrary in their monopolies, as some of our millionaires.

In 1765 there lived in the service of the monastery at Ettal a man named Joseph Lang. He was a trusted man, a sort of steward and general supervisor. When the monastery was suppressed Joseph Lang's occupation was gone. He was a handy man, both with tools and with colors, and, wandering down to Oberammergau, halted for a little to see if he could work himself in with the industry already established there of toy-making. At first he made simply frames, and of the plainest sort; soon—perhaps from a reverent bias for still ministering to the glory of the church, but probably quite as much from his trader's perception of the value of an assured market—he began to paint wooden figures of saints, apostles, Holy Virgins, and Christs. These figures at first he imported from the Tyrol, painted them, and sent them back there to be sold. Before long he had a large majority of the Oberammergau villagers working under his direction as both carvers and colorers in this business—a great enlargement of their previous trade of mere toy-making.

This man had eleven sons. Ten of them were carvers in wood, one was a painter and gilder. All these sons worked together in the continuing and building up of their father's business. One of them, George Lang, perceiving the advantage of widening business connections, struck out for the world at large, established agencies for his house in many

countries, chiefly in Russia, and came home to die. He had six sons and four or five daughters, it is not certainly known which; for, as the present George Lang said, telling this genealogical history in his delightful English: "The archives went up in fire once, so they did not know exactly." All six of these sons followed the trades of carving, painting, and gilding. One of them, the youngest, Johann, continued the business, succeeding to his father's position in 1824. He was, perhaps, the cleverest man of the line. He went from country to country, all over Europe, and had his agents in America, England, Australia, Russia. He was on terms of acquaintance with people in high position everywhere, and was sometimes called "The King of Oberammergau." Again and again the villagers wished to make him burgomaster or magistrate, but he would not accept the position. Nevertheless, it finally came to pass that all legal writings of the town, leases, conveyances, etc., made, were signed by his name as well as by the names of the recognized officials. First, "the magistracy of Oberammergau," then, "Johann Lang, Agent," as he persisted in calling himself, ran in the records of the parties to transactions in Oberammergau at that time.

In 1847 the village began to be in great trouble. A large part of it was burned; sickness swept it; whole families were homeless, or without father or brother to support them. Now shone out the virtues of this "king of Oberammergau," who would not be its burgomaster. He supported the village: to those who could work he gave work, whether the work had present value to him or not: to those who could not work he gave food, shelter, clothes. He was a rich man in 1847, when the troubles began. In 1849, he was poor, simply from his lavish giving. He had only two sons, to both of whom he gave an education in the law. Thus the spell of the succession of the craft of wood-workers was broken. No doubt ambition had entered into the heart of the King of Oberammergau to place his sons higher in the social scale than any success in mere trade could lift them. One of these sons is now burgomaster of the village; he is better known to the outside world as the Caiaphas of the Passion Play. To one knowing the antecedents of his house, the dramatic power with which he assumes and renders the Jewish High Priest's haughty scorn, impatience of opposition, contempt for the Nazarene, will be seen to have a basis in his own pride of birth, and inherited habit of authority.

The other son having been only moderately successful in making his way in the

world as a lawyer, returned to Oberammergau, succeeded to his father's business in 1856, but lived only a short time, dying in 1859. He left a widow and six children, three sons and three daughters. For a time, the widow and a sister-in-law carried on the business. As the sons grew up, two of them gradually assumed more and more the lead in affairs; and now bid fair to revive and restore the old traditions of the family power and success. One of them is in charge of a branch of the business in England, the other in Oberammergau. The third son is an officer in the Bavarian army. The aunt is still the accountant and manager of the house, and the young people evidently defer both to her advice and authority.

The daughters have been educated in Munich and at convents, and are gentle, pleasing, refined young women. At the time of the Passion Play in 1880 they did the honors of their house to hundreds of strangers, who were at once bewildered and delighted to find, standing behind their chairs at dinner, young women speaking both English and French, and as courteously attentive to their guests' every wish as if they had been extending the hospitality of the "King of Oberammergau," a half-century back.

Their house is in itself a record. It stands fronting an irregular open, where five straggling roadways meet, making common center of a big spring, from which water runs ceaselessly day and night into three large tanks. The house thus commands the village, and it would seem no less than natural that all post and postal service should center in it. It is the largest and far the best house in the place. Its two huge carved doors stand wide open from morning till night, like those of an inn. On the right-hand side of the hall is the post office, combined with which is the usual universal shop of a country village, holding everything conceivable, from a Norway dried herring, down to French sewing-silk. On the left-hand side are the ware-rooms of wood-carvings: the first two rooms for their sale; behind these, rooms for storing and for packing the goods, to send away; there are four of these rooms, and their piled-up cases bear testimony to the extent of the business they represent.

A broad, dark, winding stair-way leads up to the second floor. Here are the living-rooms of the family; spacious, sunny, comfortable; at the farther end of this hall a great iron door leads into the barn; whenever it is opened, a whiff of the odor of hay sweeps through; and to put out your head from your chamber-door of a morning, and, looking down the hall, to see straight

into a big hay-mow, is an odd experience the first time it happens. The house faces south-east, and has a dozen windows, all the time blazing in sunlight, a goodly thing in Oberammergau, where shadow and shade mean reeking damp and chill. On the south side of the house is an old garden, chiefly apple-orchard; under these trees, in sunny weather, the family take their meals, and at the time of the Passion Play more than fifty people often sat down at outdoor tables there. These trees were like one great aviary, so full were they of little sparrow-like birds, with breasts of cinnamon-brown color, and black crests on their heads. They chatted and chattered like magpies, and I hardly ever knew them to be quiet except for a few minutes every morning, when, at half-past five, the village herd of fifty cows went by, each cow with a bell at her neck; and all fifty bells half ringing half tolling a broken drowsy, sleepy, delicious chime, as if some old sacristan, but half awake, was trying to ring a peal. At the first note of this the birds always stopped, half envious, I fancied. As the chime died away, they broke out again as shrill as ever, and even the sunrise did not interrupt them.

The open square in front of the house is a perpetual stage of tableaux. The people come and go, and linger there around the great water-tanks as at a sort of Bethesda, sunk to profaner uses of every-day cleansing. The commonest labors become picturesque performed in open air, with a background of mountains, by men and women with bare heads and bare legs and feet. Whenever I looked out of my windows I saw a picture worth painting. For instance, a woman washing her windows in the tanks, holding each window under the running stream, tipping it and turning it so quickly in the sunshine that the waters gliding off it took millions of prismatic hues, till she seemed to be scrubbing with rainbows. Another, with two tubs full of clothes, which she had brought there to wash, her petticoat tucked up to her knees, her arms bare to the shoulder, a bright red handkerchief knotted round her head, and her eyes flashing as she beat and lifted, wringing and tossing the clothes, and flinging out a sharp or a laughing word to every passer. Another, coming home at night with a big bundle of green grass under one arm, her rake over her shoulder, a free, open glance, and a smile and a bow to a gay postilion watering his horses; another, who had brought, apparently, her whole stock of kitchen utensils there to be made clean—jugs, and crocks, and brass pans. How they glittered as she splashed them in and out! She did not wipe them, only set

them down on the ground to dry, which seemed likely to leave them but half clean after all. Then there came a dashing young fellow from the Tyrol, with three kinds of feathers in his green hat, short brown breeches, bare knees, gray yarn stockings with a pattern of green wreath knit in at the top, a happy-go-lucky look on his face, stooping down to take a mouthful of the swift-running water from the spout, and getting well splashed by missing aim with his mouth, to the uproarious delight of two women just coming in from their hay-making in the meadows, one of them balancing a hay-rake and pitchfork on her shoulder with one hand, and with the other holding her dark-blue petticoat carefully gathered up in front, full of hay; the other drawing behind her (not wheeling it) a low, scoop-shaped wheelbarrow full of green grass and clover—these are a few of any day's pictures. And thither came every day Issa Kattan, from Bethlehem of Judea—a brown-skinned, deer-eyed Syrian, who had come all the way from the Holy Land to offer to the Passion Play pilgrims mother-of-pearl trinkets wrought in Jerusalem; rosaries of pearl, of olive-wood, of seeds, scarlet, yellow, and black, wonderfully smooth, hard, and shining. He wore a brilliant red fez, and told his gentle lies in a voice as soft as the murmuring of wind in pines. He carried his wares in a small tray, hung, like a muff, by a cord round his neck, the rosaries and some strips of bright stuffs hanging down at each side and swinging back and forth in time to his slow tread. Issa paced the streets patiently from morn till night, but took good care to be at this watering-place many times in the course of the day, chiefly at the morning, and when the laborers were coming home at sunset.

Another vender, as industrious as he, but less picturesque, also haunted the spot—a man who, knowing how dusty the Passion Play pilgrims would be, had brought brushes to sell,—brushes big, little, round, square, thick, thin, long, short, cheap, dear, good, bad, and indifferent; no brush ever made that was not to be found hanging on that man's body, if you turned him round times enough. That was the way he carried his wares: in tiers, strings, strata, all tied together and on himself, in some inexplicable way. One would think he must have slipped himself into a dozen "cat's-cradles" of twine to begin with, and then had the brushes netted in and out on this foundation. All that remained to be seen of him was his head above this bristling ball, and his feet shuffling below. To cap the climax of his grotesqueness, he wore on his back a wooden box, shaped like an Indian papoose-frame, and in

this stood three or four lofty long-handled brushes for sweeping, which rose far above his head.

Another peasant woman—a hay-maker—I remember, who came one night; never again, though I watched longingly for her, or one like her. She wore a petticoat of umber-brown, a white blouse, a blue apron, a pink-and-white handkerchief over her head, pinned under her chin; under one arm she carried a big bunch of tall, green grasses, with the tasseled heads hanging loose far behind her. On the other shoulder rested her pitchfork, and in the hand that poised the pitchfork she held a bunch of dahlias, red, white, and yellow.

But the daintiest and most memorable figure of all, that flitted or tarried here, was a little brown-eyed, golden-haired maiden, not more than three years old. She lived near by, and often ran away from home. I saw her sometimes led by the hand, but oftenest without guide or protector; never alone, however, for rain or shine, early or late, she carried always in her arms a huge puppet, with a face bigger than her own. It wore a shawl and a knit hood; the child herself being always bareheaded. It was some time before I could fathom the mystery of this doll, which seemed shapeless yet bulky, and heavier than the child could well lift, though she tugged at it faithfully, and with an expression of care, as we often see poor babies in cities lugging about babies a little younger than themselves. At last I caught the puppet out one day without its shawl, and the mystery was revealed. It was a milliner's bonnet-block, on which a face had been painted. No wonder it seemed heavy and shapeless; below the face was nothing but a rough base of wood. It appeared that as soon as the thing was given to the child, she conceived for it a most inconvenient and unmanageable affection—would go nowhere without it, would not go to sleep without it, could hardly be induced to put it for one moment out of her tired little arms, which could hardly clasp it round. It seemed but a fitting reward to perpetuate some token of such faithfulness, and after a good deal of pleading I induced the child's aunt, in whose charge she lived, to bring her to be photographed with her doll in her arms. It was not an easy thing to compass this, for the only photographer of the town, being one of the singers in the chorus, had small leisure for the practice of his trade in the Passion Play year; but, won over by the novelty of the subject, he found an odd hour for us, and made the picture. The little thing was so frightened at the sight of the strange room and instruments that she

utterly refused to stand alone for a second, which was not so much of a misfortune as I thought at first, for it gave me the aunt's face also, and a very characteristic Oberammergau face it is.

At the same time I also secured a photograph of the good Frau Rutz. It was an illustration of the inborn dramatic sense in the Oberammergau people, that when I explained to Frau Rutz that I wished her to sit for a picture of an Oberammergau woman at her carving, she took the idea instantly, and appeared prompt to the minute, with a vase of her own carving, her glue-pot, and all her tools—to lay on the table by her side. "Do you not think it would be better with these?" she said, simply; then she took up her vase and tool, as if to work, seated herself at the table in a pose which could not be improved, and looked up, with "Is this right?" The photographer nodded his head, and, presto! in five seconds it was done; and Frau Rutz had really been artist of her own picture. The likeness did her less than justice. Her face is even more like an old Memling portrait than is the picture. Weatherbeaten, wrinkled, thin,—as old at forty-five as it should be by rights at sixty,—hers is still a noble and beautiful countenance. Nothing would so surprise Frau Rutz as to be told this. She laughed and shook her head when, on giving her one of the photographs, I said how much I liked it. "If it had another head on it it might be very good," she said. She is one of the few women in Oberammergau who do delicate carving. In the previous winter she had made thirty vases of this pattern, besides doing much other work.

Very well I came to know Frau Rutz's chiseled and expressive old face before I left Oberammergau. The front door of her house stood always open; and in a tiny kitchen opposite it—a sort of closet in the middle of the house, lighted only by one small window opening into the hall, and by its door, which was never shut—she was generally to be seen, stirring or skimming, or scouring her bright saucepans. Whenever she saw us she ran out with a smile, and the inquiry if there was anything she could do for us. On the day before the Passion Play she opened her little shop. It was about the size of a steamboat state-room, built over a bit of the side walk—Oberammergau fashion—and joined at a slant to the house; it was a set of shelves roofed over, and with a door to lock at night, not much more; eight people crowded it tight; but it was packed from sill to roof with carvings, a large part of which had been made by herself, her husband, and sons, or workmen in their employ, and most of which,

I think, were sold by virtue of the Frau's smile, if it proved as potent a lure to other buyers as to me. If I drove or walked past her house without seeing it, I felt as if I had left something behind for which I ought to go back; and when she waved her hand to us, and stood looking after us as our horses dashed round the corner, I felt that good luck was invoked on the drive and the day.

Driving out of Oberammergau, there are two roads to choose from: one up the Ammer, by way of a higher valley, and into closer knots of mountains, and so on into the Tyrol; the other down the Ammer, through meadows, doubling and climbing some of the outpost mountains of the range, and so on out to the plains. On the first road lies Ettal, and on the other Unterammergau, both within so short a distance of Oberammergau that they are to be counted in among its pleasures.

Ettal is one of the twelve beautiful houses which the ecclesiastics formerly owned in this part of Bavaria. These old monks had a quick eye for beauty of landscape, as well as a shrewd one for all other advantages of locality; and in the days of their power and prosperity they so crowded into these South Bavarian Highlands that the region came to be called Pfaffenwinkel, or, The Priest's Corner. Abbeys, priories, and convents—a dozen of them, all rich and powerful—stood within a day's journey of one another. Of these, Ettal was preëminent for beauty and splendor. It was founded early in the fourteenth century by a German emperor, who, being ill, was ready to promise anything to be well again, and being approached at this moment by a crafty Benedictine, promised to found a Benedictine monastery in the valley of the Ammer, if the Holy Virgin would restore him to health. An old tradition says that as the emperor came riding up the steep Ettaler Berg, at the summit of which the monastery stands, his horse fell three times on his knees, and refused to go farther. This was construed to be a sign from Heaven to point out the site of the monastery. But to all unforwarned travelers who have approached Oberammergau by way of Ettal, and been compelled to walk up the Ettaler Berg, there will seem small occasion for any suggestion of a supernatural cause for the emperor's horse's tumbling on his knees. A more unmitigated two miles of severe climb was never built into a road; the marvel is that it should have occurred to mortal man to do it, and that there is as yet but one votive tablet by the roadside in commemoration of death by apoplexy in the attempt to walk up. It was Alois Pfaurler who did thus die in July, 1866,

and before he was half way up, too! Therefore, this tablet on the spot of his death has a depressing effect on people for the latter half of their struggle, and no doubt makes them go slower.

How much the Benedictines of Ettal had to do with the Passion Play which has made Oberammergau so famous, it is now not possible to know. Those who know most about it disagree. In 1634, the year in which the play was first performed, it is certain that the Oberammergau community must have been under the pastoral charge of some one of the great ecclesiastical establishments in that region; and it is more than probable that the monks, who were themselves much in the way of writing and performing in religious plays, first suggested to the villagers this mode of working for the glory and profit of the Church.

Their venerable pastor, Daisenberger, to whom they owe the present version of the Passion Play, was an Ettal monk, and one of the many plays which he has arranged or written for their dramatic training is "The Founding of the Monastery of Ettal." The closing stanzas of this well express the feeling of the Oberammergauer to-day, and no doubt of the Ettal monk centuries ago, in regard to the incomparable Ammer Thal region:

"Let God be praised! He hath this vale created  
To show to man the glory of His name!  
And these wide hills the Lord hath consecrated  
Where He His love incessant may proclaim.

"Ne'er shall decay the valley's greatest treasure,  
Madonna, Thou the pledge of Heaven's grace!  
Her blessings will the Queen of Heaven outmeasure  
To her quiet Ettal and Bavaria's race."

Most travelers who visit Oberammergau know nothing of Unterammergau, except that the white and brown lines of its roofs and spires make a charming dotted picture on the Ammer meadows, as seen from the higher seats in the Passion Play theater. The little hamlet is not talked about, not even in guide-books. It sits, a sort of Cinderella, and meekly does its best to take care of the strangers who come grumbling to sleep there, once in ten years, only because beds are not to be had in its more favored sister village farther up the stream. Yet it is no less picturesque, and a good deal cleaner, than is Oberammergau; gets hours more of sunshine, a freer sweep of wind, and has compassing it about a fine stretch of meadowlands, beautiful to look at, and rich to reap.

Its houses are, like those in Oberammergau, chiefly white stucco over stone, or else dark and painted wood, often the lower story

of white stucco and the upper one of dark wood, with a fringe of balconies, dried herbs, and wood-piles where the two stories join. Many of the stuccoed houses are gay with Scripture frescoes, more than one hundred years old, and not faded yet. There are also many of the curious ancient windows, made of tiny round panes set in lead. When these are broken, square panes have to be set in. Nobody can make the round ones any more. On the inside of the brown wooden shutters are paintings of bright flowers; over the windows, and above the doors, are also Scripture frescoes. One old house is covered with them. One scene is Saint Francis lying on his back, with his cross by his side; and another, the coronation of the Virgin Mary, in which God the Father is represented as a venerable man wrapped in a red-and-yellow robe, with a long white beard, resting his hand on the round globe, while Christ, in a red mantle, is putting the crown on the head of Mary, who is resplendent in bright blue and red. On another wall is St. Joseph, holding the infant Christ on his knee. There must have been a marvelous secret in the coloring of these old frescoes, that they have so long withstood the snows, rains, and winds of the Ammer valley. The greater part of them were painted by one Franz Zwink, in the middle of the last century. The peasants called him the "wind painter," because he worked with such preternatural rapidity. Many legends attest this; among others, a droll one of his finding a woman at her churning one day and asking her for some butter. She refused. "If you'll give me that butter," said Zwink, "I'll paint a Mother of God for you above your door." "Very well; it is a bargain," said the woman, "provided the picture is done as soon as the butter," whereupon Zwink mounted to the wall, and, his brushes flying as fast as her churn-dasher, lo! when the butter was done, there shone out the fresh Madonna over the door, and the butter had been fairly earned. Zwink was an athletic fellow, and walked as swiftly as he painted; gay, moreover, for there is a tradition of his having run all the way to Munich once for a dance. Being too poor to hire a horse, he ran thither in one day, danced all night, and the next day ran back to Oberammergau, fresh and merry. He was originally only a color-rubber in the studio of one of the old rococo painters; but certain it is that he either stole or invented a most triumphant system of coloring, whose secret is unknown to-day. It is said that in 1790 every house in both Ober and Unter Ammergau was painted in this way. But repeated fires have destroyed many of the most valuable frescoes, and many others have been

ruthlessly covered up by whitewash. An old history of the valley says that when the inhabitants saw flames consuming these sacred images they wept aloud in terror and grief, not so much for the loss of their dwellings as for the irreparable loss of the guardian pictures. The effect of these on a race for three generations,—one after another growing up in the habit, from earliest infancy, of gazing on the visible representations of God, and Christ, and the Mother of God, placed as if in token of perpetual presence and protection on the very walls and roofs of their homes,—must be incalculably great. Such a people would be religious by nature, as inherently and organically as they were hardy of frame by reason of the stern necessities of their existence. It is a poor proof of the superiority of enlightened, emancipated, and cultivated intellect, with all its fine analyses of what God is not, if it tends to hold in scorn or dares to hold in pity the ignorance which is yet so full of spirituality that it believes it can even see what God is, and feels safer by night and day with a cross at each gable of the roof.

One of the Unterammergau women, seeing me closely studying the frescoes on her house, asked me to come in, and with half shy hospitality, and a sort of childlike glee at my interest, showed me every room. The house is one of some note, as note is reckoned in Unterammergau: it was built in 1700, is well covered with Zwink's frescoes, and bears an inscription stating that it was the birth-place of one "Max Anrich, canon of St. Zeno." It is the dwelling now of only humble people, but has traces of better days in the square-blocked wooden ceilings and curious old gaily-painted cupboards. Around three sides of the living-room ran a wooden bench, which made chairs a superfluous luxury. In one corner, on a raised stone platform,

stood a square stove, surrounded by a broad bench; two steps led up to this bench, and from the bench, two steps more to the lower round of a ladder-like stair leading to the chamber overhead. The kitchen had a brick floor, worn and sunken in hollows; the stove was raised up on a high stone platform, with a similar bench around it, and the woman explained that to sit on this bench with your back to the fire was a very good thing to do in winter. Every nook, every utensil was shining clean. In one corner stood a great box full of whetstones, scythe-sharpeners; the making of these was the industry by which the brothers earned the most of their money, she said; surely very little money, then, must come into the house. There were four brothers, three sisters, and the old mother, who sat at a window smiling foolishly all the time, aged, imbecile, but very happy. As we drove away, one of the sisters came running with a few little blossoms she had picked from her balcony; she halted, disappointed, and too shy to offer it, but her whole face lighted up with pleasure as I ordered the driver to halt that I might take her gift. She little knew that I was thinking how much the hospitality of her people shamed the cold indifference of so-called finer breeding.

A few rods on, we came to a barn, in whose open door-way stood two women threshing wheat with ringing flails. Red handkerchiefs twisted tight round their heads and down to their eyebrows, bare-footed, bare-legged, bare-armed to the shoulders, swinging their flails lustily, and laughing as they saw me stop my horses to have a better look at them; they made one of the vividdest pictures I saw in the Ammer valley. Women often are hired there for this work of threshing, and they are expected to swing flails with that lusty stroke all day long for one mark.

## FEBRUARY.

NEWLY wedded, and happy quite,  
Careless alike of wind and weather,  
Two wee birds, from a merry flight,  
Swing in the tree-top, sing together:  
Love to them, in the wintry hour,  
Summer and sunshine, bud and flower!

So, beloved, when skies are sad,  
Love can render their shadow golden;  
A thought of thee, and the day is glad  
As a rose in the dewy dawn unfolds;  
And away, away, on passionate wings,  
My heart like a bird at thy window sings!

*Ina D. Coolbrith.*

## A POET TO HIS WIFE.

[THE reader of Mr. Bryant's poems will readily remember the many verses addressed to his wife, such as "Oh Fairest of the Rural Maids," written about the time of their marriage; "The Future Life," speculating as to the union of their spirits in the world to come; the "Sick-Bed," describing an illness; "The Life That Is," rejoicing in recovery; "The Twenty-seventh of March,"—the birthday of Mrs. Bryant; "October, 1866," descriptive of her death and burial; and "May Evening," a gentle reference to her loss. But in addition to these, as we learn from Mr. Godwin's forthcoming biography of the poet, a fragment was found among his papers, which recalls her memory in a very tender way, seven years after her death. The lines were unfinished and uncorrected; but we cannot refrain from giving them as they were written—dated "Roslyn, 1873."]

THE morn hath not the glory that it wore,  
Nor doth the day so beautifully die,  
Since I can call thee to my side no more,  
To gaze upon the sky.

For thy dear hand, with each return of spring,  
I sought in sunny nooks the flowers she gave;  
I seek them still, and sorrowfully bring  
The choicest to thy grave.

Here, where I sit alone, is sometimes heard,  
From the great world, a whisper of my name,  
Joined, haply, to some kind, commending word,  
By those whose praise is fame.

And then, as if I thought thou still wert nigh,  
I turn me, half forgetting thou art dead,  
To read the gentle gladness in thine eye  
That once I might have read.

I turn, but see thee not; before my eyes  
The image of a hill-side mound appears,  
Where all of thee that passed not to the skies  
Was laid with bitter tears.

And I, whose thoughts go back to happier days  
That fled with thee, would gladly now resign  
All that the world can give of fame and praise  
For one sweet look of thine.

Thus, ever, when I read of generous deeds,  
Such words as thou didst once delight to hear,  
My heart is wrung with anguish as it bleeds  
To think thou art not near.

And now that I can talk no more with thee  
Of ancient friends and days too fair to last,  
A bitterness blends with the memory  
Of all that happy past.

Oh, when I——

## SIGNS AND SEASONS.

ONE has only to sit down in the woods or fields, or by the shore of the river or lake, and nearly everything of interest will come round to him,—the birds, the animals, the insects; and presently, after his eye has got accustomed to the place, and to the light and shade, he will probably see some plant or flower that he had sought in vain for and that is a pleasant surprise to him. So, on a large scale, the student and lover of nature has this advantage of people who gad up and down the world, seeking some novelty or excitement; he has only to stay at home and see the procession pass. The great globe swings around to him like a revolving show-case; the change of the seasons is like the passage of strange and new countries; the zones of the earth, with all their beauties and marvels, pass one's door, and linger long in the passing. What a voyage is this we make without leaving for a night our own fireside! St. Pierre well says that a sense of the power and mystery of nature shall spring up as fully in one's heart after he has made the circuit of his own field as after returning from a voyage round the world. I sit here amid the junipers of the Hudson, with purpose every year to go to Florida, or to the West Indies, or to the Pacific coast, yet the seasons pass and I am still loitering, with a half-defined suspicion, perhaps, that, if I remain quiet and keep a sharp lookout, these countries will come to me. I may stick it out yet, and not miss much after all. The great trouble is for Mahomet to know when the mountain really comes to him. Sometimes a rabbit or a jay or a little warbler brings the woods to my door. A loon on the river, and the Canada lakes are here; the sea-gulls and the fish-hawk bring the sea; the call of the wild gander at night, what does it suggest? and the eagle flapping by or floating along on a raft of ice, does not he bring the mountain? One spring morning five swans flew above my barn in single file going northward—an express train bound for Labrador. It was a more exhilarating sight than if I had seen them in their native haunts. They made a breeze in my mind, like a noble passage in a poem. How gently their great wings flapped; how easy to fly when spring gives the impulse! On another occasion I saw a line of fowls, probably swans, going northward, at such a height that they appeared like

a faint, wavering, black line against the sky. They must have been at an altitude of three or four miles. I was looking intently at the clouds to see which way they moved, when the birds came into my field of vision. As it was near sun-down they were probably launched for an all-night pull. They were going with great speed, and as they swayed a little this way and that, they suggested a slender, all but invisible, ærial serpent cleaving the ether. What a highway was pointed out up there!—an easy grade from the Gulf to Hudson's Bay.

Then the typical spring and summer and autumn days, of all shades and complexions, one cannot afford to miss one of them, and when looked out upon from one's own spot of earth, how much more beautiful and significant they are! Nature comes home to one most when he is at home; the stranger and the traveler finds her a stranger and traveler also. One's own landscape comes in time to be a sort of outlying part of himself; he has sowed himself broadcast upon it, and it reflects his own moods and feelings; he is sensitive to the verge of the horizon: cut those trees, and he bleeds; mar those hills, and he suffers. How has the farmer planted himself in his fields; builded himself into his stone walls, and evoked the sympathy of the hills by his struggle! This home feeling, this domestication of nature, is important to the observer. This is the bird-lime with which he catches the bird; this is the private door that admits him behind the scenes. This is one source of Gilbert White's charm and of the charm of Thoreau's "Walden." These men staid at home; they made their nests, and took time to brood and hatch.

The birds that come about one's door in winter, or that build in his trees in summer; what a peculiar interest they have! What crop have I sowed in Florida or in California, that I should go there to reap? I should be only a visitor, or formal caller upon nature, and the family would all wear masks. No; the place to observe nature is where you are: the walk to take to-day is the walk you took yesterday. You will not find just the same things: both the observed and the observer have changed; the ship is on another tack in both cases.

I shall probably never see another just such day as yesterday was, because one can never exactly repeat his observation—can-

FLIGHT OF THE BIRDS.

not turn the leaf of the book of life backward, and because each day has characteristics of its own. This was a typical March day, clear, dry, hard, and windy, the river ruffled and crumpled, the sky intense, distant objects strangely

uniformly diffused through it." Again, he says that the mountaineers of the Alps "predict a change of weather, when, the air being calm, the Alps covered with perpetual snow, seem on a sudden to be nearer the observer,

THE GATHERING STORM.

near; a day full of strong light, unusual; an extraordinary lightness and clearness all around the horizon, as if there were a diurnal aurora streaming up and burning through the sunlight; smoke from the first spring fires rising up in various directions; a day that winnowed the air, and left no film in the sky. At night how the big March billows did work! Venus was like a great lamp in the sky. The stars all seemed brighter than usual, as if the wind blew them up like burning coals. Venus actually seemed to flare in the wind.

Each day foretells the next, if one could read the signs; to-day is the progenitor of to-morrow. When the atmosphere is telescopic, and distant objects stand out unusually clear and sharp, a storm is near. We are on the crest of the wave, and the depression follows quickly. It often happens that clouds are not so indicative of a storm as the total absence of clouds. In this state of the atmosphere the stars are unusually numerous and bright at night, which is also a bad omen.

I find this observation confirmed by Humboldt. "It appears," he says, "that the transparency of the air is prodigiously increased when a certain quantity of water is

and their outlines are marked with great distinctness on the azure sky." He further observes that the same condition of the atmosphere renders distant sounds more audible.

There is one redness in the east in the morning that means storm, another that means wind. The former is broad, deep and angry; the clouds look like a huge bed of burning coals just raked open; the latter is softer and more vapory. Just at the point where the sun is going to rise, and some minutes in advance of his coming, there rises straight upward a rosy column; it is like a shaft of deeply dyed vapor, blending with and yet partly separated from the clouds, and the base of which presently comes to glow like the sun itself. The day that follows is pretty certain to be very windy.

The approach of great storms is seldom heralded by any striking or unusual phenomenon. The real weather gods are free from brag and bluster; but the sham gods fill the sky with portentous signs and omens. The 5th of last March was a day that would have filled the ancient observers with dreadful forebodings. At ten o'clock the sun was attended by four extraordinary sun-dogs. A

large bright halo encompassed him, on the top of which the segment of a larger circle rested, forming a sort of heavy brilliant crown. At the bottom of the circle, and depending from it, was a mass of soft, glowing, iridescent vapor. On either side, like fragments of the larger circle, were two brilliant arcs. Altogether, it was the most portentous storm-breeding sun I ever beheld. In a dark hemlock wood in a valley, the owls were hooting ominously, and the crows dismally cawing. Before night the storm set in, a little sleet and rain of a few hours' duration, insignificant enough compared with the signs and wonders that preceded it.

To what extent the birds or animals can foretell the weather is uncertain. When the swallows are seen hawking very high it is a good indication; the insects upon which they feed venture up there only in the most auspicious weather. Yet bees will continue to leave the hive when a storm is imminent. I am told that one of the most reliable weather signs they have down in Texas is afforded by the ants. The ants bring their eggs up out of their underground retreats and expose them to the warmth of the sun to be hatched. When they are seen carrying them in again in great haste, though there be not a cloud in the sky, your walk or your drive must be post-

is one of the latest metrical translations. Dryden has it:

"The careful ant her secret cell forsakes  
And drags her eggs along the narrow tracks."

which comes nearer to the fact. When a storm is coming Virgil also makes his swallows skim low about the lake, which agrees with the observation above.

In observing the weather, however, as in the diagnosis of disease, the diathesis is all-important. All signs fail in a drought, because the predisposition, the diathesis, is so strongly toward fair weather; and the opposite signs fail during a wet spell, because nature is caught in the other rut.

Observe the lilies of the field. Sir John Lubbock says the dandelion lowers itself after flowering, and lies close to the ground while it is maturing its seed, and then rises up. My dandelions continue to grow after the flower has dropped; the stalk lengthens daily, keeping just above the grass till the fruit is ripened, and the little globe of silvery down is carried many inches higher than was the ring of golden flowers. And the reason is obvious. The plant depends upon the wind to scatter its seeds; every one of these little vessels spreads a sail to the breeze, and it is necessary that they be launched above the grass and weeds, amid

BUTTON BALLS.

poned: a storm is at hand. There is a passage in Virgil that is doubtless intended to embody a similar observation, though none of his translators seem to have hit its meaning accurately:

"Saepius et tectis penetralibus extulit ova  
Angustum formica terens iter:"

"Often also has the pismire making a narrow road brought forth her eggs out of the hidden recesses" is the literal translation of old John Martyn.

"Also the ant, incessantly traveling  
The same straight way with the eggs of her hidden store,"

which they would be caught and held did the stalk not continue to grow and outstrip the rival vegetation. It is a curious instance of foresight in a weed.

I wish I could read as clearly this puzzle of the button-balls (American plane-tree). Why has nature taken such particular pains to keep these balls hanging to the parent tree intact till spring? What secret of hers has she buttoned in so securely, for these buttons will not come off. The wind cannot twist them off, nor warm nor wet hasten or retard them. The stem, or peduncle, by which the ball is held in the fall or winter, breaks up into a dozen or more threads or strands, that

AMONG THE PINES.

are stronger than those of hemp. When twisted tightly they make a little cord that I find it impossible to break with my hands. Had they been longer the Indian would surely have used them to make his bow-strings and all the other strings he required. One could hang himself with a small cord of them. (In South America, Humboldt saw excellent cordage made by the Indians from the petioles of the Chiquichiqui palm.) Nature was determined that these buttons should stay on. In order that the seeds of this tree may germinate it is probably necessary that they be kept dry during the winter, and reach the ground after the season of warmth and moisture is fully established. In May, just as the leaves and the new balls are emerging, at the touch of a warm, moist south wind, these spherical packages suddenly go to pieces—explode, in fact, like tiny bomb-shells that were fused to carry to this point and scatter their seeds to the four winds. They yield at the same time a fine pollen-like dust that one would suspect played some part in fertilizing the new balls, did not botany teach him otherwise. At any rate, it is the only deciduous tree I know of that does not let go the old seed till the new is well on the way. It is plain why the sugar-berry tree (*Celtis*) holds its drupes all winter: it is in order that the birds may come and sow the seed. The berries are like small gravel stones with a sugar coating, and a bird will not eat them till he is pretty hard pressed, but in late fall and winter the robins, cedar birds, and

blue birds devour them readily, and of course lend their wings to scatter the seed far and wide. The same is true of the juniper.

One must always cross-question nature if he would get at the truth, and he will not get at it then unless he frames his questions with great skill. Most persons are unreliable observers because they put only leading questions, or vague questions.

People live in the country all their lives without making one accurate observation about Nature. The evergreen trees in front of their doors—what do they know about their habits? Do the pine and the hemlock shed their leaves? Not in any strict sense. In the deciduous trees the new leaves take the place of the old; they come out in the axils of the old leaves, and the branch is re-clothed each spring, even if no new shoots appear. Not so with the pine or the hemlock; they turn over a new leaf only when they turn over a new growth of wood. The white pine usually sheds its leaves in midsummer, though I have known all the pines to delay till October. It is on with the new love before it is off with the old. From May till near autumn it carries two crops of leaves, last year's and the present year's. Emerson's inquiry

—"how the sacred pine-tree adds  
To her old leaves new myriads,"

is framed in strict accordance with the facts. It is to her *old* leaves that she adds the new. Only the new growth, the outermost leaves, are carried over till the next season, thus keeping the tree always clothed and green. As its molting season approaches, these old leaves, all the rear ranks on the limbs, begin to turn yellow, and a careless observer might think the tree was struck with death; but it is not. The decay stops just where the growth of the previous spring began, and presently the tree stands green and vigorous, with a newly-laid carpet of fallen leaves beneath it. But the same is not true of the hemlock, or the spruce, or the red cedar. These trees do not shed their leaves periodically, but outgrow them gradually, as they do their bark, or as a person outgrows or wears out his clothes, here a shred and there a shred, a bit to-day or a bit to-morrow, and were it not for the new growth made each spring, they would, in time, become quite naked. The winds and storms whip them off, and, as the branches grow, the old leaves gradually disappear, leaving a naked stem. But none of the coniferæ renew their leaves as do the deciduous trees. New leaves come only upon new wood. If the tree were to cease to grow it would probably (though of this I am not certain) cease to shed its leaves. The pines

and firs and spruces differ still more radically from the deciduous trees. They have less scope, less versatility, fewer resources. They never sprout. Cut them down, and that is the end. Cut off a limb, and it is never renewed by a new shoot. Trim a pine or a hemlock closely and it will die; it has no power to start a branch *de novo*, to burst the bark with a new shoot. A sort of fatalism is characteristic of these trees. The limbs of the white pine tend to recur in regular intervals, like the rounds of a ladder. As it shoots upward in the forest it pulls this ladder up after it, so that the tallest trees are limbless for eighty or ninety feet.

When you cut off the top of a pine or spruce, removing the central and leading shaft, the tree does not develop and send forth a new one to take the place of the old, but a branch from the next in rank, that is, from the next whorl of limbs, is promoted to take the lead. It is curious to witness this limb rise up and get into position. One season I cut off the tops of some young hemlocks, that were about ten feet high, that I had balled in the winter and had moved into position for a hedge. The next series of branches consisted of three that shot out nearly horizontally. As time passed one of these branches, apparently the most vigorous, began to lift itself up very slowly toward the place occupied by the lost leader. The third year it stood at an angle of about forty-five degrees; the fourth year it had gained about half the remaining distance when the clipping shears again cut it down. In five years it would probably have assumed an upright position. A white pine of about the same height lost its central shaft by a grub that developed from the egg of an insect, and I cut it away. It rose from a whorl of four branches, and it now devolved upon one of these to take the lead. Two of them, on opposite sides, were more vigorous than the other two, and the struggle now is as to which of these two shall gain the mastery. Both are rising up and turning toward the vacant chieftainship, and, unless something interferes, the tree will probably become forked and led upward by two equal branches. I shall probably humble the pride of one of the rivals by nipping its central shoot. One of my neighbors has cut off a yellow pine about six inches in diameter so as to leave only one circle of limbs seven or eight feet from the ground. It is now the third year of the tree's decapitation, and one of this circle of horizontal limbs has risen up several feet, like a sleeper rising from his couch, and seems to be looking around inquiringly, as much as to say: "Come, brothers, wake up! Some one must take the lead here; shall it be I?"

The good observer of nature holds his eye long and firmly to the point, as one does when looking at a puzzle picture, and will not be baffled. The cat catches the mouse, not merely because she watches for him, but because she is armed to catch him and is quick. So the observer finally gets the fact, not only because he has patience, but because his eye is sharp and his inference swift. Many a shrewd old farmer looks upon the milky-way as a kind of weathercock, and will tell you that the way it points at night indicates the direction of the wind the following day. So also every new moon is either a

the truth that they do not. Do honey-bees injure the grape and other fruits by puncturing the skin for the juice? The most patient watching by many skilled eyes all over the country has not yet settled the point. For my own part, I am convinced that they do not. The honey-bee is not the rough-and-ready freebooter that the wasp and bumble-bee are; she has somewhat of feminine timidity, and leaves the first rude assaults to them. I knew the honey-bee was very fond of the locust blossoms, and that the trees hummed like a hive in the height of their flowering, but I did not know that the bumble-bee was the

WAITING FOR SPRING.

dry moon or a wet moon—dry if a powder-horn would hang upon the lower limb, wet if it would not; forgetting the fact that, as a rule, when it is dry in one part of the continent it is wet in some other part, and *vice versa*. When he kills his hogs in the fall if the pork be very hard and solid he predicts a severe winter; if soft and loose, the opposite; again overlooking the fact that the kind of food and the temperature of the fall make the pork hard or make it soft. So with a hundred other signs, all the result of hasty and incomplete observations. In most of the operations of nature there is one or more unknown quantity; to find the exact value of this unknown factor is not so easy. The wool of the sheep, the fur of the animals, the feathers of the fowls, the husks of the maize, why are they thicker some seasons than others; what is the value of the unknown quantity here? Does it indicate a severe winter approaching? Only observations extending over a series of years could determine the point. How much patient observation it takes to settle many of the facts in the lives of the birds, animals, and insects. Gilbert White was all his life trying to determine whether or not swallows passed the winter in a torpid state in the mud at the bottom of ponds and marshes, and he died ignorant of

sapper and miner that went ahead in this enterprise till one day I placed myself amid the foliage of a locust and saw him savagely bite through the shank of the flower and extract the nectar, followed by a honey-bee that in every instance searched for this opening and probed long and carefully for the leavings of his burly purveyor. The bumble-bee rifles the dicentra and the columbine of their treasures in the same manner, namely, by slitting their pockets from the outside, and the honey-bee gleans after him, taking the small change he leaves.

Speaking of the honey-bee reminds me that the subtle and sleight-of-hand manner in which it fills its baskets with pollen and propolis is characteristic of much of nature's doings. See the bee going from flower to flower with the golden pellets on its thighs, slowly and mysteriously increasing in size. If the miller were to take the toll of the grist he grinds by gathering the particles of flour from his coat and hat, as he moved rapidly about, or catching them in his pockets, he would be doing pretty nearly what the bee does. The little miller dusts itself with the pollen of the flower, and then while on the wing, brushes it off with the fine brush on certain of its feet, and by some jugglery or other, catches it in its pollen basket. One

needs to look long and intently to see through the trick. I have seen the bees come to a meal barrel in early spring, and to a pile of hard-wood sawdust before there was yet anything in nature for them to work upon, and having dusted their coats with the finer particles of the meal or the sawdust, hover on the wing above the mass till the little legerdemain feat is performed. Nature fills her baskets by the same sleight-of-hand, and the observer must be on the alert who would possess her secret. If the ancients had looked a little closer and sharper, would they ever have believed in spontaneous generation in the superficial way in which they did; that maggots for instance, were generated spontaneously in putrid flesh? Could they not see the spawn of the blow-flies? Or if Virgil had been a real observer of the bees, would he ever have credited, as he certainly appears to do, the fable of bees originating from the carcass of a steer? But the ancients, like children, or like barbarous tribes, were not observers in the modern sense. Nature was too novel, or else too fearful to them to be deliberately pursued and hunted down. Their youthful joy in her, or else their dread and awe in her presence, may be better than our scientific satisfaction, or cool wonder, or our vague, mysterious sense of "something far more deeply inter-fused," yet we cannot change with them if we would, and I, for one, would not if I could. Science does not mar nature. The railroad, Thoreau found after all, to be about the wildest road he knew of, and the telegraph wires the best æolian harp out-of-doors. Study of nature deepens the mystery and the charm because it removes the horizon farther off. We cease to fear, perhaps, but how can one cease to marvel and to love?

The fields and woods and waters about one are a book from which he may draw exhaustless entertainment, if he would. One must not only learn the writing, he must translate the language, the signs, and the hieroglyphics. It is a very quaint and elliptical writing, and much must be supplied by the wit of the translator. At any rate, the lesson is to be well conned.

All we know about the private and essential natural history of the bees, the birds, the fishes, the animals, the plants, is the result of close, patient, quick-witted observation. Yet nature will often elude one for all his pains and alertness. Thoreau, as revealed in his journal, was for years trying to settle in his own mind what was the first thing that stirred in spring after the severe New England winter—in what was the first sign or pulse of returning life manifest; and he never seems to

have been quite sure. He could not get his salt on the tail of this bird. He dug into the swamps, he peered into the water, he felt with benumbed hands for the radical leaves of the plants under the snow; he inspected the buds on the willows, the catkins on the alders; he went out before daylight of a March morning and remained out after dark; he watched the lichens and mosses on the rocks; he listened for the birds; he was on the alert for the first frog ("Can you be absolutely sure," he says, "that you have heard the first frog that croaked in the township?") he stuck a pin here and he stuck a pin there, and there, and still he could not satisfy himself. Nor can any one. Life appears to start in several things simultaneously. Of a warm thawing day in February, the snow is suddenly covered with myriads of snow fleas looking like black, new powder just spilled there. Or you may see a winged insect in the air. On the self-same day the grass in the spring run and the catkins on the alders will have started a little, and if you look sharply while passing along some sheltered nook or grassy slope where the sunshine lies warm on the bare ground, you will probably see a grasshopper or two. The grass hatches out under the snow, and why should not the grasshopper? At any rate, a few such hardy specimens may be found in the latter part of our milder winters wherever the sun has uncovered a sheltered bit of grass for a few days, even after a night of ten or twelve degrees of frost. Take them in the shade, and let them freeze stiff as pokers, and when thawed out again they will hop briskly. And yet if a poet were to put grasshoppers in his winter poem, we should require pretty full specifications of him, or else fur to clothe them with. Nature will not be cornered, yet she does many things in a corner and surreptitiously. She is all things to all men; she has whole truths, half truths, and quarter truths, if not still smaller fractions. The careful observer finds this out sooner or later. Old fox-hunters will tell you, on the evidence of their own eyes, that there is a black fox and a silver gray fox, two species; but there are not; the black fox is black when coming toward you, or running from you, and silver gray at point blank view, when the eye penetrates the fur; each separate hair is gray the first half and black the last. This is a sample of nature's half truths.

Which are our sweet-scented wild flowers? Put your nose to every flower you pluck, and you will be surprised how your list will swell the more you smell. I plucked some wild blue violets one day, the *ovata* variety of the *sagittata*, that had a faint perfume of sweet clover, but I never could find another that

AN OBSERVER.

had any odor. A pupil disputed with his teacher about the hepatica, claiming in opposition that it was sweet-scented. Some hepaticas are sweet-scented and some are not, and the perfume is stronger some seasons than others. After the unusually severe winter of 1880-81, the variety of hepatica called the sharp-lobed (*acutiloba*) was markedly sweet in nearly every one of the hundreds of specimens I examined. A handful of them exhaled a most delicious perfume. The white ones that season were largely in the ascendant, and probably the white specimens of both varieties, one season with another, will oftenest prove sweet-scented. Darwin says a large percentage of all fragrant flowers (I have forgotten exactly his proportion) are white. The only sweet violets I can depend upon are white, *viola blanda* and *viola Canadensis*, and white largely predominates among our other odorous wild flowers. All the fruit-trees have

white or pinkish blossoms. I recall no native blue flower that is fragrant except in the rare case of the arrow-leaved violet, above referred to. The earliest yellow flowers, like the dandelion and yellow violets, are not fragrant. Later in the season yellow is frequently accompanied with fragrance, as in the evening primrose, the yellow lady's-slipper, horned bladderwort, and others.

My readers probably remember that on a former occasion I have mildly taken the poet Bryant to task for leading his readers to infer that the early yellow violet—*rotundifolia*—was sweet-scented. In view of the capriciousness of the perfume of certain of our wild flowers, I have during the past two years tried industriously to convict myself of error in respect to this flower. The round-leaved yellow violet was one of the earliest and most abundant wild flowers in the woods where my youth was passed, and whither I still

make annual pilgrimages. I have pursued it on mountains and in lowlands, in "beechen woods" and amid the hemlocks; and while, with respect to its earliness, it overtakes the hepatica in the latter part of April, as do also the dog's-tooth violet and the claytonia, yet the first hepaticas, where the two plants grow side by side, bloom about a week before the first violet. And I have yet to find one that has an odor that could be called a perfume. A handful of them, indeed, has a faint, bitterish smell, not unlike that of the dandelion in quality; but, if every flower that has a smell is sweet-scented, then every bird that makes a noise is a songster.

On the occasion above referred to, I also dissented from Lowell's statement, in "Al Fresco," that in early summer the dandelion blooms, in general, with the buttercup and the clover. I am aware that such criticism of the poets is small game and not worth the powder. General truth, and not specific fact, is what we are to expect of the poets. Bryant's "Yellow Violet" poem is tender and appropriate, and such as only a real lover and observer of nature could feel or express, and Lowell's "Al Fresco" is full of the luxurious feeling of early summer, and this is, of course, the main thing; a good reader cares for little else; I care for little else myself. But when you take your coin to the assay office it must be weighed and tested, and in the comments referred to I (unwisely, perhaps) sought to smelt this gold of the poets in the naturalist's pot to see what alloy of error I could detect in it. Were the poems true to their last word? They were not, and much subsequent investigation has only confirmed my first analysis. The general truth is on my side, and the specific fact, if such exists in this case, on the side of the poets. It is possible that there may be a fragrant yellow violet, as an exceptional occurrence, like that of the sweet-scented, arrow-leaved species above referred to, and that in some locality it may have bloomed before the hepatica; also, that Lowell may have seen a dandelion or two in June amid the clover and the buttercups; but, if so, they were the exception, and not the rule—the specific or accidental fact, and not the general truth.

Dogmatism about Nature, or about anything else, very often turns out to be an ungrateful cur that bites the hand that reared it. I speak from experience. I was once quite certain that the honey-bee did not work upon the blossoms of the trailing arbutus, but while walking in the woods one April day I came upon a spot of arbutus swarming with honey-bees. They were so eager for it that they crawled under the

leaves and the moss to get at the blossoms, and refused on the instant the hive-honey which I happened to have with me, and which I offered them. I had had this flower under observation more than twenty years, and had never before seen it visited by honey-bees. Hence I would not undertake to say again what flowers bees do not work upon. Virgil implies that they work upon the violet, and for aught I know they may. I have seen them very busy on the blossoms of the white oak, though this is not considered a honey or pollen-yielding tree. From the sumac (*R. glabra*) they reap a harvest in midsummer, and in March they get a good grist of pollen from the skunk cabbage.

I presume, however, it would be safe to say that there is a species of smilax with an unsavory name that the bee does not visit, *herbacea*. The production of this plant is a curious freak of nature. I find it growing along the fences where one would look for wild roses, or the sweet-brier; its recurving or climbing stem, its glossy, deep-green, heart-shaped leaves, its clustering umbels of small greenish-yellow flowers, making it very pleasing to the eye; but to examine it closely one must positively hold his nose. It would be too cruel a joke to offer it to any person not acquainted with it to smell. It is like the vent of a charnel-house. It is first cousin to the trilliums, among the prettiest of our native wild flowers, and the same bad blood crops out in the purple trillium or birthroot.

The good observer of nature exists in fragments, a trait here and a trait there. Each person sees what it concerns him to see. The fox-hunter knows pretty well the ways and habits of the fox, but on any other subject he is apt to mislead you. He comes to see only fox traits in whatever he looks upon. The bee-hunter will follow the bee, but lose the bird. The farmer notes what affects his crops and his earnings, and little else. Common people, St. Pierre says, observe without reasoning, and the learned reason without observing. If one could apply to the observation of nature the sense and skill of the South American *rastreador*, or trailer, how much he would track home. This man's eye is keener than a hound's scent. A fugitive can no more elude him than he can elude fate. His perceptions are said to be so keen that the displacement of a leaf or pebble, or the bending down of a spear of grass, or the removal of a little dust from the fence are enough to give him the clew. He sees the half-obliterated foot-prints of a thief in the sand, and carries the impression in his eye till a year afterward, when he again detects it in the suburbs of a city, and the culprit is tracked

home and caught. I knew a man blind from his youth who not only went about his own neighborhood without a guide, turning up to his neighbor's gate or door as unerringly as if he had the best of eyes, but who would go many miles on an errand to a new part of the country. He seemed to carry a map of the township in the bottom of his feet, a most minute and accurate survey. He never took the wrong road, and he knew the right house when he had reached it. He was a miller and fuller, and ran his mill at night while his sons ran it by day. He never made a mistake with his customers' bags or wool, knowing each man's by the sense of touch. He frightened a colored man whom he detected stealing, as if he had seen out of the back of his head. Such facts show one how delicate and sensitive a man's relation to outward nature through his bodily senses may become. Heighten it a little more, and he could forecast the weather and the seasons, and detect hidden springs and minerals. A good observer has something of this delicacy and quickness of perception. All the great poets and naturalists have it. Agassiz traces the glaciers like a *rastreador*, and Darwin misses no step that the slow but tireless gods of physical change have taken, no matter how they cross or retrace their course. In the obscure fish-worm he sees an agent that has kneaded and leavened the soil like giant hands.

One secret of success in observing nature, is capacity to take a hint; a hair may show where a lion is hid. One must put this and that together and value bits and shreds. Much alloy exists with the truth. The gold of nature does not look like gold at the first glance. It must be smelted and refined in the mind of the observer. And one must crush mountains of quartz and wash hills of sand to get it. To know the indications is the main matter. People who do not know the secret are eager to take a walk with the observer to find where the mine is that contains such nuggets, little knowing that his ore-bed is but a gravel-heap to them. How insignificant appear most of the facts which one sees in his walks, in the life of the

birds, the flowers, the animals, or in the phases of the landscape, or the look of the sky!—insignificant until they are put through some mental or emotional process and the true metal appears. The diamond looks like a pebble until it is cut. One goes to nature only for hints and half-truths. Her facts are crude until you have absorbed them or translated them. Then the ideal steals in and lends a charm in spite of one. It is not so much what we see as what the thing seen suggests. We all see about the same; to one it seems much, to another little. The artist, the poet, the essayist, do not get their picture, or poem, or sketch, from nature; they only get the seed-cone of it, which they plant in their minds and hearts, and from which the crop is grown. A fact that has passed through the mind of man, like lime or iron, that has passed through his blood, has some quality or property superadded or brought out that it did not possess before. You may go to the fields and the woods, and gather fruit that is ripe for the palate without any aid of yours, but you cannot do this in science or in art. Here truth must be disentangled and interpreted; must be made in the image of man. Hence all good observation is more or less a refining and transmuting process, and the secret is to know the crude material when you see it. I think of Wordsworth's lines:

“ — the mighty world  
Of eye and ear, both what they half create, and what  
perceive; ”

which is as true in the case of the naturalist as of the poet: both “half create” the world they describe. Darwin does something to his facts as well as Tennyson to his. Before a fact can become poetry, it must pass through the heart or the imagination of the poet; before it can become science, it must pass through the understanding of the scientist. Man can have but one interest in nature, namely to see himself reflected or interpreted there, and we quickly neglect both poet and philosopher who fail to satisfy, in some measure, this feeling.

*John Burroughs.*

## A NEW KNOCK AT AN OLD DOOR.

IN my morning journal stand five solid columns of advertisements of girls' schools. "It is fit," says Mr. Samuel Pepys, speaking of some new gown bought for his wife, "that the poor wretch should have something wherewith to content her." But it would seem that some hundreds of New York wives refuse to content themselves with these manifold educational concessions of the Pepysian spirit. For beside the journal lies a petition, very fully signed, a large proportion of names being those of women, which reads:

"We, the undersigned, residents of New York City and neighborhood, beg leave to present our respectful petition: That in view of the present state of public opinion, both here and in other countries, touching the justice and expediency of admitting women to the same educational advantages as men, a state of opinion especially evidenced by the recent action of the English universities of Cambridge and London, and in view of the influential position of Columbia College as among the oldest and most richly endowed educational institutions in the United States, and preëminently representing the intellectual interests of the city of New York, you will be pleased to consider how best to extend, with as little delay as possible, to such properly qualified women as may desire it, the many and great benefits of education in Columbia College, by admitting them to lectures and examinations."

To many sober and conscientious persons, both men and women, this demand sounds absurd, needless, improper, and dangerous. But do these objectors remember that every appeal for a better female education seemed, in its day, equally preposterous? It is hardly three centuries since Mademoiselle Françoise de Saintonge was hooted through the streets of her native village for proposing so disreputable a plan as the establishment of schools for girls in France, and her anxious father called in four learned doctors to determine whether this mad idea was not due to her possession by devils. The doctors pronounced her in her right mind, but her pious fellow-citizens stopped the spread of immoral ideas by the conclusive argument of insults leveled at the teacher and stones addressed to the pupils. The progress of the next century and a half is recorded in Dean Swift's observation that men constantly asked each other whether it was prudent to choose a wife who had good natural parts, some sense of wit and humor, a little knowledge of history, the capacity to relish travels or moral and entertaining discourse, and to discern the more obvious beauties of poetry. The general verdict, he says, was against such attainments in women, because their tendency was

to make wives pretentious and conceited, and not duly subject to their husbands.

Lady Mary Wortley Montagu, translating Epictetus at nineteen, and sending her work to her kind friend, the Lord Bishop of Salisbury, apologizes at length for attempting a task universally pronounced unfit for a woman, and certain to draw down censure upon her (excusing herself, however, by citing the opinions of Erasmus, in the Latin!) Nearly fifty years afterward, in advising her daughter concerning the education of a bright little namesake, she entreats that free scope may be accorded the child's capacity, for the sake of the pure delight of learning and of her future happiness. But she adds the warning that, to insure a satisfactory marriage, the young girl's wit and acquirements must be as carefully concealed as a deformity, from a world which suspected or despised a learned woman. So strong, almost to our own day, has been this half-conscious contempt of the feminine mentality, that even Charles Lamb, that gentle and charitable soul, could speak of "L. E. L." with an unmanly sneer, and declare that a female poet, or female author of any kind, invited disrespect.

It is but ninety years since an English woman published the first serious demand for the higher education of English women. Her public found the book immodest, irreligious, anarchic. Issued to-day, it would appear a harmless plea, a trifle heavy and conservative, perhaps, for the thorough cultivation of the female mind, urged on social, moral, and religious grounds, and protesting against the sentimentalism of Rousseau, and the now forgotten Dr. Gregory. Mrs. Hannah More's dull novel of "Cœlebs in Search of a Wife," issued in 1808, contained, perhaps, the first argument in fiction that a ninny is not necessarily the ideal wife, or a knowledge of the Latin grammar incompatible with a turn for housekeeping.

It was no scoffer but the sweet-spirited Fénelon who taught that contact with learning would be almost as fatal to womanly delicacy as contact with vice. To Voltaire's love of epigram might be pardoned his saying that, "Ideas are like beards; women and young men have none." But Lessing was serious when he declared that, "The woman who thinks is like the man who puts on rouge, ridiculous." And even Niebuhr, the large-minded, believed that he should not have educated a girl well, for he should have made her know too much.

It was the first care of the Pilgrim Fathers to establish schools. Girls were allowed to attend these, two hours a day. But afterward the system was remodeled in a spirit of wide liberality, and girls were suffered all day—in the summer. When women teachers came to be employed they were required to “teach the English language correctly and the rudiments of arithmetic.” In 1826, after a discussion of three years, the city fathers of Boston resolved to establish a high school for girls, on the model of its admirable high school for boys. But such an army of young women battered the gates of that educational heaven with storms of prayers, that, after a trial of eighteen months, the dismayed corporation decided—to enlarge the building and multiply teachers? No, but to close the school altogether.

We smile at Monsieur de Saintonge and the sages of Boston. The two hundred and fifty advertisements refute the ancient prejudices. The innumerable names of women who have conquered success in literature, science, art; as great organizers, administrators, educators, refute them. The very discussion of the hour puts them to silence, for it declares that the question is no longer whether women are worth educating, but what education is worth most to them. The point of view is changed because the social conditions are changed.

If the cultivated judgment of ages held the female understanding to be inferior, doubtless it was inferior. Without incentives, means, or opportunities for growth, the mind of woman did not grow. And these helps were denied her, not by any mean desire of man to defraud her, not by any divine limitation of her needs, but because her time had not come. Just as war and slavery have been inevitable conditions and natural agents of human progress, so has the subjection of woman. In a rude society, man was her necessary protector, she his helpless dependent. Some sort of marriage utilized the capacity, such as it was, of every woman, because every man needed a household of cheap servitors. If he fought to protect his property in wives and concubines, they canceled the debt by labor. Ignorance was their normal and necessary estate. So long as the exercise of brute force remained the chief satisfaction of man, so long was woman insignificant. As advancing civilization has required them, the feminine qualities have answered, with growing adequacy, to the requirement. But the traditions of the time of man's legitimate supremacy, of course, lived on, and still survive in the general if vague notion that something external, mechanical,

eleemosynary, must continually be done *for* woman; whereas the modern spirit, which has been so long struggling into recognition, maintains that little of permanent value can be done *for* woman which is not done *by* woman. Growth is from within.

In his attitude of guardian, man—as, in the progress of time, he has felt the need of a companion and ally rather than of a servant and toy—has gradually released to woman the freedom of certain tracts of knowledge, finding his own account in it. And if he has not hitherto been ready to endow her with the whole fair domain, neither has she been free to occupy it. Ever since the Old Testament matrons ground the corn between stones, and sewed the skins their husbands brought home, and baked, and brewed, and made wine, and taught their slaves, and tended their sick, and reared their children, and adorned themselves to find favor in the sight of their lords, have generations of women found their first untroubled rest in the grave. But now machinery does half their work at half the cost, while organization still further relieves them from drudgery. Moreover, the great increase of wealth following on the arts of peace, fosters a growing class of unemployed and luxurious women, free to use the means of the higher education which their higher needs demand.

How, then, shall we make the most of that great indeterminate factor of the new civilization,—the feminine intelligence? It would seem self-evident that those studies which have taken their place in the higher education of man, because philosophy and experience found in them the surest and readiest means of symmetrical mental development, must be equally valuable to woman. If the languages, mathematics, modern science, logic, metaphysics, psychology, best train the faculties of observation, comparison, reflection; if they give flexibility and strength to the mind, and mold it to be always progressive, always acquiring more knowledge by thoughtful experience,—ought not their salutary discipline, as administered in college, to be extended to girls?

It is answered, first, that girls, being different, do not need the same training as boys; second, that they already have it; third, that they could not endure it. But whether likeness or difference predominates can never be known until like training develop the one or emphasize the other. “As long as boys and girls run about in the dirt and trundle hoops together,” wrote Sydney Smith, “they are precisely alike. If you catch up one half of these creatures and train them to a particular set of actions and opinions, and the other half to a perfectly opposite set, of course their un-

derstandings will differ, as one or the other sort of occupations has called this or that talent into action. There is surely no occasion to go into any deeper or more abstruse reasoning to explain so very simple a phenomenon." Teachers of mixed classes agree that what profits the one profits the other. Seneca advocated the study of the Greek philosophy for women, who, he said, needed it as a restraint upon their more impulsive temperament; and Plutarch urged upon his countrywomen the study of the Greek language and literature, for a like reason. No less forcible is Doctor Johnson's plea for this culture,—that whatever withdraws us from the power of the senses, whatever makes the past, the distant, or the future predominate over the present, advances us in the dignity of human beings.

The education of women is notoriously defective in the cultivation of definite ideas and the training of the judgment. Familiarity with scientific methods of study would dissipate their general and perilous confidence in "luck," and in that impossible condition known as "about right." Of directly practical value, also, would they find the capacity to deduce a conclusion from its premises, to estimate the worth of evidence, and understand the nature of proof. In every household, affairs daily come to judgment requiring more or less scientific knowledge and a scientific habit of thought. An exact mental training would mitigate the evils and enlarge the best possibilities of woman's existence.

This training both private schools and high schools must fall short of. Girls' high schools afford four years of what is projected as an eight years' term, and girls are expected to be satisfied with what is merely a preparatory course for their brothers. Private schools necessarily reflect the indefinite and various demands of their patrons. Undue stress must be laid upon accomplishments, undue cramming must be encouraged, the period of study being far too short; the methods of teaching must be empirical rather than scientific, and the end aimed at temporary and unreal, having no relation to life beyond the examination and the class-room. Our best private schools are indeed admirable, but there is no recognized standard of worth, and the bad are as ten to one. Besides, in apparatus, cabinets, libraries, and professorships, the richest among them is poor, compared with the richer colleges. There is but so much first-rate teaching capacity existent at any one time, and the larger salaries, honors, and pleasant conditions of the colleges, of course, absorb the most of it. Agassiz thought that a young student would gain more from coming into contact for a single month with a man

of really profound knowledge on any subject than he could from many months spent under the tutelage of one who himself knows but very little more than he attempts to teach. But the majority of teachers fall into this latter classification. Even the women's colleges, proposing the same curriculum as the men's, deserving the most sincere respect for their aims and their successes, must long be hampered by the difficulty of securing the ablest teaching talent and appliances. The best high-class boys' schools are conceded to be those which send the best equipped candidates to the universities. Were pupils from the girls' schools admitted to the same examinations there is no doubt that their standards and their methods of teaching would immediately advance.

If, however, the health of our girls is threatened by hard study, further opportunities of self-immolation must, of course, be denied them. The average health of boarding-schools is, indeed, low. From the graded and normal schools, girls are withdrawn more frequently than boys, by reason of physical inability. But the monstrosity of the prevailing curriculum, the high pressure, bad dressing, bad diet, external distractions, and the almost total want of healthful exercise among girls, explain this difference. The experience of twelve years at Ann Arbor, of eight at Cornell, of nine at Boston University, of much longer terms at the Ohio colleges, and of the entire existence of Vassar and Smith,—testifies to a constant improvement in the health of their girls, and a wholesome and preservative power in severe study, provided the conditions are right.

If it be true that the higher the civilization, the more nearly is companionship of the sexes reached, it seems a paradox that they should be united everywhere except in study, the most refining and least self-conscious of employments. Yet there is a general feeling that some vague danger, to manners if not to morals, lurks in the demand for the admission of girls to the precincts of the college. When the trustees of Cornell were debating the wisdom of accepting the munificent Sage endowment, with its conditions, their committee gathered the opinions of nearly all the educators of note in the country, as to the feasibility and propriety of opening the classes to women. The speculations of the officers of the older colleges (inheriting their traditions from semi-monastic institutions, founded and administered by men vowed to celibacy, and dreading the influence of women), almost uniformly discouraged and disapproved such a step. The testimony of the colleges already open to

both sexes, of academies and high schools, in the hands of men touching life at more points, with equal uniformity encouraged it. In theory it was averred that the girls would become mannish, or the boys effeminate; that the standard of scholarship would be lowered in concession to feminine limitations; and that sentimentalism would be developed, with a consequent deterioration of morals. In practice it was proved that while the boys acquired finer manners, the girls advanced in truthfulness, sincerity, and courage; that the standard of scholarship was raised, and that the predicted period of sentimentalism, though everywhere overdue, had persistently failed to appear. Cornell took the forward step, and President White adds the great weight of his own approval to the side of the innovators.

By some subtle process of reasoning quite inscrutable to the ordinary mind, it is maintained, however, that though coeducation may do for the barbarian regions of Michigan and Cornell universities, the metropolis, as represented by Columbia College, cannot with propriety extend her lectures and examinations to girls. But what then shall be thought of Cambridge?—for, after all, the experience of the great English university offers the best precedent, since the demand upon her was almost identical with that made to-day upon Columbia. It is, perhaps, twenty-five years since the English advocates of the higher education of women began to feel that their educational advantages could never equal those of men, until not only the subjects taught should be the same, but the teachers of equal and equally acknowledged ability. In ten years this feeling organized itself into the opening to them of the Cambridge local examinations, which are simply for standing. A little later the famous Girton College was founded, its object being “to hold in relation to girls’ schools and to home teachings, a position analogous to that occupied by the universities toward the public schools for boys,” and “to obtain for the students of the college admission to the examinations for degrees of the University of Cambridge, and generally to place the college in connection with that University.” It was understood that the immediate instruction should be given daily by the professors, lecturers, and fellows of the universities and its colleges.

The new college went into operation with six students, in a hired building, in October, 1869. It now possesses a building of its own, and even in its first decade recorded the admission of eighty-six candidates, of whom nineteen were graduated with honors, according to the university standard, and eleven passed the examinations which qualify for the degree

of Bachelor of Arts. These examinations, however, presented only an honor standard, and it was not until February, 1881, that the liberal action of the senate placed women students of Cambridge for all practical purposes upon an equal footing with men. In 1875, Newnham Hall was erected for the accommodation of women students coming to Cambridge to avail themselves of the new opportunities. Newnham Hostel was presently added, and the two, constituting Newnham College, to-day overflow with students.

Following on the Cambridge success came the opening of Lady Margaret Hall and Somerville College at Oxford, the free admission of women to the examinations of the University of London, and the granting of liberal opportunities on the part of Edinburgh, Dublin, Glasgow, Aberdeen, Durham, and St. Andrews. The University of London is a young institution, unhampered by the prejudices and restrictions of its elders. “Hence it has been able to take a more decisive step than any other university in the direction of improvement in women’s education. For several years, it tried the experiment of a special examination for women, with a curriculum framed in supposed deference to special feminine needs. But though many women availed themselves of this examination, it soon became evident that the successes they won were all on the old lines—in classics, science, mathematics, literature; in fact, the subjects which belong to an ordinary course of liberal education, and not in any of the special studies which were presumed to be appropriate for them as women. Moreover, it was manifest that a distinctly feminine examination was not what women wanted; for the public believed that it was inferior, or specially lenient, whereas female students desired to have their knowledge and intellectual cultivation tested by the ordinary and recognized standards, and asked for no special tenderness or favor. Accordingly, after much discussion, it was determined, in 1877, to obtain from the crown a new charter, *admitting women on exactly the same footing as men to all the degrees in all the faculties*—arts, laws, medicine, science, music—and permitting them to receive the same honors and degrees. An increasing number of women has each year come up for matriculation and graduation, and some of the successes they have attained have been remarkable. The gold medal in anatomy—one of the chief and most coveted prizes in the medical profession—was won last year by a woman. Another came out first in mental and moral philosophy, and the proportion of women who pass *well* in the examinations is much

greater than that of the men. This, however, is easily accounted for by the fact that at present the numbers are much smaller, and are necessarily made up of students of exceptional ability and enterprise; whereas the crowds of men, of course, include a large number of the rank and file of those who are treading the usual path toward professional life, and who have no special aptitude or enthusiasm for study." This is the testimony of J. G. Fitch, Esquire, inspector of schools, member of the senate of London University, and one of the most distinguished educationists of England.

Professor Jackson, of Trinity College, Cambridge, writes:

"Having taken classes of ladies through the Ethics and part of the Metaphysics of Aristotle, and the 'Republic,' the 'Phaedo,' and the 'Philetus' of Plato, I can speak in the very highest terms of their industry and capacity. I put their attention to a severe test, as I sometimes lectured for an hour and a half, and even for an hour and three-quarters without interruption. As a proof of their capacity, I may mention that at the end of the Academic year, 1877-78, I examined some of my lady pupils in the Aristotle papers, which I was giving to the Trinity men who graduated in 1879, and the Plato papers which I was giving to the Trinity men who graduated in 1880, and that one of the ladies was third in Aristotle and first in Plato. In the following year another lady was second in my Aristotle paper. In both cases these ladies had among their competitors some of the very best men of the time."

J. P. Postgate, Esquire, M. A., Fellow of Trinity, and Professor of University College, London, writes:

"The performances of women in examinations at Cambridge and elsewhere, I look upon as wholly encouraging. The standard by which I should test them is an absolute one, and judged by that they show work which is intrinsically good and worth doing. I have been surprised at the numbers of first-class and other distinctions that they have gained. Both at Cambridge and at University College the women not unfrequently beat the men in the lists. Last year two-thirds of those examined in Comparative Philology were women; and a woman was easily first in the paper, beating another very good candidate, a man who has since taken a scholarship at Oxford, I believe. She did extremely well in the paper, and has been working at the subject since, and showing a very remarkable linguistic aptitude not merely in ancient, but in modern languages. The third candidate was a young lady who has since brought out a Hebrew grammar, which I believe is very well done. She also distinguished herself in Greek and Latin."

From the other colleges come equally favorable reports of feminine application, persistency, and accomplishment. Here, then, are some hundreds of women doing the same tasks as men, submitting to the same tests as men, showing at least as good work as men, without injury to their health. For no complaint of physical inability comes from any source; while at Girton, the pleasant apartment thoughtfully provided as a hospital for the deli-

cate women who were to break down under the strain of constant brain-work has never been used except as a room for examinations. Equally satisfactory is the testimony to the moral safety of the new system, not the slightest suggestion of impropriety having arisen.

From the beginning the most distinguished men in England, both lay and clerical, have been most friendly to this movement for the liberation of learning. At a recent distribution of prizes at the Oxford higher local examination, the Archbishop of Canterbury expressed his great gratification that opportunities for the highest instruction were so rapidly opening to young women.

The fortunate candidates for honors or recognition long since began to reap substantial benefits from having received the Cambridge certificate, not only in being preferred as teachers or governesses, but by commanding better salaries. The standard of girls' schools has been perceptibly advanced, and the character of pupils elevated, "sentimentalism and conceit being lessened, and habits of order, economy of time, and interest in study developed, as well as a new sympathy with those who are engaged in the graver business of life."

So much for conservative England. What is asked of New York? To quote from the admirable address of Dr. Storrs—"that a great, distinguished, opulent institution of learning in the midst of this metropolitan city, which has received, undoubtedly, large endowments from the direct gift of women, or under their influence, should give them the opportunity to pursue the higher branches of study, under the care of the teachers already assembled." Columbia cannot justify their exclusion on the ground that Vassar, and Wellesley and Smith Colleges invite them. Boys are intrusted to her care when Harvard and Yale exist, because New York parents prefer that home influences should accompany college training; and girls do not need these influences less. Besides, the expense of girls' resident-colleges is very great, compared with those of a richly endowed institution like Columbia. It is true that the charter of that venerable college did not contemplate the admission of girls. But it did contemplate the enlightenment and refinement of the community. And it would hardly be too much to say that, in the changed conditions of our time, if it were necessary to discriminate between the sexes in the matter of education, the cause of morality and progress would be better served by giving the higher opportunities to women.

The question of coeducation is not even to be considered,—at most, it is one of method only. If it be found convenient that boys

and girls should listen to lectures in common, as at Cambridge, it is difficult to see any sound objection to that economy of teaching. If it be found convenient to instruct them separately, again, as at Cambridge, criticism is equally silenced. The President of Columbia, who heartily favors the admission of girls, says that the college can provide for them separate entrances, cloak-rooms, and class-rooms. It is not apprehended that a crowd will assail the doors. It is not proposed to compel the many, who have no desire for better opportunities, but only to invite the few, who now stand vainly waiting.

The spirit of justice, of course, would rest woman's claim to the highest educational privileges on the human right to unrestricted growth, for soul is above sex. But here, as everywhere, the way of justice is the way of expediency. Enlightenment is not in proportion to the amount of knowledge on deposit, at any one time; it is in proportion to its diffusion. Because of the devotion of the average American to business, the mother and the school-mistress mold the early and sensitive years of the child's life to what shape they must. To the fitness of the average mother and school-mistress for this high task, what wasted powers, what mean ideals, what mistaken views of life bear

witness! Raise her schools, and the whole standard of woman's existence is raised. For the higher the few can reach, the higher the many rise. It is her perverted love of beauty which makes woman extravagant. It is her uncultivated desire for the higher satisfactions of art which makes our homes museums of upholstery. It is her unenlightened loyalty to the spirit of good which bids her cling to old abuses that were once uses, to harmful superstitions that were once faiths, and to-day constitutes her the most conspicuous bar to progress. Tocqueville says that he ascribes the treachery of some of the first leaders in the reform movements in France to the unhappy influence of wives and sisters on husbands and brothers. The claims of the past and their own private interests were more to them than the welfare of the struggling millions. Their perspective was in fault. But when a thorough culture and a trained judgment are added to the "superlunary virtues" of women, these accusations must fall.

In the time of old Cato the women raised an insurrection to obtain the privilege of riding in chariots, of decking themselves with rings, and of wearing purple robes. To-day they demand the outlook of a broader humanity, the jewel of high culture, the royalty of knowledge.

### CHAPTER XIV.

#### LITTLE REST.

"WHY was it called 'Little Rest?'" Cecil asked, as the carriage slowly climbed the hill from the station. She had known the name since childhood, but its familiarity had dulled her ear to its meaning, which struck her now for the first time.

"It was a half-way stopping place for the stages on the old post road," Miss Esther replied. "They changed horses at Sullivan, two miles on. This long hill was hard for the tired teams, and they used to stop at the foot of the first rise to water and breathe them a little. First there was a blacksmith's shop, and a box on the side of the big elm

for letters and papers; then there was a tavern called 'The Little Rest.'"

Cecil softly repeated the name to herself. The horses dropped into a steady, hard-pulling walk, after their first spurt up the long, steep grade, which was broken at intervals by shallow, transverse hollows to lead off the water.

The Hartwell house stood at the end of a broad, grass-grown lane which joined the main road at the top of the hill. Cecil remembered her grandmother's house when she was just tall enough to see her face, distorted in miniature reflection, in the polished brass door-knobs; when, to her small stride, the meadow grass in June was a tropical jungle, and a seat among the low apple-tree boughs

\* Copyright, 1882, by Mary Hallock Foote. All rights reserved.

in the orchard had seemed from the ground a perilous adventure.

In those days she had found it a long walk from the white-painted gate-posts up the straight drive to the high-pillared porch. The house had been built during the white wooden temple period of domestic architecture, which belonged to the early eighteen hundreds. Its formal lines were repeated in those of the leafless locust trees, facing each other, on either side of the drive, in a stately expectancy—as of the arrival of some guest who never came, or the passing of bridal carriages, or a funeral procession from the white-paneled front-door beneath the porch. This fancy occurred to Cecil looking from the window of the hack, which had stopped before the closed gate. The driver called to a man who was raking the dead leaves into heaps upon the withered grass of the door-yard. He was an elderly man and he came deliberately, first hooking his rake in the low boughs of a tree. He put his shoulder under the top bar of the gate and lifted it on its hinges, before swinging it open. As the carriage passed through, he stood aside and nodded silently in response to Miss Esther's greeting.

The years since Cecil had seen them last had thinned the ranks of the locusts. Here and there a comrade had dropped out of line; the loss of their close-set, plummy foliage suffered the amputation of limbs to be seen. A few faded leaves clung to the boughs, or drifted downward in the still air, falling as light as the first snow-flakes would soon fall on the shrunken turf. The rose-bushes in the beds beneath the front windows were swathed in straw, and bowed with their heads to the earth, and the cords which had sustained their blossoming sprays in summer hung slack and rain-bleached against the side of the house.

Miss Esther straightened the door-mat with her foot, before entering. She did not knock, but the heavy door stuck slightly, and opened with a jar which set the brass knocker's teeth a-chattering.

The interior of the hall was darkened by faded green silk shades drawn down over the side-lights. The slender mahogany stair-rail made a square turn at the landing, and, continuing upward, caught a strong gleam of pure white light from an uncurtained window above. A tall closet opened on the landing. Cecil remembered how her brother had been wont to conceal himself there and spring out upon her unawares, on her toilsome journeys up and down the stair-case. She had never, as a child, been able to pass that closet, without thrills of acute terror; even when the doors

stood ajar, the long, dark garments hanging within had been invested to her imagination with the mystery of which they were the sole proprietors.

Martha, the respectable "help," warned by the involuntary noise of their entrance, met them at the door of the back-parlor, and informed them that Mrs. Hartwell was in her own room dressing after her afternoon nap. She looked deliberately and curiously at Cecil, glanced at the hard-coal fire to see if it required mending, asked Miss Esther some common-place question about their journey, and then retired to the region of the kitchen.

The two women, left alone, were silent; Cecil gazed about her, taking in the details of the room, with shocks of recollection, and Miss Esther followed the expression of her face, wistfully. The presence of a young girl in the house made her realize its subdued life and remoteness, and the lapse of time since her own girlhood.

A slow, heavy step was heard moving about overhead.

"I will go up and see mother," Miss Esther said, "and see if your room is ready."

Cecil turned toward her aunt with a quick, affectionate gesture.

"Everything is just as it used to be—only then I did not know how lovely it was! If you only *knew* how different it is!"

"Different?"

"From other places I have known."

"Ah, my dear, if you had only come to us last summer!"

Cecil did not echo this wish; she could hardly have told why. She had put off her hat and wraps, and knelt before the fire as she had often knelt in the glow of the great stone chimney of the Shoshone cabin.

"I *must* be content!" she adjured her failing heart, on the threshold of this new life of peace.

There was a rustle of thin silk behind her, as the door opened and her grandmother entered. She greeted Cecil very quietly, almost coldly, and, to her exquisite relief, made no allusion to the circumstances connected with her present visit to Little Rest. She took the chair on the opposite side of the fire, rocking gently, while her eyes dwelt on Cecil's face with a prolonged and retrospective gaze. Her white, withered hands, with the purplish veins showing on their backs, were crossed over her pocket-handkerchief, and rested on the ample slope which the folds of her black satin apron took in their descent toward her lap. Clear white muslin bands encircled her wrists.

The placid figure, the creak of the chair in its brief oscillations, the tinkle of a coal falling on the iron pan beneath the grate, had

for Cecil a fascinating, dreamy familiarity. In the plain slab of black marble which crossed the chimney-piece, there was a darkly reflected picture of the room, in the fading light. Miss Esther was laying the cloth for tea, and placing the gilt china and the thin, bent-edged silver tea-service in order. As a child, Cecil had often watched this same picture from her seat on the embroidered footstool, which was decorated with a pink-eyed lamb, whose outlines, year by year, became more confused with the green-and-buff landscape in which its feet were set. Even the strip of orange-colored sky showing behind the thin woods on the hill, looked in through the window with a friendly light. Her childhood seemed waiting, with gentle, appealing touches of memory, to heal the wounds that womanhood had given her.

When Mrs. Hartwell spoke to Cecil of her brother, it was always of the little boy she had known long ago. The events of his life subsequent to that time she ignored, as if he had died in childhood. Cecil sometimes wondered at this silence, but she accepted it and was unspeakably grateful for it. It was a silence which covered more than the proud old heart that kept it would have permitted any one to guess. Grandmamma Hartwell had been enlightened in various ways as to Harry Conrath's development, since the days of his childish sovereignty over the household at Little Rest. As a trifling incident of this development, he had borrowed sums of money of her from time to time, making little filial journeys down into the country for that purpose. Miss Esther had often recalled these visits with the pathetic appreciation with which elderly retired gentlewomen dwell upon the disinterested attentions of their young male relatives.

Mrs. Hartwell had received the news of her grandson's death with outward composure, but for many days she had been strangely restless. She had seemed more heavy and silent since that time. Only once had she alluded to the family grief. This was on the evening before Miss Esther's journey to New York to meet Cecil. Miss Esther had come into her mother's room to cover her fire and arrange her for the night. The old lady was sitting up in bed in her night-cap, with a loose, wadded silk sack over her night-dress. She seemed nervous, and watched Miss Esther's movements with impatience.

"Why don't you let Martha attend to the fire? She does it perfectly well. What is the use of making your hands rough for nothing at all except a fancy that I'm more comfortable for it. I'm not. I can't bear to see you on your knees before that grate."

"Martha can do it when I'm away," Miss Esther replied, mildly.

When she came to the bedside to say good-night, her mother detained her by the hand.

"Sit down a minute, Essie. Put that shawl around you." Mrs. Hartwell did not speak again, immediately. She was rolling up her cap-string, and her fingers were slightly tremulous. "I don't suppose he would let you bring her down here," she said, presently.

"He didn't say anything about it; but of course he couldn't say anything in a telegram. Perhaps there will be a letter—or she may know what he wants her to do."

"He cannot want to keep her in that hotel! Strange ways! Strange ways!" the old lady repeated.

"He always seemed to be afraid the children would get—well—our ways," said Miss Esther. "I know he thinks we are very provincial down here."

"He didn't seem to think your sister was provincial—before he married her." After a moment's silence, Mrs. Hartwell spoke again, in her deep voice. "Where is that picture, Essie,—that picture of Harry?"

"Mother, I put it away. I thought it would hurt you to see it all the time."

"People have to get used to being hurt. I wish you'd bring it back."

#### CHAPTER XV.

#### OLD PATHWAYS.

CECIL had not been brought up in the habit of industry. To sit perfectly still and unemployed for an hour at a time was no affliction to her, as it would have been to Miss Esther—as it undeniably was to Miss Esther to see her thus listlessly drifting, day after day, with the tide of her thoughts. She spoke to her mother on the subject of her duty to the young girl in this respect, but Grandmamma Hartwell replied:

"Let her alone for awhile. She doesn't look like one who needs spurring."

Cecil was never troubled by the long gaze which her grandmother would often fix upon her, as they sat opposite each other by the fire. She made no attempt to respond to it. It seemed to pass beyond her own personality and to recall, in her face and movements, other faces and older histories than hers. But she was happier with her grandmother than with Miss Esther, whose hovering solicitude fretted her and increased her self-consciousness. Her spirit gradually keyed itself to the subdued monotone of the eventless days, succeeding each other with the

soft, obliterating effect of dropping water. The sharpness of her pain subsided into a mental torpor which forbade either hope or passionate repining. It would have been premature to call it resignation.

Cecil did not look unhappy in these days, but she was not able to bear the house-life without long, solitary walks which had the effect, almost, of a voluntary religious exercise.

On rainy days she would stand at the windows of the cold, unused parlor and watch the locust trees rock and strain in the wind; with them, in spirit, she rode out the storm. At twilight she was able to take her place at the piano, whose keys had a thin, sweet tinkle, like the melodies that had been played on it in its prime. The folding-doors were parted, that her grandmother, sitting by the fire in the back parlor, might listen to "Joys that we've tasted" and "Believe me if all those endearing young charms," until Martha came in with the lamp and announced that supper was ready.

Cecil had found a succession of harmonies that fitted the words:

"Oh, me, oh, me! what frugal cheer  
My love doth feed upon";

and sometimes in moments of weakness she gave them utterance, enunciating the perilous syllables softly, with a sense of self-betrayal and of tampering with resolution.

Fair days or cloudy always found her a-field, climbing the brown orchard slope behind the house and fleetly following the path which led through the gap in the stone fence to the level meadows, below the mill-dam. It was a country of abrupt heights and hollows; in the spring, the half-hidden water-courses made a pleasant noise among the hills, but only the greater streams survived the summer.

Cecil's accustomed way took her across the mill-dam by the well-worn path. The leafless willows crossed their red-tipped lances in the sun above her head. On one side lay the glassy pond, and, below the wall of the dam, the shorn meadow, with a faint new greenness showing along the course of the wastewater from the dam. The path rose abruptly, beyond the mill-dam, and disappeared on the wooded hill which bounded the eastern shore of the pond. There were no long outlooks here, but there was seclusion and peace in the narrow boundaries of the horizon. The sky limits were confined; there was no mystery of far-off line of sea or estranging plain. The hills were near neighbors; their language was content rather than aspiration.

Cecil's most frequent refuge was the wood. Here her restless footsteps were staid; she waded into its rustling hollows, deep in

fallen leaves; she stood and listened to its stillnesses. Often she would throw herself down, like a burden she was weary of, on its broad, brown lap, letting her eyes travel upward to the complex tracery of tree-stems screening the sky, as a sick child will dully follow the pattern of its mother's dress or the reflections in her bending eyes.

Yet she could be merry at times, when other young voices were near, to catch and repeat the fitful note of gayety in her own. The young voices that sometimes echoed with hers through the wood belonged to two bright-faced lads of twelve and fourteen years, who appeared to enjoy more liberty than usually falls to the lot of school-boys. They were the only boarding-pupils in the family of the minister, who kept a private school in the neighborhood. When the afternoon sunlight gilded the tree-stems and dappled the warm slopes of the wood, they were always at large, making the rounds of their favorite haunts; visiting their quail-snares and rabbit-traps, or the chestnut-trees, where the last of the crop lay under the leaves, or extending their circuit to the neighboring fields in search of frozen-thawed apples. Divers and many were their errands, but none of so pressing a nature that time was wanting for wrestling together in beds of fallen leaves or flinging surreptitious armfuls of them over each other, or pausing on the top rail of a fence that crossed a hill, to wake the silent landscape with a shrill hoot or whistle.

By little and little, in odd ways, a shy, wary comradeship had sprung up between this light-hearted pair and the lonely girl. She took no particular attitude toward them; she was not motherly or sisterly or cousinly,—she was not even invariably friendly. Her mood could not be foretold. Sometimes she would pass them with an abstracted smile; for days, perhaps, they would not exchange a word; then an afternoon would find them following, side by side, the obscure highways of the wood, or seated in the shelter of a rock, or on some dry hill-slope, munching sweet withered chestnuts and talking idly, while the shadows crept past them before the low sun.

In the early stages of their acquaintance, Cecil was not greatly interested in the lads as individuals. She liked their impersonal boyhood; their calls to each other across intervening hills; their ambuscades and sallies and notes of warning; their unexpected touches of rude sentiment; the listening look in their faces, and the unconscious, perpetual play of life in their slim, restless bodies. But her observation of them was respectful and reticent. They were vaguely stimulated by it, though its outward

signs were slight. Her companionship was a unique experience in the lives of the two boys. Her indefinite, girlish loveliness and grace of silence or of speech, the unexplained solitude of her musing walks, some hint of melancholy which they dimly felt in her presence as they felt the thrill in the note of the hermit-thrush in the heart of the spring woods, touched that dumb response to beauty which, in a boy's nature, is often hidden in proportion to its strength. To each other they seldom spoke of Cecil, and by a tacit understanding, when they were attended by their school-mates, they avoided her company, as a pleasure too fine to be indiscriminately shared.

Cecil was as incurious about the actual lives and character of her two comrades as if she had been a veritable nymph or dryad of the woods, meeting them on that borderland of enchantment which tradition supplies for such mythical companionships. She heard them call each other Bert and Charley, and she inferred from their accent and bearing that their associations had been gentle and their discipline scant. They had read with youthful avidity and promiscuously, like boys who had had books within reach, with no one to guide their selection.

She had no distinct preference for Bert, but when she talked to both boys, she looked in his face more often than in Charley's. Bert's eyes were dark, and his strongly marked eyebrows descended slightly as they approached each other; when his hat was pushed back, his thick, brown forelock showed below the brim; his nose was still uncertain in shape. He laughed a great deal, showing his big, solid, white teeth between lips whose curves kept their child-like purity of outline. His face was deeply, richly colored; the rims of his well-formed ears glowed a fine crimson against the slope of close-shorn hair fading into the lighter brown of his neck. Charley, the elder lad, was blonde and freckled. He had an honest, sensitive countenance, and eyes which needed only darker shading in the brows and lashes to bring out their beauty; but Charley's good looks were problematical, while Bert's were in transition.

It was not, however, its joyous beauty that drew Cecil's eyes so often to Bert's face; it was a puzzling, elusive hint which came and went, with its changing expressions, of another face she had known. The fascination of its recurrence grew upon her unawares; she watched for it, and yet shrank from it when it returned. It was an innocent, unaccountable likeness; its little intermittent hurt could hardly be said to trouble a peace that was not yet attained, or to rouse memories that had never slept.

Early in December, the thin, gray ice that stilled the surface of the pond, grew strong enough to bear skaters. The quiet of the neighboring hills was invaded by a confusion of voices and the echoes of iron-shod feet treading the sounding ice-floor. A light, dry snow fell, whitening the pathways of the wood. It disappeared quickly from the open fields, but lingered, like sifted ashes, on the brown leaves in the wooded hollows.

Cecil had found a new revelation of half-forgotten beauty in the white precincts of the pond, lying, like water in a swoon, beneath the bright, unfruitful winter skies. She was still attended by her juvenile body-guard, nor did she covet other company. Quite unconsciously she had become a member of a triple alliance, which kept itself intact in the midst of the shifting crowd of skaters; but she was under no temptation to break the tacit bond. The representative young ladies of Little Rest were of Miss Esther's age; its young men were a tradition of the days before the war. A subsequent and less characteristic crop had been reaped by the great cities or neighboring factories, by the enticing, devouring frontier, and the equally insatiable sea.

One Saturday evening, after sunset, Charley and Bert had kindled a fire against the slope of a rock that walled in one side of a little cove. The shore of the pond, following the curves of the hill, formed this miniature bay, where the water, sheltered from wind-flaws, froze into a sheet of ice, clearer than that of the open pond. The white, opaque ice-field beyond was tinted by a rosy reflection from the western sky; above the frozen stubble-fields the new moon's sickle gleamed. The skaters were leaving the pond. Cecil was too far lost in the enchantment of watching their gypsy fire brighten the edge of twilight, to think of the hour, and the boys were not likely to remind her.

They had piled stones to make a seat for her on the windward side of the fire. She sat with her back against the rock, her muff extended in one hand to shield her face from the heat. She had a skater's color in her cheeks, but her lowered lashes gave her eyes a dreamy look. The wood was already a mass of brown shadows; around the fire-lit circle of faces the pale tints of the winter landscape were fading. The blush color in the west had changed to a cold blue, in which the new moon gleamed more sharply, but as yet there were no distinct shadows. The white ice-shield gathered and diffused the lingering light.

The boys sat at Cecil's feet, feeding the flames with snapping cedar-twigs and watching the scattering volleys of sparks. The

smoke-coils floated off and dispersed among the deepening gloom of the wood.

Cecil was silent, confused by the awakening of that dull heart-ache which, in its moments of suspension, she called content. She was restless with the beauty of the evening. It rankled in her soul. Such evenings were for happy people, or for children, to whom each day was a separate existence. At that moment she would have given all the beauty that enfolded her loneliness,—hushed, dusky wood and glimmering pond, slumberous fields and softly-colored twilight, lit by the crescent moon,—for the sky of solid rock, the yellow candle-rays and inky shadows of those rugged underground pastures where she had first recognized the love and the sorrow of her life-time. With this or with that small circumstance different, how different all might have been! The thought came to her with the agony of an old pain that returns after an interval of rest. She could not recall one moment of absolute happiness that she had ever known through Hilgard, or with him. Their moments together had been clouded by the trouble that was coming to them both; but few and poor as they had been, the memory of them was intolerable now.

What was it, after all, she asked herself, that had separated them? No fatality of their past had kept her from him in his extremity. She would have renewed her broken promise at his death-bed, and felt that it was the sacrament of her life. She could think of him no longer as the dim-eyed figure she had left, prostrate on a sick-bed. But were youth and strength and love of life offenses in him for which she held him accountable? Was it not rather her sick faith—her doubt of herself as a positive and vital need to a life already replete? If it were possible to believe that wherever he might be that night he was thinking of her and wanting her! If indeed his happiness were in her gift and he should ask it once more at her hands—what would she do with it? Would she deny him, and bury his hope and hers in her brother's grave,—the old wrongs revenged in the old way,—the hard deeds of men remembered and perpetuated by women!

She rose suddenly to her feet and stood against the rock, receiving upon her full-length figure the strong red glow. The two lads looked up at her, half abashed at her loveliness.

"Come," she said, "let us put out the fire. We must go home! Will you go with me as far as the orchard?" She looked doubtfully at the lads. She had never before made even so small a claim as this on their friendship.

Charles grew red with pleasure, but remained silent, while Bert answered for both.

"We'll go all the way. But there is a man coming down through the wood. Let's wait till he gets by."

The footsteps left the path, and came crashing and trampling down into the hollow by the rock. Bert began mentally to take an attitude of defiance, expecting the usual remonstrance from some farmer of the neighborhood, in regard to carelessness with fire. As the intruder came within the circle of light Bert and Charles turned to confront him. He was tall, youthful, and stalwart of figure, dressed for a winter journey, in seal-skin cap and belted ulster. There was a formidable directness in his glance and bearing. The boys hesitated a moment and then fell upon him with boisterous greetings, and dragging him forward, presented him to Cecil as their brother.

Hilgard had come down to Little Rest in a despairing pause of his search for Cecil. He was on the track of the truant lads, but he had not expected to find Cecil with them, encamped like a Romany girl, on the charmed edge of evening, in that remote hollow of the hills. It was an exquisite surprise—a rush of joy, so keen and sweet that it had almost brought the tears to his eyes. She was a radiant figure in the warm fire-glow, but there was no warmth in her greeting.

Cecil knew that he had not come to see her. The bond between them seemed more unreal than ever in the presence of this relationship which she had not even suspected. As she looked at the three who had found each other, she discovered with a fresh pang that she had grown fond of the little lads. She must lose them, too, since they belonged with all that she had put out of her life, forever. They counted among Hilgard's compensations,—if, indeed, he needed any,—not among hers. She waited in awkward misery for a chance to escape, while Hilgard submitted to the tumultuous questions of the boys: Where had he kept himself, and why hadn't he written? How long was he going to stay, and would he give them that week in New York with him at Christmas, as he had promised?

"Oh, I say! You're not going home without us?" they exclaimed to Cecil, who had turned away toward the wood-path.

"I shall not need you. It will be light enough when I get on the hill."

She did not stop, and her manner was so decided that the lads hesitated, looking puzzled and hurt.

"She asked us to go home with her," they appealed to Hilgard.

"You must first put out that fire, every spark, before you leave it," he said, in the

tone of authority that came to his firm voice more readily than tones of tenderness. But the tenderness trembled in it the next moment, when he had followed Cecil, and, walking by her side, his head down close to hers, said:

"I don't know where home is, but I am going there with you."

"Not to-night. You must leave me to-night."

"I shall never leave you, because I shall never find you again, if I do."

Hilgard's nerve had not quite forsaken him. He felt very quiet, but very desperate. From the shore of the pond came the boys' clear treble shouts as they trod out the sparks and flung the brands of their fire out upon the ice.

"Cecil, let us understand each other now," Hilgard continued. "Did you mean every word in your letter. A woman should not write such a letter as that to a man she does not mean to marry."

"I told you not to come!"

"You may tell that to a sick man. I'm not sick now. I have as good a right to my wife as any man. I have found her, and I mean to make her happy."

Cecil had stopped, moving away from his side in the narrow path.

"It is too much," she said. "No one could bear this!"

"Is my coming too much to bear?"

"Your coming—and your going. It is cruel to keep offering me what I cannot take!"

"You shall take it!" Hilgard put his arms around her and held her fast, with her head pressed close against his turbulent heart. "It is not taking, it is giving. Will you give me nothing for all my love? Let us end it here—now. This is the only human way!"

But Cecil was not yet at rest. In a moment she drew away from him and listened, with her hands against his breast, and her cheek turned toward the faint breeze that blew up from the hollow.

"Where are the boys?" she whispered. The moon hung low over the darkening outline of the hills; the dim landscape returned no sound but the rustling of the sere leaves in the aisles of the wood, and the slight reverberations of the ice, warping with the night's increasing cold.

The lads had not been slow to perceive that there was a mystery of previous acquaintance between Hilgard and their girl-comrade, and that their company along the wood-path was neither missed nor desired. With hasty, boyish resentment, they had taken themselves off by another path toward the village.

"They have gone back alone," Cecil said,

quickly divining her offense against good fellowship. "Won't you go after them and bring them back? No, you needn't come back! Stay with them, please, and make them understand!"

Hilgard laughed, a low excited laugh of insecure triumph.

"No, indeed, I won't! The boys will have to wait. They have had their turn."

"But it is not kind, and they *have* a right to you—they have not seen you for so long!"

"I have some rights, myself. They might have seen me if they had told me you were here. Can't you spare *me* a little of your kindness for the boys. Cecil, you don't know what an awful power you have over me. For God's sake, don't play with it!"

She put up her cheek close to his bent head.

"I am afraid to begin—if I once *began* to be good to you——"

## CHAPTER XVI.

### THE PATHS MEET.

HILGARD and Cecil were married on a wet May morning when the wind that blew across the farms bore with it the fragrance of rain-drenched blossoms. In the Hartwell house a wood-fire lit the gloom of the heavily curtained parlor, where the remnants of the two families were assembled to witness the marriage ceremony. Mr. Conrath did not lend his countenance to the proceedings, in any sense of the word, and it remained for the grandmother to give away the bride. It was with a stern reluctance in her heart that she fulfilled this duty of relationship. The two women who represented the family of the bride wore their dull, black mourning robes, but Cecil, with pathetic magnanimity, had put on a gown as white as the happiest omens might have called for.

In the pauses of the service the soft spring showers dashed in gusts against the window-panes, and rustled in the deep-mouthed chimney. The perfume of hot-house roses stole luxuriously upon the cool, pure air of the old-fashioned room, with a suggestion of the distant city and the men and women of the world outside.

The carriage had not yet come when Cecil entered the parlor in her traveling dress. Mrs. Hartwell was moving about the room with that restlessness upon her which is so much more painful to witness in a large calm person than in one to whom it is habitual. The boys, on whom every one had counted as a relief to the intensity of the occasion, had developed an unexpected shyness of Hilgard, in his anomalous character of bride-

groom. Cecil, very white about the lips and dark about the eyes, sat buttoning her gloves, and trying to listen to the clergyman's voice, prosing gently through the unhappy silence. The fire snapped behind the ponderous brass-work which guarded the grate. Miss Esther sobbed audibly. Hilgard went out into the entry and waited by one of the side-lights looking down the empty, dripping vista of trees. It was a relief to all, when the spattering of hoofs and the soft roll of wheels sounded on the wet gravel outside, and Hilgard, standing in the door-way, said "Cecil, the carriage is here."

Mrs. Hartwell crossed the room and folded Cecil, with passionate deliberateness, in her large embrace.

"Oh, say one good word to him before we go!" the girl entreated, in rapid smothered whispers. "He is my husband. He is your son!"

The grandmother straightened herself. She did not speak, but as she turned away her face and covered it with her handkerchief, she extended one hand to Hilgard, with a noble and gracious gesture. He bent above it and kissed it, as a prince of the reigning house might kiss the hand of an aged queen in exile.

That evening, Mrs. Hartwell was in her old seat by the fire-place in the back parlor, and Miss Esther was standing at the west window, watching the locust boughs, heavy with their white blossoms, toss in the gale. The rain had ceased, and the struggling moonlight served, as it were, to make visible the wild, soft wind, whose voice they heard in the chimney, and in the creaking of vines against the side of the house.

"Esther, I wish you would set those flowers in the other room. I hate the scent of stale flowers!" said Mrs. Hartwell.

"But these roses haven't faded a bit. Just look at them, mother; I never saw such roses!"

"They do not please me. There were no such roses when I was a bride. They are too big and too expensive, like everything nowadays. The idea of sending such things to Cecil! They are about as much like *her*——!"

A vision of Cecil on the empty stool opposite—her elbow resting on one hand, while the other strayed to the pin at her throat, her cheek pressed against the cold marble of the mantel—finished the sentence for the two women. Miss Esther did not look at her mother, who spoke again, breaking the silence with her deep intonation.

"Journeys, journeys, nothing but journeys! Why couldn't they leave her here in peace?"

"Mother, you know she was not happy here."

"She would have been happy, if he had let her be."

"She would have been happy, perhaps, if she had never seen him," Miss Esther said.

"She never ought to have seen him. It was no place for a young girl. I always said so. There were no such places when I was a girl;—the name is enough. There was no such West! When people went West, they thought about it beforehand; they consulted their friends; families went together. They were a long while going, and when they got there, they staid. There was none of this rushing back and forth, thousands of miles at a stretch!"

"I don't think it is the journey Cecil minds. And he will take good care of her."

"*He* take care of her! He is nothing but a boy, himself."

"You cannot deny, mother, that he has a manly look——"

"His looks are well enough. They are nothing but boy and girl, both of them. They might have waited five or ten years—it would have been more fitting, to say the least."

"If they had waited, something else would have happened very likely; I think it is better to marry young——"

"Than not to marry at all?" Mrs. Hartwell interrupted with scorn. "Why isn't it respectable for a woman, now and then, to stay at home and keep things together for those who go and make a shipwreck of it? Why couldn't she have been to you what you have been to me?"

"No, mother. I would not have had that!"

"Have you found it so hard?"

"Mother, you should be the last to ask that! You know it is all the life I could have had. But it would have crushed Cecil, after what was past. And it wouldn't have been fair to him."

"He seems to have been quite able to look out for himself. Those were nice boys—his brothers."

"Half-brothers," Miss Esther corrected.

"One of them is very like him in looks," her mother continued. "Did you say they were staying here? What can they be doing here?"

"They are pupils of Mr. Lord's."

"Well, that isn't a bad place for them. When you send out the cake, Esther, I wish you would send them plenty—what boys call plenty. Perhaps Mr. Lord will let them come up to tea, some Sunday night."

"He might like to come with them," Miss Esther suggested, meekly.

"I daresay he would, but I don't think I care about him. He is well enough, but the boys will have a better time without him."

Miss Esther carried the roses into the front parlor, where she remained a few moments, setting chairs back into their places, and closing shutters for the night. She paused before the open piano, and laid her hand on the cold, soundless key-board. The worn ivory sank under her touch, breaking the stillness of the room with its helpless discord. She closed the piano with a dull clap of the lid, and leaned upon it while the murmurs of the imprisoned chords prolonged the sound. To her wistful ear the room was haunted by echoes of dumb music: songs that had been sung there, quick, unsteady sallies of childish feet, laughter of young girls, whispered vows that death had broken, stifled sobs and prayers for the dead.

"Esther, I want you," her mother called, from the inner room. "Come close to me, child. We have got the house all to ourselves again. Do you think I am a hard, old woman? Oh, I miss my children! I miss them every day and every night." She reached out blindly and gathered her daughter into her arms. "I had set my foolish, old heart upon the child. She was the last one. She filled the empty place. She suited me."

"She suited him, too," Miss Esther said, in a broken voice. "She suited us all! Even her father was proud of her—though he said she had no manner and never would have!"

"Manner!" the old lady repeated wrathfully. "She had heart!"

#### CHAPTER XVII.

#### EXIT SHOSHONE.

THE successor of Hilgard and Conrath in the management of the Consolidated Led-Horse and Shoshone mines was one day searching out the corner monuments of the original claims.

The young pines in the gulch,—which, instead of dividing, now united the two properties,—had counted two more circles of concentric growth. The aspens again bore their frail golden fleece, a prize for the rapacious autumn winds. The Shoshone dwelling-house had been converted into a miners' boarding-house, presided over by Molly, the wife of the ex-timberman, now night foreman on the Led-Horse division, and the path where Cecil had taken her solitary walks was graded into a road for ore-wagons.

The history of the Led-Horse and the Shoshone was the history of the camp, epitomized. The stormy beginning of days was

over; the illegitimate forces were under control, and such a rude challenge as that which had tested Hilgard's leadership had not been known in the camp since his effectual and impressive acceptance of the issue. The public value of his deed it was not given him to know. He had only known its sharp recoil upon himself.

The superintendent was studying the inscriptions on the low monument stones in the bottom of the gulch. A slight golden glitter led his eyes to the spot where a ring lay, half embedded in the brown pine needles, which had borne the weight of the winter's snows.

He rubbed away the earth clinging to the words heavily embossed on its outer circle: *Dieu vous garde*. In the inner circle he read the initials *C. C. from H. C.* He slipped the ring on his smallest finger; it would not pass the middle joint.

The superintendent had heard of Conrath's sister, the fair young girl who had presided over the Shoshone household during its stormiest epoch, and had vaguely wondered what part, if any, might have been hers in its history. He was not so mature as to have lost sight of the fateful nature of the feminine element, even in mining complications, but he had not found it easy to believe in the existence of a young girl, such as Miss Conrath had been described, in such a place, under such circumstances. It had been his experience that women generally fitted the places where they were found, and the men who were their companions. Here, however, was presumptive proof of civilized feminine occupation at an early period of the Shoshone history. He carried the ring a week or more, each day intending to express it eastward, and finally sent it, directed to the office of the Consolidated Company, to be forwarded to Miss Conrath. It was not without a faint sentiment of regret that he parted with the one gentle association connected with the story of the Shoshone tragedy.

He leaned against the counter of the express office, waiting for his receipt and watching, meanwhile, the weighing of one of those long, pine boxes, which form part of the freight of every overland train.

"Who is that they're shipping East?" one of the loungers at the counter inquired of the express agent.

"Don't you remember—young fellow got shot, up at the Shoshone, a year ago?"

"Oh, yes—jumpin' scrape, wasn't it?"

"Yes. He just about closed out the jump-in' business in this camp."

"I thought they planted him for good," another voice struck in. "They made row enough about it!"

"Oh, that was Gashwiler's racket. Pity they hadn't planted him instead!"

"What's *come* of old Gash?" the first speaker asked, of the company, generally.

"Last *I* heard of him he was stealin' Indian ponies over on the reservation,—three ninety-seven," the man at the scale called to the clerk. He printed the number

in which all was forgotten save the good they had known of him.

They made his grave beside an older one, the head-stone of which bore the name of Cecilia Hartwell, wife of Robert Conrath, who had died in the twenty-eighth year of her life and the sixth year of her marriage. A matted growth of periwinkle had woven its

"A SLIGHT GOLDEN GLITTER LED HIS EYES TO THE SPOT WHERE A RING LAY."

of pounds weight upon the lid of the box, and swept, with one stroke of his marking-brush, a black circle around the figures.

Conrath was going home at last. The camp remembered only his misdeeds; but the women who had waited long for his body to be brought to them from the alien soil where it had lain, kept a different record—a record

coverlet of dark and shining leaves above the mother's bed; before another winter's snows had whitened it and another summer had starred it with purple blossoms, it had crept half across the new-made grave. One might fancy the mother in her sleep, reaching out unconsciously, and covering her child.

THE END.

A COUNTRY HOUSE.

## THE ARCHITECTURAL LEAGUE OF NEW YORK.

NEW YORK never looks so well as at night in the height of a snow-storm. Its dingy brown and bricky hues become an acceptable foil to the pure white of the newly fallen snow. Every window-ledge and cornice has new moldings, the thick atmosphere which softens the glare of the electric lights, and reduces the gas-lamps to the brilliancy of a tallow candle, makes the streets and other open spaces seem immense. The drifts that waltz past the lights on the tall mast in Union Square, like innumerable swarms of gray moths, promise to outdo before morning Augustus's transformation of Rome.

In spite of its advantages of site and surroundings, New York is an ugly city. Not ugly, merely, but architecturally despicable. It is only in such weather as would make a wigwam or a ruined barn seem a desirable shelter, that our flimsy buildings can command respect. In the desolateness of a winter's night the locked and shuttered inhospitality of Fourteenth street gives it a certain air of solemnity, and at such a time we do not stop to condemn the unsightliness of the only house that opens its door to us, but dart into the sloppy vestibule, wet and cluttered with coat-shakings, and casts of boot-heels, and rinsings from umbrellas and slouched hats. The creaking of the wood-work is welcome to us, for it shows that the planks are dry. We are ready to forgive any sins that the builder may have been guilty of in the narrow corridors and surprising ups and downs of the staircase, if only his walls will stand erect, and his roof will not fly away on

the wings of the wind, or fall in and crush us under its débris. It is therefore with a profound appreciation of the present and past achievements of our architects rather than with any high-flown hopes for the future that we enter on one of these stormy nights the meeting-room of a club composed of the younger members of the profession. It is on the top floor of our Fourteenth-street house; a large, hexagonal room with walls in Pompeian red, diversified with black shelves and close-drawn yellow window-curtains. Two great brazen chandeliers and a red-hot stove illumine the space next the door, but a cloud of tobacco-smoke hovering in the middle of the room obscures the farther end. Getting used to the smoke, as we add our coats and hats to a

WATER-FRONT OF BONDED WAREHOUSE.

A MEETING OF THE LEAGUE.

profession, the gregariousness of youth, and the attractions of a social smoke. Like Chaucer's scholar, each of these young men is equally eager to learn or to teach. Each finds a leader or a pupil or a comrade in the League, who entertains ideas on architectural

One of these veterans of the profession now moves toward the blackboard. A good dome-like top story to head, disorderly iron-gray hair; thick eyebrows, sharp eyes; cheeks massing with neck; quick and peremptory manner—perhaps some of my readers may recognize him as a difficult person to deal with, and a stickler for the rights of his art. The dozen or more drawings are brought to him for criticism. Using the blackboard to illustrate his remarks, he begins with one in which he finds a strong projecting cornice casting a deep shadow to commend and a frieze of painted tiles to disapprove of. All is fair in love and iron architecture, he says; but the substitution of tiles for iron alters the matter. The design with the Moorish arcade is next handed up and comes in for unqualified approval, to the confusion of the strict constructionists who had maintained that it was an anomaly. The criticism is all from an artistic rather than a constructional point of view. The massing of two or more stories by cornices which divide them from others, in order to break up the great height of a city front; the treatment of a top-story as a frieze for the same reason; judicious changes of centers, placing the windows, etc., of one story out of line with those of the inferior or superior stories for the sake of variety—all these expedients and others like them, he is gratified to find used with moderation in many of the drawings. But cast-iron regular-

reform similar to his own. Occasionally one of the older men known to be in sympathy with them is invited to lecture on a subject chosen by himself or to criticise the drawings of the League.

ity, which one would think was in order in an iron store-front if anywhere, excites his spleen, and getting warmed up in his denunciation of it, he blazes away at it and peppers it with condemnation, until considerate thunders of applause allow him time to cool off and an opportunity to change the subject. In conclusion, he recapitulates the faults and dangers of iron construction. Iron is liable to rust, costs much yearly for paint, and is affected by vibration to an extent that is as destructive as the dry-rot in timber. It expands and contracts with every change of temperature, making cracks and fractures unavoidable when other material is used in connection with it; and it is the occasion of peculiar dangers in case of fire. Lastly, its unfitness for receiving fine form of any kind, large or small, makes the prospect of an iron architecture ever arising a very small one.

The cheers with which this conclusion is received show that iron has nothing to hope for from the young architects present. There are only one or two who appear to be at all concerned for the fate of iron architecture; the others show their artistic leanings by the fervor of their applause and by shaking hands with the happy author of the Moorish

A DWELLING AT LE MANS, FRANCE.

arcade, whose pseudonym has failed to shield him from recognition. The remaining business of the meeting is transacted amid renewed confusion and fresh volumes of smoke. Up-town members search out their coats and hats and disappear after a vote of thanks to the lecturer has been passed, and at length a good two-thirds of the meeting adjourn to a neighboring retreat where argument on matters architectural may be kept up till a late hour.

The League began some two or three years ago in hap-hazard meetings in the room of one of the members. Here, while the host, in a velvet jacket buttoned with a single immense bronze medal, ruled lines on a huge sheet of drawing-paper, one visitor told of a fine old carved mantel which he had discovered at Tommy Triplet's second-hand stone and lumber yard. Another, fresh from the Beaux-Arts, held forth on the necessity of an academical training for architects, while a third ventured to think that it might be dispensed with, and the latest comer, sauntering in just as everybody was getting ready to depart, gave utterance to some paradox which set the meeting by the ears and prolonged the session for another hour. All were then very fond of French architecture, and swore by Viollet-le-Duc, whose twenty volumes, bound in black and red, filled the handiest shelf of the book-case. Here all the young architects in the city became acquainted with one another, and found that they had a common cause and a mission which they were

BALCONY OF STONE—ITALIAN RENAISSANCE.

WINDMILL AND BILLIARD-ROOM.

called on to perform as a body. From chance gatherings in this room a step was made toward corporate existence by the institution of monthly meetings at the rooms of the several members, and so many were anxious to attend them that a regular club organization with fortnightly meetings and a home of its own, soon became possible. The new society met for a few times in the halls of its friends, the Salmagundians, but found permanent quarters before long in the top-story-back in Fourteenth street.

Since its final organization the League has attacked a great variety of architectural problems. Many have been as purely fanciful as castles in the clouds or the architecture of

dreams. Men who have given their entire day, perhaps, to calculating the cost of rubble work at so much the cubic yard have found a delightful recreation in designing cemetery entrances and draw-bridges to walled cities. A proposition to lay out the streets of the New Jerusalem, or to "restore" the walls of ancient Troy, would hardly come amiss to them. Occasionally one of the lecturers, falling into the humor of the thing, has set the League a fantastical problem of combining a billiard-room with a reservoir of water and a windmill to pump the water up, or the like. But there has been no lack of more serious efforts. There have been designs for college-buildings, for an Italian renaissance cornice, for chimney-tops, for a city residence, a country house, a suburban school-house, etc., etc. Some of these have been published from time to time in the "American Architect." Examples may also be found among the illustrations to this article.

No one can avoid being struck with the handsome and substantial appearance of the design for the water-front of a bonded warehouse, on page 698. It is copied from one of these sketches dashed off after the day's work is over, for a League competition. Its massive piers, the abundance of windows, and the flat-pitched, broad-eaved roof have manifest practical advantages, and they are combined in a manner to satisfy a very exacting taste. There can be no doubt of the supporting power of the massive arcade on the ground floor; nor of the sufficiency of means for ingress and egress that it affords; nor, again, of its quiet beauty. The two central arches admit the wagons which are to be laden or unladen at the platforms on each side. The plan which accompanied the orig-

inal sketch, but is not given in the cut, showed the building to be one hundred feet square, fronting on two streets, and containing a large court-yard in the middle. The upper floors are, of course, for storage. No less practical, though much more picturesque, are some of the designs for country school-houses given on page 704. The simplest would probably prove to be the best in practice. It has large windows where they would be sure to be needed; a single, ample porch, big enough to shelter the crowd of early arrivals that are always seen, before school-hours, in front of a village school; and with its bell in a pent-house overhead, instead of in a separate belfry, which always looks affected in any building but a church. If a belfry there must be, however, commend us to Mr. Barlow's; standing out as it does fair and square, and with its bulbous dome constituting itself the chief ornament of his house, it looks far too honest and too pretty to need an apology. But all that we can say for those in the remaining conceptions is that they are somewhat painful excrescences on otherwise pleasing designs. There will be many of our readers, we have no doubt, who will wish for a broad demesne and handsome private grounds, if it were only for the pleasure of building a gate-house like that below. The combination of wood and stone and plaster is very taking; and if one imagines a wisteria vine or a climbing rose trained up the mountainous slope of its roof, what could one have more fascinating at the threshold of his home than this home in miniature? The stone balcony by "Fazan" (page 702) is an example of simplicity of a different sort. It is suited to the richer city exterior, and by itself would give an air of elegance and

DESIGN FOR A CITY RESIDENCE.

refinement to the plainest front. The cornice on page 706 is much fuller of detail in parts of such a character that it would be difficult (though not impossible) to have it properly carried out. The designs for chimneys (page 707) are among the handsomest of all. It can safely be said of them that they would be the crowning glory of any house fortunate enough to exhale its breath by them. And it must be remembered that these are but a few

examples out of a breast-high pile of similar drawings that the League has already accumulated, dozens of which will, doubtless, yet be produced in a more solid form. For, good conceptions do not remain as embryos; they are bound to develop into facts.

The League has already had its first annual dinner. Each one of the *menus* was decorated in accordance with the prevailing fashion by one of the participants, mostly with pictures of the good things they hoped to enjoy at the feast. One art-

DESIGNS FOR A VILLAGE SCHOOL-HOUSE.

ist of giant-like appetite has loaded his bill-of-fare with tuns of wine and caldrons of potage and huge rounds of beef, and represents himself diving into the ocean to snatch from a shoal of mermaids their pet delicacy, the oyster. A Falstaffian proportion of liquid to solid was evidently looked for at the banquet; but it may fairly be said that, in reality, the ethereal predominated. Alive to the fact that a dinner is nothing without a poem, several of the members, and at least one honored guest, came provided with compositions called forth by the occasion. In this respect it was a genuine surprise party. Who would suspect a grave professor of making light rhymes full of alliterative frivolities about the acquire-

ments necessary to the ideal architect? Yet, before the graver members had ceased to count their bumpers and resolve mentally that "this would be the last," the best friend of the League, whose streak of gray hair just furnishes an excuse for the tincture of reverence in the affectionate regard of all true Leaguers toward him, felt himself constrained to deliver some such pleasantry as this:

Do you want a receipt for that capital article Known as the architect, artist and man? Of every best thing take the very best particle, Then let them beat the result if they can. The classical taste of Italian Palladio; Skill of Sir Christopher making a plan; Knowledge of mortars and bricks of a Paddy, oh; Knowledge of style of Labrousse or Duban;

SOME OF THE

Judgment unerring of pictures and  
pottery,  
Patterns a Persian might paint on  
a pan,  
Figures for friezes or carved terra-  
cotta;  
Dainty designs for the face of a fan;  
\* \* \* \* \*  
Courage, ambition, and love of the  
work,  
Spunk of a Yankee and zeal of a  
Turk,—  
Take of these elements all that's most  
durable,  
Cure all the faults that are not quite  
incurable,  
Strain, and refine just as much as  
can be,  
And the thing that you'll get is—  
the men that you see!

and more of the same sort. If the lilt is familiar, the being described is rare and wonderful enough, one would say. Let us wait to see what the League will furnish us of this pattern.

However, as before intimated, the League was not organized for merely convivial purposes. In its great object of enabling its members to advance themselves by comparing notes on all subjects that interest them, and bringing into play, by means of the fortnightly competitions, faculties and talents that would remain undeveloped by ordinary practice, the League has been successful to an unexpected degree. A good many of the older architects in the city have shown an active interest in it. Its list of lecturers comprises nearly every name of note in the profession, and the most sincere well-wishers of the society are among those who have themselves done the most to make us alive to the ugliness of our streets. It has taken something more than mere good luck to bring this about. Although the League, as a body, has as yet undertaken

for "New York Architectural League"

TURKISH FOUNTAIN, MYTILENE.

nothing to claim attention from non-professionals, communications from individuals which have been published in the "American Architect" have excited considerable interest even outside the profession; and those who have, so far, found no time for any work of this kind, have acquired a well-founded local reputation, which will surely widen, for thorough and capable performance of what is given them to do. A few of the earliest and most enthusiastic members have secured a much coveted opportunity for study and research in that cradle of architecture, the Levant. At long intervals, letters from them reach the League which make their less for-

BILLS OF FARE.

TURKISH GRAVE-STONE, MYTILENE.

tunate comrades wild for a similar chance to excavate and measure and "restore" (with pencil) long-buried tombs and temples. Only a determined student would care to encounter the following:

"We are so driven and hurried just at this moment that we cannot tell one hour what we may be doing the next, running about from one gang of men to another, seeing that they don't pull down and destroy walls that they ought not, or I may be drawing away for dear life in our room down at the port, when, as the other day, down will rush one of the workmen with an incendiary note from B., saying: 'Come up quick. Turks pegging rocks at the sculptures. Bring my pistol!' And away we all scamper up the hill. The Turks all run away and the stones have not hurt much, but it is some time before we are calm. Then the workmen need to be continually watched and directed, and, altogether, things are not such as to keep one's blood tranquil. But then, at other times, one finds in the course of a single evening stroll such *trouvaille* as a solid sarcophagus lying in the quarry which some poor devil of a Gaul, looking for treasure, had spent many hours of hard labor boring holes into before he comprehended the situation; and a little further on, in the ancient channel of the stream, the piers and part of the causeway of a Greek bridge!"

Another letter begins with a report of a still more interesting discovery:

"Assos, March 25th.

"The spirits of eight ancient Greeks, in as many black jars, are on a shelf near my shoulder, and I

must hasten and tell you what an exciting time we had yesterday. I have been digging, for the past three weeks, at the Street of Tombs, sinking pits and cutting trenches all over it, and yesterday we struck a very ancient burial spot, and spent the last two hours of the afternoon in pulling out archaic jars, full of bones, small earthen vessels, etc. They were thick as hops, and, from all indications, if we choose to keep on excavating, we could load a ship with pots, etc. Day before yesterday we found two unopened sarcophagi, and perhaps you can imagine my anticipations as I leaped into the trench, shined up my eyes on my coat-sleeve, and prepared to look sharp as the men pried up the stone lid. I know of nothing more fascinating than to be the first to peek into a tomb that has lain buried in the earth for hundreds of years. I had that pleasure the other day. Unfortunately they were only very ordinary sarcophagi, and probably very late, of Roman time most likely. The barbarians who went about cracking the large, important tombs probably scorned to open such an one."

They contained only some crumbling bones and small glass and earthen vessels, but were important from their position, for one was found *inside* a large tomb and the other just in front of the entrance,

STUDIES FOR CHIMNEYS.

showing how cramped the space had become in consequence of the wish of the ancient citizens of Assos to be buried within the customary limits.

Other valuable results of the expedition to Assos will be a plan and restoration of the ancient Stoa, temples, baths, gymnasium, and theater, and some interesting sculptures and fragments of mosaic pavement, etc. The

American Institute of Archæology, which sent out the expedition, will therefore have something to show for its money, besides the gratification of having done a real service to art in providing these young men with an opportunity to study in the most profitable manner.

Other members of the League who have traveled abroad or at home, and made good use of their pencils and sketch-books the while, have favored us with some of their gleanings, which show what interesting bits the architectural student, led by his professional instinct, picks up on such occasions. The windmill at Easthampton is a sample of the odds and ends to be found here at home, often containing some suggestive feature capable of being worked into a very different kind of building. The Turkish gravestone, full of beautiful oriental detail, is a scantling of what may yet be found unappropriated across seas. The curious carvings upon it, in the hands of some of our New York decorators, would furnish "motives" for many a frieze and dado. The exquisite little fountain from Mytilene is worth a volume of lectures on architectural design. The old French Renaissance house, sketched by Mr. Wheeler, furnishes an excellent study for whoever would erect himself a mansion in that capricious style, and Mr. Gilbert's tower and gate-way is yet more worthy of close examination.

It is a pet scheme of the League to get up a fund for a traveling studentship, which would constantly keep two or three of our energetic young men at such work as that

OLD TOWER IN SOUTHERN FRANCE.

described in the letters we have been quoting. It is to be hoped that the effort will not fail to attract the sympathies of our many Crœsuses. In other countries the government patronage afforded to art is not reserved for painting and sculpture only. Architecture comes in for some share. Here there is no free school for architectural students, and their existence appears to be ignored by those who are willing to make themselves known as patrons and promoters of art. It is, perhaps, contrary to the spirit of our institutions

to look to the nation for help in such studies, and many are of opinion that the best of schools is the office of a practicing architect. So it might be, if, as in Europe, the greatest works of the past and present were, virtually, around the corner or across the way. In this most conservative of the arts it is useless to look for progress until we can, so to speak, hitch ourselves on to the past, not by the medium of a long chain of mistaken traditions, but by real and vital contact.

*Roger Riordan.*

### LÉON GAMBETTA.

JOSEPH GAMBETTA, THE FATHER OF LÉON.

[THE following paper, by one who for years had excellent opportunities for knowing M. Gambetta and for studying his career, was prepared during the past autumn at the special request of the editor, and its assignment was made to the present issue previous to the illness which resulted in the death of the French statesman on the first of January. It is thought best to print the paper as it was written, retaining the attitude implied in the author's occasional use of the present tense. ED.]

GAMBETTA, who was for many years the hope of French democracy, is, notwithstanding his diminished influence and the attacks of which he is the object, one of the chief men of the Republic. Michelet, in relating the tragical end of one of the great actors in the first Revolution, exclaimed: "France is yet unconsoled for his loss." Future biographers of Gambetta might repeat this exclamation were the rest of his career to belie the promise

of his earlier years. In the range of modern history there has been no public man who occupied so large a place in the heart and imagination of a great people. The idolatrous love of which he was the object grew up in a day, and during ten years did not cease to sustain him. Fortune all the while heaped upon him her favors. His very blunders seemed to carry him forward. The hostility which his success aroused among the reactionists, who

were no despicable force at the beginning of the last decade, only increased his prestige. Popular favor bore him so high, that when the three presidents—to wit, the chief of the Executive and the speakers of the Chambers—went in 1880 to visit Cherbourg, Gambetta appeared to be invested with the effective supremacy. As the last general elections approached, he seemed to have laid his hand on France, and was universally regarded as the arbiter of her destinies. A few impatient and angry words, spoken under great provocation, brought about an eclipse of his popularity which, to those who gazed on him from afar, appeared as sudden as it was inexplicable, but which to a few judicious friends was neither the one nor the other. Hereafter I shall try to lay bare the chain of causes which brought about this turn in the tide of popular favor, which has since, and, in a great degree through his own fault, continued steadily to ebb from him. To regain the ground that he has lost, it would be necessary for him to modify the policy he was induced to adopt when the death of the Prince Imperial left the Bonapartists without a chief. He has taken, since he went to reside at the Petit Bourbon in the spring of 1879, many false steps which it behooves him to retrace. But, above everything else, it behooves him to give unity to his life, and to shape his course as a statesman upon the lines that he pledged himself to follow as a tribune. In his deflection from these lines is to be found the explanation of his collapse. No doubt his *rôle* as a tribune is played out. The political doctrine which he declared and expounded on balconies, in dancing-halls, in roughly built sheds, in circuses and in provincial theaters, was the great source of his popularity. Gambetta was idolized because he revived the democratic faith which was so fervently embraced by the French nation at the close of the last century. He had himself that faith, which was the reason why he was able to revive it in others. In allowing his flatterers to persuade him that his triumphs were those of a histrion, he wronged himself and the great people who acclaimed him as their leader, and would be glad to hail him again as such.

A knowledge of his ancestry will help the explanation of what is duplex in his genius and disposition, and of that want of unity between his career as a tribune and as a statesman which has been fraught with evil consequences to him. We find a Genoese weft and a Gascon woof, with perhaps a Semitic twist in the thread. The precise hue of his moral nature is as hard to determine as the color of shot silk. Its shiftiness is very provoking to those who, being high-

minded themselves, hold him in affection because of his great qualities. This variability of hue also explains the animosity with which Gambetta is attacked by Republicans who were once his sincere friends. The French like sharp outline, clear definition, and fixed, sober colors. On the paternal side, Gambetta springs from the smallest class of Genoese *mercanti*. Rochefort has attempted to make his grandfather out a highwayman. Nothing is less proven than that he resorted to such a gentlemanly occupation as brigandage. If he did, unlawful gains failed to entail wealth on his children,—one of whom, Veronica, actually receives outdoor relief from the syndic of her commune near Genoa. He had many sons. One of them settled at Orange on the Rhône, and was the ancestor of Claire Gambetta, a singer in a *café chantant*, who went to Cahors to sing when her illustrious kinsman was expected there. Another son, Guisepppe, or Joseph, went to set up in business at Cahors, in Languedoc, as a grocer and dealer in cheap textiles and pottery. His house, which he sold on retiring from trade, has still on the sign-board this inscription:

“AU BAZAR GÉNOIS. GAMBETTA JEUNE.”

From the word *jeune* (junior) we may infer there was a Gambetta senior. Joseph certainly kept aloof from his kindred. His house, well situated in the market-place for business, was low and dark. The Italian grocer was industrious and close-handed. All his faculties were concentrated in the shop. He got on fairly well, but not sufficiently to emancipate himself and his family from cheese-paring economy.

At Cahors, “Gambetta Jeune” took for a wife a Mademoiselle Onasie Massabie, the youngest of four children who had been doubly orphaned from a tender age. She was a daughter of a respectable apothecary at Montauban. The providence of her childhood was a lame elder sister who died unmarried in 1876, and was Gambetta’s housekeeper when he was a young advocate in the Rue Bonaparte, and when, a popular tribune, he lived in the Rue Montaigne. Onasie Massabie, perhaps, was remotely descended from a Jewish stock. Whatever may have been the origin of Madame Onasie Gambetta, she was a woman of rare and noble endowments. Her mind, though extremely practical, was lofty, and her warm heart was the source of fine impulses. She had a hopeful way of taking the cares of life, and decision in facing them. Though plain-mannered and unpretending, she was the contrary of vulgar. A citizen of

the world falling in casually with her in her latter days would not have supposed that her school education was of the most elementary kind, and that she had led the cramped life of a small, provincial tradeswoman. It was from her that Gambetta derived those faculties which have rendered him so apt to personify the democratic movement which he inaugurated toward the close of the Second Empire. To her, also, he owes that taste for the eloquence of the tribune which carried him so high. This remarkable woman and admirable mother designedly stimulated her son's oratorical vocation and turned his mental energies into the channel in which they have been flowing. Unknown to any one, she hoarded up money to enable Léon to choose his own career, and to buy him out of the army in the event of his electing to be a Frenchman, and drawing a bad number for the conscription. His father, who had no prevision of the boy's future celebrity, wanted to secure him against military service by keeping him an Italian. Immunity from soldiering was brought about accidentally. As Gambetta was watching a knife-grinder operate on a wheel, the blade of the knife got detached from the handle and flew into the boy's eye and blinded it. He was very much petted in consequence, and the mother was emboldened by her increased tenderness to insist upon Léon being sent to the Petit Séminaire of Montfaucon to receive a classical education. Her husband was an enemy to higher instruction and thought the communal school sufficient for a boy whose destiny it was to be a provincial grocer.

The late Madame Onasie Gambetta was a reading woman. She subscribed to the "National," when Armand Carrel was its editor, and went on taking it until it was suppressed by Napoleon III. It contained an "essence of Parliament." When Léon came home from Montfaucon on Saturday nights, if his marks were good, he was rewarded with cuttings from the Parliamentary reports of the "National," which were stuffed into his pocket. Paris at this time was in the throes of revolution. The days of February and June, and Cavaignac's Dictature were followed by Prince Louis Napoleon's election to the Presidency, the Roman expedition, and the *Coup d'État*.

The youthful Léon was heart and soul with the popular cause. He was thrown by the days of December into a fever of excitement. On quitting the chapel one Friday morning, he got on a bench in the playground, and delivered a burning harangue. A mixed commission was terrorizing Cahors. Clerical and political reaction had gathered

overriding strength. The rector of the Petit Séminaire was alarmed at the hot eloquence of Léon, and wrote to his parents to come and take him away. He gave the future tribune and statesman an excellent character, and praised his intelligence, assiduity, and lovable warmth of heart. But he also said he was a born demagogue, and was growing up for Cayenne. That, however, concerned the parents; what the rector could not tolerate was his school being turned into a nursery for Jacobins. So home the budding orator was taken. There was nothing which he could be taught at the primary school that he did not know already; it was decided, therefore, to send him to the Cahors Lyceum, but on the understanding that he was to be kept a close prisoner there. Joseph Gambetta, as an Italian, might have been at any moment, with his whole family, expelled from French territory. Prudence was, therefore, incumbent on him. The high-school was in the old priory of Cahors. Léon was kept as if in a jail, and never allowed to go home except in the long vacations. To cheat tedium he threw himself with energy into study. For history and physics he had a special predilection, and became well versed in those Latin authors whose accounts of Old Rome and its decadence were to him full of actuality. Their influence was shown long after in the speech in which Gambetta defended Delescluze.

The future statesman had exhausted the high-school programme in his sixteenth year. His father was obliged accordingly to take him home. Mental energy had ceased to flow in a demagogic channel, but its fire was not quenched. In the Lyceum, Gambetta had risen to a high intellectual plane. It is worthy of remark, however, that he did not catch from his architectural surroundings a particle of mediæval feeling; but the mental training he received rendered a narrow mercantile life distasteful to him. As the "Bazar Génois" was in the market-place its business lay in a great degree with rustics. Léon got sick of dealing with haggling rustics, and prayed to be removed from behind the counter to the desk. As he was a quick accountant, and wrote in a neat, legible, and flowing hand, this was granted. He did his best to give his mind to the business, but failed, and his health sank under the tedium of uncongenial pursuits. No device to which the watchful and tender mother resorted could get the better of his splenic state. He had a fixed ambition which, as it appeared to him a chimerical one, made him restless, discontented, and miserable; it was to study law, and become a teacher to a Legal Faculty in a provincial city. One day his mother called him to her. She said she had been unhappy

in witnessing his growing depression, and she handed him a bag of money which she had saved unknown to anybody—enough to defray the cost of his journey to Paris and enable him to study law there for some time. A trunk full of clothing had been prepared, and was at the office of the stage-coach, where a place was booked for him to the nearest railway. Madame Gambetta instructed him to slip quietly away, in order to avoid a painful scene with his father, who was determined that his son should succeed him in the business. This communication was so unexpected and delightful that for the rest of the day Léon was in a state of bewilderment. He rose betimes next morning, and stole off as instructed. Before Madame Gambetta had instructed her son to follow his vocation, she had taken steps to keep him out of misery when the hoard placed in his hands should be exhausted. In 1856, the year in which Gambetta left Cahors, M. Émile Menier went there on a business tour. He had just opened the chocolate factory at Noisiel, and traded in medicated biscuits and sweet-stuffs. Calling at the "Bazar Génois," he was received by Madame Gambetta. In answer to his proposal to sell his goods on commission she, with tears in her eyes, met it with another. It was in the nature of the one enunciated by the unjust steward. "I have a son of great promise," she said, "whom I want to send to Paris, against his father's will, to study law. He is a good lad and no fool. But my husband, who wants him to continue his business here, will, I know, try to starve him into submission. What I am about to propose is that if I buy your chocolate at the rate you offer it, and buy it outright instead of taking it to sell on commission, you will say nothing if I enter it at a higher price, and you will pay the difference to my son?" M. Menier, from whose lips I had this anecdote, agreed, and for some years carried out the arrangement.

Léon Gambetta was an utter stranger to the French capital. He had not so much as a letter of introduction. On alighting from the train he called a hackney-coach, and when asked by the driver where to go, replied: "To the Sorbonne." The man stared wonderingly, and then obeyed. On arriving, his "fare" stepped out and looked at a building of gloomy and prosaic aspect. "That's the Sorbonne," said the driver, "but nobody lives there except the porter. I suppose you are a country relation of his?" "No," said Gambetta, "I have come to study, and would be obliged if you could recommend me to a cheap hotel." The Jehu took him to a mean-looking *garnie*, or licensed lodging-house, facing the Sorbonne. There Gambetta asked

for "the cheapest room in the house," and was shown to a garret, which he occupied until his father pardoned him and agreed to make him an allowance. The student from Cahors boarded at a dairy. For two years his life was one of hard work and solitude. His arrival in the French metropolis coincided with public *fêtes*, illuminations, and reviews to celebrate the Prince Imperial's birth and baptism, and the signing of the Treaty of Paris. The impressions he received in 1856 explain, in some degree, the numerous points of analogy between his theory of an authoritative and highly centralized democracy and Imperialism. They were like the river flood leaving a deposit which, though it may in the end be fertilizing, is miasmatic. There were times when Gambetta was only separated from the Empire by the remembrance of the *Coup d'État*. But he was not conscious, until the death of the Prince Imperial, that his political system bore a strong resemblance to the Napoleonic one. Soon after that event, when Bonapartists gathered round him, tempting him to become their disguised chief, he discovered the likeness. He then began to think seriously of bringing the Party of the Appeal to the People (*Appel au Peuple*) (less M. de Cassagnac and a few Jérômists) into the governing majority of the Chamber. The vehicle for effecting this change of front was to have been the *scrutin de liste* bill. Gambetta, no doubt, flattered himself that he would be able to impose much of his original programme on his new allies, while they reckoned upon using him as an instrument for a second exploitation of France. He let himself be persuaded that in virtue of the principle of atavism, the French would never be able to do without a Cæsar, and that since the uprising of one was inevitable, it would be better that he should be a popular man. Atavism precisely cuts at the root of Bonapartism, which was only a prolongation of the Bourbonism established by Henry IV. and Richelieu, and which entered its period of decrepitude in the old age of Louis XIV., to perish in rottenness and imbecility in the eighteenth century. The active principle of the French nation was favorable to communal development, of which there was an arrest in the long war with England, which began in the reign of Edward III., and ended in the regency of the Duke of Bedford. France had attained a very high degree of health, wealth, and happiness when Philippe of Valois came to the throne. The communes in the north and the cities in the south had attained a high degree of prosperity and civilization. Joan of Arc's victories over the English threw power into the hands of a

feudal nobility which, at the Renaissance, attempted to establish a federal system on an evangelical basis. In Admiral de Coligny this movement found its highest political incarnation. It was an instinctive one, suppressed by treachery, massacre, an alliance between Catherine de Médicis and Philip II. of Spain, and finally the League. There was another arrest of national development. Henri IV., who, after Coligny's death, became the leader of the Federalists, stepped into the shoes of the extinct Valois after Ivry, just as the Bonapartists wanted Gambetta to become the disguised inheritor of the Empire. The tyrannies of Richelieu and Louis Quatorze prevented the active principle of the nation from asserting itself. It broke loose in 1793. As the Government of France is still highly centralized in the Medician, Richelieu, Louis Quatorze, and Napoleonic lines, it is to be feared that the cycle of revolution is not yet exhausted.

At the Law School Gambetta was a hard worker. He was then pale, slender, and had a physiognomy at once interesting and picturesque. There had been a good deal of sadness in his life, which his face told of. His countenance showed that his mind was not shaped on a small pattern. The outlines were ample, and there was an imposing air of grandeur in the carriage of the head. A full, wide brow indicated a brain rich in the objective faculties. But the equilibrium of the forehead was imperfect. Height was wanting, and the profile line receded too much toward the crown. Observation outran reflection. It was not the head of a Demosthenes, a Cicero, or a Cæsar, but that of a Rienzi. The capacity to assimilate the ideas of others was prodigious. A mass of raven-black hair, long and slightly curled at the end, betokened a vigorous temperament. In the school amphitheater, M. Valette, an old professor at the Faculty of Law, was struck with Gambetta's assiduity, with the originality of his look and manner, and the resonance of his voice. In the second year, one day after a lecture, he detained the Cahors student, whom he interrogated discreetly about his life and prospects. On learning how his father had broken with him and would not suffer his name to be uttered in his presence, M. Valette said: "*Monsieur, votre père fait une bêtise*" (Your father acts stupidly). "You have a true vocation. Follow it. But go to the bar, where your voice, which is one in a thousand, will carry you on, study and intelligence aiding. The lecture-room is a narrow theater. If you like, I will write to your father to tell him what my opinion of you is." M. Valette wrote, appealing to affection and to reason, to the father and the tradesman. "The best

investment you ever made," he said, "would be to spend what money you can afford to divert from your business in helping your son to become an advocate." Finding herself supported by the high authority of a professor at the Law School of Paris, Madame Gambetta continued to stand up for her son. She was aided by her relatives and friends, and her husband yielded.

In 1858 Gambetta was a graduate of the Law School, but he could not be admitted to practice at the bar for three years more. In this long interval he did nothing. Having money enough to keep his head above water, he led the life of a Quartier Latin student of active mind, ambitious instincts, and unrefined tastes — one, moreover, devoid of religious ballast. It was a life that in many respects was good for the intellect, but unfavorable to the development of moral sensibility. In a curious manner he was drawn into the legislative theater, on the boards of which he was one day to be the greatest actor. An usher of the Corps Législatif, whose acquaintance he had made in the dairy where he boarded, admitted him to the gallery to hear the debates, of which reports were not given in the journals previous to 1861. He also gave him admission to the lobby, where he obtained a close view of the chief men of the empire. During the legislative session he regularly availed himself of the usher's services, and acquired much direct knowledge of politics and politicians. In the Bohemia into which, in his idleness, he drifted, he made the acquaintance of some men of intellectual value, and of others of small worth, whom, because they were old chums, he has since hoisted into great official posts. The *cénacle* was the Café Procope, in the Rue de l'Ancienne Comédie, where Voltaire used to go between the acts of tragedies which he brought out at the Odéon. Courbet, Manet, Carjat, the photographers, and Alphonse Daudet, were of the set into which he fell in the Quartier Latin. He picked up Spuller and Léon Renault at the Palais de Justice. Laurier was another bar acquaintance. A member of the *cénacle* was Ranc, who had a passion for political conspiracy, and was affiliated to the Mazzinians. He had been transported at the *Coup d'État*, but escaped from the silos of Algeria and remained in Italy until a general amnesty was granted. Alphonse Daudet and Gambetta took their meals together at a cheap *table d'hôte* in the Rue de Tournon. It was a boarding-house akin to the Pension Vautier in Balzac's novel of "Le Père Goriot." Neither of the young men had visions of that gastronomic paradise which Trompette was to create at the Palais Bourbon. Daudet

closely observed the Cahors student, and has told the world in "Numa Roumestan" what manner of man he thought him. It was Daudet's nature to watch human creatures as entomologists study insects. He had a particular reason for studying Gambetta, whose applause in the gallery of the Chamber, when any of "the five" deputies of the Opposition spoke, had been noticed by the President, De Morny. That personage was curious to know who the audacious habitué of the gallery was, and applied for information to his secretary, Ernest Daudet, who asked his brother to procure it for him. Nothing was easier, inasmuch as Alphonse and Gambetta dined at the same *table d'hôte*, and the future tribune was open and expansive. At the Molé Conferences (a forensic society at which young advocates debate under the tuition of old ones), a German Hebrew, who affected red republicanism, was simultaneously charged to watch Gambetta and furnish reports about him to the Prefect of Police.

M. Alphonse Daudet also knew Rochefort, who was in 1859 a clerk at the Hotel de Ville, a contributor to "La Presse Théâtrale," and was bringing out a Satirical Dictionary of Conversation, and had produced a clever farce, "The Well-dressed Man," at Les Folies Dramatiques. Daudet imagined that the young satirist and Gambetta would suit each other, and asked him to meet Rochefort at dinner at the *table d'hôte*. The "Red" Marquis, who was then an Orleanist, and as well dressed as the chief personage of his farce, conceived an aversion for the future tribune. The one was a born Parisian and an ingrained aristocrat. He was natty, refined in his tastes, and had the irritable nerves of a woman. His complexion had a cadaverous tinge, and his skeleton face was lighted up by a pair of deep-set and permanently blazing eyes. His wit was sardonic, and, though he was good company, his tongue castigated. Gambetta was slovenly in his person. Being used to a warm climate, he kept his hands in his pockets, to resist the cold; and when he was not excited by his own eloquence, his shoulders were drawn up to his ears. His exuberance jarred on Rochefort, who, on his side, impressed the orator disagreeably. They were predestined to be enemies. For ten years they kept aloof from each other, to meet again on the Irreconcilable Platform, at Belleville. Rochefort's latent antipathy burst forth, when he was an exile in Geneva, with a fury that has never abated. Gambetta, for whom the "Lanterne" had prepared the political stage on which he was the chief actor after the collapse of the Empire, was not so forgetful as Rochefort imagined

of the obligations which he was under to him. But he was too supine when urged to press M. Waddington on behalf of the exiled satirist for an amnesty. Rochefort's anger was moreover inflamed by a conversation which took place in the spring of 1878, at the table of Madame Adam. That lady having urged his claim to republican gratitude, the famous orator, who had risen to be the Warwick of the Third Republic, lost his temper, and said that the articles then sent from Geneva to the "Mot d'Ordre" were in a fish-wife style, seasoned with kitchen salt, and quite ignoble. M. Émile de Girardin, who was by, repeated the harsh criticism to a person, by whom it reached the ears of the Red Marquis.

In Gambetta's idle days in the Quartier Latin, the Empire entered upon a new phase. Orsini's attempt had thrown the Emperor back into the ideas on Italian independence, which had taken hold of his brain in youth. He made war on Austria to emancipate Italy. It was impossible for him to take credit for liberating Italians and keep Frenchmen in slavery. While the laurels won on the plains of Lombardy were fresh, he thought it advisable to grant a full political amnesty, to restore to the Chamber the right to vote an address on the imperial speech at the opening of the session, and to the journals the privilege of reporting (but only *in extenso*) the debates in Parliament. This meed of liberty only emboldened foes, and gave the Orleanists room to move about and agitate. They started a militant journal, "Le Courrier du Dimanche," which at once became a power. It was kept up with funds provided by a liberal ex-minister of Louis Philippe, M. Duvergier de Hauranne, and was directed by Gregory Ganesco—a subtle, flexible, very "slippery" and polyglot Wallachian. This Ganesco was an illegitimate son of the Chevalier Von Gentz, and a man rich in expedients, a hard worker when he had any heavy business to get through, and a clever, ready writer. He was absolutely devoid of *sens moral*, and, while running the Orleanist journal, was in the secret service of the Empire. For the staff of his Sunday paper he enlisted Weiss, Prévost-Paradol, Chalmel Lacour, Spuller, and Édouard Hervé, who is still an Orleanist. M. Thiers gave the "Mot d'Ordre" to Ganesco and Prévost-Paradol. Through Spuller, Gambetta was drawn into this curious Orleanist center of agitation. He never wrote for the "Courrier du Dimanche"; but he made, with some members of its staff, two pilgrimages to Twickenham. At the time of his second visit he was canvassing Belleville. The Duc d'Aumale, in a walk in his grounds along the Thames, said, apropos of the river and some apple-trees:

"They remind me of St. Cloud, and make me homesick. When do you think we are to go back to France?"

Gambetta answered:

"No patriot should wish for your return. Imperialists for their own safety, and Republicans from loyalty to their cause, are bound to keep you and the other members of your family in exile." (The word Opportunist was not invented when Gambetta was last at Twickenham.) When he had spoken, he noticed that the face of his interlocutor dropped. The Duke's secretary called, in 1870, upon the Deputy of Belleville, whom he had known in the Quartier Latin, to ask his support for the petition of the Orleans princes to be admitted to the rights of French citizens. The answer given to the secretary was, "In acting as you desire, I should prove myself an indifferent patriot." As Rochefort and other Red Radicals charge Gambetta with being an apostate Orleanist, I think it well to show on what a slender basis the accusation rests. Orleanism was the only organized form of opposition to the Empire previous to 1863, when Garnier-Pagès created a militant democratic party, which went on rapidly from victory to victory. Gambetta was also brought into relations with Orleanists at the office of M. Crémieux, in which he worked for some years as a law secretary. It was this eminent advocate, who, in the days of February, proposed in the Chamber the Regency of the Duchess of Orleans, whom, with her two sons, he escorted there. He went from advanced liberalism to republicanism in '48, on being named a member of the Provisional Government. Crémieux was the first Hebrew ever called to the Paris bar. At Tours, when he there headed the Delegate Government, I heard him express himself timidly in favor of the claims of the Comte de Paris, which Lady Waldegrave urged upon him in a series of letters to Madame Crémieux. Whether nineteen years ago Gambetta and his masters were or were not Orleanists, they resorted to Orleanism as a means for obtaining concessions from the Emperor. That group had an état-major well disciplined and redoubtable, because headed by Thiers, who secretly was hostile to every plan for a monarchical restoration. In canvassing Belleville in 1863 and 1869, Gambetta learned what vitality there was in the democratic principle, and resolved to become its exponent.

There was no steady progression in Gambetta's rise to political fortune. He advanced *per saltum*. The first great jump was into M. Crémieux's office. To be allowed to turn down the work for an eminent advocate is deemed a high privilege by young French

lawyers; it was one that Gambetta attained on the day on which he argued the first case that was confided to him. It came to pass in this way. His client was an eccentric creole from the Antilles, who had picked him up adventitiously. Days and nights were spent in conning the brief and laboring at a set oration. The first lawyer of the age in civil business, Dufaure, was to plead on the opposite side. On the eve of the day on which the suit was to be heard, the novice sat up until day-break, and went nervous and confused before the judges. When the case was called on he rose to address the court, and started with a grand exordium. Dufaure eyed him with an expression of scornful irony, which upset him in the midst of a florid sentence. Seeing Gambetta hopelessly floundering, the hardened veteran on the other side begged for "an adjournment of eight days, to give his young adversary time to collect his ideas." It was granted. The creole's attorney, believing in Gambetta's forensic ability, went up to him and asked leave to coach him. Next day he called and thus admonished him: "You must not try to learn your speech by heart. State now to me the case in a conversational sort of way as if you were instructing me. When I raise objections answer them. Read over and over again your authorities. When I come back, re-state the case—but in no speech. You will thus get the whole affair methodically into your head *and on the tip of your tongue*. Juries want eloquence, because they don't understand law. Civil judges want sound argument and to be saved trouble. They are sick of advocates' talk, and are therefore pleased with lucid brevity. So far as it is consistent with gracefulness of style, be laconic. Take care not to be frightened at the sound of your own voice, and be sure not to talk loud at the outset. Loudness is only good in the finale, or if the judge is falling asleep." The attorney made another call on the eve of Gambetta's second appearance in court. He came to propose spending the early part of the evening at an amusing theater. On quitting his young friend, he invited him to breakfast with him next morning. The repast was of delicate oysters, a tender beefsteak, and not too much of it, and old Bordeaux wine. Not a word was said about the case. A cigar was brought in with coffee, to be quietly smoked. The attorney and the young advocate walked from the house of the former to the Palais de Justice, and Gambetta went into court in a pleasant state of well-being. Dufaure was there; but his adversary was not confounded by his presence. He entered quietly into the kernel

of the affair, and gradually warmed. The case was a heavy one. It was argued solidly, and yet in a brilliant manner, which was an evident treat to the judges. After Dufaure spoke there was a short rejoinder. Judgment was deferred, but the veteran lawyer came up to the novice to felicitate him on his talent and acumen. Other old and eminent advocates pressed round to congratulate. One of them was Crémieux. He offered on the spot to take Gambetta into his office as a secretary. The brilliant and skeptical Laurier was already at a desk there. He struck up with the newcomer that friendship which never abated, and acquired over him an ascendancy which eventually led to some bad consequences. Gambetta was in the malleable period at Crémieux's. There was a tinge of Laurier's skepticism in the Opportunist policy into which the "République Française" drifted, both before and after MacMahon's resignation.

Between the delivery of his maiden speech and the one in defense of Delescluze—who was prosecuted for aiding in a manifestation at the tomb of Baudin (a Deputy shot on a barricade at the *Coup d'État*)—Gambetta made no mark at the Palais de Justice. He occasionally appeared for Crémieux in secondary cases, and now and then pleaded for a journalist, in whom the public took small interest, before the tribunal of Correctional Police. He was noted, however, by his legal brethren, for his southern verve, dash, and originality, his fine, far-reaching voice, and Dantonian manner, which, to some extent, was assumed. The secret police watched him at his lodging, on a fifth floor, in the Rue Bonaparte, where his aunt, Mademoiselle Massabie, had come to act as housekeeper and domestic drudge. There was barely furniture enough to meet the rule of the Council of the Order of Advocates, in virtue of which young barristers are obliged to furnish the chambers in which they live. It was the aunt's good pleasure to drudge. On Sundays members of the Café Procope cénacle and junior members of the legal profession gathered at the apartment, which served as a study, dining, and reception room. As many as could be accommodated at table sat down at the luncheon-hour to partake of a leg of mutton rubbed with garlic, which the aunt cooked, or some other homely and high-spiced southern dish. Those for whom there was no place at the board smoked. Every one talked, and Gambetta the loudest of all. They passed in review the lectures of the week at the schools of the Faculties, the Sorbonne, and the College of France; the events at the Palais de Justice; the plays that had come out or were going to be produced; and arranged *clagues* to damn authors of

imperialist proclivities. Gambetta was the king of the company. He and his friends had the utmost confidence in themselves, and in their plans for renovating art, science, literature, and politics. They burned with ambition to knock down the Empire and to stand in its place, and were impatient of the restraints which it placed on the tongue and pen. Paris, at that time, was reduced to the silence of an exhibition of wax figures. This oppressive stillness Gambetta was destined to break. The young briefless barristers and Bohemians who gathered round him had a vague feeling that Gambetta was the coming man, and hung to his skirts. As he was good-natured, he let them hang on, and when he had the power to do so, shoved them into lucrative offices. In a police report about the Sunday gatherings in the Rue Bonaparte, Gambetta was described as eaten up with ambition, and capable of developing into a Marius if not gained over to the Empire. He was ambitious, but this passion took no definite form before he was elected for Belleville.

The great events of history often hinge on trifling circumstances. A visit paid by the Empress Eugénie brought under her notice a procurator named Pinard, who was a very able lawyer, and a miniature man,—admirably proportioned, handsome as an Adonis in his small way, natty, gallant, fluent, and skilled in paying ingeniously turned compliments. He was very clerical, and an enemy of the Duc de Persigny, whom the Empress hated, and who wanted the Emperor to take confidence in the vitality of the imperial principle, and grant the liberties to speak in public and to print newspapers, which had been enjoyed in Louis Philippe's reign. Pinard became the darling of the court ladies, and the Empress insisted upon the Home portfolio being given to him. The audacious manikin at once began to play with fire. To prove that Persigny was wrong, and that it would be dangerous to make concessions to liberals, the Home Minister organized a seditious manifestation by police agency. The young republicans and old revolutionists fell into the trap, and went, on the All-Souls' Day of 1868, with M. Pinard's spies to lay crowns and make speeches on the grave of Baudin, who was killed, girt in his Deputy's scarf, on a barricade at the *Coup d'État*. The *bona-fide* manifestants were prosecuted, and one of them named Delescluze asked Gambetta to defend him. If the Court of Correctional Police, before which the affair was to be tried, had not been presided over by a M. Vivien, Delescluze's counsel might still be a practising barrister. That judge was very short-sighted and hard of hearing. He generally decided

according to reports made to him in his private room of the trials that he had "heard," or, when the case was political, according to instructions sent from the Tuileries. As, by reason of his infirmities, he was slow, hesitating, and timorous, and was devoid of independent spirit, he suited the Emperor. Advocates who pleaded before him for journalists were in their clients' interest wont to plead extenuating circumstances and to conciliate the government. But Delescluze was a fanatical revolutionist and an old stoic, whose will had been strengthened by a long sojourn at Cayenne. All he asked of his counsel was to hit hard the author of the *Coup d'État*. As general elections were approaching, and Gambetta wanted to get into the Chamber for a Red Constituency, he was eager to avail himself of his client's instructions and M. Vivien's deafness to make a splash in the stagnant pool of politics. Any other judge would have silenced him, when, in a fervid oration, he was leading up to the parallel between Catiline, such as he was drawn by Sallust, and Napoleon III. The Roman historian and jurist described Catiline and his crew when they were beaten. But Gambetta anathematized his modern and victorious prototype when worshipers of success were lauding him as the master-mind of Europe and the arbiter of her fate. After giving a vivid picture of the author of the *Coup d'État* and his accomplices, and of the massacre of peaceful citizens on the boulevard, the orator exclaimed, "They talk here of the *plébiscite* and of ratification by a national vote. The will of the people can never transform might into right. A nation is no more justified in committing suicide than one of its individual members. And after seventeen years we are forbidden to discuss the iniquities of December. Government will not succeed in always holding the gag where they want to keep it. This trial must go on until the world's conscience has received the satisfaction that it demands, and until the wages of crime are disgorged. In your seventeen years' mastery of France you have never dared celebrate the second of December. It is we who take up the anniversary which you no more dare face than an affrighted murderer can the corpse of his victim." Loud as Gambetta thundered, M. Vivien did not understand what he said, until he had withdrawn from the bench to deliberate on the judgment which he was to render. One of his assessors then told him. The direct attack on the Emperor came with terrible force. Rochefort, who was an exile in Brussels, by making out the Empire ridiculous as well as odious, had prepared the way for Gambetta, who, the following summer,

was returned by Marseilles and Belleville to the Corps Législatif.

Soon after his double election Gambetta started for a tour in Germany and Switzerland. He was threatened with consumption, and had been ordered to pass a season at Ems, and then try the grape and buttermilk cure at Bex. At the German spa he met Bismarck casually and had some conversation with him about the prospects of the Empire. When they separated, the Prussian statesman asked M. Émile de Girardin who the young Frenchman was.

"Don't you know? Gambetta!"

"The irreconcilable Member for Belleville?"

"Yes. I thought he was a mad fire-brand from reading what the papers said about him. But he is very intelligent and has a shrewd judgment. He will go far. I pity the Emperor for having such an irreconcilable enemy."

"His irreconcilability," answered Girardin, "will depend upon the future policy of the Emperor. Gambetta is a *Jacobin autoritaire*, and nearer to the Empire than he imagines."

On the way to Switzerland, Gambetta took Vienna and the Tyrol. At that city he presented a letter of introduction from M. Thiers to an Austrian statesman. He had asked for it in the Chamber, and it spoke of the bearer as not only being a young man gifted with eloquence, but endowed with prudence and common-sense. At Bex, Gambetta stayed with M. and Mme. Laurier, with both of whom he was extremely intimate. Health returned in Switzerland. But the slight figure grew corpulent, and, notwithstanding frequent resorts to a depleting regimen, it has since gained in stoutness.

Gambetta entered the Chamber on a programme to which he voluntarily swore in public at Belleville. It embraces the abolition of standing armies, local decentralization, and the election by universal suffrage of functionaries. This document, which is omitted in the Reinach edition of Gambetta's speeches, produced a stupendous effect. Its omission contributed to the ebb in the tide of Gambetta's popularity. Opportunism, as it was first understood, meant payment by installments. So long as it was professed to be this it had with it urban democracy and drew toward it the rural electors. The quarrel with it only began when it was proclaimed by its authors a bad bond, which they did not intend to honor. Since the defeat of MacMahon, the Opportunist platform has been the negation of the Belleville one. "La République Française" has become one of the last strongholds of the old spirit of military adventure. The hostility of that journal to every scheme for communal or municipal form of local self-

government is rabid. It struggles to keep up the contemptible and anti-democratic prefectorial rule in the departments. Prefects live in palaces in departmental chief towns and draw large salaries. They are closely dependent on the Home Minister, are obstructive to local energy, and only of use to concentrate secret police information and to advance the interests of government candidates at legislative elections. There is no scope in the prefecture for great administrative or any other kind of ability, whereas it was communes and municipalities which built the cathedrals and town-halls of Picardy and Flanders, and rendered Florence the queen of mediæval Italy.

Gambetta's attitude in the Corps Législatif, in which he sat for a little more than a year, was one of reserve, until M. Ollivier brought forward the plebiscitary scheme, which M. Rouher and his group secretly imposed on him. On this occasion the Deputy for Belleville made in the Tribune his confession of Republican faith. The speech in which he vindicated the unalienable right of the nation to sovereignty was the most perfect he ever delivered. It cut at the root of the imperial theory of government. No dynasty could be *de jure* established upon a national vote. This was one of the orations of Gambetta which does not lose in being read. The style is copious without being redundant, the arguments are weighty, and the general tone is one of lofty dignity. This speech at once placed Gambetta at the head of the democratic Opposition. He was as much the artist as Jules Favre, and, in a higher degree, the statesman. On the question of peace or war, which was raised in the month of June that followed, his manner showed embarrassment. He, however, decided to vote the war supplies demanded by M. Ollivier and Marshal Leboeuf.

On the night of the memorable Third of September, the day after the surrender of the Emperor at Sedan, Gambetta concerted, with his intimate friends, what to do on the following day. Clémenceau, who had just returned from the United States, Madame Laurier, and Bratenet,—the vintner, to whose good offices Gambetta owed his election for Belleville,—had gone round that faubourg, and other democratic parts of the city, to invite patriots to march on the House of Deputies, and prevent the formation of an executive committee, which was to govern in lieu of the Empress Regent, but in her name—a project to which Thiers and Grévy had lent themselves. Thiers, when told that Gambetta was endeavoring to defeat it, said of him: "*Cet homme mourra dans la peau d'un fâcheux*" ("This man will always be a troublesome fellow"). The Chamber was in-

vaded by the freshly organized National Guard, which had fire-arms but no uniforms, and the Republic was proclaimed. To get before his electors, who intended to install a radical government at the Hôtel de Ville, the deputy for Belleville drove rapidly there with Spuller. He was joined by other representatives of Paris and by General Trochu, and wrote on slips of paper, which were thrown out to the armed multitude, the names of his colleagues who had agreed to enter a provisional government. The Interior he kept for himself, and lost no time in proceeding to the Ministry. He wanted to direct the general elections, and to replace all the imperialist prefects by men of a democratic shade of republicanism. His friend Laurier was named Secretary-General to the Home Department, and was sent as its delegate to Tours. He accompanied thither the senile M. Crémieux (who cumulated War and Justice), and Admiral Fourichon. Laurier at once began to negotiate the Morgan loan, which was to be to him a source of fortune, and to facilitate the operation published a gigantic canard about a victory of the Paris National Guard over the Germans. He stood in the way of a National Assembly, a convocation—a measure of which Crémieux, Thiers, and Grévy were partisans. When pressed hard by them he found means of advising Gambetta that reactionary counsel prevailed, and that to save the Republic he should quit Paris in a balloon and come to Tours. M. Crémieux, whose wife corresponded about the Orleans princes with Lady Waldegrave, was friendly toward them, but did not believe a monarchical restoration feasible. Nor had he the slightest faith in the military preparations for defending the Loire that Admiral Fourichon was making. His chief object was to convene speedily a national assembly, and throw on it the responsibility of a continuance of war or an inglorious peace. At Tours, in the councils held in the Archbishop's palace, Laurier stood out against his old master's policy. The reason he urged was, that if there were general elections soon after the fall of the Empire, radicals would predominate in the sovereign assembly. It may have been that he sincerely dreaded this result. Although elected on a democratic programme in Toulon, in 1871, Laurier at Versailles joined the clerical section of the Right. His detractors ascribed this step to anxiety lest, if he remained true to his pledges, the Morgan loan to the Committee of National Defense and other financial transactions at Tours and Bordeaux might be closely scanned by a Commission of Inquiry.

Gambetta reached Tours simultaneously with Garibaldi, whom Laurier relegated to a servant's room at the prefecture. There were

conflicting opinions in the Government, but only there on the subject of resistance. Wherever the invaders did not show themselves, there was an idea that France would eventually be victorious. Few were aware, in the early stages of the national defense, to what an extent the military spirit generated by the Revolution had been undermined. It may be here observed that this spirit had been kept up by the liberal and Voltairian bourgeoisie of the Restoration and of Louis Philippe's time, for whom Thiers wrote his history and Béranger indited his Napoleonic songs. In 1870 the bourgeoisie professed Chauvinist ideas, but did not feel them. Thiers was the first to renounce the doctrine inculcated in his own historical works. But when he began to do so his words found no echo. He was also one of the few men in the temporary capital on the Loire competent to judge of the military situation. The generals that were there had had experience chiefly in irregular Algerian warfare and the Arab Bureaux. They were ill-disposed toward the Republic, and bereft of all martial qualities except indifference to human suffering. Both they and the crude civilians who helped the War Minister trusted to drum-head courts-martial to atone for the want of that steady, sharp-eyed discipline which is only to be kept up by officers who sacrifice their ease to duty. Executions were of shocking frequency before Gambetta's attention was called to this dark fact. They took place at dawn, in the faubourg of Tours lying nearest to the Cher. A soldier dying of inanition, who pilfered food, was given a short shrift, and there was no organization for lodging and feeding the raw levies. The working classes were honest, patient, and ready to make any sacrifice demanded of them by the State; but they were without initiative, and supine. Railway directors were in the Bazaine conspiracy, and shunted food and munition trains laden with supplies for campaigning regiments. Thiers, on his return from his diplomatic tour from London to St. Petersburg, through Florence and Vienna, denounced as madness the efforts to resist invasion, and called the Dictator a "raging madman." When the premature and intensely harsh winter began to decimate the Mobile Corps and the invasion to spread west, the denunciations of him were repeated. Gambetta at the outset had only to struggle against dishonesty above and inertia below. But from the day that Prince Frederick Charles was able to quit Metz, he had to contend with a hostile animus. His theoretical and technical ignorance was severely criticised and his blunders magnified. A clear distinction was drawn between Gambetta commander-in-chief of the army, and

Gambetta the tribune. He is still under the illusion that the military part he played was the source of his popularity after the war. His strength lay in his harangues, which awoke the old republican feeling that had lain dormant in the provinces seventy years. Aided by the strangest chapter of events in modern history, he had brought about a democratic revival and helped to fuse Paris and the provinces. This was the great work that he began at Tours and Bordeaux, and continued when the Assembly was at Versailles. In accomplishing it he was sustained by the disinterested friendship of MM. Adam, Spuller, Poujade, Brisson, and Clémenceau, who was his second in the duel with M. de Fourtou, and who broke with him for the policy he adopted on the morrow of Grévy's election to the Presidency. Clémenceau wanted Gambetta to accept the responsibility of office and propose to the Chambers a total amnesty for participation in the civil war.

Gambetta had a narrow escape from being captured near Bourges by Von Zastrow, and sent to join the Emperor at Cassel. When that general was at Auxerre, M. Paul Bert was prefect at the place. It was his native town, and he had been sent to it to organize the defense. In discharging his mission, he gave proof of strategical ability and resource. The scientist, acting on the maxim that all is fair in war, corrupted an Alsatian valet of Von Zastrow. The servant agreed to slip into the potatoes of his master and aid-de-camp and military secretary opiates furnished to him by M. Paul Bert. The general was a deep drinker. When he was slumbering, after dinner, Fritz, the man, was to rummage his pockets and his desk, and bring dispatches from headquarters to the prefect to be read by him. One evening a letter was brought addressed by Moltke to Von Zastrow. It instructed him of the exact position of Bourbaki's camp, and of Gambetta's intended visit of inspection to it. The general at Auxerre was to coöperate with a detachment of Prince Frederick Charles's army in hemming in the camp. M. Paul Bert lost no time in riding across country to a telegraphic station that was in communication with Bourges, and warning the general and Gambetta. Bourbaki was to have kept on the south bank of the Loire, while Chanzy fought on the north. But on reading Moltke's instructions to Von Zastrow, he decided, under the pretext of going to coöperate with Garibaldi, to retreat into the Tura mountains. Gambetta arrived in the camp in time to be consulted. When he was joined by M. Paul Bert, he sent him to Lille to help General Faidherbe. One of the defensive measures of the savant was to

post the names of cowardly mobiles at the doors of town-halls, post-offices, and factories, and to invite the girls to read the lists of shame. Gambetta followed M. Paul Bert to Lille, to stimulate the population there, and returned by Cherbourg. Ten years later he revisited that naval stronghold as President of the Chamber. He was drawn by his recollection of the invasion into making a speech which alarmed Germany. There are some men who habitually put a guard upon their lips and weigh their words in uttering them. Gambetta is not one of these. From infancy upward he has nearly always been king of his company, and surrounded by adoring female relations and intimate friends who at once regarded him as a comrade and superior. The latter were of his own age, and their presence imposed on him no reserve. He had not been brought up like Cavour, in the severe tradition of a patrician family.

Gambetta sprang from the smallest *bourgeoisie* of a provincial town. His southern loquacity and expansiveness were unbridled and have always been so until the extreme radicals broke with him and turned to rend him. Thus his tongue, which has been his chief source of influence with the French nation, has also come to be an unruly member, and often expresses with too much emphasis passing moods and fugitive thoughts. No post-collegiate study has sobered, strengthened, and tempered the mind and imagination of Gambetta. His books are men and things, and he does not so much learn as *pick up*. This is in consequence of the loss of one eye, and the delicacy of the other. His ocular weakness places him at a disadvantage relatively to other statesmen. When even Thiers was obliged to retire from active politics, he returned to the arena intrinsically greater than he was in quitting it. The interval had been devoted to study—not the less severe because recreative—of art, science, history, philosophy. Gladstone betakes himself to the Greek classics. Cavour busied himself in writing agricultural treatises and review articles. But close application to books is forbidden to Gambetta, and to correct a plethoric habit of body, when he is in the country he is obliged to take an amount of physical exercise which is unfavorable to meditation. His ocular infirmity explains why his intellect does not follow the same law of growth as the minds of Thiers, Cavour, Burke, Gladstone, and Sir Robert Peel. Study in mature life brings up and brings out great personal qualities, and gives succulence to that best fruit of our elderly years—wisdom. Gambetta, when he became the virtual head of the Republic, was flattered by the moneyed and aristocratic class and taken hold

of by them. Although he has more natural sympathy with the blouse than any public man I can think of, he was estranged from his old and true allies of the workshops. The smaller-minded upstarts around him at the Palais Bourbon were for striking up a friendship with pleasure-loving Dives.

The former tribune has many qualities besides eloquence which place him above his rivals. One is geniality. Another is absolute freedom from *bourgeois* curishness. He affects an interlocutor as would pleasant sunshine, and he has ready sympathies which command sympathy. His experience of human nature and skill in parliamentary management are very wide. It is said that at the Palais Bourbon he lost his faith in principle. What befell him there should strengthen him. Whenever he trusted in such material forces as his cook, Trompette's, dishes and other forms of corruption, defeat soon followed. His highest achievements as a tribune and militant republican politician were victories of pure moral force. I witnessed his action at Tours and Bordeaux, at which last place I saw him, in the teeth of a freezing north wind, harangue from a balcony an immense concourse of country people. It was so good, grand, and invigorating that I feel, in noting his recent backslidings, as Neot did in rebuking Alfred the Great, before adversity had purified that king. In the militant part of his career Gambetta's confidence in his principle was never shaken. The brightness of his hope enabled multitudes who had been in secular darkness to see the way before them. His boldness was never daunted. The advisability of implicating him in the charge of communism brought against his friend Ranc, was often debated. It is certain that at St. Sebastian he did foment the communal insurrection in Paris and the provincial cities, and he might have been, with a show of justice, condemned by a military tribunal to join Rochefort and Louise Michel in the antipodes. Gambetta also was warned that if the Élysée party went to the length of a *coup d'état*, in 1877, he would be arrested and shot. There would not have been any means of escaping from his lodgings in the Chaussée d'Antin, if the gendarmerie had entered in at a front door, the garden being surrounded by dead walls six stories high. Such was the public favor he enjoyed that not a person taunted him with the political blunder made at Bordeaux which gave in the Assembly preponderance to the royalists. When that body met to sign away Alsace and Lorraine, Gambetta did not realize its *de-facto* sovereignty. His position was that if the

National defense had been carried on with spirit France could have made at least an honorable peace. One of the departments which sent him to the Assembly was the Haut-Rhin. When the other deputies of Alsace and their Lorraine colleagues met at Bordeaux, Gambetta proposed to resign *en masse* the day on which the peace preliminaries were ratified. They consented. I saw them, headed by Gambetta, quit the house, and noted the void their absence had made on the republican side. President Grévy, who was Speaker, refused to accept their resignation until they had thought over it for twenty-four hours. A dramatic incident strengthened their resolution. The venerable Jean Kuss, mayor of Strasburg, in leaving the theater which was used as a Parliament House, staggered up to Gambetta, his face blanched with emotion, and said: "Let me grasp your patriot's hand. It is the last time I shall shake it. My heart is broken. Promise to redeem brave Strasburg. *L'Alsace vous attend.*" He fell in a state of syncope. When the carriage into which he was lifted reached his hotel, he was dead. "*Elle attend,*" the motto of Henner's patriotic picture of Alsace, is taken from Jean Kuss's dying words. This work of art was dedicated to Gambetta, who probably would not have advised a protestation which secured a majority to the royalists whenever they might fuse, if he had not anticipated the communal rising and counted upon its success. Unquestionably that movement prevented the Comte de Chambord's advent at Versailles as king.

It was during the Universal Exhibition in 1878 that Gambetta reached the climax of his popularity. He then appeared the incarnation of Republican France in the widest meaning of the term, and was what he looked. Any one who could give an introduction to him was almost a personage, and was beset by foreigners who wanted to shake hands with him and hear him talk. In the preceding year he had been victor in the greatest political struggle, in which neither military nor revolutionary force were brought into play, that ever came off in France. It may not have closed a cycle, but it marked an epoch. Thiers died when it was going forward. At his death, and in virtue of an arrangement he had made just before it happened, the command of the republican forces devolved upon Gambetta, who, however, was bound, when MacMahon resigned, not to oppose Grévy's candidature to the presidency. In obedience to the verbally expressed wish of Thiers, all his friends in the campaign against the Élysée were to be subordinate to one leader. The honors of victory were not, there-

fore, divided when the three hundred and sixty-three deputies, who protested against MacMahon's *coup de tête*, were sent back to Versailles. Of the intensity of the effort made by the one side and the other, a single fact will enable those who did not witness it to form an opinion. The Marshal and his cabal were only beaten by five hundred thousand votes. What, in the heat of the battle, the republican part of France hoped, believed, desired, or willed, Gambetta formulated in short phrases which electrified and were easily retained and circulated. The roll of thunder and the sudden, sharp flash of lightning in his eloquence, with the aid of M. Émile de Girardin's press auxiliaries, defeated the nearly six hundred thousand civil service agents who were maneuvered as a single man by a tyrannical and unscrupulous ministry.

As Marshal MacMahon resigned a year after he "submitted," Grévy did not at once occupy the high place which it was settled he should fill. It would have been better for Gambetta and perhaps for the Republic had there been no delay, for there was no counterpoise to the influence of the victor, who soon became omnipotent. He had no official standing beyond that of Deputy. His power, as chairman of the Budget Committee, was known to ministers and lobbyists, but not to the outside public. But he was a man above his fellows—the Grand Elector—and with the exception of the rugged Dufaure, ministers were his humble servants. That crusty, hard-grained old lawyer, Dufaure, stood out against him openly and in secret and strove to circumvent him. He discovered from a proposal made him that the Opportunists wanted to make Gambetta Chief of the Executive, and to keep out Grévy. Dufaure watched closely and rendered the negotiation sterile. Notwithstanding his political omnipotence, Gambetta in the last year of MacMahon's tenure of office did not do anything to excite envy. He felt then the danger of solitary prominence, and shunned rather than courted ovations. His power was often discreetly exercised in releasing foreign commissions to the exhibition from the fetters of red-tape. Assistance was quickly given. If the Senator apprehended a deficit, Gambetta whispered a promise that he would ask the Budget Committee to make it up. Gambetta wished the exhibition to redound abroad to the glory of France, and to be an agency for gaining a wide-world sympathy for the Republic. The chief Opportunist journal was studiously moderate in its polemics. Its director kept aloof from the fêtes given in honor of illustrious strangers connected with the exhibition. He lived in rooms allowed him by the shareholders of the

"République Française," in the house in which the offices of that paper were located. His establishment was on a modest scale, and there was no private equipage, a plain *coupé* being hired by the month.

The politico-financists who have swamped the Opportunist party did not appear in the bright summer of 1878. But the anterooms of the great man were filled with idolators. Place-hunters were to swarm in later. Idolatry was borne by its object with good humored simplicity. Foreign votaries were helped with evident amusement to translate the feeling which they tried to express in broken French. He heard himself praised in French spoken with every known accent. Anglo-Saxons were the most demonstrative admirers. The intelligent and original Sir John Bennett, of Cheapside, was among those who found their way into the presence of the Jove of French politics. Sir John asked leave to present a signet ring at a future visit. "What," he asked, "shall be the motto?"

"*Vouloir c'est pouvoir*," replied Gambetta. "Shall I write it down for you?"

"Oh, no," answered Sir John. "My memory will hold fast every word you utter."

The ring was in due time made and presented, and a superb one it was. But the knight's memory played him a trick. He omitted the conjunctive "*c'est*," and "*Vouloir pouvoir*" were the only words on the seal. The recipient did not look this gift-horse in the mouth, but was greatly amused by it. He has worn Sir John's ring from the day on which he accepted it.

In that same memorable year Gambetta wore at home a loose pea-jacket, or *vareuse*, bought at some ready-made clothes store. Often when old and humble friends from Belleville dropped in to see him in the morning, he kept them to take pot-luck at *déjeuner*. At the Chaussée d'Antin he afforded himself a white damask table-cloth. The plated spoons and forks were superseded by real silver ones, bearing the initials *L. G.* in plain capital letters. A delightful host Gambetta was. He ate with good appetite, and, stimulated by the friendly faces and the chattering tongues around him, he became witty, humorous, a thinker, and a word-painter. The cerebation which his talk revealed was prodigious. He did not set up to be a Doctor of Republican Philosophy, as in his journal. At the same time, he never spoke of the Republic but with enthusiasm. With intimate friends he often argued. He was more Democratic than Liberal, and more Jacobin than Socialist. Although a warm Anti-Clerical, his mind had taken the Papal, or Roman im-

press. In his system the state was incarnate in the man who best expressed the universal sentiment and felt the universal want. He adopted the Positivist philosophy of Comte, which teaches the necessity, in the fatalistic sense of the word of an *homme pontife*—a very dangerous doctrine for Secularists to hold who dispose of the Bourse, army, and civil service patronage. Gambetta's conversation was no monologue. Great personages found themselves at his table with meanly born folks, who had not risen much above their primitive condition, but were worthy citizens and had helped the Democratic cause in difficult times, and were able to give further assistance. The host was equally attentive to his guests. He was ignorant of many social usages which facilitate smooth relations in a mixed society and keep down the heart-burnings to which sensitive, meritorious, but unsuccessful men are liable.

Dom Pedro, when first visiting Paris, said to M. Théophile Gautier *fils* :

"I have now seen everything I want to see here except Victor Hugo."

"There is no reason, sire, why you should not also see him. He would be greatly flattered to receive a visit from your Majesty."

"I do not doubt that he would treat me with courtesy. But I am afraid that he would not return my visit. What do you think?"

The question was repeated by M. Théophile Gautier to the poet in the presence of a lady, the wife of a struggling journalist whom Victor Hugo particularly esteemed for the consistent dignity of his life, which had been an obstacle to the acquirement of wealth.

"Tell the Emperor that I shall regard his call as a high honor," answered Victor Hugo, "but it would be impossible for me to call on him, for the simple reason that I have never yet found time to call on Madame B. (the journalist's wife) or on other ladies who often come to see me, and who merit my respectful friendship."

I doubt if Gambetta could so much as understand the exquisite breeding revealed in this message to Dom Pedro. In his own house, or at the table of a friend or acquaintance, Gambetta, however, always does and says the right thing. At the board of the Prince of Wales he was as much at his ease as though he were breakfasting with one of his old Palais de Justice associates.

A leaven of Cæsarism was at work in the Opportunist party. This ferment might easily have been suppressed when MacMahon resigned. When that event happened Gambetta was urged by Republicans who had subordinated themselves to him, under the reserve of asserting their independence when there

would be no longer necessity for military discipline, to aid them to elect M. Brisson Speaker of the Chamber, and to head a cabinet himself. But he and his immediate following preferred to shirk responsibility. Gambetta dominated the 363, and would therefore have been the master of every cabinet which could possibly be formed. He wanted to retain his hold on the urban democracies, and to draw to his side the rich, timorous, and sybaritic conservatives who were advancing upon him, and insidiously surrounding him. It so little entered into his ideas at that time to become their instrument, that he carried against the President of the Republic, who grieved over the measure, and against the lukewarm Republicans of both chambers, a change in the constitution whereby Versailles ceased to be the parliamentary capital. The Chambers, in obedience to Gambetta's will, came back to Paris, the population of which he then expected would help him to bridle them, were they to grow restive. This step of the Legislature was a signal proof of the omnipotence of the Deputy of Belleville. Had it been followed by a plenary amnesty he would have retained his popularity; and because he was popular the Conservatives would have gone on courting his favor. But he forgot to what extent he was morally culpable with the Commune, and while felicitating himself on the return of the Parliament to Paris, refused to press for a complete act of oblivion. It was said to him: "When you have carried the translation of the Chambers you can obtain a full measure of mercy." His objection was that in asking for the very restricted amnesty which Waddington obtained, ministers had surpassed the limits indicated by the country. As a matter of fact, the country had indicated nothing. What rendered the feeling which began to grow up against Gambetta more bitter was that a member of the committee which carried his first election at Belleville—Trinquet—was perishing from scurvy in New Caledonia. Instead, therefore, of having the additional weight of Paris to bear upon the Chambers, the capital fell from him. The Government, from motives of economy, ordered the first batch of amnestied communists to be landed at Port Vendres in the Eastern Pyrenees (a Red district), instead of at Catholic Brest. Their utter misery, and the tale of nine years of wretchedness told in their scorbutic and emaciated bodies, produced an explosion of compassion not only at Port Vendres and Perpignan, but in reactionary towns where the third-class trains chartered to bring them to Paris halted. Louis Blanc and Clémenceau went to meet them, but Gambetta, although many of them were his

old personal friends and constituents, gave no sign. It would have been hard for him publicly to give one. As President of the Chamber he was the third person of the State Trinity established by the Constitution Wallon. But he might have taken advantage of the sentiment of public pity to demand a complete amnesty, in behalf of which Louis Blanc began to agitate in the South. Eventually, Gambetta forced the hand of the de Freycinet ministry. But he seemed to do so under weighty pressure. At the municipal elections of Paris, the candidates most particularly recommended by him had been defeated. Trinquet, who was still in the galleys, was elected at Belleville. Legislative elections were not far off. A trifling circumstance rendered the situation more tense. The Mayor of Belleville, a Gambettist, got up, in the interest of his party, a popular banquet in the Lime Tree Garden at Ménilmontant, the most democratic part of his *arrondissement*. The great orator was there to explain his policy, in a way to meet the attacks which the press was beginning to make. In the invitations, of which about nine hundred were issued, the hour stated was seven o'clock. This was understood to mean half-past seven. But the dinner was not served until after half-past eight. Gambetta had not come. The landlord insisted upon not waiting any longer. Two places were kept vacant at the table of honor. At nine "the guest of the evening" and Spuller entered to fill them. Whether habituated at the Palais Bourbon to the dishes of Trompette, they had grown too dainty for the plain cooking of Ménilmontant, or for what other reason, it does not appear. They had both dined with a few friends at a restaurant. They did not at the banquet even go through the polite comedy of pretending to eat. No apology was offered either at the time, nor afterward in the press; a polite fib, though a transparent one, would have calmed irritation. Punctuality, it was remarked *sotto voce*, was the politeness of kings; but the elect of the millions thought themselves higher than born sovereigns. The speech which followed the banquet was listened to with icy coldness. The orator went back to the Petit Bourbon heavy and discontented. He had for ten years given a mighty impulsion in a democratic sense. Ministers had been made to feel that universal suffrage was everything, and the executive but its instrument. As president of the Budget Committee, he had made them realize that power of the purse was vested in the Chambers, and he had hotly contested the position of M. Jules Simon that the Senate had a right to amend the budget. He had

agitated for revision of the judicial bench, and the democratization of the army. Suddenly he turned round and attempted to push back the torrent which he had set flowing. Its impetus was too great for him to withstand, and it has pursued its course, bearing with it other men less renowned. The world watches with interest his attempts to recover the position which he has lost, as the representative man of the Third Republic. If his short administrative career was a series of blunders, his resource in fighting against difficulties is boundless. He is not the Cæsar, but the Hannibal, of French politics. The African general never

made up for the time lost at Capua. The enemies of Gambetta trust that he will never recover from the errors into which he fell at the Petit Bourbon, and especially in the last of the three years which he spent there. In that year only a vote of the Senate stood between him and the official mastery of France. The *scrutin de liste* bill once passed, he could have had a docile Chamber elected, and could have applied himself to the execution of his scheme for creating a new France along the whole northern coast of Africa, and recovering Alsace and Lorraine. Time will soon tell whether the hopes of Gambetta's enemies are well grounded.

JONES VERY.

BARE are the blooming fields, the hills are bare,  
Where erst the wild flowers trembled in the breeze,  
And stript and leafless stand the sheltering trees,  
The snow lies deep on all that once was fair;  
Yet, as the sun sinks down, the coming gloom  
Brightens again, and, as in summer's prime,  
See, blushing o'er the cold snow's frosted rime,  
Soft tints of rose on all the uplands bloom.

Fair through the fading gold the planet glows,  
And shineth brighter as the night comes on,  
And only in its perfect splendor shows,  
When from our sky the daylight quite is gone.  
O Poet Soul, that roamed these fields erewhile:  
The type and token of thy life shines here;  
Thy life we knew not while its day was near,  
But vaguely guessed its beauty from thy smile,  
That, like an angel, glimpsed from heights afar,  
Shone for a moment, but to disappear,  
As in the glow we see,—then lose the star.

Indeed thou seemest nearer to us now,  
That we most need thy love; as in the cold  
And friendless winter, we with thee behold  
The stars beam brighter through the leafless bough,  
And with thee track Love's foot-prints in the snow,  
Who bade us note the way and onward go.  
And when the glad spring shall to earth return,  
When the first flowers look up with trustful eye,  
Or, blushing, bend above the laughing burn,  
And on the hill-sides thou hast loved we lie,  
Watching thy honey-bells that nod and smile,  
And hear the robin's sweet, outpouring joy,  
That with morn's stillness blends the voice of song,—  
Thou, too, wilt come, with all that doth belong  
To Nature; who will surely still employ  
Her well-loved son, and pour his song awhile  
Forth in her bird-notes, and a tenderer green  
Lend the embroidered bank whereon we lean  
To pluck his Wind-flower, gloriously arrayed  
With faith like his, who heard the Father's call,  
When others 'neath the sordid earth were laid,  
And he, "the Dreamer," saw yet more than all.

William P. Andrews.

## MIGRATIONS OF AMERICAN COLONISTS.\*

BY EDWARD EGGLESTON.

### I.

#### THE DUTCH IN NEW NETHERLAND.

THERE is no story in American history more picturesque than the coming of the first Dutch vessel into American waters in 1609, about the time that John Smith left Jamestown. This venturesome ship was the *Half Moon*, commanded by Henry Hudson, a famous English sea-farer and explorer. He had already tried to sail to China by going directly across the North Pole itself, and had pushed farther into the great ice-barrier than any preceding navigator. He had in his time discovered some of those marvels of which the sea anciently had many, but which, alas! have quite vanished out of our commonplace and steamer-ridden world. One of these was a mermaid, with a body like a woman's, which on going down tossed in the air a "tayle which was like the tayle of a porpoise, and speckled like a macrell." The Dutch East India Company and Henry IV. of France strove to gain the services of the English captain, for the great "pilots" of that time were accustomed to hire themselves in the open market. Joining the Dutch, Hudson was sent to discover the way to China "around by the north side of Nova Zembla." Encountering insuperable obstacles almost at the outset of his voyage, he sailed to the westward, in violation of his orders, having, perhaps, a lurking desire to try that passage to the Pacific in latitude forty degrees which he found on a map newly sent to him out of Virginia by his friend Captain John Smith. After many adventures, and the discovery of Delaware Bay, we find Captain Hudson and his Dutch ship, in 1609, in sight of the Navesink Highlands. He carefully sounded his way across Sandy Hook bar, and anchored the *Half Moon* in the beautiful bay of New York. Here he found an abundance of fish, and the shores were adorned with "great and tall oaks." Wondering savages in garments of feather, deer-skin and furs crowded the deck of the vessel.

After a week's loitering in the lower bay he sailed through the Narrows admiring, as succeeding voyagers did, the loveliness of the banks and the fragrance which came from them. And so the *Half Moon* passed on into what is perhaps the finest river

of the world, the crew regarding with wonder the varying landscape as they sailed by the Palisades and then through the Highlands, and came at length to anchor in sight of the Catskills. On their way the Dutch trucked with the savages for beans and oysters, Indian corn, pumpkins, and tobacco. When Hudson went ashore "the swarthy natives all stood around, and sang in their fashion," dressed in the skins of foxes and other animals; their weapons were bows carrying arrows pointed with sharp stones, which were held in place by "hard rosin." Apparently "they had no houses, but slept under the blue heavens, sometimes on mats of bulrushes interwoven, and sometimes on the leaves of trees," carrying all their goods with them when they journeyed. "They appear to be a friendly people," he says, but adds significantly that they "have a great propensity to steal, and are exceedingly adroit in carrying away whatever they fancy." On another occasion the captain went ashore in company with an old Indian; and found a band of forty men and seventeen women about a large wigwam of oak-bark, which contained a store of maize, or, as he calls it, "Turkish wheat." Two mats were spread in the wigwam for the visitors, and some food—probably mush or hominy—was served in a red wooden bowl, while a hunter was sent to shoot some game for the guest. He came back presently with a brace of pigeons, which the hospitable savages supplemented by a fat dog killed in haste and skinned with shells from the river shore.

After ascending the river, to the neighborhood of the present city of Hudson, or, as some compute, to Albany, and then sending a boat higher up, the navigator reluctantly concluded, perhaps, that the South Sea could not be found at the head of the "Great River," and so turned about and descended first to Newburg Bay, and then, when he had caught a favorable wind, passed through the somber Highland passes. He got a taste of Indian hostilities on the lower river, and at length sailed out to sea, one month after entering the outer bay. Disappointed of his principal object, he had achieved immortality without knowing it.

Possessed by the South Sea mania, the adventurous Hudson did not care to waste

DUTCH SHIPPING IN THE XVIII CENTURY. FROM VAN DER VELDE'S PAINTING, "A VIEW ON THE RIVER Y."  
AFTER A PHOTOGRAPH BY BRAUN & CO.

his time in exploring farther the new land and great river that he had found, but perished the next year through the treachery of his crew in that vast northern bay which also bears his name. He had gone thither after the much-sought passage to China and Japan, to which geographical jack-o'-lantern he was one of the last martyrs. Short cuts to the South Sea, and porpoise-tailed mermaids, passed out of fashion at about the same time. The *Half Moon*, however, with part of her old crew, returned to the Great River the year after the discovery; white men and red men were glad to greet each other again, and the beaver trade prospered from that time.

In 1613 the ship of Captain Adrian Block was burned near the island of Manhattan. Like a true Dutch child of the sea, the *schipper* set about building a new one, erecting first three or four huts for his men on the lower point of the island, which temporary cabins were probably the earliest European habitations on the site of New York. Here, fed by the kindness of the savages, he constructed and launched the little yacht *Onrust*, or *Restless*, of sixteen tons. In this he boldly ventured the untried whirlpools of Hell-gate, and so passed through the unexplored

Long Island Sound to Montauk Point, and thence to the triangular island still called by Block's name. The *Restless* continued her voyage around Cape Cod, and sailed along the wild coast to Nahant Bay, beyond Boston Harbor, which point is made on Block's map to be the utmost limit of the New Netherlands. The territory beyond was conceded to France. On his return voyage, he entered the "Fresh" River, (the Quonehtacut of the savages, and the Connecticut of our time), and ascended it to the rapids above Hartford.

Meantime, a small redoubt had been built on Castle Island, near the present city of Albany, to protect the most advanced fur-market of the Dutch. But the greater part of the Dutch trade was for years carried on in ships and small vessels, which served at once for houses, forts, and means of transportation. On the ship's deck, cloth, rum, beads, knives, hatchets, awls, hoes, and even fire-arms, were bartered for beaver skins and other furs. The center of this traffic was at the lower end of Manhattan Island, and thus, after a while, the foundation of the commercial metropolis of North America was laid in trade.

In 1621, the year after the pilgrims settled

at Plymouth, the great Dutch West India Company was chartered, and given, with many other privileges, a monopoly of trade and government in the Dutch possessions in America. Immediately on the completion of the organization of the company in 1623, New Netherland in America was erected into a province, with the armorial bearings of a count. The beaver naturally held a central place in its arms, for by the beaver trade it

miles long on the Delaware, and all the region about Fort Orange, or Albany, were quickly bought up from the Indians by directors of the company speculating in their own interest. This tempting plan caused to be projected many unsuccessful and some successful colonies. The feudal system thus established survived the fall of the Dutch power; the great manors and the anti-rent riots of a later period were results of the

DUTCH YACHT OF 1612. PROBABLE FORM OF THE "RESTLESS." FROM CHARNOCK'S "MARINE ARCHITECTURE."

lived. A colony was dispatched in this same year. The first settlers of New York, like the beginners of the less commercial colonies, were refugees from persecution, the greater part of the first thirty families being Walloons, — Protestants expelled from the provinces of Belgium, adjacent to France, and speaking the old French language; indeed, a great part of these so-called Walloons appear to have been Huguenots from Rochelle, Rouen, Paris, and elsewhere. About eighteen families were settled near the projected Fort Orange, on the present site of Albany; four newly married couples were dispatched to the Delaware, or, as they called it, the "South River"; two families and six men were sent to the Connecticut, and eight men were planted on Manhattan Island.

The Netherlands were at this period prosperous, and their government was liberal, so that well-to-do Dutchmen were probably not inclined to emigrate, and the peasant tenants were unable to do so. While the English were generally bringing the poorer class to the colonies in a state of limited servitude, the Dutch company met the difficulty by its liberal grant of semi-monarchical powers to *patroons*, or large buyers of land, who should establish colonies at their own expense in New Netherlands. Vast slices of New Jersey, all of Staten Island in a piece, a tract thirty-two

Dutch patroonships. The device of granting large manors served to plant the country, though in but a thin and inadequate way, and it worked evil to New Netherland by founding an order of territorial lords, whose trading interests brought them into commercial rivalry with the company, and whose rights of government weakened the State. Besides the authority granted them by the charter of their order, the patroons set up a claim to exclusive jurisdiction in their territories as "successors to the lord Sachems," from whom they had bought their land. The system of patroonships was one of the causes, and the fur trade was the other, that served to scatter the Dutch colonists so widely that the West India Company's power in America crumbled with slight resistance when once the English chose to assail it with force. The Dutch and French spread the ramifications of their trading companies over vast regions, but neither the one nor the other could resist the closely settled agricultural colonies of the English, which were able to present a serried front to enemies.

The first Dutch block-house on the Delaware was called Fort Nassau, and was a little below the present city of Philadelphia, on the Jersey side of the river. But this settlement was considered too weak, and the four young married couples, who had been sent in 1623 to begin the population of the country,

TRINITY FORT. ORIGINALLY FORT CASIMIR. FAC-SIMILE OF AN OLD PRINT IN CAMPANIUS'S "NEW SWEDEN," BY PERMISSION OF THE LIBRARY SOCIETY OF PHILADELPHIA.

the dead chief while at work in the field. When patroon De Vries sailed into the Delaware in 1632, to look after his colony, the river had no European occupant remaining alive, though twenty-three years had elapsed since Hudson's discovery, and eighteen since the little yacht *Restless* had explored its waters. After this the Dutch seem to have attended but sluggishly to their trade in the South River, until it found powerful rival claimants, who were able to hold their own against the Hollanders for seventeen years.

## II.

### THE RISE AND FALL OF NEW SWEDEN.

AMONG the many plans for Swedish enlargement entertained by the bold imagination of the great King Gustavus Adolphus, was that of planting a new Sweden in America, and organizing at the same time a powerful West

were removed to Manhattan, where after some years enough people were concentrated under the walls of Fort Amsterdam to make a petty village, which so late as 1641 contained but two hundred and fifty people, though it was then considered "a clever little town, which went on increasing day by day."

In 1631, influenced by the tempting offers to patroons, the famous sea-farer and writer of interesting "voyages," David Pieterzen de Vries and his partners took up lands on Lewiston Creek, in Delaware, and had built there a brick house for the protection of a colony of thirty people, which he called Swanendael, "the Vale of Swans." In the spirit of solemn and childish ceremony, so characteristic of the age, the settlers erected a column, and hung upon it a piece of tin emblazoned with the arms of the States-General. A simple-minded Indian chief, with a savage's love of trinkets and a Spartan passion for theft, purloined the glittering toy and hung it about his neck, where it served perhaps for ornament, breast-plate, and amulet. The stupid commander whom De Vries had sent with his people took this theft for an act of hostility against their High Mightinesses the States-General. He made so much of it that some of the Indians killed the offender and delivered his head to appease the angry Dutchman, who was frightened enough when he saw what was done. The farce had now turned to tragedy which found swift completion in the total destruction of the colonists, who were massacred by the friends of

India company which might serve to enlarge the commerce of his kingdom, propagate the Lutheran faith, and aid him in his struggle against the Catholic powers. The enthusiastic young king called this projected colony "the jewel of his kingdom," and urged "high and low to contribute something to the company according to their means." He himself gave four hundred thousand dollars; the queen dowager, the highest nobility, and all the civil and military officers followed the royal example, and the project became an object of patriotic enthusiasm. The king forbade slavery in the new colony: "Slaves cost a great deal, labor with reluctance, and perish with hard usage," he said. "The Swedish nation is industrious and intelligent, and we shall gain more by a free people with wives and children." The stock was open to all Europe. The colony was to be a refuge for Protestants of every nation, and "a benefit to the whole world," and the company was vaguely authorized to trade "in Asia, Africa, and the Straits of Magellan."

But the thoughts of Gustavus were engrossed with warlike concerns, and he fell in the battle of Lützen in 1632, without seeing the beginning of New Sweden. It was only five years after his death that the Swedish Company dispatched its first colonists to America. Peter Minuit, who had been director of the Dutch colony at Manhattan and had lost or left his place, now gave the benefit of his experience and knowledge to the Swedish colony, of which he was the first governor.

PETRUS STUYVESANT. FROM A PAINTING FROM LIFE, IN POSSESSION OF THE NEW YORK HISTORICAL SOCIETY.

On his arrival in the Delaware, in 1638, he allayed the suspicions of the Dutch authorities at Manhattan by giving out that his company was on the way to the West Indies, and had only stopped in the South River to refresh themselves and take in wood and water. But the planting of some garden herbs, and the erection of a "fort" near the present city of Wilmington, soon revealed his intention to remain. The Swedish colony was very small, but as the Dutch Governor, in the usual fashion of the Dutch governors, fired nothing at them more dangerous than formal protests, their Fort Christiana was soon completed. By the knowledge Minuit had acquired in his government of New Netherland, he managed with liberal presents to draw the greater part of the fur trade of the South River to his new fort, so that the Swedish vessels returned with valuable cargoes.

A portion of the first comers were transported bandits, but the colonists opposed the sending of such convicts, and at last forced a ship laden with them to return. The Swedish Government thereupon ordered that no more convicts should be sent, "lest Almighty God

should let his vengeance fall on the ships and goods and the virtuous people on board." With the Swedes came also some nomadic Finns, who dwelt for long years after the fall of New Sweden in villages of their own. The new settlers pushed their trade with vigor, often making wearisome journeys on foot into the Iroquois country, carrying packs of goods for barter over rough mountain trails. The traffic in furs and the culture of tobacco were their sources of prosperity; they lived in log or clay huts, and dressed in leathern breeches, wore "jerkins" or jackets, and, instead of cloaks, donned the "match-coats," or dark blankets of coarse woolen cloth, such as were sold to the Indians. The most prominent article in the dress of the Swedish women was the linsey petticoat.

New Sweden was short-lived, and the seventeen years of its life were full of trouble and wrangling with the Dutch. Printz, one of the Swedish governors, is remembered as a violent man, weighing four hundred pounds, and cursing the English who had intruded into the Delaware, as "runnagates." When the Dutch urged that they had preceded the

Swedes in the South River, the huge Printz rejoined sardonically "that the devil was the oldest possessor of hell, but that he now and then admitted a younger one." His foolish successor, Rysingh, in 1654, seized the Dutch Fort Casimir, and the next year Stuyvesant, the Governor of New Netherland, in slow and solemn fashion mustered a force of six or seven hundred men and a fleet of seven vessels of one sort and another. A day of fasting had been observed in New Amsterdam, and the sailing, which was on a Sunday, did not take place until "after sermon." Dominie Megapolensis, the clergyman, accompanied the expedition which was to "render the province prosperous and successful, to the glory of God's name." In twenty days the loss of Fort Casimir had been gloriously avenged, and the Swedes were brought wholly into subjection to their High Mightinesses the States-General and the Honorable Dutch West India Company. In this, as in most of the wars in New Netherland, no Christian blood was shed. It was only a matter of bluster, of firing guns overhead, pillaging settlers, and sending drummers to demand the surrender of beleaguered block-houses.

Most of the people of New Sweden remained as subjects of the Dutch Government and were with the Dutch surrendered to the English, nine years after their subjugation. In 1693, those of them who remained together and used their own tongue, numbered

## III.

## LORD BALTIMORE'S COLONY.

BEFORE the Swedes reached their New Sweden, a colony of English had been planted on the waters of the Potomac. It was the first English plantation to grant toleration to Roman Catholics, as well as to other Christian bodies, and the only English colony ever planted under Catholic auspices. When once the Mayflower party had shown that a red heathen might be a better neighbor than an enraged fellow-Christian, there were many glad to follow their example. Puritans were not the only ones to learn the lesson, but victims of puritan laws as well,—Hutchinsonians, Gortonians, the despised Anabaptists and the detested Quakers discovered that the American wilderness was large enough for more than one kind of religious refugees; and even the abhorred English Papist followed the open highway over seas.

In 1621, the year after the landing of the pilgrims, George Calvert, afterward Lord Baltimore, planted the colony of Avalon in Newfoundland under a patent from James I. Wearied with the northern winter, and discouraged by the continual peril to which his settlement was exposed from proximity to the French, he sailed with his family, in 1629, to Virginia, in which colony he had been interested as a stock-holder, or "adventurer,"

ST. CLEMENT'S, NOW HERON ISLAND. FIRST LANDING-PLACE OF THE MARYLAND COLONISTS.

one thousand, and the kingdom of Sweden supplied them with ministers for a century afterward, until the use of the language had died out among their increasing posterity. Charles XII., in his most engrossing campaigns, did not forget this obscure little mission in America, which was all that remained of the dream of a New Sweden, in which Gustavus Adolphus had taken so much pleasure.

as such investors were then called. The over-zealous Virginia churchmen forthwith exacted of him that he take the oath of supremacy, by which he was required to acknowledge Charles I. as an island pope, supreme governor "in all spiritual or ecclesiastical things." Refusing this, Baltimore returned to England, and took an exquisite revenge in procuring from the king a grant of a liberal slice off the south side of Virginia, embracing

GEORGE CALVERT, FIRST LORD BALTIMORE. FROM A PORTRAIT PRESENTED TO THE STATE OF MARYLAND BY JOHN W. GARRETT, ESQ.

the territory from the James River to what is now the middle of North Carolina. So vehement was the opposition of the enraged Virginians that his lordship relinquished this grant and took instead other Virginian territory lying north of the Potomac. This he called Maryland in honor of the queen of Charles I. Before any colonists had been sent out, the first Baron Baltimore died, and the enterprise fell to his son Cecilius, the second of the title, who dispatched his brother Leonard Calvert, with a colony, in 1633.

In its motive and mainspring, the first Maryland settlement was Roman Catholic. The non-Catholics in Calvert's company were for the most part people of no great consequence, and without strong religious convictions or purposes, while the Catholic portion of the emigrants were in fiery earnest, and having on their side the lord proprietor, his brother the Governor, and several enthusiastic

and able Jesuit priests, were the dominant, as they were possibly, at the very first, the more numerous party. The large ship in which they crossed the flood to a new world was called the *Ark*, the pinnacle by her side was the *Dove*, and the two were solemnly placed "under the protection of God, imploring the intercession of the Blessed Virgin, St. Ignatius, and all the guardian angels of Maryland." In the itineraries of the Puritans who came to Massachusetts at this time, when allusions are made to the Spanish islands the names are religiously shorn of the prefix "Saint." But the Marylanders made a geographical diary of their progress through the Chesapeake and Potomac by attaching to islands and rivers the names of the appropriate saints in the Roman calendar. On St. Clement's Island, where they made their first landing, they erected a cross with solemn ceremonies and great emotion.

Calvert planted his first settlement of St. Mary's on a tributary which enters the Potomac near its mouth. This became immediately a center of missionary activity on the part of the tireless and adventurous Jesuits, who sailed up and down the water-ways of the wilderness in a little boat, sending home every year "relations" which are filled with expressions of intense devotion, picturesque stories of missionary labor, and an admixture of marvelous occurrences such as one often finds in religious writing of the seventeenth century, when miracles had not yet gone out of vogue with either Catholics or Protestants.

The early governors of Maryland were required by the proprietor to take oath that they would not "trouble, molest, or discountenance any person professing to believe in Jesus Christ," on account of his religion. Besides Claiborne's old settlement of Virginians on Kent Island, which preceded that at St. Mary's, and for a long time resisted the proprietary's authority, there were soon thousands of Protestants from Virginia and England settled under the Baltimore charter, so that the Catholics were at length but a small minority. The Puritans, hunted out of Virginia by Sir William Berkeley, found Maryland a congenial refuge; and in about twenty years after Governor Calvert's landing at St. Mary's, the ultra-Protestant element, inflamed by the bitter conflict of parties in England, became sufficiently powerful to overturn for a time the proprietary government, and expel the priests from the province, sending one in irons to England, and compelling others to hide in cave-houses in Virginia.

The exclusive spirit prevalent in Virginia and New England produced colonies homogeneous in nationality and faith, but the hospitality of Maryland institutions early brought churchmen and Puritans from Virginia and New England, while Dutch and Swedes came from the Delaware into its northern districts. Irish and Scotch brought the machinery of sessions and presbyteries to the Eastern shore; Quakers came freely to propagate their doctrines; Germans, Spaniards, and Italians, in small numbers, were mingled with these, and French exiles from Acadie found here a refuge where they might erect a Roman Catholic altar.

#### IV.

##### THE NEW ENGLAND DISPERSION.

In six years after the great Massachusetts migration of 1630, under John Winthrop, there began a new movement to the parts of New England beyond the limits of the Mas-

sachusetts charter. As Virginia was the hive from which the Southern colonies drew population, so Massachusetts was the prolific mother of New England. Its population increased rapidly during the first years, the immigrants usually grouping themselves around some favorite minister; for the peculiar circumstances of the great Puritan migration made the "teaching elders," or ministers, the dominant class, and gave them an ascendancy almost inconceivable in our less religious time. Men and women of high intelligence left their homes and undertook a tedious and dangerous ocean voyage that they might be edified by the words of some revered preacher exiled to the wilds of Massachusetts Bay. The colonists thus gathered themselves into communities, and sometimes changed their places of abode, according to their affection for Higginson or Warham, Cotton or Hooker. An attractive minister served better to replenish a town than fertility of soil or convenience of situation.

The famous Thomas Hooker, of Newtown, now the city of Cambridge, was called the Luther of New England, while John Cotton, of Boston, was its gentler Melancthon. Mr. Hooker's people and others complained that they had not room enough in which to pasture their cattle, and so could not adequately support their ministers. We need not conclude that there was an open rivalry between the two divines, in order to understand the motives that lay below this discontent with the restricted cow-pastures of Cambridge. Cotton had been the adviser of Winthrop's company before they left England; he was at the capital with a large and influential following; his ideas were in the ascendant in church and state. Hooker, perhaps, found in Massachusetts no room for the ideals which he, too, wished to realize on virgin soil. "Nature doth not allow two suns in one firmament," says Hubbard, the old historian. After some resistance, Hooker's people got leave to remove to the "Fresh River," which they did in 1636, suffering bitter hardships in beginning the colony of Connecticut by settling what is now the city of Hartford. Warham, another influential minister, of Dorchester, in Massachusetts, was over a church which had organized itself, and formally installed its pastor just before setting sail from Plymouth in England, and which now made its second removal in a body, under the guidance of its minister, to Windsor, on the Connecticut River. Wethersfield and Springfield were settled at about the same time.

A government so austere, and a clerical domination so entire, as that in Massachusetts,

could not but find dissentients. It was no more possible for Puritan ministers and magistrates to secure uniformity by repression, than it had been for Laud to achieve the same result in England. About the time of the setting forth of the first pioneers to the Connecticut, Roger Williams, a disinterested and lovable young man, erratic and somewhat contentious, was forced to fly from Massachusetts into the frozen wilderness in winter, in consequence of having maintained the liberty of the human conscience, and the sinfulness of the patent by which the King had presumed to give away the lands of the Indians, as well as some other doctrines more absurd, but which were thought nearly as dangerous. Befriended by savages, for whom he had performed kindly offices, and guided by advice privately sent him by Winthrop of Massachusetts, and Winslow of Plymouth, the outcast Williams got a patent that satisfied his conscience from the original savage land-owners, and settled on Narragansett Bay, calling his new plantation Providence.

About this time the theological people on Massachusetts Bay were disturbed even more than by the Pequot war by the doctrines of the so-called Antinomians of Boston, followers of the eloquent mystic, Mrs. Hutchinson, who denied the resurrection of the body, and held some other opinions, most of which, in this less speculative time, would pass for harmless and rather incomprehensible nonsense. Both parties became embittered, and the Hutchinsonians were cast out with a reprobation harsh enough for malefactors. A portion of these settled in 1637 on the island of Aquidneck, which had been called by the Dutch "Roode"—that is, red—Island. This colony was afterward united with the Providence plantation in forming the colony of Rhode Island. Others of the Hutchinsonians joined the settlements in New Hampshire, which, with the "district" of Maine, received frequent accessions from Massachusetts.

The grouping into churches, and the dominance of the minister, gave form to most of the New England migrations. Cotton wrote to Davenport, an exiled minister of great reputation living in Holland, that the order of the churches and commonwealth in New England, "brought into his mind the new heaven and the new earth." But, when the learned and pious Davenport arrived in Boston, he thought that even the new heaven and the new earth of Massachusetts might be improved by incorporating certain rigid ideas of his own in matters of church-membership and of refusing baptism to the infant children of the unregenerate, as well as by the establishment of a civil order "more strictly in ac-

JOHN DAVENPORT. FROM A PAINTING IN YALE COLLEGE.

cordance with the word of God." He sailed with his company, in 1638, to Quinnipiack, west of the Connecticut River, where they planted the colony, which they called New Haven. After a separate existence of twenty-seven years this little colony, in 1665, with reluctance became part of Connecticut, and lost by degrees the peculiarities which Davenport and Eaton, its first religious teacher and its earliest governor, had impressed upon it.

Thus, the planting of all the New England States, except the inland Vermont, was begun in less than twenty years after the forlorn beginning at Plymouth. It was estimated, by one who had the best means of knowing, that not more than twenty thousand people came to New England in the twelve years from 1628 to 1640. After that period those who returned exceeded those who came. Yet, in spite of destructive wars with the Indians and French, and large emigrations to other colonies, there were, a hundred and thirty years later, about five hundred thousand people in New England; so rapidly did this temperate and hardy race increase in a new land.

#### V.

#### THE ENGLISH AND THE DUTCH. FALL OF NEW NETHERLAND.

BETWEEN Maryland and New England, after the fall of the little New Sweden,

nothing intervened but the Dutch government of New Netherland, which stretched its jurisdiction from the lands on both sides of the Bay of Delaware to the Connecticut Valley, and inland beyond Fort Orange on the site of Albany to the wigwams of wandering traders in the hamlets of the Five Nations. But the inflexible Puritan on the north, and the adventurous Maryland Leather-stocking on the south, were ever evoking the ancient shade of Sebastian Cabot to disturb the repose of the Directors-General at New Amsterdam. The slender population of the Dutch territory lacked national unity; it had been brought, indeed, out of almost every nation under the whole heavens. Director Kieft told Father Jogues, in 1643, that eighteen languages were spoken in New Amsterdam,—the little Babel that has grown into the greater one of New York. At the close of the Dutch rule in 1664, there were about ten thousand Europeans in all New Netherland, and fifteen hundred of these dwelt in and about the village at the lower end of Manhattan Island. The rest were remote or wandering traders, scattered farmers, and liegemen of the patroons. Everything in the shape of a village languished, and life was well-nigh stagnant in so sparse a population. Bergen, for example, was a huddle of farmers who lived together for protection. It had its petty court, and after a long while a saw-mill; and about twenty-four years after the settlement of the place, the inhabitants, in an interval of wakefulness, formally resolved that a well should be digged.

The Dutch could never hold their own on the Connecticut River, of which they were the discoverers and the actual occupants, when traders from Plymouth first, and the Massachusetts emigrants under Hooker and Warham soon afterward, settled beside their fort called "The House of Good Hope." The English claimed the country for no better reason than that Cabot, in 1598, had mistaken some part of the American coast for "the territory of the Grand Cham" in Asia. The Dutch, in English eyes, were "always mere intruders," and "interlopers who had fallen into the middle between Virginia and New England." The war between them and the Puritans on the Connecticut was a contest of diplomatic bluster and petty squabbles. The Dutch were accused of doing such unneighborly things as the harboring of runaway servants. If we may believe the other side, the English impounded the cattle of the Dutch for trespass, and harvested crops which the Netherlanders had sown on disputed ground. A Dutchman sowing a hatful of barley on

ground claimed by the Connecticut people was knocked down with an adze, and other such measures were taken as characterize neighborhood feuds rather than international conflicts. There were endless complaints and pettifogging maneuvers. After twenty years of this bickering, the West India Company was quite crowded out of its early trading ground on the Fresh River. Then, by one judicious encroachment after another, the slow-going and peace-loving Dutch were pushed yet farther back from the Connecticut, and on Long Island, by the oncoming current of teeming and aggressive New England population.

On their other flank, the Dutch were equally harassed by the English. As early as 1634, an English explorer, Thomas Young, sailed up the Delaware to find the great lake at its head and a Mediterranean Sea beyond, of which the Indians had spoken. In the following year, some of Claiborne's adventurous people from Kent Island in the Chesapeake seized the vacant Fort Nassau, but they were in turn seized by the Dutch and set down again, "pack and sack," at Old Point Comfort. Sir Edmund Plowden, a fine specimen of the visionary land speculator of two centuries and a half ago, secured a grant under the seal of Ireland and boasted a colony somewhere in the region within Cape May, though the published accounts of it are so full of biographical and geographical mysteries and incongruities that the very existence of such a colony at any time has been questioned. If Sir Edmund's claim to have made a settlement in the New Jersey country is not a pure fabrication, some of the English who disturbed both Swedes and Dutch in 1641 may have been subjects of the government of "the right honorable Lord Edmund, by Divine Providence Lord Proprietor, Earl Palatine, Governor and Captain General of the province of New Altion." His was an enterprise in which small investors were promised "two for one," with good land thrown in; for did not the territory of the right honorable Sir Edmund "possess alabaster, plaster of Paris, pudding and slate stone, store of timber, clear fields, meads and woods, and no Indians neer"? There were also "rich lead mines containing silver tried," and these most luckily were "in an uninhabited desert; no Christians or Indians near it; where elkes, stagges and deer are most quiet, most fat and not disturbed"; while there were "whole warrens of sweet muskrat," and to put a climax to it, a "camel mare" had been seen by the head of Chesapeake River, "of which three hundred miles west there are stores." The spring waters

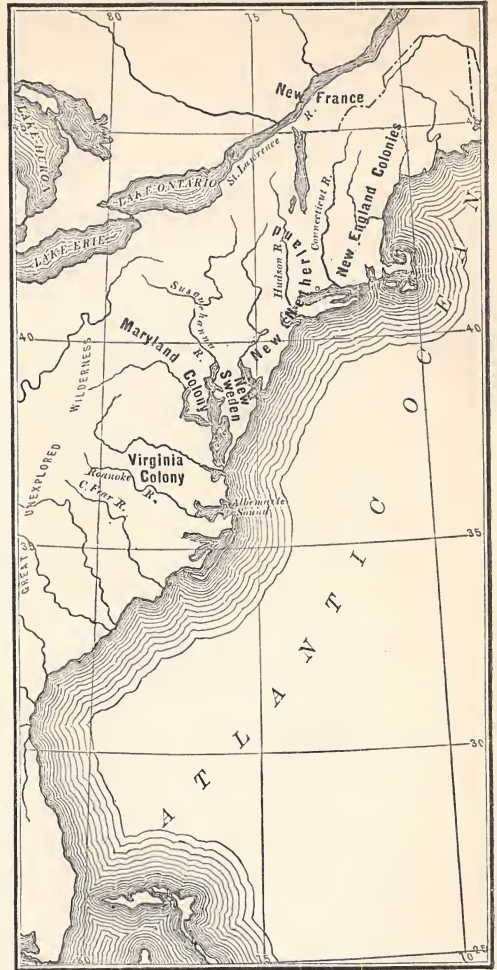

in New Albion were "as good as small beere" in England, and there were "bufaloes" which were to be used for saddle-beasts besides being "brought to draw and plowe and be milked."

It is probable that none of the English in the Delaware region were of Plowden's planting; for in 1640 and 1641 the New Haven people made purchases and set up houses in the South River; and these were, doubtless, the English expelled or brought into submission by the combined force of the Dutch and Swedes in 1642 or 1643. An expedition from Boston, seeking the "great lake" by way of the Delaware, was sent back by the Swedes in 1644. The New Haven people were persistent in the vain attempt to plant in the Delaware so late as 1655, and the English on Long Island continued to smuggle goods and wampum into that river until the termination of the Dutch dominion, while the proprietary government of Maryland added to the discomfort of the Dutch by pressing a claim to a considerable portion of the territory occupied by their Delaware settlement.

The rather hollow shell of Dutch occupancy was pressed on all sides by the eager New Englanders. A party from New Haven, in 1661, sought permission to settle in New Jersey under the Dutch, if they might at the same time preserve their own church order, exclude whom they pleased from their community, and punish certain sins of impurity with the death penalty. This last proviso seemed dreadful to the authorities of lax New Amsterdam, which would have suffered decimation under a code so severe; but the Dutch West India Company, to whom the case was referred, greatly desired settlers, and was willing to concede that the Puritans might execute the laws of Moses on their own people, provided that no Dutchman living in the Puritan towns should be held to so strict an account for offenses about which "the laws of our fatherland use some connivance." There were many New England emigrants who, from one ground or other of discontent with the severity of the administration of law in the eastern colonies, found refuge in the New Netherlands and swore allegiance to the States-General; and there were others who, believing in Sebastian Cabot's title, perhaps, endeavored to buy land of the Indians and make an independent settlement in New Jersey.

It was inevitable that England should sooner or later seize the Dutch colony, not because of Cabot's discovery, or of the early Virginia charters, which were but poor pretexts, but because the great fertile middle region was important to the unity and defense

SETTLEMENTS ON THE COAST OF NORTH AMERICA IN THE MIDDLE OF THE XVII. CENTURY.

of the English colonies, and chiefly because England was strong enough to lay hold of it. In September, 1664, in time of peace, the little capital on Manhattan Island was surprised, overawed, and captured by an English fleet. The subjugation of the whole of New Netherland quickly followed, and the middle territory was thrown open to English settlers. This vast region had been granted, previous to its capture, to the Duke of York, afterward James II., but he had early transferred New Jersey to Lord John Berkeley and Sir George Carteret, and it was soon after divided into East and West Jersey. As the Jersey governments were more liberal than that founded by the duke in his own territory of New York, the New Englanders settled in large numbers in East Jersey.

Next to New England, the proprietors of East Jersey looked to Scotland for immi-

THE EARLIEST PICTURE OF NEW AMSTERDAM, ABOUT 1650. FROM AN ORIGINAL COPY OF VAN DER DUNCK'S MAP.

grants, especially during the time of the Episcopal intrusion, when the apostolical succession of bishops was borne in upon the Presbyterian conscience by imprisonments, gibbets, thumb-screws, mutilations, massacres, ravishing of women, and drowning in the tide. Robert Barclay, the famous Quaker, was appointed governor, though he did not reside in America. Many Scotch emigrants flocked to the province, and many others were carried thither without any volition of their own. In 1666 it was ordained that, of the Scotch rebels, the ministers and officers should be hanged; one in ten "of the common sort" was to be hanged; one in ten "forced to confession," and the rest sent to the plantations. Yet there were ministers among those shipped as convict servants to East Jersey.

## VI.

## THE QUAKER MIGRATION.

BUT the movement to America between the restoration of Charles and the sending of James "on his travels" may be called the Quaker migration, so large an element in it were the followers of Fox and Penn. In 1664 the hackneyed methods of persecuting this fanatically patient people had been varied by sending sixty of them to America in one vessel. It may have been from such deportations that the Friends themselves caught the idea of emigration in large bodies. Certain it is that the authorities at home gave them reason enough to wish to get out of England. Even before Barclay's appointment to the governorship they began to come into East Jersey; and when Byllinge, Fenwick, Penn, and other well-known Friends became proprietors of West Jersey, a tide set in toward the Delaware River which soon became a Quaker exodus. One large company of these Quaker emigrants to West Jersey, sailing down the Thames in 1677, encountered the pleasure-barge of Charles II., whereupon the profligate king, surrounded by dissolute courtiers, condescended to give his royal benedic-

tion to the devout refugees from the tyranny of his own government. It was in West Jersey that Quakerism, which was a religious democracy, for the first time had an opportunity to frame laws. "We put the government in the hands of the people," said Penn.

One result of the West Jersey colony was that it served to interest the practical mind of William Penn in schemes of American colonization. Next to Fox, Penn was the most influential of the early Friends. It was not the amiable enthusiast, but his most eminent disciple, Penn, who first exemplified that union of piety and zeal with worldly shrewdness which marks the prevalent Quaker type of recent times. The son of Admiral Penn, and the favorite of two monarchs, William Penn was an aristocratic figure in the despised Society, but no Friend of humble origin was more ready than he to bear the brunt of persecution and contumely. Capable of generous self-sacrifice, he was also a shrewd and politic guardian of his own interests, and a careful observer of his own dignity, not neglectful of the pomp and state proper to a lord proprietary. Preaching in humble conventicles and associating with illiterate and often fanatical people, he was none the less an adroit courtier, and rendered many services to the Society and to himself by his influence with those in power, to acquire and maintain which must have necessitated a suppleness somewhat incongruous with his leadership in a despised and inflexible sect.

Penn found it a difficult task to collect sixteen thousand pounds due from the royal treasury to his father. His address and perseverance were well matched by Charles's reluctance and dilatoriness. But there lay the unappreciated wilds of America, with which the Quaker leader had now become acquainted. After much solicitation he secured for his debt the ownership and lordship of a forest large enough for a small kingdom, paying a fealty of two beaver-skins yearly. This new province the king named Pennsylvania, in honor of Penn's father, the admiral. Fearing that the world would attribute the name to a vanity inconsistent with his sanctity,

Penn offered a bribe to an under-secretary to change it, but in vain. The "public Friend" had become feudal lord of Pennsylvania and Delaware. When he arrived in America, the key of the fort at Newcastle was delivered to him; with this he locked himself in and afterward let himself out. A turf with a twig upon it was then handed to him, and a porringer of river-water; and thus, in ancient feudal form, Delaware was transferred.

The "first landers" of Penn's new colony arrived at the site of Philadelphia in 1681, and spent the winter in caves which they dug in the river-bank for temporary shelter. While the women and children dwelt in these dingy holes, the men traveled up and down the streams and through the untracked woods selecting land. But the Friends endured hardships in the same temper as that shown by religious refugees in the earlier colonies. "Our view," says one of them, two years later, "was to have freedom of worship, and to live in greater simplicity and innocence on a virgin elysian shore, and to give thousands of dark souls to civilization and piety." Not only did the Friends seek to escape from an unendurable persecution, but they seem to have been terrified at the wickedness of England and her rulers, and to have fled from coming judgments of the Almighty as the Puritans had done before them. Some years after Penn's beginning, a prophet arose in the Friends' meetings in London, who was moved by an inward power to predict judgments of sword, famine, and pestilence against England, and, as if this were not enough, he proclaimed also an earthquake that should lay the greater part of London "in rubbish and ruins."

Penn's renown brought nearly thirty vessels laden with two thousand emigrants to the Delaware in the first year of the settlement. The most of these were Friends from various parts of England, Wales, and Ireland, but there were some German and Dutch Quakers from places on the Continent in which Penn had preached. The Swedes, who were the old settlers, welcomed the Friends with joy, and carried their goods up the steep river-bank. The new-comers scattered themselves from the Delaware counties all the way to the falls at Trenton. When Penn returned to England in 1684, he left seven thousand people in his dominions, though there were then but three hundred houses. Many of the people were yet, no doubt, in wigwams and in caves cut in the sandy banks.

#### VII.

#### THE PEOPLEING OF CAROLINA.

THE rush from Europe in this period of the restored Stuarts, and of the persecution

of Protestants on the Continent, replenished most of the colonies, but chiefly those in which religious toleration was liberally granted. Such were the Jerseys, Pennsylvania, and Maryland, and such were the Carolinas, which had their rise in this movement. Charles II. was ready enough to give to friends and favorites lands in America which could not be made tributary to royal dissipations. He satisfied the greed of his brother with the territories which the Dutch had been at so much pains to occupy for fifty years. To Penn, at a later period, he trucked Pennsylvania to be rid of an importunate creditor. About the time of the grant to the Duke of York he bestowed on certain courtiers the country south of Virginia, which in his honor they called Carolina. Religion being a fashionable outer garment, the preamble to the Carolina charter assigns a motive for this gift to a knot of avaricious favorites in these words: "The grantees being excited with a laudable and pious zeal for the propagation of the Gospel, begged a certain country in the parts of America not yet cultivated and planted, or only inhabited by some barbarous people who had no knowledge of God."

Having procured the territory, the next care, from a practical stand-point, would have been to people it. But visionary and utopian ideas tinged almost all schemes of American colonization, and one of the proprietors, Lord Ashley, afterward the first Earl of Shaftesbury, was the friend and patron of the famous John Locke. What more natural in that age than to ask the philosopher to project a scheme of laws and institutions for Carolina? Never were speculative legislators luckier than Locke and Shaftesbury; here was a virgin province ready to hand, with no useless lumber of antiquated institutions in the way. A set of fundamental laws was therefore prepared, as in a vacuum, for a people whose origin, character, and circumstances were wrapped in the darkness of the future. The unexplored acres of the Carolina wilderness were distributed in rectangular tracts to orders of noblemen yet unknown, who were to be called palatines, landgraves, and caciques. So perfect did the framers of this cumbrous system account it that they made it unchangeable and perpetual; but its feeble and qualified existence did not outlast a single generation.

It would not be quite correct to say that there were no inhabitants in the territory for which these ponderous constitutions were intended, for pioneers can cut down trees, build huts and plant corn-patches without the advice of philosophers. The constitutions conferred upon the wilderness an admiral; a chamberlain to look after ceremonies, fashions,

and heraldry; a constable with lieutenant-generals, and other such great dignitaries; but before any of these were thought of, and before the grant had been made to the lords-proprietors, a few settlers had pushed off to the rivers flowing into Albemarle Sound, under the lead of one Roger Green, to whom the Virginia Legislature, in 1653, voted a thousand acres of land for his "charge, hazard, and trouble" in opening the country. This pioneer settlement became a convenient resort for persecuted dissenters and embarrassed debtors who wished to place the Dismal Swamp between them and the operation of the Virginia laws. About 1660 a colony of New England people settled near Cape Fear. The Indians, having suspected them of a design to kidnap their children under pretense of converting them, became hostile, and the additional discouragement of a poor soil caused the settlers to abandon their cattle and leave the coast, posting a warning to all future comers against settling a land so infertile. These were followed in 1663 by a company from Barbadoes, under Sir John Yeamans; a part of whom deserted the country in 1667, some going to Virginia and others to New England. The proprietors added, in 1670, a new colony at

WILLIAM PENN, FROM A PORTRAIT IN THE NATIONAL MUSEUM OF PHILADELPHIA.

WILLIAM PENN'S CHAIR, IN INDEPENDENCE HALL, PHILADELPHIA.

Port Royal. This last one soon removed to the neighborhood of Charleston, which city was founded in 1680. Carolina was thus begun by three weak and widely separated settlements.

The difficulties of the new colony in the southern part of the province were aggravated by the incongruity of its elements. The bankrupt and dissolute Cavaliers hated and domineered over the rigid Puritans who had left England after the king's return, to escape the judgment which they believed to be imminent over a nation given up to immorality and scoffing irreverence. The Roundhead emigrant despised the Cavalier as a son of Belial and a persecutor of the Lord's people. To add to the discord, the king had sent some Huguenots to introduce the culture of "wine, oil, and silk," and the warm climate had attracted others; but the old English prejudice against the French made them trouble,—

they were excluded from all share in the government, and the validity of their marriages by ministers without Episcopal ordination, and the legitimacy of their children, were questioned.

Finding that some of the Dutch were in a state of discontent after the surrender of New York to the English, the Carolina proprietors sent two ships in 1671 to bring such as wished to emigrate to the colony, and this was the beginning of an important movement from New York and from the fatherland, of Dutch, whose thrift and industry contrasted with the dissolute idleness of many of the English settlers. The Scotch emigrants, who supplied the colony with many of its physicians, lawyers, and school-masters, rose to importance by their thrift, and in many cases by their prudent habit of marrying into large estates. There came also numerous Palatines from Ger-

PENN COAT-OF-ARMS.

many, and settlers from Switzerland, and yet larger numbers of Protestant Irish. There were some French Catholics from Acadie, and in the later colonial period thousands of emigrants from the northern colonies, seeking unoccupied wild lands and a warmer climate, journeyed overland in caravans to the Carolinas, driving their cattle and hogs before them.

Besides offering bounties in land, and such

(FROM A PRINT BY VERTUE, AFTER A PAINTING BY SIR GODFREY KNELLER.)

like inducements to emigrants, interested people circulated in Europe the most glowing accounts of the advantages of Carolina. The Swiss who settled Purrysburg—had read in a tract circulated in Switzerland that the houses in Charleston were very costly, and that “if you travel into the country you will see stately buildings and noble castles.” “Horses of the best kind in the world are so plentiful” that whenever “a tailor or a shoe-maker is obliged to go three miles from his house it would be very extraordinary to see him walk.” Where tailors and shoe-makers ride, what is there more to be said?

The province of North Carolina, which became distinct from South Carolina in 1729, was more homogeneous than the latter in the origins of its people, who came in the first instance, as we have seen, chiefly from the colonies to the north of it, from Barbadoes, and from England. The early comers were a hardy, independent, and generally illiterate race of woodsmen, not restrained from resisting the oppression of governors by any scrupulous regard for established institutions or regular processes of law. They were wont to serve, by means of their muskets, a pioneer's rude and riotous *quo warranto* on oppressive rulers. They lived for the most part, however, in peace with the savages, and the early diffusion of Quakerism softened their manners.

The later colonists in North Carolina were not wholly English. Before 1729, the Highland Scotch began to settle on Cape Fear River, and after the overthrow of the young Pretender, when the Highlands were ruthlessly harried by the Duke of Cumberland, the faithful clansmen took the hint given them by George II., who pardoned some of the rebels on condition of their removal to the plantations. The Gaelic was heard in six North Carolina counties, and to this region came, in 1775, Flora McDonald, the romantic deliverer of “Prince Charlie.” In the later period a large Protestant Irish population poured down through the Appalachian valleys into Virginia and North Carolina, and met and mingled with another stream of the same people, who came in from the coast of South Carolina up the valleys of the Pedee and the Wateree. About the time of the earliest Scotch immigration the Moravians bought, in two purchases, a hundred thousand acres in North Carolina, and sent twelve young “single brethren” to begin a settlement. They had to chop a road for their wagon, on which they brought salt and a swarm of bees from Virginia as part of their outfit. Germans from the Palatinate, that exhaustless source of emigration, with some Swiss, very early settled

GENERAL JAMES OGLETHORPE.

Newbern; French Huguenots came from Virginia, and for the rest there were some New Englanders and English Quakers who came at various times.

## IX.

## THE PHILANTHROPIC COLONY.

THE latest planted of the thirteen colonies was perhaps the most curious of all, if we consider the character of its founder and the purposes of its foundation. General James Oglethorpe, the last captain of colony planting, was, like John Smith, the first of the line, a man of imaginative temperament, uniting high qualities of generalship with romantic ideas. The latest founder, like the earliest, had distinguished himself in wars against the Turks, having fought in the army of Prince Eugène in the difficult and brilliant campaign which resulted in the capture of Belgrade in 1717. An ingenious philanthropist, General Oglethorpe conceived the notion of providing for ruined debtors, persecuted Protestants, and others in a colony on a utopian plan, which was also to serve as a barrier against the encroachments of the Spanish from Florida, and to be a means of snatching the lucrative production of silk

from the Italians, besides accomplishing divers other laudable objects. No rum was to be admitted, though the bankrupt objects of charity might have beer and wine. Slaves were excluded; for though the founders of Georgia did not give liberty to their white subjects, the rights of the negro seem to have been considered. It was also necessary to shut out the slave in order to teach the indigent colonists to work, and to increase the military strength of the settlement. No man might have more than fifty acres, except he brought white servants at his own expense, and this fifty-acre patch, laid off regardless of the character of the land, he could neither sell, lease, nor bequeath. The ancient and demoralizing stupidity of entail in the male line was introduced in the interest of agrarian ideas, lest the petty farm should be divided. Failing a lineal male heir, the estate reverted to the trustees, for fear that, falling to a daughter, two little farms might be consolidated into one by marriage of the owners. In the interest of benevolent schemes the trustees defied insuperable difficulties, and calmly put aside all thought of human rights and liberties,—men were to be good in Georgia by sheer force of law and circumstance, and women were to wind silk whether they would or not. All must have town lots, garden patches, and petty farms of the same size, and the growing of mulberry trees and silk-culture were conditions of land-holding. The ideal which the trustees sought to realize was a frontier community in a strait-jacket,—a province treated as *non compos mentis*, and handed over to twenty-one guardians.

But Oglethorpe and his associates were disinterested, and excluded themselves from every chance of profit. They might well take for the device on their corporate seal, silk-worms spinning, with the motto: *Non sibi, sed aliis*: "Not for one's self, but for others." The trustees gave liberally of their private means; a contagious benevolence was awakened, the Bank of England subscribed, Parliament voted nearly ten thousand pounds, and in all, the sum of thirty-six thousand pounds was collected without solicitation; the authorities of South Carolina gave cattle, rice, and hogs, while private individuals in that colony made personal donations. It is a pity that in this scheme, on which so much benevolence was expended, there should not have been a glimmer of practical statesmanship. Rum could not be kept

TOMO-CHI-CHI AND HIS NEPHEW. (FROM A PRINT AFTER THE PAINTING BY WILLIAM VERELST.)

from crossing the wilderness frontier of Carolina, and silk-culture is for old countries, not for struggling settlers on a savage coast. It seems hard to enforce the gathering of mulberry leaves, limit land-holdings to fifty acres, and charge an exorbitant quit-rent where there was no stint of ground. The indigent debtor, thriftless or unwise in England, was not likely to be improved by a few years' coddling on public stores in Georgia. The result was one that might easily have been foreseen; the settlers came to regard charity as a right, and grumbled roundly when gratuitous supplies were cut off. They attributed their miseries chiefly to this cessation of alms and to the lack of negro slaves.

In 1732 Oglethorpe took out his first company of a hundred and fourteen, not counting the clergymen and the Italian silk-tender. Many others were soon added, including a company of Highlanders for the defense of the Southern border, and a society of persecuted Protestants who had traveled afoot all the way from the valleys by Salzburg to a sea-port in Holland, that they might at last find rest and liberty in Georgia. Twenty families of Jews came the first year, for none but Roman Catholics were excluded. So considerate and excellent were Oglethorpe's

arrangements that the usual sickness and death among emigrants at sea were almost entirely avoided in the ships which came under his direction. In the colony he bore more than his share of hardships, slept on the ground and wore a kilt with the Highlanders, exposed himself everywhere, and won the admiration even of the savages, from among whom he led a retinue of "Indian kings" to England on his return, one of whom was the famous Tomo-chi-chi, who became for a while the lion of London society. While Oglethorpe was in the colony to feed the people at public expense, and to overthrow the Spanish by a brilliant maneuvering of his small force that was worthy of Prince Eugène himself, the popularity of the governor suppressed the growing discontent. But all of his regulations, and even his popularity, utterly broke down after a while. Colonization is a hard task at best; but the addition of artificial limitations made the lot of the Georgia settlers peculiarly irritating, and their lack of a share in the government robbed them of the hope of redress for their wrongs. The settlement declined by migration to South Carolina. The trustees yielded one by one many of their restrictions—even the beneficent one against the introduction of slaves—and in 1752 they surrendered the government to the crown, leaving the colonists to work out their improvement by the only method ever tried with success,—the gradual education of the people under the operation of institutions suited to their conditions, and ameliorated, as civilization increases, by free political action.

## X.

## RACE ELEMENTS.

It will be seen that while the preponderant element in colonial life was English, this was in most of the provinces mixed with and modified by many others. Ireland and Scotland naturally furnished the greater number after the English. To establish Episcopacy in the three kingdoms, and to extirpate Dissent had been the purpose of English legislation; the planting of the colonies with Dissenters and Presbyterians had been the chief result. Thousands of Scotch came into New England at an early period, Cromwell exported to Boston some hundreds of Scotch prisoners after the battles of Dunbar and Worcester, and there was no colony that did not receive reinforcements from Scotland. But, in the eighteenth century, Ireland sent the greatest number; the immigration of Irish Presbyterians before the American Revolution being relatively as remarkable as the coming of Irish Catholics has been in later times. Five

thousand Protestant Irish arrived in Pennsylvania in the single year 1729, and there was not a colony in which they did not plant themselves. The fiery temper of the Irish frontiersmen did much to embroil Pennsylvania with the Indians, and that race has produced a great number of daring pioneers. The woodsmen who fought over every mile of Kentucky's dark and bloody ground, and who pushed back the fierce Miamis, Delawares, Wyandots and Shawnees, inch by inch, on the north side of the Ohio, came, in very many cases, from the Irish stock of Western Pennsylvania and the Virginia valleys. President Andrew Jackson and the impetuous John C. Calhoun were both sons of emigrants from Ireland.

Of all immigrations from the European continent, the German has always been the most numerous, as it was, no doubt, the first. The so-called "Dutchmen" who were sent over to make potash in Virginia were probably Germans. Some Germans came with the Puritans in the earlier migrations to Massachusetts Bay. The vast movement from the Palatinate of the Lower Rhine, in colonial times, had its beginning as early as the foundation of New Sweden, which had some Palatine forerunners. But the tendency of the German Quakers and the Mennonists, or non-resistant Anabaptists, to seek shelter in Pennsylvania, where soldiering would not be required, brought the real beginning of that great Teutonic flood, the ultimate magnitude of which cannot yet be measured. From Pennsylvania as a distributing point, the Germans, along with the Scotch and Scotch-Irish, moved down the valleys and the eastern flank of the Appalachian range of mountains into Virginia and North Carolina, where many of the curious customs brought from the Rhine survived even after the Revolution. The first of the Pennsylvania Germans who sought a grant of land in the valley of Virginia was a man named Stover, who only secured it with much difficulty, by giving to every horse, dog, cow, pig, and chicken that he possessed, a human name, and representing in England,—whither he had gone to press his claim,—that all of these were ready to move with him to the new country. Other Germans, fleeing persecution, came directly to Virginia, and were granted the same liberal immunities as had been previously given to the Huguenots. The Virginia opposition to Dissenters did not extend to people who were so unhappy as not to speak the English language.

In 1708 there set in the small beginning of a movement which brought to England in the two following years about thirteen thou-

sand poor people from the Palatinate. Their country had suffered extremely in the wars waged by Louis XIV., and their reigning prince had changed his religion; so that the territory which had previously been a refuge for persecuted Huguenots from France, and Mennonists exiled by Protestant bigotry from Berne and Zürich, fell under the rule of a Roman Catholic. Some interest, political or commercial, fostered the emigration of these people to England; mysterious strangers were said to have circulated among the simple and sufficiently wretched Palatine peasants papers offering them vague inducements to remove to England, whence they were to be taken in a body to one of the plantations. It is impossible to believe, as the Tories insisted, that the Whig leaders had brought these refugees to England with the foolish intent of "strengthening the dissenting interest." It is more likely that some colonial proprietors sought to fill their waste lands at the expense of the royal treasury. Certain it is that the emigrants were deceived, and must have perished had it not been for large expenditures on the part of the government and the most liberal private contributions of money,—to say nothing of liturgies which were expeditiously translated into "High Dutch" to win them to the English Church, and so perhaps to prevent their "strengthening the dissenting interest." Some were sent to "strengthen the Protestant interest in Ireland," where their exceptionally industrious and thrifty descendants may still be found; others went to North Carolina with Baron De Graffenreid, and some settled at Governor Spotswood's iron-works in Virginia; some went to Maryland, and yet others found their way to the hill country of South Carolina. About four thousand of these wretched exiles were dispatched to New York, of whom seventeen hundred died during the voyage and soon after. The survivors were to carry out one of those visionary projects so often cherished by English public men dabbling in colonization. In 1703, the Swedes had raised the price of naval stores by putting their production under an exclusive monopoly. What could be easier than to set these refugees from the Palatinate to making tar and pitch in America? Accordingly, a hundred thousand pine trees near the Hudson River were got ready for tar-making in 1711, but the money failed; the half-starved Germans complained of their servitude, and at length broke away. Some of the refugees settled on the Hudson, where many of their descendants dwell to-day; others went to Schoharie County; while three hundred, unwilling to accept the ten acres apiece offered them in New York, and hearing of the pros-

perity of their countrymen in Pennsylvania, made a bold push down the wilderness streams into the back regions of that province. In after years, when German immigrants were compelled to land at New York, they contemptuously took the first ship for Philadelphia, and from this time the rich limestone lands of Pennsylvania became the home of the German.

Next to the Germans, French Protestants were the most numerous and the most widely distributed of immigrants from the European continent to America. They were of the fine-flower of an accomplished people; men of active minds, austere morals, heroic courage, and often of refined manners. Their descendants have furnished many men of distinction; such were Laurens, Jay, Boudinot, and Gallatin in civil life, Horry and Marion in war. In France, the Huguenots endured civil wars and harassing persecutions with sublime steadfastness. To get out of France, which was guarded like a prison, they were obliged to flee with secrecy, abandoning all their property and their means of livelihood. The members of one family were accustomed to tell how they had left the pot boiling on the fire when they came away, while another household deceived the police by giving an entertainment and fleeing while their guests were feasting at the table. At first, the refugees were dependent on alms and government aid in the countries in which they found shelter; but their thrift and skill in handicraft work soon lifted the economic civilization of Switzerland, Germany, Holland, England, and America to a higher level.

The growing intolerance of the government of France produced a constant increase in the number of emigrant Huguenots, and we find them obtaining land in Massachusetts in 1662, and settling in Ulster County, New York, at about the same period. Many were deterred from coming to the English colonies by the reactionary tendency of the Stuarts, and especially by the accession of a Catholic king. In one letter, written by a Huguenot to friends in Europe, there is a mysterious use of the letter "r," as standing for something concerning which observation is to be sought; doubtless "roi" is the word to be supplied. The subserviency of James II. to the policy of Louis XVI. was well known. But when the edict of Nantes had been revoked in 1685, and the Protestant Prince of Orange had succeeded to the English throne by the revolution of 1688, the French Protestants came in great numbers to the different colonies, as to Virginia,—where their neat little vine-clad dwellings extended for many miles along the James River above Richmond,—

to Trent River in North Carolina, and to South Carolina, which last soon came to be their favorite place of refuge. The French were, next to the Dutch, the most numerous nationality in New Amsterdam, and in 1656 public documents were issued in French; and this was occasionally done under the early English governors. In 1715, Fontaine of Virginia, visiting New York, made the mistake of supposing them the largest element in the population. "They are of the council, of the parliament, and in all other employments," he writes.

There was often a picturesque aspect to the religious enthusiasm of expatriated emigrants, such as was shown when the Salsburgers in Georgia selected and laid off their land with a Bible in their hands, and when the Huguenot women in Westchester carried mortar in their aprons to expedite the building of their little church. An aged Huguenot at New Rochelle was accustomed to go down to the water-side at sunrise and pray with his hands extended toward France, in which act of devotion and patriotism he was sometimes joined by others. The New Rochelle people, for the most part, attended church in New York at certain periods to receive the sacraments, and they used to walk the eighteen or twenty miles on Sunday morning, always singing one of the psalms from Clement Marot's version as they set out. The long distance was retraced the same evening, that they might be ready for their arduous toil on Monday morning.

Even under the sun of South Carolina the labors of the French exiles were incessant. The Huguenot grandfather and grandmother of General Horry began life by working together at the whip-saw on the banks of the Santee, and the mother of Gabriel Maginault, the patriotic millionaire of the Revolutionary period, writes to her brother in Europe: "I have been for six months together without taking bread, while I work the ground like a slave; and I have even passed three or four years together without always having it when I wanted it."

The Huguenots had suffered too much and had been too often in hostility to the royal family to hold any allegiance to France, though it was thought prudent, in 1692, to forbid their living in sea-ports on the ground that there might be other than Protestants among them. The French in Canada, however, were in fear of them, exaggerating their numbers and probably their ferocity. Denonville, Governor of Canada, reports to the French Government in 1686: "I know that some have arrived at Boston from France. Here is fresh material for banditti." Again, in 1691, a

French memoir on the state of Canada declares that the Huguenots who have fled in great numbers to New England constitute the main force of the expeditions against Canada, "and openly proclaim that they will revenge themselves on the priests, friars, and nuns of that country." In the alarms that followed the unsuccessful expedition of Sir William Phips against Quebec, the specter of Huguenot vengeance appears again. Among the foes whom Canada has to dread, we find enumerated French Calvinists who had once marched against Quebec, and "who flatter themselves that they will come again in order to indemnify themselves for the losses they allege they have sustained in quitting France." The fear was mutual; Peter Reverdy writes to the Bishop of London in 1689, that "there are two hundred French families about New York which will be put to the torture if the French take it." This fear was an exaggerated one, perhaps, but in the splendid scheme of conquest and depopulation which Frontenac was instructed to execute against New York in that same year, "the fugitive French of the pretended reformed religion" were to be sent back to France, probably for purposes of conversion, or perchance for the supply of the galleys, which just at that time were in such need of *galériens* that Iroquois braves, captured by treachery in time of peace, had been chained to the benches among thieves and Huguenots.

There was a miscellaneous but less significant emigration to America from other countries of Europe than those we have named. Switzerland contributed not only directly by means of voluntary emigration, but indirectly through the Mennonists from the Palatinate, many of whom had been cruelly expelled by Protestant bigotry from some of the Swiss cantons. Zwingli, the reformer, a man from whom one might expect better things, condemned one of the founders of these "harmless" Anabaptists to die by drowning, giving sentence with a cruel joke: "*Qui iterum mergit mergatur*," "he that dips again, let him be dipped"; and the persecution of them in parts of Switzerland was maintained at intervals for a century later, and with especial virulence in Berne.

While the proprietors of unoccupied lands in America were glad to find French and German occupants, many of the English colonists had a prejudice against them. We have seen how shabbily the French settlers were treated in South Carolina. The powerful influence of the enlightened Colonel Byrd was necessary to keep the Huguenots in countenance in Virginia. In Pennsylvania it was represented to Governor Gordon, in

1727, "that a large number of Germans, peculiar in their dress, religion, and notions of political government, had settled on Pequea, and determined not to obey lawful authority of government; that they had resolved to speak their own language, and acknowledge no sovereign but the Creator of the universe." The fears of both the English and the provincial government were excited by the arrival of so many Germans, and in 1729 Pennsylvania laid a duty of forty shillings a head on alien immigrants,—a tariff for the protection of British American population against foreign competition. Even Franklin was not without fear of danger to the State from the inoffensive Pennsylvania Germans, many of whom still, indeed, persist in the crime of speaking their own language, and in some sects continue to be peculiar in their dress.

From the beginning, the Americans have been a migratory people. New Englanders, as we have seen, planted themselves in Westchester and on Long Island, came by throngs into East Jersey, and migrated to the more southern colonies. So Virgin-

ians helped to people Maryland and North Carolina, migrated northward to New York, and, even before the Revolution, began to look wistfully over the mountain barrier into the great interior valley. New York Dutch migrated to South Carolina; some of them settled also in Maine, Pennsylvania, and Maryland; while Pennsylvanians, excited by fear of Indian massacre during the French wars, occupied much of the mountain and "piedmont" regions of the colonies to the southward. It is said that of three thousand five hundred militiamen of Orange County in North Carolina, during the Revolution, every man was a native of Pennsylvania. There was an incessant movement to and fro of people seeking to better their condition. Once the European had broken away from his mooring of centuries, the vastness of the new continent piqued him, and he became a rover. This instability as to place remains yet in the American character. The mental alertness, which comes of changing circumstances, new scenes, and unexpected difficulties, was early remarked by travelers as a characteristic of the native of the colonies.

---

### PISIDICÊ.

The incident is from the Love Stories of Parthenius, who preserved fragments of a lost epic on the expedition of Achilles against Lesbos, an island allied with Troy.

THE daughter of the Lesbian king  
 Within her bower she watched the war,  
 Far off she heard the arrows ring,  
 The smitten harness ring afar;  
 And, fighting from the foremost car,  
 Saw one that smote where all must flee;  
 More fair than the Immortals are  
 He seemed to fair Pisidicê!

She saw, she loved him, and her heart  
 Before Achilles, Peleus' son,  
 Threw all its guarded gates apart,  
 A maiden fortress lightly won!  
 And, ere that day of fight was done,  
 No more of land or faith recked she,  
 But joyed in her new life begun,—  
 Her life of love, Pisidicê!

She took a gift into her hand,  
 As one that had 'a boon to crave;  
 She stole across the ruined land  
 Where lay the dead without a grave,  
 And to Achilles' hand she gave  
 Her gift, the secret postern's key.  
 "To-morrow let me be thy slave!"  
 Moaned to her love Pisidicê.

Ere dawn the Argives' clarion call  
 Rang down Methymna's burning street;  
 They slew the sleeping warriors all,  
 They drove the women to the fleet,  
 Save one, that to Achilles' feet  
 Clung, but, in sudden wrath, cried he:  
 "For her no doom but death is meet."  
 And there men stoned Pisidicê.

In havens of that haunted coast,  
 Amid the myrtles of the shore,  
 The moon sees many a maiden ghost,—  
 Love's outcast now and evermore.  
 The silence hears the shades deplore  
 Their hour of dear-bought love; but *thee*  
 The waves lull, 'neath thine olives hoar,  
 To dreamless rest, Pisidicê!

*Andrew Lang.*

## YATIL.

WHILE in Paris, in the spring of 1878, I witnessed an accident in a circus, which for a time made me renounce all athletic exhibitions. Six horses were stationed side by side in the ring before a spring-board, and the whole company of gymnasts ran and turned somersaults from the spring over the horses, alighting on a mattress spread on the ground. The agility of one finely developed young fellow excited great applause every time he made the leap. He would shoot forward in the air like a javelin, and in his flight curl up and turn over directly above the mattress, dropping on his feet as lightly as a bird. This play went on for some minutes, and at each round of applause the favorite seemed to execute his leap with increased skill and grace. Finally, he was seen to gather himself a little farther in the background than usual, evidently to prepare for a better start. The instant his turn came, he shot out of the crowd of attendants and launched himself into the air with tremendous momentum. Almost quicker than the eye could follow him, he had turned and was dropping to the ground, his arms held above his head, which hung slightly forward, and his legs stretched to meet the shock of the elastic mattress.

But this time he had jumped an inch too far. His feet struck just on the edge of the mattress, and he was thrown violently forward, doubling up on the ground with a dull thump, which was heard all over the immense auditorium. He remained a second or two motionless, then sprang to his feet, and as quickly sank to the ground again. The ring attendants and two or three gymnasts rushed to him and took him up. The clown, in evening dress, personating the mock ring-master, the conventional spotted merryman, and a stalwart gymnast in buff fleshings, bore the drooping form of the favorite in their arms, and, followed by the by-standers, who offered ineffectual assistance, carried the wounded man across the ring and through the draped arch under the music gallery. Under any other circumstances the group would have excited a laugh, for the audience was in that condition of almost hysterical excitement when only the least effort of a clown is necessary to cause a wave of laughter. But the moment the wounded man was lifted from the ground, the whole strong light from the brilliant chandelier struck full on his right leg dangling from the knee, with the foot

hanging limp and turned inward. A deep murmur of sympathy swelled and rolled around the crowded amphitheater.

I left the circus, and hundreds of others did the same. A dozen of us called at the box-office to ask about the victim of the accident. He was advertised as "The Great Polish Champion Bare-back Rider and Aërial Gymnast." We found that he was really a native of the East, whether Pole or Russian the ticket-seller did not know. His real name was Nagy, and he had been engaged only recently, having returned a few months before from a professional tour in North America. He was supposed to have money, for he commanded a good salary, and was sober and faithful. The accident, it was said, would probably disable him for a few weeks only, and then he would resume his engagement.

The next day an account of the accident was in the newspapers, and twenty-four hours later all Paris had forgotten about it. For some reason or other I frequently thought of the injured man, and had an occasional impulse to go and inquire after him; but I never went. It seemed to me that I had seen his face before, when or where I tried in vain to recall. It was not an impressive face, but I could call it up at any moment as distinct to my mind's eye as a photograph to my physical vision. Whenever I thought of him, a dim, very dim, memory would flit through my mind, which I could never seize and fix.

Two months later, I was walking up the Rue Richelieu, when some one, close beside me and a little behind, asked me in Hungarian if I was a Magyar. I turned quickly to answer no, surprised at being thus addressed, and beheld the disabled circus-rider. It flashed upon me, the moment I saw his face, that I had seen him in Turin three years before. My surprise at the sudden identification of the gymnast was construed by him into vexation at being spoken to by a stranger. He began to apologize for stopping me, and was moving away, when I asked him about the accident, remarking that I was present on the evening of his misfortune. My next question, put in order to detain him, was:

"Why did you ask if I was a Hungarian?"

"Because you wear a Hungarian hat," was the reply.

This was true. I happened to have on a

little, round, soft felt hat, which I had purchased in Buda Pesth.

"Well, but what if I were Hungarian?"

"Nothing; only I was lonely and wanted company, and you looked as if I had seen you somewhere before. You are an artist, are you not?"

I said I was, and asked him how he guessed it.

"I can't explain how it is," he said, "but I always know them. Are you doing anything?"

"No," I replied.

"Perhaps I may get you something to do," he suggested. "What is your line?"

"Figures," I answered, unable to divine how he thought he could assist me.

This reply seemed to puzzle him a little, and he continued:

"Do you ride or do the trapeze?"

It was my turn now to look dazed, and it might easily have been gathered, from my expression, that I was not flattered at being taken for a sawdust artist. However, as he apparently did not notice any change in my face, I explained without further remark that I was a painter. The explanation did not seem to disturb him any: he was evidently acquainted with the profession, and looked upon it as kindred to his own.

As we walked along through the great open quadrangle of the Tuileries, I had an opportunity of studying his general appearance. He was neatly dressed, and, though pale, was apparently in good health. Notwithstanding a painful limp, his carriage was erect and his movements denoted great physical strength. On the bridge over the Seine we paused for a moment and leaned on the parapet, and thus, for the first time, stood nearly face to face. He looked earnestly at me a moment without speaking, and then, shouting "*Torino*" so loudly and earnestly as to attract the gaze of all the passers, he seized me by the hand, and continued to shake it and repeat "*Torino*" over and over again.

This word cleared up my befogged memory like magic. There was no longer any mystery about the man before me. The impulse which now drew us together was only the unconscious souvenir of an earlier acquaintance, for we had met before. With the vision of the Italian city, which came distinctly to my eyes at that moment, came also to my mind every detail of an incident which had long since passed entirely from my thoughts.

It was during the Turin carnival, in 1875, that I happened to stop over for a day and a night, on my way down from Paris to Venice. The festival was uncommonly dreary, for the

air was chilly, the sky gray and gloomy, and there was a total lack of spontaneity in the popular spirit. The gaudy decorations of the Piazza and the Corso, the numberless shows and booths, and the brilliant costumes, could not make it appear a season of jollity and mirth, for the note of discord in the hearts of the people was much too strong. King Carnival's might was on the wane, and neither the influence of the Church nor the encouragement of the State was able to bolster up the superannuated monarch. There was no communicativeness in even what little fun there was going, and the day was a long and a tedious one. As I was strolling around in rather a melancholy mood, just at the close of the cavalcade, I saw the flaming posters of a circus, and knew my day was saved, for I had a great fondness for the ring. An hour later I was seated in the cheerfully lighted amphitheater, and the old performance of the trained stallions was going on as I had seen it a hundred times before. At last, the "Celebrated Cypriot Brothers, the Universal Bare-back Riders" came tripping gracefully into the ring, sprang lightly upon two black horses, and were off around the narrow circle like the wind, now together, now apart, performing all the while marvelous feats of strength and skill. It required no study to discover that there was no relationship between the two performers. One of them was a heavy, gross, dark-skinned man, with the careless bearing of one who had been nursed in a circus. The other was a small, fair-haired youth of nineteen or twenty years, with limbs as straight and as shapely as the Narcissus, and with joints like the wiry-limbed fauns. His head was round, and his face of a type which would never be called beautiful, although it was strong in feature and attractive in expression. His eyes were small and twinkling, his eyebrows heavy, and his mouth had a peculiar proud curl in it which was never disturbed by the tame smile of the practiced performer. He was evidently a foreigner. He went through his acts with wonderful readiness and with slight effort, and, while apparently enjoying keenly the exhilaration of applause, he showed no trace of the *blasé* bearing of the old stager. In nearly every act that followed he took a prominent part. On the trapeze, somersaulting over horses placed side by side, grouping with his so-called brother and a small lad, he did his full share of the work, and, when the programme was ended, he came among the audience to sell photographs while the lottery was being drawn.

As usual during the carnival, there was a

lottery arranged by the manager of the circus, and every ticket had a number which entitled the holder to a chance in the prizes. When the young gymnast came in turn to me, radiant in his salmon fleshings and blue trunks, with slippers and bows to match, I could not help asking him if he was an Italian.

"No, signore, Magyar!" he replied, and I shortly found that his knowledge of Italian was limited to a dozen words. I occupied him by selecting some photographs, and, much to his surprise, spoke to him in his native tongue. When he learned I had been in Hungary, he was greatly pleased, and the impatience of other customers for the photographs was the only thing that prevented him from becoming communicative immediately. As he left me I slipped into his hand my lottery-ticket, with the remark that I never had any luck, and hoped he would.

The numbers were, meanwhile, rapidly drawn, the prizes being arranged in the order of their value, each ticket taken from the hat denoting a prize, until all were distributed. "Number twenty-eight!—a pair of elegant vases!" "Number sixteen—three bottles of vermouth!" "Number one hundred and eighty-four—candlesticks and two bottles of vermouth!" "Number four hundred and ten—three bottles of vermouth and a set of jewelry!" "Number three hundred and nineteen—five bottles of vermouth!" and so on, with more bottles of vermouth than anything else. Indeed, each prize had to be floated on a few liters of the Turin specialty, and I began to think that perhaps it would have been better, after all, not to have given my circus friend the ticket, if he were to draw drink with it.

Many prizes were called out, and at last only two numbers remained. The excitement was now intense, and it did not diminish when the conductor of the lottery announced that the last two numbers would draw the two great prizes of the evening, namely: An order on a Turin tailor for a suit of clothes, and an order on a jeweler for a gold watch and chain. The first of these two last numbers was taken out of the hat.

"Number twenty-five—order for a suit of clothes!" was the announcement.

Twenty-five had been the number of my ticket. I did not hear the last number drawn, for the Hungarian was in front of my seat trying to press the order on me, and protesting against appropriating my good luck. I wrote my name on the programme for him, with the simple address, U. S. A., persuaded him to accept the windfall, and went home. The next morning I left town.

On the occasion of our mutual recognition in Paris, the circus-boy began to relate, as soon as the first flush of his surprise was over, the story of his life since the incident in Turin. He had been to New York and Boston, and all the large sea-coast towns; to Chicago, St. Louis, and even to San Francisco; always with a circus company. Whenever he had had an opportunity in the United States, he had asked for news of me.

"The United States is so large!" he said, with a sigh. "Every one told me that, when I showed the Turin programme with your name on it."

The reason why he had kept the programme and tried to find me in America was because the lottery-ticket had been the direct means of his emigration, and, in fact, the first piece of good fortune that had befallen him since he left his native town. When he joined the circus he was an apprentice, and, beside a certain number of hours of gymnastic practice daily and service in the ring both afternoon and evening, he had half a dozen horses to care for, his part of the tent to pack up and load, and the team to drive to the next stopping-place. For sixteen, and often eighteen hours of hard work, he received only his food and his performing clothes. When he was counted as one of the troupe his duties were lightened, but he got only enough money to pay his way with difficulty. Without a *lira* ahead, and, with no clothes but his rough working-suit and his performing costume, he could not hope to escape from this sort of bondage. The luck of number twenty-five had put him on his feet.

"All Hungarians worship America," he said, "and when I saw that you were an American I knew that my good fortune had begun in earnest. Of course, I believed America to be the land of plenty, and there could have been no stronger proof of this than the generosity with which you, the first American I had ever seen, gave me, a perfect stranger, such a valuable prize. When I remembered the number of the ticket and the letter in the alphabet, Y, to which this number corresponds, I was dazed at the significance of the omen, and resolved at once to seek my fortune in the United States. I sold the order on the tailor for money enough to buy a suit of ready-made clothes and pay my fare to Genoa. From this port I worked my passage to Gibraltar, and thence, after performing a few weeks in a small English circus, I went to New York in a fruit-vessel. As long as I was in America everything prospered with me. I made a great deal of money and spent a great deal. After a couple of years I went to London with a company, and there lost

my pay and my position by the failure of the manager. In England my good luck all left me. Circus-people are too plenty there; everybody is an artist. I could scarcely get anything to do in my line, so I drifted over to Paris."

We prolonged our stroll for an hour, for, although I did not anticipate any pleasure or profit from continuing the acquaintance, there was yet a certain attraction in his simplicity of manner and in his naïve faith in the value of my influence on his fortunes. Before we parted he expressed again his ability to get me something to do, but I did not credit his statement enough to correct the impression that I was in need of employment. At his earnest solicitation I gave him my address, concealing, as well as I could, my reluctance to encourage an acquaintance which could not result in anything but annoyance.

One day passed, and two, and, on the third morning, the porter showed him to my room.

"I have found you work!" he cried, in the first breath.

Sure enough, he had been to a Polish acquaintance who knew a countryman, a copyist in the Louvre. This copyist had a superabundance of orders, and was glad to get some one to help him finish them in haste. My gymnast was so much elated over his success at finding occupation for me that I hadn't the heart to tell him that I was at leisure only while hunting a studio. I therefore promised to go with him to the Louvre some day, but I always found an excuse for not going.

For two or three weeks we met at intervals. At various times, thinking he was in want, I pressed him to accept the loan of a few francs; but he always stoutly refused. We went together to his lodging-house, where the landlady, an Englishwoman, who boarded most of the circus people, spoke of her "poor, dear Mr. Nodge," as she called him, in quite a maternal way, and assured me that he had wanted for nothing, and should not so long as his wound disabled him. In the course of a few days I had gathered from him a complete history of his circus-life, which was full of adventure and hardship. He was, as I had thought then, somewhat of a novice in the circus business at the time we met in Turin, having left his home less than two years before. He had indeed been associated as a regular member of the company only a few months, after having served a difficult and wearing apprenticeship. He was born in Kolosvar, where his father was a professor in the university, and there he grew up with three brothers and a sister, in a comfortable

home. He always had had a great desire to see travel, and, from early childhood, developed a special fondness for gymnastic feats. The thought of a circus made him fairly wild. On rare occasions a traveling show visited this Transylvanian town, and his parents with difficulty restrained him from following the circus away. At last, in 1873, one show, more complete and more brilliant than any one before seen there, came in on the newly opened railway, and he, now a man, went away with it, unable longer to restrain his passion for the profession. Always accustomed to horses, and already a skillful acrobat, he was immediately accepted by the manager as an apprentice, and, after a season in Roumania and a disastrous trip through Southern Austria, they came into Northern Italy, where I met him.

Whenever he spoke of his early life he always became quiet and depressed, and, for a long time, I believed that he brooded over his mistake in exchanging a happy home for the vicissitudes of Bohemia. It came out slowly, however, that he was haunted by a superstition, a strange and ingenious one, which was yet not without a certain show of reason for its existence. Little by little I learned the following facts about it: His father was of pure Szeklar, or original Hungarian, stock, as dark-skinned as a Hindoo, and his mother was from one of the families of Western Hungary, with probably some Saxon blood in her veins. His three brothers were dark like his father, but he and his sister were blondes. He was born with a peculiar red mark on his right shoulder, directly over the scapular. This mark was shaped like a forked stick. His father had received a wound in the insurrection of '48, a few months before the birth of him, the youngest son, and this birth-mark reproduced the shape of the father's scar. Among Hungarians his father passed for a very learned man. He spoke fluently German, French, and Latin (the language used by Hungarians in common communication with other nationalities), and took great pains to give his children an acquaintance with each of these tongues. Their earliest playthings were French alphabet-blocks, and the set which served as toys and tasks for each of the elder brothers came at last to him as his legacy. The letters were formed by the human figure in different attitudes, and each block had a little couplet below the picture, beginning with the letter on the block. The Y represented a gymnast hanging by his hands to a trapeze, and, being a letter which does not occur in the Hungarian language except in combinations, excited most the interest and imagination of the youngsters. Thousands of times did they practice the grouping of the figures on the

blocks, and the Y always served as a model for trapeze exercises. My friend, on account of his birth-mark, which resembled a rude Y, was early dubbed by his brothers with the nickname Yatil, this being the first words of the French couplet printed below the picture. Learning the French by heart, they believed the *Y a-t-il* to be one word, and, with boyish fondness for nicknames, saddled the youngest with this. It is easy to understand how the shape of this letter, borne on his body in an indelible mark, and brought to his mind every moment of the day, came to seem in some way connected with his life. As he grew up in this belief he became more and more superstitious about the letter and about everything in the remotest way connected with it.

The first great event of his life was joining the circus, and to this the letter Y more or less directly led him. He left home on his twenty-fifth birthday, and twenty-five was the number of the letter Y in the block-alphabet.

The second great event of his life was the Turin lottery, and the number of the lucky ticket was twenty-five. "The last sign given me," he said, "was the accident in the circus here." As he spoke, he rolled up the right leg of his trowsers, and there, on the outside of the calf, about midway between the knee and ankle, was a red scar forked like the letter Y.

From the time he confided his superstition to me he sought me more than ever. I must confess to feeling, at each visit of his, a little constrained and unnatural. He seemed to lean on me as a protector, and to be hungry all the time for an intimate sympathy I could never give him. Although I shared his secret, I could not lighten the burden of his superstition. His wound had entirely healed, but, as his leg was still weak and he still continued to limp a little, he could not resume his place in the circus. Between brooding over his superstition and worrying about his accident, he grew very despondent. The climax of his hopelessness was reached when the doctor told him at last that he would never be able to vault again. The fracture had been a severe one, the bone having protruded through the skin. The broken parts had knitted with great difficulty, and the leg would never be as firm and as elastic as before. Besides, the fracture had slightly shortened the lower leg. His circus career was therefore ended, and he attributed his misfortune to the ill-omened letter Y.

Just about the time of his greatest despondency, war was declared between Russia and Turkey. The Turkish ambassadors were drumming up recruits all over Western Europe. News came to the circus boarding-house that

good riders were wanted for the Turkish mounted gendarmes. Nagy resolved to enlist, and we went together to the Turkish embassy. He was enrolled after only a superficial examination, and was directed to present himself on the following day to embark for Constantinople. He begged me to go with him to the rendezvous, and there I bade him adieu. As I was shaking his hand he showed me the certificate given him by the Turkish ambassador. It bore the date of May 25, and at the bottom was a signature in Turkish characters which could be readily distorted by the imagination into a rude and scrawling Y.

A series of events occurring immediately after Nagy left for Constantinople resulted in my own unexpected departure in a civil capacity for the seat of war in the Russian lines. The line of curious coincidences in the experience of the circus-rider had impressed me very much at the time, but in the excitement of the Turkish campaign I entirely forgot the circumstance. I do not, indeed, recall any thought of Nagy during the first five months in the field. The day after the fall of Plevna I rode through the deserted earth-works toward the town. The dead were lying where they had fallen in the dramatic and useless sortie of the day before. The dead on a battle-field always excite fresh interest, no matter if the spectacle be an every-day one, and as I rode slowly along I studied the attitudes of the fallen bodies, speculating on the relation between the death-poses and the last impulse that had animated the living frame. Behind a rude barricade of wagons and household goods, part of the train of non-combatants which Osman Pasha had ordered to accompany the army in the sortie, a great number of dead lay in confusion. The peculiar position of one of these instantly attracted my eye. He had fallen on his face against the barricade, with both arms stretched above his head, evidently killed instantly. The figure on the alphabet-block, described by the circus-rider, came immediately to my mind. My heart beat as I dismounted and looked at the dead man's face. It was a genuine Turk.

This incident revived my interest in the life of the circus-rider, and gave me an impulse to look among the prisoners to see if by chance he might be with them. I spent a couple of days in distributing tobacco and bread in the hospitals and among the thirty thousand wretches herded shelterless in the snow. There were some of the mounted gendarmes among them, and I even found several Hungarians; but none of them had ever heard of the circus-rider.

The passage of the Balkans was a campaign

full of excitement, and was accompanied by so much hardship, that selfishness got entirely the upper hand of me, and life became a battle for physical comfort. After the passage of the mountain range, we went ahead so fast that I had little opportunity, even if I had the enterprise, to look among the few prisoners for the circus-rider.

Time passed, and we were at the end of a three days' fight near Philippopolis, in the middle of January. Suleiman Pasha's army, defeated, disorganized, and at last disbanded, though to that day still unconquered, had finished the tragic act of its last campaign with the heroic stand made in the foot-hills of the Rhodope Mountains, near Stanimaka, south of Philippopolis. A long month in the terrible cold, on the summits of the Balkan range; the forced retreat through the snow after the battle of Taskosen; the neck-and-neck race with the Russians down the valley of the Maritza; finally, the hot little battle on the river-bank, and the two days of hand-to-hand struggle in the vineyards of Stanimaka—this was a campaign to break the constitution of any soldier. Days without food, nights without shelter from the mountain blasts, always marching and always fighting, supplies and baggage lost, ammunition and artillery gone,—human nature could hold out no longer, and the Turkish army dissolved away into the defiles of the Rhodopes. Unfortunately for her, Turkey has no literature to chronicle, no art to perpetuate the heroism of her defenders.

The incidents of that short campaign are too full of horror to be related. Not only did the demon of war devour strong men, but found dainty morsels for its bloody maw in innocent women and children. Whole families, crazed by the belief that capture was worse than death, fought in the ranks with the soldiers. Women ambushed in coverts shot the Russians as they rummaged the captured trains for much-needed food. Little children, thrown into the snow by the flying parents, died of cold and starvation, or were trampled to death by passing cavalry. Such a useless waste of human life has not been recorded since the indiscriminate massacres of the Middle Ages.

The sight of human suffering soon blunts the sensibilities of any one who lives with it, so that he is at last able to look upon it with no stronger feeling than that of helplessness. Resigned to the inevitable, he is no longer impressed by the woes of the individual. He looks upon the illness, wounds, and death of the soldier as a part of the lot of all combatants, and comes to consider him an insignificant unit of the great mass of men. At last, only novelties in horrors will excite his feelings.

I was riding back from the Stanimaka battle-field, sufficiently elated at the prospect of a speedy termination of the war—now made certain by the breaking up of Suleiman's army—to forget where I was, and to imagine myself back in my comfortable apartments in Paris. I only awoke from my dream at the station where the highway from Stanimaka crosses the railway line about a mile south of Philippopolis. The great wooden barracks had been used as a hospital for wounded Turks, and, as I drew up my horse at the door, the last of the lot of four hundred, who had been starving there nearly a week, were being placed upon carts to be transported to the town. The road to Philippopolis was crowded with wounded and refugees. Peasant families struggled along with all their household goods piled upon a single cart. Ammunition wagons and droves of cattle, rushing along against the tide of human beings, toward the distant bivouacs, made the confusion hopeless. Night was fast coming on, and, in company with a Cossack, who was, like myself, seeking the headquarters of General Gourko, I made my way through the tangle of men, beasts, and wagons toward the town. It was one of those chill, wet days of winter when there is little comfort away from a blazing fire, and when good shelter for the night is an absolute necessity. The drizzle had drenched my garments, and the snow-mud had soaked my boots. Sharp gusts of piercing wind drove the cold mist along, and as the temperature fell in the late afternoon, the slush of the roads began to stiffen and the fog froze where it gathered. Every motion of the limbs seemed to expose some unprotected part of the body to the cold and wet. No amount of exercise that was possible with stiffened limbs and in wet garments would warm the blood. Leading my horse, I splashed along, holding my arms away from my body, and only moving my benumbed fingers to wipe the chill drip from my face. It was weather to take the courage out of the strongest man, and the sight of the soaked and shivering wounded, packed in the jolting carts or limping through the mud, gave me, hardened as I was, a painful contraction of the heart. The best I could do was to lift upon my worn-out horse one brave young fellow who was hobbling along with a bandaged leg. Followed by the Cossack, whose horse bore a similar burden, I hurried along, hoping to get under cover before dark. At the entrance to the town numerous camp-fires burned in the bivouacs of the refugees, who were huddled together in the shelter of their wagons, trying to warm themselves in the smoke of the wet fuel. I could see the wounded, as they were

jolted past in the heavy carts, look longingly at the kettles of boiling maize which made the evening meal of the houseless natives.

Inside the town, the wounded and the refugees were still more miserable than those we had passed on the way. Loaded carts blocked the streets. Every house was occupied, and the narrow sidewalks were crowded with Russian soldiers, who looked wretched enough in their dripping overcoats, as they stamped their rag-swathed feet. At the corner, in front of the great Khan, motley groups of Greeks, Bulgarians, and Russians were gathered, listlessly watching the line of hobbling wounded as they turned the corner to find their way among the carts, up the hill to the hospital, near the Konak. By the time I reached the Khan the Cossack who accompanied me had fallen behind in the confusion, and, without waiting for him, I pushed along, wading in the gutter, dragging my horse by the bridle. Half-way up the hill I saw a crowd of natives watching with curiosity two Russian guardsmen and a Turkish prisoner. The latter was evidently exhausted, for he was crouching in the freezing mud of the street. Presently the soldiers shook him roughly, and raised him forcibly to his feet, and, half supporting him between them, they moved slowly along, the Turk balancing on his stiffened legs, and swinging from side to side.

A most wretched object he was to look at. He had neither boots nor fez. His feet were bare, and his trowsers were torn off near the knee, and hung in tatters around his mud-splashed legs. An end of the red sash fastened to his waist trailed far behind in the mud. A blue cloth jacket hung loosely from his shoulders, and his hands and wrists dangled from the ragged sleeves. His head rolled around at each movement of the body, and at short intervals the muscles of the neck would rigidly contract. All at once he drew himself up with a shudder and sank down in the mud again.

The guardsmen were themselves near the end of their strength, and their patience was well nigh finished as well. Rough mountain marching had torn the soles from their boots, and great unsightly wraps of raw-hide and rags were bound on their feet. The thin, worn overcoats, burned in many places, flapped dismally against their ankles; and their caps, beaten out of shape by many storms, clung drenched to their heads. They were in no condition to help any one to walk, for they could scarcely get on alone. They stood a moment shivering, looked at each other, shook their heads as if discouraged, and proceeded to rouse the Turk by hauling him upon his feet again. The three moved

on a few yards, and the prisoner fell again, and the same operation was repeated. All this time I was crowding nearer and nearer, and as I got within a half-dozen paces, the Turk fell once more, and this time lay at full length in the mud. The guardsmen tried to rouse him by shaking, but in vain. Finally, one of them, losing all patience, pricked him with his bayonet on the lower part of the ribs exposed by the raising of the jacket as he fell. I was now near enough to act, and with a sudden clutch I pulled the guardsman away, whirled him around, and stood in his place. As I was stooping over the Turk he raised himself slowly, doubtless aroused by the pain of the puncture, and turned on me a most beseeching look, which changed at once into something like joy and surprise. Immediately a death-like pallor spread over his face, and he sank back again with a groan.

By this time quite a crowd of Bulgarians had gathered around us, and seemed to enjoy the sight of a suffering enemy. It was evident that they did not intend to volunteer any assistance, so I helped the wounded Russian down from my saddle, and invited the natives rather sternly to put the Turk in his place. With true Bulgarian spirit they refused to assist a Turk, and it required the argument of the raw-hide (*nagajka*) to bring them to their senses. Three of them, cornered and flogged, lifted the unconscious man and carried him toward the horse, the soldiers, meanwhile believing me to be an officer, standing in the attitude of attention. As the Bulgarians bore the Turk to the horse, a few drops of blood fell to the ground. I noticed then that he had his shirt tied around his left shoulder, under his jacket. Supported in the saddle by two natives on each side, his head falling forward on his breast, the wounded prisoner was carried with all possible tenderness to the Stafford House hospital, near the Konak. As we moved slowly up the hill, I looked back, and saw the two guardsmen sitting on the muddy sidewalk, with their guns leaning against their shoulders,—too much exhausted to go either way.

I found room for my charge in one of the upper rooms of the hospital, where he was washed and put into a warm bed. His wound proved to be a severe one. A Berdan bullet had passed through the thick part of the left pectoral, out again, and into the head of the humerus. The surgeon said that the arm would have to be operated on, to remove the upper quarter of the bone.

The next morning I went to the hospital to see what had become of the wounded man, for the incident of the previous evening made a deep impression on my mind. As

I walked through the corridor I saw a group around a temporary bed in the corner. Some one was evidently about to undergo an operation, for an assistant held at intervals a great cone of linen over a haggard face on the pillow, and a strong smell of chloroform filled the air. As I approached, the surgeon turned around, and, recognizing me, with a nod and a smile said, "We are at work on your friend." While he was speaking, he bared the left shoulder of the wounded man, and I saw the holes made by the bullet as it passed from the pectoral into the upper part of the deltoid. Without waiting longer, the surgeon made a straight cut downward from near the acromion through the thick fiber of the deltoid to the bone. He tried to sever the tendons to slip the head of the humerus from the socket, but failed. He wasted no time in further trial, but made a second incision from the bullet-hole diagonally to the middle of the first cut, and turned the pointed flap thus made up over the shoulder. It was now easy to unjoint the bones, and but a moment's work to saw off the shattered piece, tie the severed arteries and bring the flap again into its place.

There was no time to pause, for the surgeon began to fear the effects of the chloroform on the patient. We hastened to revive him by every possible means at hand, throwing cold water on him and warming his hands and feet. Although under the influence of chloroform to the degree that he was insensible to pain, he had not been permitted to lose his entire consciousness, and he appeared to be sensible of what we were doing. Never-

theless, he awoke slowly, very slowly, the surgeon meanwhile putting the stitches in the incision. At last he raised his eyelids and made a movement with his lips. With a deliberate movement he surveyed the circle of faces gathered closely around the bed. There was something in his eyes which had an irresistible attraction for me, and I bent forward to await his gaze. As his eyes met mine they changed as if a sudden light had struck them, and the stony stare gave way to a look of intelligence and recognition. Then, through the beard of a season's growth and behind the haggard mask before me, I saw at once the circus-rider of Turin and Paris. I remember being scarcely excited or surprised at the meeting, for a great sense of irresponsibility came over me, and I involuntarily accepted the coincidence as a matter of course. He tried in vain to speak, but held up his right hand and feebly made with his fingers the sign of the letter which had played such a part in the story of his life. Even at that instant the light left his eyes, and something like a veil seemed drawn over them. With the instinctive energy which possesses every one when there is a chance of saving human life, we redoubled our efforts to restore the patient to consciousness. But while we strove to feed the flame with some of our own vitality, it flickered and went out, leaving the hue of ashes where the rosy tinge of life had been. His heart was paralyzed.

As I turned away, my eye caught the surgeon's incision, which was now plainly visible on the left shoulder. The cut was in the form of the letter Y.

### THE WAY OF LIFE.

THE warrior frowned and pressed his temples gray;  
"Enough," he cried, "away with love—away!"

A boy from play by fondest kiss beguiled,  
"Mother, I'll love thee ever!" spake the child.

A maiden gazed into the night sky wide—  
"Oh, I will love him when he comes!" she sighed.

These three moved on along the way of life:  
A fair face lured the soldier from his strife,

Upon a tomb was carved the sweet child's name,  
The lover to the maiden never came.

*John Vance Cheney.*

## A WOMAN'S REASON.\*

BY W. D. HOWELLS,

Author of "Venetian Life," "A Chance Acquaintance," "A Modern Instance," etc.

### III.

HELEN woke the next morning with the overnight ache still at her heart: she wondered that she could have thought of leaving her father; but when she opened her shutters and let in the light, she was aware of a change that she could not help sharing. It was the wind that had changed, and was now east; the air was fresh and sparkling; the homicidal sunshine of the day before lay in the streets and on the house fronts as harmless as painted sunshine in a picture. Another day might transform all again; the tidal wave of life that the sea had sent from its deep cisterns out over the land might ebb as quickly, and the world find itself old and haggard and suffering once more; but while it lasted, this respite was a rapture.

Helen came down with something of it in her face, the natural unreasoned and unreasoning hopefulness of young nerves rejoicing in the weather's mood; but she began at breakfast by asking her father if he did not think it was rather crazy for her to be starting off for Beverly the very day after she had got home for good, and had just unpacked everything. She said she would go only on three conditions: first, that he felt perfectly well; second, that he would be sure to come down on Saturday; and third, that he would be sure to bring her back with him on Monday.

"I don't think I could stand Marian Butler in her present semi-fluid state *more* than three days; and I wouldn't consent to leave you, papa, except that while you're worrying over business you'd really rather not have me about? Would you?"

Her father said he always liked to have her about.

"Oh yes; of course," said Helen. "But don't you see, I'm trying to make it a virtue to go, and I can't go unless I do?"

He laughed with her at her hypocrisy. They agreed that this was Thursday the 15th, and that he should come down on Saturday the 17th, and that he would let nothing detain him, and that he would come in time for dinner, and not put it off, as he would be

sure to do, till the last train. Helen gave him a number of charges as to his health and his hours of work, and bade him, if he did not feel perfectly well, to telegraph her instantly. When he started down town she made him promise to drive home. After the door closed upon him, she wondered that she had ever allowed herself to think of leaving him, and indignantly dismissed the idea of going to Beverly; but she went on and packed her trunk so as to have it ready when the expressman came for it. She could easily send him away, and besides, if she did not go now, there was no hope of getting her father off for a holiday and a little change of scene. She quitted the house in time to catch the noon train, and rode drearily down to Beverly, but not without the comfort of feeling herself the victim of an inexorable destiny. All the way down she was in impulse rushing back to Boston, and astonishing Margaret by her return, and telling her father that she found she could not go, and being fondly laughed at by him. She was almost in tears when the brakeman shouted out the name of the station, and if Marian Butler had not been there with her phaeton, in obedience to the captain's telegram announcing Helen's arrival, she would have hidden herself somewhere, and taken the next train back to town. As it was, she descended into the embrace of her friend, who was so glad to see her that she tried to drive through the train, just beginning to move off, on the track that crossed their road, and had to be stopped by the baggage-master, who held the pony's nose till the train was well on its way to Portland. At the door of the cottage, when the pony had drawn up the phaeton there, with a well-affected air of being driven up; Mrs. Butler met Helen with tender and approving welcome, and said that they could never have hoped to get her father to come unless she had come first.

"This change in the weather will be everything for him, and you mustn't worry about him," she said, laying a soothing touch upon Helen's lingering anxieties. "If he has any business perplexities, you may be sure he'd rather have you out of the way. I have seen

something of business perplexities in my time, my dear, and I know what they are. I shall telegraph to Mr. Butler to bring your father in the same train with him, and not give him any chance of slipping through his fingers."

Mrs. Butler was one of those pale, slight ladies, not easily imaginable apart from the kind of soft breakfast shawl which she wore, and which harmonized with the invalid purple under her kind eyes, the homes of habitual headache; and the daughters of the marriage Captain Butler had made rather late in life with a woman fifteen years younger than himself, were as unlike their mother as their father was. These large, warm blondes invited all the coolness they could with their draperies, and stood grouped about her, so many statues of health and young good looks and perpetual good-nature, with bangs and frizzes over their white foreheads, and shadowing their floating, heavily lashed blue eyes. When alone they often tended in behavior to an innocent rowdiness; they were so amiable, and so glad, and so strong, that they could not very well keep quiet, and when quiet, especially in their mother's presence, they had a knowingly quelled look: in their father's presence they were not expected nor liked to be quiet. They admired Helen almost as much as they admired their mother. She was older than any of them, except Marian, and was believed to be a patron of style and wisdom, who had had lots of offers, and could marry *anybody*. While Helen and their mother talked together, they listened in silence, granting their superiority, with the eager humility of well-bred younger girlhood; and Marian went to see about lunch.

Mr. Ray was coming to lunch, and Helen was to see him with Marian for the first time since their engagement. He was a man she had not known very well in Harvard, though he was of the class she had danced through with. He was rather quiet, and she had not formed a flattering opinion of him; some of the most brilliant fellows liked him, but she had chosen to think him dull. That was some years ago, and she had not often met him since; he had been away a great deal.

His quiet seemed to have grown upon him, when he appeared, or it might have been the contrast of his composure with the tumult of the young girls that gave it such a positive effect. He seemed the best of friends with them all, but in his own way. He spoke little and he spoke low; and he could not be got to repeat what he said; he always said something different the second time, and if he only looked as if he were going to speak, his prospective sisters-in-law fell helplessly silent. He was not quite so tall as Marian, and he was

much slighter; she generously prided herself upon being unable to wear his gloves, which Jessie Butler could just get on. He was a very scrupulously perfect man as to his gloves, and every part of his dress, which the young ladies now criticised in detail, after he had paid his duty to Helen and their mother. They all used him with a freedom that amused Helen, and that was not much short of the frankness with which Marian came out and planted a large kiss upon his lips, and then, without speaking to him, turned to her mother with an air of housekeeperly preoccupation to ask something about the lunch, and disappeared again.

Mr. Ray took everything with grave composure, a little point of light in either of his brown eyes, and the slightest curve of the small brown mustache that curled tightly in over his upper lip, showing his sense from time to time of what he must have found droll if some one else had been in his place. He had an affectionate deference for Mrs. Butler that charmed Helen. He carved at lunch with a mastery of the difficult art, and he was quite at ease in his character of head of the family. It gave Helen a sort of shock to detect him in pressing Marian's hand under the table; but, upon reflection, she was not sure that she disapproved of it.

She perceived that she must revise her opinion of Mr. Ray. Without being witty, his talk was bright and to the last degree sensible, with an edge of satire for the young girls, to whom, at the same time, he was alertly attentive. Helen thought his manner exquisite, especially toward herself in her quality of Marian's old and valued friend; it was just what the manner of a man in his place should be. He talked a good deal to her, and told her he had spent most of the summer on the water, "which accounts," she mused, "for his brown little hands, not much bigger than a Jap law student's, and for that perfect mass of freckles." He said he was expecting his boat round from Manchester; and he hoped that she would come with the other young ladies and take a look at her after lunch. He said "boat" so low that Helen could just catch the word, and she smiled in consenting to go and look at it, for she imagined, from his deprecatory tone, that it was something like a dory which might have been bestowed upon Mr. Ray's humility by some kindly fisherman. Walking to the shore by Helen's side, he said something further about running down to Mount Desert in his boat, and about one of his men knowing how to broil a mackerel pretty well, which puzzled her and shook her in her error, just before they came upon a vision of snowy duck and paint and

shining brasses, straight and slim and exquisite as Helen herself in line, and light as a bird dipped for a moment upon the water. A small boat put out for them, and they were received on board the yacht with grave welcome by Mr. Ray, whose simple dress—so far hitherto from proclaiming itself nautical in cut or color—now appeared perfectly adapted to yachting. He did not seem to do the host here any more than at Captain Butler's table, but he distinguished himself as his chief guest, with a subtle accent in his politeness that gave her quick nerves something of the pleasure of a fine touch of music. She was now aware that she admired Mr. Ray, and she wondered if he did not look shorter than he really was.

She found it quite in character that he should have a friend on board whom he had not mentioned to any of them, and whom he now introduced in his most suppressed tones. The friend was a tall young Englishman, in blue Scotch stuff, and Helen decided at once that his shoulders sloped too much; he talked very far down in his throat, and he had a nervous laugh. Helen discovered that he had also a shy, askance effect of having just looked at you.

Ray asked the ladies if they would fish, and when they would not, he frankly tried to entertain them in other ways. It came out that he could both play and sing; and he picked on a banjo the air of a Canadian boat-song he had learned at Gaspé the summer before. That made the girls ask him to show his sketches of the *habitants*, and Helen thought them very good, and very droll, done with vigor and *chic*. He made the afternoon pass charmingly; but what amused Helen most was Marian's having already got his tone about his possessions and accomplishments. Her instinct would not suffer her to afflict him by any show of pride in them, proud as she was of them; and on the yacht there was no approach to endearments between them. "Really," thought Helen, "Marian will be equal to it, after all," and began to respect her sex. After supper, which Ray offered them on board, and which that one of the men who could broil a mackerel pretty well served with touches of exquisite marine cookery, Helen felt that it would be mean to refrain any longer. "Marian," she whispered to her friend apart, "he is *perfect*!" and Marian looked gratefully at her and breathed "Yes."

Helen was generous, but the proximity of this prosperous love made her feel very desolate and left behind. The aching tenderness for Robert, which was at the bottom of all her moods, throbbed sorer; she must still it somehow, and she began to talk with the

Englishman. As she went on she could not help seeing that the young Butler girls, innocently wondering at her under their bangs, were suffering some loss of an ideal, and that Marian's averted eyes were reflecting Mr. Ray's disapproval, otherwise hidden deeper than the sea over which they sailed.

The Englishman, after a moment of awkward hesitation and apparent self-question, seemed to fall an easy prey. He presently hung about her quite helplessly; but his helplessness did not make her pity him. "So nice," he said, as they sat a little apart, after Ray had attempted a diversion with another Canadian barcarole, "to be able to do something of that kind. But it isn't very common in the States, is it, Miss — Harkness?"

"I don't understand. Do you mean that we don't commonly know Canadian boat-songs? I don't suppose we do."

"No, no; I don't mean *that*!" replied Mr. Rainford (if that was the name which Helen had caught) "I meant being able to do something, you know: to keep the ball rolling, as you say."

"Do we say 'keep the ball rolling'?" Helen affected to muse.

"I heard it was an Americanism," said Mr. Rainford, laughing at the pretence she made, with her downward look, of giving his words anxious thought. "I was thinking of the Canadians when I spoke. They seem to be up to all sorts of things. I was at a place last month—Old Beach or Old Orchard—something like that—where the Montreal people come; and some of those fellows knew no end of things. Songs, like Mr. Ray's; and tricks; and — and — well, I don't know."

Helen shook her head. "No; we don't have those accomplishments in the States, as you say. We're a serious people."

"I don't know," laughed Mr. Rainford. "You have your own fun, I suppose."

"In our poor way, yes. We go to lectures, and attend the public school exhibitions, and — yes, we have our amusements."

Mr. Rainford seemed carried quite beyond himself by these ironical impertinences. "Really, I can't admit that they're all of that kind. I saw a good deal of an amusement at the seaside that I was told was not very serious."

"Indeed! What could it have been?" asked Helen, with the affectation of deep interest.

"Oh, surely now, Miss Harkness, you don't expect me to explain it. All the young people seemed to understand it; the Canadian ladies said it was an American institution." She did not help him on, and he had to get out of the affair as he could. He red-

dened with the effort. "I must say it seemed very pleasant, at least for the two people concerned" —

"Oh, only two!" cried Helen.

The poor young man laughed gratefully, and took up the burden of silliness which she now left wholly to him. "Yes; a young lady — always very charming — and —"

"A gentleman always very brilliant and interesting. Oh, yes!" She turned about on her camp-stool with an unconscious air, and began to talk to the young Butler girls. She had provoked his recognition of the situation, if he had meant his allusion to sea-side flirtations for that; but her fretted nerves did not resent it the less because she was in the wrong. She could have said that there was nothing in her words, and afterward she did say this to herself; but as if he had felt a personal edge in them, Mr. Rainford sat quite blank for a moment, then, after some attempts at self-recovery in talk with the others, he rose and went below.

"Ned," said Marian, "where *did* you pick up that particularly odious Englishman?" In her vexation with Helen it was necessary to assail *some* one.

"He's a very good fellow," said Ray, quietly. "I met him in Cairo, first. He's very clever, and remarkably well up in Coptic—for a lord."

All the Butlers started, as if to pounce upon Ray. "A *lord*!" they hoarsely breathed, with the bitter sense of loss natural to girls who might never see a nobleman again.

"*Why* did you introduce him as Mister!" demanded Marian, in accents expressive of the common anguish; and somehow the revelation of her victim's quality seemed to Helen to render the folly and cruelty of her behavior more atrociously vulgar; it seemed to elevate it into a question of international interest.

"I said Lord Rainford," retorted Ray.

"You *whispered* it!" cried Marian, bitterly.

"Well, he wont mind your calling him Mr. Rainford. I can explain," said Ray. "Don't change now," he added mischievously.

"As if I ever should!" indignantly retorted Marian. "And let him know that we'd been talking about him! No, he shall remain Mister to the end of the chapter with *us*. Are you going to bring him to the house?"

"I'm going to Salem with him as soon as I put you ashore. I'd have asked you to let me bring him to lunch if I'd supposed he was on the boat. When I left him at Manchester this morning, he talked of going to Boston by the cars."

"I think he's hideous," said Marian, for all comment on the explanation.

"Not pretty, but precious," returned Ray, tranquilly. "He's a good fellow, but he knows he isn't good-looking. He's rather sensitive about it, and it makes him nervous and awkward with ladies; but he's a very sensible fellow among men," Ray concluded.

There was a little unpleasant pause, and then Ray and Marian began talking eagerly to Helen, as if they felt a little ashamed, and a good deal sorry for her, and were anxious to get her to do or say something that would bring back their good opinion of her.

They dropped anchor in a sheet of sunset red off Captain Butler's place, and Ray pulled them ashore in his small boat. Some of them tried to sing the barcarole he had played, but the girlish voices thrilled sadly over the glassy tide, which was softly ebbing, and leaving more and more bare the drowned-looking bowlders, heavily tressed with the dripping golden brown seaweed.

Marian sat in the bow of the boat, and as she rose and stood there, holding out one hand to Ray to be helped ashore, and gathering her skirts with the other, she glanced toward the house: "Why, who is there with mamma on the veranda? Why, it can't be papa!"

Helen looked round over her shoulder where she sat, and now they all looked, Ray turning his head and mechanically clapping Marian's hand.

Captain Butler was walking up and down before his wife, who sat listening to what he was saying. He was talking very loud and very fast, with a sort of passionate vehemence; his tone reached them, but they could not make out his words. He gesticulated as if describing some scene, and then suddenly stopped, and threw back his head, and seemed to be laughing.

"What can amuse Captain Butler so much?" asked Helen with a smile. At the same time she saw him draw out his handkerchief and hide his face in it, and sit down with his face still hidden. The pantomime which they could see with such distinctness, and of which they yet remained so ignorant, somehow began to overawe them. Ray quickly helped them from the boat. "I am going up with you," he said, and with a glance at Marian, "Miss Harkness," he added, "wont you take my arm over these rocks?"

Helen clung heavily to him as she tottered up the path. "I wonder what has brought Captain Butler to-night," she said tremulously. "He wasn't to be here till Saturday."

"I fancy he's persuaded your father to come with him," answered Ray. "Look out for that stone, Miss Harkness."

"Oh, I hope papa isn't worse again," said

Helen, stumbling over it. She hurt herself, and was glad of the pain that let her give their way to the tears that came into her eyes.

"No; I should think he was more likely to be better," said Ray, refusing to see her trouble, and really lifting her along. The others had fallen behind a little, and these two had now reached the gravel drive up to the piazza steps alone.

They saw a quick parley between the captain and Mrs. Butler, and he stepped indoors through one of the long windows, while she came forward to the rail, and called out to Marian, "Your father wants all of you to go to the other door, Marian."

"Why, mamma?" began Marian.

"Go, go!" cried her mother. "Don't ask! Edward, bring Helen here!"

"Yes, it's some little surprise," said Ray, beginning to laugh. "Do you like surprises, Miss Harkness?"

"I don't believe I do," she answered, trying to laugh too.

Mrs. Butler came forward and took her from Ray, motioning or rather looking him aside, as she clasped the girl tight in her arms. At this moment she saw Captain Butler glance stealthily at them from within the room; his face was contorted and wet with tears. "What—what is it, Mrs. Butler?" she gasped, weakly pulling back a little from her close embrace, and facing her.

There was an instant in which the elder woman dwelt upon her with all of compassion and imploring in her eyes. Then she said, "Death, Helen. Your father is dead!"

Helen's strength came back. As if many days had passed since she saw him, "To-day?" she asked, still holding her hand against Mrs. Butler's breast, where she had pressed it.

"At two o'clock."

Helen softly loosed herself from Mrs. Butler's arms, and sat down in the chair near which they stood, and looked out upon the grounds sloping to the water, the black rocks by the shore; the huger rocks that showed their backs like sleeping sea-beasts out of the smooth water; the yacht darkening against the east; far beyond the rim of the sea, a light just twinkling up in the invisible tower at the horizon's verge. A thick darkness seemed to come down out of the sky over all, but Helen would not let it close upon her. She fought the swoon away, and looked up at the pitying, suffering face above her.

"I am glad you told me at once, Mrs. Butler. Thank you," she said, and sank back in her chair, while the other fell on her knees beside her, and gathered her to her heart again, and wept over her.

"O my poor, poor child! It's the one certain thing in all the world. It *will* be known, and it *will* be seen. What wouldn't I have given to keep it from you for ever, Helen? You and my Marian were babies together. I used to know your mother. You are like a daughter to me." Helen passively submitted to the caresses, to the kisses, dropped with tears upon her pale cheeks, but she did not say anything, or try to reply. "But it was not to be kept," Mrs. Butler went on. "It could not be hidden, and it seemed the mercifullest and best way not to try to keep it from you in foolish self-pity for a moment, more or less."

"Oh, yes, yes," said Helen, like another person hearing of her own case. "It was best," and she found herself toying with the strings of her hat, curling them round her finger, and running them out in a long roll.

"It doesn't kill, my dear. It brings its own cure with it. It's sorrow, but it isn't trouble! It passes over us like a black wave, but it doesn't destroy us. You don't realize it yet, Helen, my poor girl, but even when you do, you will bear it. Put your head down on my shoulder, dear, and I will tell you. It was in his office, where he had spent so many years at the work which had given him his honored name and place in the world. My husband was there with him. They were turning over some books together. He saw your father put his hand over his heart, and then your father sank down in his arm-chair, and gave a little sigh, and—that was all."

Mrs. Butler broke into a fresh sobbing on the girl's neck, but Helen remained silent and still, letting herself be clutched tight to that loving breast.

"There was no pain, Helen, there was no suffering. It was a falling into rest. But before he rested—before he drew that last little sigh, my dear—he spoke one word. Do you know what it was, Helen?" She felt the girl tremble, and, as it were, lapse in her arms. "It was just your name: it was, 'Helen.' You were the last thing in his thoughts upon earth—the first in heaven."

Helen broke into a long, low wail. She rose from where she sat, and flung off the kind clinging arms, as if their pity stifled her, and fled up and down the veranda—a storm of grief that beat forth in thick sobs, and escaped in desolate moans.

Mrs. Butler did not try to stay her, or even to approach her, as she wavered to and fro, and wrung her hands, or pressed them to her streaming eyes. At last, after many moments, as long as hours of common life, Helen suddenly checked herself, and dried the tears that drenched her face. There had come the lull

which must succeed such a passion. She stopped before Mrs. Butler, and asked in a husky, changed voice, "Isn't there any train up to-night?"

"Why, Helen—"

"Because, if there is, I must take it. I know what you will say, but don't say it. If you try to stop me, I will *walk*. I am going *home*."

It was too soon yet for her to realize that she should never go home again; but the word went to the mother-heart that ached for her with the full measure of its tragic irony, and she perceived with a helpless throe of compassion how alone in the world this fair young stricken creature stood.

Ray had sent word to his English friend that he should not join him again on board the yacht that night, briefly explaining the trouble that kept him, and promising to see him again on the morrow. He directed the yacht to put in to Salem, as had been arranged, and instructed his men to tell Lord Rainford about the trains for Boston. He was with Captain Butler and the awe-stricken girls in the parlor, while Mrs. Butler kept Helen on the veranda, and he had gathered from the Captain such part of the story as he had not already divined.

"Edward!" called Mrs. Butler from without, and he went to her where she stood with Helen, now perfectly silent and tearless. "Miss Harkness wishes to go home to-night. I shall go with her. Mr. Butler has just got home, and—" She hesitated to say before Helen's affliction that he had had too hard a day already, and she could not let him incur the further excitement and fatigue; but Ray seemed to know.

"Captain Butler had better stay here," he said, promptly, "and let me go. We haven't time for the seven o'clock at Beverly," he added, glancing at his watch, "but we can catch the eight o'clock express at Salem if we start at once."

"I am ready," said Helen quietly. "My trunk can come to-morrow. I haven't even unlocked it."

Ray had turned away to ring the stable-bell. "Jerry, put my mare into the two-seated phaeton. Don't lose any time," he called out, stopping Jerry's advance up the walk for orders, and the phaeton was at the steps a minute or two after Mrs. Butler appeared in readiness to go.

Helen went into the lighted dining-room, where Captain Butler and the girls had fearfully grouped themselves, waiting what motion of farewell she should make. Her face was pale, and somewhat stern. She went round and kissed them, beginning and ending with

Marian, and she did not give way, though they each broke out crying at her touch, or at her turning from them. When she came to the Captain she put out her arms, and took him into them, and pressed herself to his breast in a succession of quick embraces, while he hid his face, and could not look at her.

"Good-bye all," she said, in a firm tone, and went out and got into the phaeton, where Mrs. Butler was sitting. Ray sprang to the place beside the driver. "Salem, Jerry. Quick!" and they flew forward through the evening air, cold and damp in currents, and warm in long stretches over the smooth road. She smelt the heavy scent of the spiræa in the swampy places, and of the milkweed in the sand. She said no, she was not chilly, to Mrs. Butler; and from time to time they talked together: about the days beginning to get a little shorter now, and its not being so late as it seemed. Once Ray struck a match and looked at his watch, and the driver looked at Ray, who said, "All right," and did not say anything else during the drive. Again, after silence, Helen spoke.

"You know I wouldn't let you come with me, if I could help it, Mrs. Butler."

"You couldn't help it, dear," answered the other. "Don't talk of it."

The station was a blur and dance of lights; she was pushed into the train as it moved away. She sat next the window in the seat with Mrs. Butler, and Ray in the seat before them. He did not look round, nor did Mrs. Butler sit very close, or take her hand, or try in any futile way to offer her comfort. The train seemed to go forward into the night by long leaps. Once it stopped somewhere on the track remote from a station, and Ray went out with some other passengers to see what had happened. Helen was aware of a wild joy in the delay, and of a wish that it might last for ever. She did not care to know what had caused it. As the cars drew into the Boston depot, she found her handkerchief, soaked with tears, in her hand, and she pulled down her veil over her swollen eyes.

At her own door, she said, "Well, Margaret," like a ghostly echo of her wonted greetings, and found Margaret's eyes red and swollen too.

"I knew you would come, Miss Helen," said Margaret. "I told them you never would let the night pass over your head."

"Yes, I would come, of course," answered Helen. She led the way back into the library, where there were lights, and where the study lamp burnt upon the table at which last night she had sat with her father. Then, while the

others stood there, she took up the lamp, and pushed open the drawing-room doors, as she had seen him do, and, as she felt, with something of his movement, and walked forward under the dimly-burning gas to the place where she had known he would be lying. Everything had been done decorously, and he appeared, as they say, very natural. She stood with the lamp lifted high, and looked down at the face, slowly and softly wiping the tears, and shaken now and then with a sob. She did not offer to kiss or touch him. She turned from the clay out of which he had departed, and walked back to the library, where it seemed as if he should meet her, and speak to her of what had happened.

There were Mrs. Butler and Mr. Ray, and behind them there was Margaret. She felt how pitifully she must be looking at them. Some one caught the lamp, which had grown so light, from her hand, and some one had thrown up the window. That was right; she should not faint now; and now she was opening her eyes, and Mr. Ray's arm was under her neck, where she lay upon the floor, and Mrs. Butler was dashing her face with cologne.

## IV.

IN those days Helen came to understand what her father had meant by saying, that after her mother and her little brothers died, the house seemed full of them, and that it did not make him afraid. Now that he had died, the house seemed full of him, and she was not afraid. She grew to be weak and sore, and almost blind from weeping; but even when she covered over the dead face, and cried and moaned to it, it seemed something earthly and perishable in her love bewailing only the earthly and perished part of him, while what was really himself beheld her grief with a high, serene compassion, and an intelligence with some immortal quiet in her own soul. Whatever it was, whether the assurance of his life after death, or the mere blind effect of custom, prolonging his presence, as the severed nerves refer sensation to the amputated limb, and rehabilitate and create it anew, this sense of his survival and nearness to her was so vivid at times that she felt as if she might, could she but turn quickly enough, see him there before her; that the inward voice must make itself audible—the airy presence tangible. It was strongest with her that first night, but it did not cease for long afterward. He was with her as she followed him to the grave; and he came back with her to the house from which they had borne him.

In this sense of his survival, which neither then nor afterward had any fantastic quality to her, she seemed to draw nearer to him than ever before. He understood now, he knew the depth and truth of her love, through all her vanities and follies. Something inexpressibly sweet and dear was in this consciousness, and remained always, when its vividness had faded with the keen anguish of her grief. Such things, the common experience of all bereavement, are hard to put in words. Said, they seem crude and boastful, and more than what is felt; but what is felt is more than can ever be said.

Captain Butler came up the morning after Helen's return home, and he and Mrs. Butler remained in the house with her till all was over. Marian came up too, and Ray was there with his silent vigilance, through which everything seemed done without his agency. Helen had but to weep, to sorrow up and down the house; they gave her anguish way, and did not mock it with words of comfort. When the tempests of her grief swept over her, they left her to herself; when the calm that follows such paroxysms came, they talked to her of her father, and led her to talk of him. Then she was tranquil enough. At some droll things that forced themselves into remembrance in their talk, she even laughed, without feeling it treason to her grief; and it was not what she thought or recalled of him that touched the springs of her sorrow. It was meeting Margaret, downcast and elusive on the stairs, and saying sadly to her, "Well, Margaret"; or catching sight of Captain Butler sitting opposite her father's vacant chair in the library, his grizzled head sunk on his breast, and looking suddenly aged, and, at the same time, awkward in his bereavement, like a great boy, that moved her with intolerable pathos.

Mrs. Butler went home and had out the headache which she had kept back while she must, by force of will, but every day some of them came up to see Helen, and reminded her without urgency that she was to come to them soon. She said yes, she would come very soon, and so remained without going abroad, or looking into the light of the sun. At night, when she lay down she wept, and in the morning when she woke, but through the day her tears were dried. She brooded upon what her father had said and done in the last hours they had spent together, his longing for change and for a new life that now seemed to have been prophetic of death. His weariness of the house that had so long been his home took a new meaning—he must long have been more in the other world than in this, and but for his pitying love for her,

he must have been glad when his swift summons came. She realized at last that he had been an old man. She had known without realizing it that his ways were the ways of one who has outlived himself, and who patiently remains in the presence of things that no longer interest him. She wondered if the tie by which she, who was so wholly of the earth, had bound her father to it, had not sometimes been a painful one. She remembered all the little unthinking selfishnesses of the past, and worse than these, the consolations which she had tried to offer him. She thought of the gentleness with which he always listened to her and consented, and ended by comforting her; and she bitterly accused herself for not having seen all this long ago. But she had not even seen that he had a mortal disorder about him; she had merely thought him wearied with work, or spent with the heat, in those sinkings which had at first so much alarmed her. The hand carried so often to his heart that she now recognized it as an habitual gesture, had given her no warning, and she blamed herself that it had not. But in truth she was not to blame. The sources of his malady were obscure, and even its nature had been so dimly hinted to him that doubtless her father had justified himself in keeping his fear of it from her. Perhaps he had hoped that yet somehow he could struggle to a better footing in other things, before he need cloud her young life with the shadow that hung upon his own; perhaps the end of many resolutions was that he could not do it. She wondered if he had himself known his danger, and if it was of that which he so often began to speak to her. But all now was dark, and this question and every other searched the darkness in vain.

She seemed to stand somewhere upon a point of time between life and death, from which either world was equally remote. She was quite alien here, without the will or the fitness to be anywhere else; and she shrank, with a vague resentment, from the world that had taken him from her.

This terrible touchstone of death, while it revealed the unimagined tenderness of many hearts, revealed also to her the fact that no friendliness could supply the love in which there was perfect unity of interest and desire, and perfect rest. Every day, when the Butlers came to her they brought her word from some one, from people who had known her father in business, from others who had casually met him, and who all now spoke their regret for his death. A rare quality of character had given him a standing in the world that vastly greater prosperity could not have won him; and men who were of quite another stuff had

a regard for him, which perhaps now and then expressed itself in affectionate patronage, but which was yet full of reverence. They found something heroic in the quiet constancy with which he fought his long, losing battle, and now that he was down at last, they had their honest regrets and spoke their honest praises. It made Helen very proud of her father to hear them; she read with a swelling heart the paragraphs about him in the newspapers, and even the formal preambles and resolutions which expressed the loss the commerce of the city had suffered in the death of a merchant of his standing and integrity. These things set Helen's father in a new light to her, but while they made her prouder and fonder of his memory, they brought her a pang that she should have known so little of what formed his life, and should never have cared to know anything of it apart from herself.

This was not the only phase in which she seemed to have been ignorant of him. She had always believed him good and kind, without thinking of him in that way. But now there came poor people to the door, who sometimes asked to see her, or who sometimes only sent by Margaret, to tell how sorry they felt for her, and to say that her father had at this time or that been a good friend to each of them. They all seemed to be better acquainted with him than she, and their simple stories set him in a light in which she had never seen him before. It touched Helen that they should frankly lament her father's death as another of their deprivations, more than if they had pretended merely to condole with her, and she did not take it ill of them, that they generally concluded their blessings on his memory with some hint that further benefactions would be gratefully received. The men accepted her half-dollars in sign that their audience was ended, and went away directly; the women shed tears over the old clothes she gave them, and stayed to drink tea in the kitchen.

One day after she had already seen three or four of these visitors, the bell rang, and Captain Butler's boots came chirping along the hall, not with their old cheerful hint of a burly roll in the wearer's gait, but subdued and slow as if he approached with unnaturally measured tread. Helen sprang into his arms, and broke out crying on his breast.

"Oh, Captain Butler! I felt just now that papa *must* be here. Ever since he died he has been with me somehow. It seems wild to say it; but no words can ever tell how I have felt it; and just before you came in, I *know* that he was going to speak to me."

The Captain held her away at arm's-length and looked into her face.

"Poor child! They've sent me to bring you home with me, and I see that I haven't come a moment too soon. You have been alone in this house quite long enough. My God, if he only *could* speak to us!"

The Captain controlled himself as he walked up and down the library, with his face twitching, and his hand knotting itself into a fist at his side, and presently he came and sat down in his accustomed chair near Helen. He waited till she lifted her head and wiped her eyes before he began to speak.

"Helen," said Captain Butler, "I told you they had sent me for you, and I hope that you will come."

"Yes," answered Helen, "I shall be very glad to go with you; but I think it's hard for Marian, bringing my trouble there, to be a blot on her happiness."

"We won't speak of that, my dear," said the Captain. "If Marian can't find her happiness in something besides gaiety, she'd better not think of getting married."

"I wouldn't come if I thought I could endure it here any longer; I wouldn't come, if I had anywhere else to go," cried Helen.

"We wouldn't let you go anywhere else," returned the Captain. "But we can talk of all that another time. What I have to say to you now is something for you to decide. Do you think you are equal to talking a little business with me?"

"Oh, yes. I should like to."

"Yes, it will take up your mind."

The Captain paused restively, and seemed at a loss how to frame what he had next to say.

"Helen," he broke out abruptly, "did you know anything about your father's affairs?"

"Papa's affairs?" asked Helen, with a start.

"Oh, don't be troubled—don't be troubled," the Captain hastened to say. "It's all right; perfectly right; but I want to speak to you about yourself, and—it's all right. Don't you think we'd better have one of these windows open?"

"Are they shut?" asked Helen. "Yes, you can open them, please."

"We shall be cheerfuller with a little light," said the Captain, flinging back the shutters; but they hardly looked so. Helen had dark rings round her eyes, which were swollen with her long weeping; she was very pale, and looked old in that black, which, in a house of mourning, seems to grow upon women in a single night. She thought the Captain tremulous and broken; those muscles at the sides of his chin hung down, as if ten years had been added to his age in the last fortnight. They made a feint of finding nothing

strange in each other, and the Captain resumed as he sat down again:

"I mentioned your father's affairs because there has to be some settlement of the estate, you know; and there are circumstances that make it desirable to have an early settlement. The business was left in a little confusion; it's apt to be the case," Captain Butler added quickly.

"Yes," Helen said, "papa sometimes spoke of the perplexity he felt about his accounts."

"Did he?" asked the Captain with some relief. "Then I suppose he gave you some idea of how he stood."

"No; he merely said they worried him."

"Well, well. I don't know that there was any occasion to tell you; any occasion for alarm. There seems to have been no will; but that makes no difference. The law makes a will, and you get what there is—that is, all there is."

The Captain had a certain forlorn air of disoccupation, which now struck Helen more than what he was saying.

"Would you like to smoke, Captain Butler?" she asked.

"Why, yes, if you will let me, my dear," he said, with an eager, humble gratitude, putting his hand quickly into his breast-pocket. "I didn't know——"

Helen rose, and placed the little table at his elbow, and set the ash-holder on it, as she had done that last night when he had sat there with her father. They looked at each other without speaking.

The Captain struck his match, and said, apologetically, between the long whiffs with which he lit his cigar, "I talk better with it, and I have some things to explain."

He paused, and sinking back into his chair with a sigh of comfort which brought a dim smile into Helen's face, presently resumed:

"As there is no will, and no executor, there will have to be an administrator. Whom should you like appointed? I believe the Court appoints any one you wish."

"Oh, *you*, Captain Butler!" replied Helen instantly.

"I expected this," said the Captain, "and I suppose I am as fit as any one. I'm sure that no one could care more for your father's interests and honor, and I know rather more of his affairs than anybody else. You will have to make your wishes known in form; but that's easily managed. In the meantime, you had better be away, don't you think, while we are looking into things. I don't know what there is to do, exactly; but I suppose there's to be some sort of survey, or appraisal, and—yes, you had better be away, when we are looking into things."

"Do you mean—away from the house?" asked Helen.

"Why, yes," the Captain reluctantly assented. "It's a—form; a necessary form."

"It's quite right," said Helen, positively. "And—yes—I had better be out of the way."

"I'm glad you see it in that light, my dear," returned Captain Butler. "You're a good girl, Helen, and you make it much easier for me. Pack up everything that belongs to you, and go as if you were going to stay." The Captain made a ghastly show of heartiness, and smoked without looking at Helen. "Run over the house, and put together all the things that you would like to retain, and I'll see that they come down." Helen was trying to catch his eye, and he was keeping his gaze fixed upon the ceiling.

"I don't think I need do that," said Helen; "I should merely have to bring them back with me."

Captain Butler took his cigar from his mouth in compassion, as he now looked at her puzzled face. "We don't mean you should come back, my dear child. We want you to stay with us."

"Oh, I can't do that," said Helen, quickly.

"You can't go on living here alone," retorted the Captain.

"No," Helen ruefully assented, and faced Captain Butler in touching dismay.

"You see," he said, "that you must submit. And, Helen," he said with a show of brisk, business-like cheerfulness, "I think you had better *sell* this house. If I were you I should sell it at once. You'll never get more for it."

"Why, what would become of Margaret?" gasped Helen.

"Well, Mrs. Butler has been talking of that. We want a cook, and we will take Margaret."

Helen simply looked bewildered. The Captain apparently found it better to go on while she was in this daze than await her emergence from it. "And if I were you, I would sell the furniture and pictures and all the things that you have not some particular association with; everything of that sort I should keep." Helen still made no comment, and the captain went on. "I know all this is very painful, Helen—"

"It isn't painful," said Helen quietly. "It was papa's wish to sell the house. We were talking of it that night—the night before—He thought of building in the country."

"Well, I'm glad to hear it," said Captain Butler. "Then we can push right ahead and do it."

"It's very sudden, though," faltered Helen. "Poor Margaret! What will she say?"

"We will hear what she will say," cried the Captain, ringing the bell before Helen could stop him. Margaret answered it, drying her hands on her apron as she came in, and then with a prescience of the coming interview, resting them folded upon that prop with which nature in process of time provides the persons of most cooks. "Margaret," said the Captain, "Miss Helen is going to break up housekeeping. She is coming to us. Mrs. Butler wished me to ask you to come too."

Margaret pursed her mouth, and bent forward so far over the natural provision as to catch sight of the toe of her neatly shod small foot. "Should you like to come?" asked the Captain.

"I'm afraid I should feel the change," said Margaret.

"Of course," retorted the Captain, shortly. "There is going to be a change, and you would feel it. We understand that. But you know me, and you know Mrs. Butler, and you know whether you would have a good place."

"It would be a good place," said Margaret, still surveying her slipper. "But I think I should feel the change more and more."

"Well," said the Captain, impatiently, "do you mean yes, or no?"

"I think I should feel the change," replied Margaret.

The Captain was nonplussed by this dry response to his cordial advance, and he waited a moment before he asked: "Have you any other place in view?"

"I had arranged," said Margaret, calmly, "to go to a cousin's of mine that lives in the Port; and then advertise for some small family in Old Cambridge where they only keep one girl."

Helen had felt hurt by Margaret's cold foresight in having already so far counted the chances as to have looked out for herself; but at this expression of Margaret's ruling passion, she could not help smiling.

The Captain gave an angry snort.

"Very well, then," he said, "there is nothing to do but to pay you up, and let you go," and he took out his pocket-book. "How much is it?"

"There isn't anything coming to me," Margaret returned with the same tranquillity; "Mr. Harkness paid me up."

"But he didn't pay you up to the present time," said the Captain.

"I should wish to consider Miss Helen my guest for the past two weeks," said Margaret, in the neatness of an evidently thought-out speech.

The Captain gave a laugh; but Helen, who knew all Margaret's springs of action, and her insuperable pride, interposed:

"You may, Margaret," she said gently.

"Thank you, Miss Helen," said Margaret, lifting her eyes now for the first to glance at Helen. She turned with a little nod of self-dismissal, and went back to the kitchen, leaving the Captain hot and baffled.

It was some moments before he spoke again.

"Well, then," he said; "about selling the house: do you know, Helen, I think it would be better to sell it at auction? It might be tedious waiting for a private sale, and real estate is such a drug, with the market falling, that you might have to lose more on it after waiting than if you forced it to a sale now. How do you feel about it?"

The finesse that the Captain was using in all the business, wreathing the hard legal exigencies of the case in flowers of suggestion and counsel, and putting on all a smiling air of volition, could never be fully known, except to the goodness that inspired it; but he was rewarded by the promptness with which Helen assented to everything.

"I shall be glad to have you do whatever you think is best, Captain Butler," she answered. "I have no feeling about the house—it's strange that I shouldn't have—and I don't care how soon it is sold, nor how it is sold."

The Captain instantly advanced a step further.

"Perhaps you wouldn't care to come back to it at all, any more? Perhaps you could put your hand on what you'd like to keep, and I could look after it for you, and—" He stopped at seeing Helen change countenance. "Well?"

"Did you think of selling the furniture too?" she asked.

"Why, yes," assented the Captain. "I said so just now. I'm afraid you'd find it a burden after the house was gone. You'd have to store it, you know. Still, if you don't wish it—"

"Oh, yes," said Helen, drawing a long breath, "it had better go!" She spoke with a gentle submissiveness that smote the Captain to the heart.

"You can keep everything you want, my dear—you can keep it all!" he returned, vehemently.

"That would be silly," said Helen. "Besides, there are very few things I should want to keep. I couldn't keep papa's things: they're terrible. I should like you to take everything that belonged to him, Captain Butler—except his watch and his Bible—and give them to some poor people that could use

them. Then I only want my own things; and perhaps his chair, and—" Helen stopped, and the Captain, not to look at her, cast a roving eye about the room.

"Those Copleys, of course, you would reserve," he remarked presently.

"No," said Helen, "I never saw the people. You can sell them. But I shall keep my mother's picture, because I think papa would like me to."

The sense of her father's presence expressed in these words touched the Captain again. He cleared his throat, but he was still hoarse in saying, "I think the Museum would buy the Copleys." Helen seemed too indifferent about their fate to make any reply.

The worst was now over. Captain Butler had accomplished all that he wished without being obliged to explain anything to Helen, or to alarm her fears in any way, and he was unreasonably heartened by the fact. He might, perhaps, have stated the whole truth to her ignorance of affairs without being much more intelligible than he had been with all these skillful evasions. If he had said, "Your father died with his business in the utmost confusion, and probably insolvent," she would scarcely have realized that life was not to go on just as before; and if he had said, "You are left a beggar," how could Helen Harkness have conceived of herself in the figure of one of the women who had dropped their tears into their tea-cups in the kitchen, as they cried over the old clothes she had given them? It had wrung the Captain's heart to hear her talk of poor people, and of giving; and yet he rose from his chair, when he saw Helen still safe in her ignorance, with something like cheerfulness.

"You just make a memorandum of what you'd like reserved, Helen," he said, "and I'll attend to it for you. Put your own little traps together, and I'll send a carriage to take you down to the four o'clock train. Anything you think of afterward of course will be kept for you."

He left her to this task. It was at least something to do, and Helen went about it with an energy which she was surprised to find in herself. At first the reproach with which the silent house seemed to use her indifference smote upon her, but it did not last long. Home had died out of it, as life had gone out of her father's dust; and neither house nor grave was anything to her. She passed from room to room, and opened closets and drawers, and looked at a hundred things. She ended in despair by choosing a very few. If she could not keep all, why should she want any? Whatever it seemed desecration to sell she put on her memoran-

dum to be given away. She selected a large number of things for Margaret, and when she sat down at the old Bostonian half-past two o'clock dinner (to which her father had always kept), she told Margaret what she had done. Margaret took one or two little trinkets which Helen offered her in her hand, and declined the other gifts.

"Why, what do you mean, Margaret?" asked Helen. "Why don't you take them?"

"I shouldn't wish to, Miss Helen," said Margaret, pursing her mouth.

"Well, have your own way," returned Helen. "I suppose this is another of your mysteries."

"I should wish to do everything properly, Miss Helen."

"What do you mean by properly? Why do you Miss Helen me all the time? What made you so stiff with Captain Butler? and he so kind!"

"Captain Butler is a very pleasant gentleman," said Margaret, in her neatest manner; "but I shouldn't wish him to think it was quite the same as going on here."

"You're very foolish. It would have been a nice place."

"I wished him to understand that I felt it a change."

"Well, well!" cried Helen, impatiently. "You must do as you please; but you needn't have been so cross."

Helen's nerves were beginning to give way, and she went on childishly. "You act just as if we were going to be together always. Do you know that I'm going away now, and not coming back any more?"

"Yes, Miss Helen."

"And do you think this is the way to treat me at the last moment? Why don't you take the things?"

"I shouldn't wish to be under a compliment, Miss Helen."

"What do you mean by being under a compliment?"

"I shouldn't wish to be beholden."

"Oh, you shouldn't wish; you shouldn't wish! This is too bad!" whispered Helen. "What am I but under a compliment to you, as you call it? I didn't think you'd behave so at the last moment. But I see. You're too proud for anything, and you never did care for me."

"Oh, Miss Helen!"

"Yes! And go to your cousin's—the quicker the better—and have your own cross way. I'm sure I don't care, if you'll be the happier for it. I can tell you what you are, Margaret: you're a silly goose, and you make every one hate you. The charm's broken between us—quite, and I'm glad of it."

Margaret went out without saying anything, and Helen tried to go on with her dinner, but failed, and began her inventory again, and at last went to her room and dressed for her journey. She came down into the library just before starting, and rang for Margaret. When the cook appeared, the young girl suddenly threw her arms round her neck. "Good-bye," she sobbed out, "you good, old, wicked, foolish, stuck-up Margaret. I'm glad you didn't come to the Butlers'; it would have killed me to see you there! Good-bye, good-bye! Remember your poor little Helen, Margaret, and come to see me! I can't bear to look into the kitchen! Say good-bye to it for me! Oh, my poor, old, slighted, happy home! Oh, my home, my home, my home! Good-bye, good-bye, good-bye!" She ran wildly through the well-known rooms, and bade them adieu with heart-breaking farewells; she stooped down and kissed the lounge on which her father used to lie, and spread out her empty arms upon it and laid her homeless head where his had rested. At the sound of the bell she sprang up, and opened the door herself, and fled down the steps and into the carriage, shrinking into the farthest corner, and thickly hiding her face under her black veil. She seemed to herself part of a vast train of events, without control, without volition, save the will to obey. She did what she was bid, and the great movement went on. Somewhere must be arrest, somewhere repose; but as yet she could not foresee it, and she could only yield herself to the forces carrying her forward. She was going to the Butlers' because Captain Butler had told her to come; she had assented to everything he proposed because he had seemed to wish it; but she felt that he was as powerless as she in the matter. If he had proposed everything of contrary effect, she must still have yielded the same.

Captain Butler joined her at the station half an hour after she had left home, and just in time to step aboard the train with her. He was hot and looked vexed. When he got his breath a little, "Do you know," said he, "that old fool hasn't made any bills?"

"What old fool?" asked Helen passively.

"Margaret!" replied the Captain, with a burst. "Didn't you understand that she meant merely to refuse her wages for the last two weeks, when she said she wished to consider you her guest?"

"Why, yes," said Helen.

"Well, she meant a great deal more," cried the Captain. "I've been round to the butcher, and baker, and all the rest, to settle their accounts, and I find that she's paid for every-

thing since we left you. But I shall have it out with her. It won't do. It's ridiculous!"

"Poor Margaret!" said Helen, softly. She understood now the secret of Margaret's intolerable stateliness, and of her reluctance to mar her ideal of hospitality by accepting a reciprocal benefit. It was all very droll and queer, but so like Margaret that Helen did not want so much to laugh as to weep at it. She saw that Captain Butler was annoyed at the way she took the matter, and she thought he would have scolded her at any other time. She said very gently: "We must let her have her way about it, Captain Butler. You couldn't get her to take the money back, and you would only hurt her feelings if you tried. Perhaps I can do something for her some time."

"Do you mean that you're actually going to stand it, Helen?"

"Yes, why not? It isn't as if anybody else did it for me—any equal, you know. I can't feel that it's a disgrace from Margaret; and it will do her so much good—you've no idea how much. She's been with us ever since I was born, and surely I may accept such a kindness from an old servant, rather than wound her queer pride."

The Captain listened to these swelling words with dismay. This poor girl, at whose feet he saw destitution yawning, was taking life as she had always done—*en princesse*. He wondered what possible conception she had formed of her situation. Sooner or later he must tell her what it was.

v.

CAPTAIN BUTLER believed that his old friend had died a bankrupt; he represented the estate as insolvent, and the sale of the property took place at the earliest possible day. A red flannel flag, on which the auctioneer's name was lettered, was hung out from the transom above the front door, and at ten o'clock on a dull morning, when the sea-turn was beginning to break in a thin, chilly rain, a long procession of umbrellas began to ascend the front steps, where Helen had paused to cast that look of haughty wonder after the retreating policeman. The umbrellas were of all qualities, from the silk that shuts into the slimmest of a walking-stick, to the whitey-brown, whalebone-ribbed family umbrella under which the habitual auction-goer of a certain size and age repairs to her favorite amusement. Many of the people had a suburban look, and some even the appearance of having arrived by the Fitchburg Railroad; but there was a large proportion of citizens, and a surprising number of fashionably dressed ladies, who, nevertheless, did

not seem to be of that neighborhood; they stared curiously about them, as if they had now for the first time entered a house there. They sat down in the sad old parlor, and looked up at the pictures and the general equipment of the room with the satisfied air of not finding it, after all, any better than their own. One large and handsome woman, whose person trembled and twinkled all over with black bugles, stood in the middle of the floor, and had the effect of stamping upon the supposed pride of the place. People were prowling all over the house, from cellar to garret, peering into closets and feeling of walls and doors; several elderly women in feeble health were to be met at the turns of the stair-ways, pressing their hands against their chests, and catching their breath with difficulty. Few, apparently, of the concourse had come to buy; but when the sale began they densely thronged the rooms in which the bidding successively went on, and made it hard for one another to get out of the packed doorways. The whole morning long the auctioneer intoned his chant of "A half, and a half and half, do-I-hear-the-three-quarters?" varied with a quick "*Sold!*" as from time to time he knocked off this lot or that. The cheaper carpets, chairs, beds, and tables were bought for the most part by certain fading women, who bid with a kind of reluctant greed, and got together each her store of those mismatched movables which characterize furnished lodgings. They wore cheap camel's hair wraps and thread gloves; others, who seemed poor mothers of families, showed their black stubbed finger-tips, pressed anxiously together outside the edges of imitation India shawls, and bid upon the kitchen crockery. The Copleys were bought, as Captain Butler had expected, by the Museum of Fine Arts; the other paintings were bought by men who got them low to sell again, and in whose ruinous bazaars they were destined to consort with second-hand refrigerators and strips of dusty carpeting.

Captain Butler would gladly have stayed away from the auction, but his duty in the matter was not to be avoided. Helen had given him a list of things to be reserved from the sale, which she had made out under two heads. The first was marked "For self," and this was very short, and easily managed by setting the things aside before the sale began. But the list of articles "To be given away" was on a scale which troubled the Captain's conscience, while it forlornly amused him by its lavish generosity; the girl had done charity to an extent that wronged the creditors of the estate, and that put it quite beyond Captain Butler's power to humor her unwitting

munificence by purchasing the things to give away. He used a discretion with which he invested himself, to put all the valuable articles up at the sale, and bestowed in charity only the cheaper matters on Helen's list. Even then, the auction was an expensive affair to him. He was unable to let certain things, with which he intimately associated his old friend, pass into the hands of strangers, especially things connected with the India trade. He bought the Chinese vases and bronze monsters, the terra-cotta statues and ivory carvings, the outlandish weapons, and Oriental bric-à-brac, which in the age of Eastlake mantel-shelves, then setting in with great severity, he discovered to be in great request.

His dismay increased as these costly and worthless treasures accumulated upon his hands, for his house was already full of them, to the utmost capacity of its closets and out-of-the-way corners. Besides, he laid himself open to the suspicion of bidding in, and remained under that doubt with many. He had a haughty way of outbidding that stood him in no good stead, and went far to convince the crowd that all the sales to him were sham.

The auction, which began in the basement, ascended through the several stories, wandering from room to room, till it reached the remotest attic chamber. Then, all the personal property had been sold, and it descended again to the first floor, where the crowd was already much thinner than at first, and was composed mainly of respectable-looking citizens who had come to bid on the house, or to see how much it would bring. The fashionably dressed women were gone; it was not long before the last auction-goer's whity-brown umbrella, expanded after the usual struggle, went down the front steps, and round the next corner. The auctioneer took his stand in the parlor before the pier-glass,—into which Helen looked that day to see whether her trouble with Robert had changed her,—with the long windows of the swell-front on either side of him. He was a young man, eager to win his reputation. He had been praised to Captain Butler as a frightfully vulgar wretch, who could get him more for the property than any other auctioneer in the city, and the Captain had taken him with certain misgivings. As he now confronted his respectable audience, he kept his hat a little aslant; he had an unlighted cigar in his left hand, which he put into his mouth from time to time, and chewed upon nervously; his eyes shone with a gross, humorous twinkle, and his whole face expressed a reckless audacity, and a willingness

to take other people into the joke of life's being a swindle, any way.

"Gentlemen," he said, "I feel honored in being the instrument, however humble, of offering this property to your consideration—this old family mansion, rich in tradition and association, in the very heart of the most select quarter of Boston. You have already examined the house, gentlemen, from attic to cellar; you have seen that is in perfect repair, and that it has no concealments to make—'nothing extenuate nor ought set down in malice,' as our colored brother says in the play. I will not insult your intelligence, gentlemen, by dwelling upon its entire soundness. Built forty years ago, it is this day a better house than the day its foundations were laid—better than nine-tenths of the gaudy and meretricious conceptions of modern architecture. Plain, substantial, soberly elegant—these, gentlemen, are its virtues, which, like

—'a bold peasantry, their country's pride,  
When once destroyed, can never be supplied.'

Gentlemen, I will not ask your attention to the eligible position of the house. I see none but Boston faces here, and I am proud to take it for granted that you need no instructions from *me* upon this point. When I say that this is one of the best sites on Beacon Hill, I say everything. You know the value of the location, you know the character of the social surroundings,—you know what I *mean*, and *all* that I mean. I do not appeal to strangers here. I appeal to the old Boston blood, animated by a generous affection for our city and its history, and unwilling to see dishonor cast upon her by the sale, even in these ruinous times, of a property in her midst at less than its full value. Gentlemen, I feel that you will stand by me in this matter; and I have the pleasure of opening the sale with a bid of ten thousand dollars. Is this so, Mr. Wetherall?"

The gentleman addressed, in the midst of the laughing crowd, nodded slightly.

The auctioneer looked keenly at the faces in an irregular semicircle before him.

"With a bid of ten thousand dollars from Mr. Wetherall," he resumed. "Mr. Wetherall, gentlemen, does not want the property, and he does not dream of getting it at a sixth or seventh—in any other times I should say a tenth—of its value. But he does not choose that it shall be disgraced by the offer of any ignobler sum; and, gentlemen, if Mr. Wetherall had not made this bid I should have made it myself in good faith. I am offered ten thousand, ten thousand, ten thou—*eleven*, from Mr. Wheeler. *You* don't want the property either,

Mr. Wheeler, but I thank you nevertheless. Eleven, eleven, eleven—do I hear the twelve? Twelve from Mr. White. The W.'s are doing well, but we must mount higher yet in the alphabet. Twelve; do I hear the thirteen? Five hundred! Thanks: twelve five, twelve five—thirteen. Going at thirteen, at thirteen—fourteen! This is something like, gentlemen; this is very good as a genteel relaxation; fourteen has its merits as part of the joke; but, gentlemen, we must not give too much *time* to it. We *must* come to business before long; we must indeed. I am willing to accept these ironical bids for the present, but—fifteen, did you say, Mr. Newell? Thank you for fifteen. I am offered fifteen, fifteen, fifteen, by an eminent American humorist; fifteen, fifteen, going at fifteen. Oh come, gentlemen! Some one say *twenty*, and let the sale begin *seriously*." Nobody had bidden twenty, but at that moment a greedy-eyed, nervous little man, with a hot air of having hurried to arrive, wedged his way through the people who filled the doorway, and entered the opener space inside with a bid of five hundred. A roar of laughter rewarded his ardor, and the auctioneer instantly went on: "Twenty thousand, five; twenty thousand, five. Now we are really warming to the work. We have reached the point at which blood begins to tell. Twenty thousand, five from Mr. Everton—do I hear the twenty one? Yes, right again; I do hear the twenty-one, and from Mr. Newell, who redeems his reputation from the charge of elegant trifling; and twenty-two from Mr. White, who also perceives that the time for jesting is past. Going at twenty-two, at twenty-two, twenty-two! Do I hear twenty-three? No, only twenty-two, three; I regret to say it is only twenty-two, three."

A quick succession of small bids now ran the sum up to twenty-four thousand, at which point it hung in spite of all the devices of the auctioneer to urge it beyond. "Going, going, going,"—he swung his right hand threateningly above the open palm of his left—"going to Mr. White at *twenty-four* thousand dollars! Are you all done?" He scanned the crowd, and pierced it to the outer circle with his audacious glance. "Going at twenty-four thousand dollars to Mr. White. Are you all done, twice? Are you all done, three times? Going once, going twice, going—gentlemen," said the auctioneer, putting his cigar in his mouth and his thumbs in his waistcoat pockets, and addressing them in a low, impassioned tone, "Gentlemen, it's no *money* for it! I should feel ashamed, personally disgraced, if this property went for such a sum. I should *know* that it was owing to some fault of mine,

some failure on my part to impress its value upon you. But I have trusted to your own sagacity, to your own intelligence, to the fact that you are all Boston men, and thoroughly acquainted with the prices of adjacent property, and the worth of this. I may have deceived myself; but I appeal to you *now*, gentlemen, not to let me suffer by the confidence I have reposed in you. My professional reputé is in your hands. If this estate goes at twenty-four thousand dollars I am a ruined man." A general laugh, in which the auctioneer himself joined so far as to smile, met this appeal. He ran his eye over the assembly. Suddenly he exclaimed: "*Thank* you, Mr. Everton! *Was* it twenty-six!"

He leaned forward over his desk, and beamed with a flattering gratitude upon the new comer.

"No, twenty-four fifty," replied Mr. Everton in a weak, dry voice.

"Thank you all the same, Mr. Everton. You are none the less my preserver. Thank you for twenty-four, fifty. We breathe again. Twenty-four fifty,—do I hear the five? *Twenty-four fifty*,—will you give me the five? Twenty-five; very good, twenty-five thousand, twenty-five, twenty-five—just one-fourth of the worth of the estate in prosperous times. Now let me hear the twenty-six! Gentlemen," said the auctioneer, again breaking from his chaunt, and lowering his voice to the colloquial tone, "you all know the old story of the sibyl and her books: how, when she came with nine copies in the first instance, she asked a sum which struck the officials as a fancy price; how she went away and burnt three of the edition and then asked twice the original price for the six; and how, when she had burnt three more, they were glad to take the rest off her hands at her own terms. We have here a parallel case."

"Don't see the parallel," said one of the crowd.

"Don't you, Mr. Rogers? Well, you will, presently, when you've failed to buy this property for half the money that you'd be glad to offer the purchaser for his bargain. Do I hear twenty-six from you, Mr. Rogers?" Mr. Rogers laughed and nodded. "Twenty-six it is, from Mr. Rogers. Twenty-six, twenty-six, twenty-six; will you give me seven?" He went on crying this sum in various tones of exultation, reproach, and persuasion for several minutes. Again and again he brought himself to the point of knocking off the house at that price, and then retired from it upon some fresh pretense of having heard a higher bid. But none came, or could be made to seem to have come; every one to whom he turned with a questioning look

shook his head in prompt denial. The auctioneer's mobile countenance took on an air of deep discouragement. He threw aside his mallet and pulled down his waistcoat. "I wont sell this property at that price. I suppose there are men in this city who would do it, but I wont. Captain Butler, I should like a word with you." He came down from his perch, and, retiring to a corner with the Captain, talked with him in a dumb show of bitter and passionate appeal. When he again mounted to his place he wore a look of grim despair. "Well, gentlemen, I have done my best to persuade Captain Butler to withdraw the property, and stop this bloody sacrifice." The crowd laughed, and the auctioneer's eye twinkled. "But he feels bound by the terms of his notice to you to let the sale proceed. The property will be sold without reserve. Now let us see whether you will meet him in the same magnanimous spirit." Captain Butler looked on in blank amaze while this statement was making; but an intenser surprise was painted upon the face of Mr. Wetherall as the auctioneer proceeded: "Twenty-seven, twenty-seven."

"Twenty-six was the last bid," said a bystander.

"Excuse me, sir," retorted the auctioneer, severely. "I don't think I deceived myself in a nod from my friend Mr. Wetherall. Twenty-seven!"

Mr. Wetherall seemed struggling to open his petrified mouth in protest, when Mr. Everton quickly bid twenty-seven five hundred. Mr. Wetherall turned sharply upon him and bid twenty-eight. The keen auctioneer scented their rivalry, and played upon it so artfully that in five minutes the property was going at thirty thousand to Mr. Everton. He came to the third going, in his thrice-repeated warning, when he once more paused, and, leaning forward, bent a look of pitying incredulity upon the faces before him.

"Gentlemen," he asked, in an accent of soft reproach, "is this *Boston*?"

His audience again roared their pleasure, and the auctioneer, leaving his place, stepped forward and personally approached several persons of the group in a conversational tone.

"Mr. Wetherall, am I going to have nothing more from you? Mr. White, what do you

say? You know this house is worth more than thirty thousand, and whoever buys it will have a dozen people after him to-morrow offering to take his bargain off his hands at an advance. Mr. Merritt, we haven't heard from you at all yet, I believe. You've been enjoying the show for nothing. It isn't your custom to dead-head yourself on these occasions. And you, sir—I can't call your name, but I know your face; I've seen it in State street often—can't I get a bid out of you?"

The gentleman addressed colored, and shrank further back in the crowd. The auctioneer smiled in perfect good humor, and turned away for another word with Captain Butler in private.

"Captain," he whispered, "Mr. Everton is going to buy this property. Do you think he will stand another five thousand?"

Captain Butler, who seemed in a sort of daze, said:

"I don't believe he will. But *if* you——"

"I'll get it," said the auctioneer, briskly, and returned to his work, into which he struck with a sudden and startling energy. "Going at thirty thousand, go——. Thirty-one, thirty-one, thirty-one; at thirty-two; thirty-two five; thirty-three, thirty-three—and five; thirty-four?" He dashed off the bids with a rapid confidence that would have inspired belief in the most skeptical. Mr. Wetherall bid thirty-four thousand five hundred, and was instantly topped by Mr. Everton at thirty-five. "Thirty-five, thirty-five, thirty-five," cried the auctioneer, "going at thirty-five thousand, going, going, going, and sold—*given* away—to Mr. Everton!"

Mr. Everton came forward with a half-frightened look, and laid down the money necessary to secure his purchase, and received a provisional deed of the property.

"Look here!" said Captain Butler, as soon as he could get the auctioneer aside. "I didn't hear any of those bids till Wetherall's last." The Captain looked troubled and unhappy.

The auctioneer laid a re-assuring hand upon his shoulder.

"You haven't got a practiced ear, Captain Butler. I have. Mr. Everton has got a great bargain. But it was hard, working up to that final point."

(To be continued.)

## THROUGH ONE ADMINISTRATION.\*

BY FRANCES HODGSON BURNETT,

Author of "That Lass o' Lowrie's," "Haworth's," "Louisiana," "A Fair Barbarian," etc., etc.

### CHAPTER XXIX.

THE Professor sat in his favorite chair by his library fire, an open volume on his knee and his after-dinner glass of wine still unfinished on the table near him. He had dined a couple of hours ago with Mr. Arbuthnot, who had entertained him very agreeably, and had not long since left him to present himself upon some social scene.

It was of his departed guest that he was thinking as he pondered, and of certain plans he had on hand for his ultimate welfare, and his thoughts so deeply occupied him that he did not hear the sound of the door-bell, which rang as he sat, nor notice any other sound until the door of the room opened and some one entered. He raised his head and looked round then, uttering a slight ejaculation of surprise.

"Why, Bertha!" he said. "My dear! This is unexpected."

He paused and gave her one of his gently curious looks. She had thrown her cloak off as she came near him, and something in her appearance attracted his attention.

"My dear," he said, slowly, "you look to-night as you did years ago. I am reminded of the time when Philip first came to us. I wonder why?"

There was a low seat near his side, and she came and took it.

"It is the dress," she said. "I was looking over some things I had laid aside and found it. I put it on for old acquaintance sake. I have never worn it since then. Perhaps I hoped it would make me feel like a girl again."

Her tone was very quiet, her whole manner was quiet, the dress was simplicity itself. A little lace kerchief was knotted about her throat.

"That is a very feminine idea," remarked the Professor, seeming to give it careful attention. "Peculiarly feminine, I should say. And—does it, my dear?"

"Not quite," she answered. "A little. When I first put it on and stood before the glass, I forgot a good many things for a few moments, and then, suddenly, I heard the

children's voices in the nursery, and Richard came in and Bertha Herrick was gone. You know I was Bertha Herrick when I wore this—Bertha Herrick, thinking of her first party."

"Yes, my dear," he responded, "I—I remember."

There were a few moments of silence, in which he looked abstractedly thoughtful, but presently he bestirred himself.

"By the by," he said, "that reminds me. Didn't I understand that there was a great party somewhere to-night? Mr. Arbuthnot left me to go to it, I think. I thought there was a reason for my surprise at seeing you. That was it. Surely you should have been at the great party instead of here."

"Well," she replied, "I suppose I should, but for some curious accident or other—I don't know what the accident is or how it happened—I should have had an invitation—of course if it had chanced to reach me, but something has occurred to prevent its doing so, I suppose. Such things happen, you know. To all intents and purposes I have not been invited, so I could not go. And I am very glad. I would rather be here."

"I would rather have you here," he returned, "if such seclusion pleases you. But I can hardly imagine, my dear, how the party——"

She put her hand on his caressingly.

"It cannot be an entire success," she said.

"It wont, in my absence—but misfortunes befall even the magnificent and prosperous, and the party must console itself. I like to be here—I like very much to be here."

He glanced at her gray dress again.

"Bertha Herrick would have preferred the party," he remarked.

"Bertha Amory is wiser," she said. "We will be quiet together—and happy."

They were very quiet. The thought occurred to the Professor several times during the evening. She kept her seat near him, and talked to him, speaking, he noticed, principally of her children and of the past; the time she had spent at home, before her marriage, seemed to be present in her mind.

"I wonder," she said once, thoughtfully, "what sort of girl I was? I can only remember that I was such a happy girl. Do

you remember that I was a specially self-indulgent or frivolous one? But I am afraid you would not tell me, if you did."

"My dear," he said, in response, "you were a natural, simple, joyous creature, and a great pleasure to us."

She gave his hand a little pressure.

"I can remember that you were always good to me," she said. "I used to think you were a little curious about me, and wondered what I would do in the future. Now it is my turn to wonder if I am at all what you thought I would be?"

He did not reply at once, and then spoke slowly.

"There seemed so many possibilities," he said. "Yes; I thought it possible that you might be—what you are."

It was, as he said this, that there returned to his mind the thought which had occupied it before her entrance. He had been thinking then of something he wished to tell her, before she heard it from other quarters, and which he felt he could tell her at no more fitting time than when they were alone. It was something relating to Laurence Arbuthnot, and, curiously enough, she paved the way for it by mentioning him herself.

"Did you say Laurence was here to-night?" she asked.

"Yes," he replied, "he was so good as to dine with me."

"He would say that you were so good as to invite him," she said. "He is very fond of coming here."

"I should miss him very much," he returned, "if he should go away."

She looked up quickly, attracted by his manner.

"But there is no likelihood of his going away," she said.

"I think," he answered, "that there may be, and I wished to speak to you about it."

He refrained from looking at her—he even delicately withdrew his hand so that if hers should lose its steadiness he might be unconscious of it.

"Go away!" she exclaimed, "from Washington? Laurence! Why should you think so? I cannot imagine such a thing!"

"He does not imagine it himself yet," he replied. "I am going to suggest it to him."

Her hand was still upon his knee and he felt her start.

"You are!" she said; "why and how? Do you think he will go? I do not believe he will."

"I am not sure that he will," he answered, "but I hope so; and what I mean is that I think it may be possible to send him abroad."

She withdrew her hand from his knee.

"He wont go," she said; "I am sure of it."

He went on to explain himself, still not looking at her.

"He is wasting his abilities," he said; "he is wasting his youth; the position he is in is absurdly insignificant; it occurred to me that if I used, with right effect, the little influence I possess, there might finally be obtained for him some position abroad which would be at least something better and might possibly open a way for him in the future. I spoke to the Secretary of State about it, and he was very kind and appeared interested. It seems very possible, even probable, that my hopes will be realized."

For a few seconds she sat still; then she said, abstractedly:

"It would be very strange to be obliged to live our lives without Laurence; they would not be the same lives at all. Still, I suppose it would be best for him; but it would be hard to live without Laurence. I don't like to think of it."

In spite of his intention not to do so, he found himself turning to look at her. There had been surprise in her voice, and now there was sadness, but there was no agitation, no uncontrollable emotion.

"Can it be," he thought, "that she is getting over it? What does it mean?"

She turned and met his eyes.

"But whether it is for the best or not," she said, "I don't believe he will go."

"My dear," he said, "you speak as if there was a reason."

"I think there is a reason," she answered, "and it is a strong one."

"What is it?" he asked.

"There is some one he is beginning to be fond of," she replied; "that is the reason."

He kept his eyes fixed upon her.

"Some one he is *beginning* to be fond of?" he repeated.

"I don't know how it will end," she said. "I am sometimes afraid it can only end sadly; but there is some one he would find it hard to leave, I am sure."

The Professor gradually rose in his chair until he was sitting upright.

"I wish," he said, "that you would tell me who it is."

"I do not think he would mind your knowing," she answered. "It seems strange you have not seen. It is Agnes Sylvestre."

The Professor sank back in his chair, and looked at the bed of coals in the grate.

"Agnes Sylvestre!" he exclaimed; "Agnes Sylvestre!"

"Yes," she said; "and in one sense it is very hard on him that it should be Agnes

Sylvestre. After all these years, when he has steadily kept himself free from all love affairs, and been so sure that nothing could tempt him, it cannot be easy for him to know that he loves some one who has everything he has not—all the things he feels he never will have. He is very proud and very unrelenting in his statement of his own circumstances, and he won't try to glaze them over when he compares them with hers. He is too poor, she is too rich—even if she loved him."

"Even!" said the Professor. "Is it your opinion that she does not?"

"I do not know," she answered. "It has seemed to me more probable that—that she liked Colonel Tredennis."

"I thought so," said the Professor. "I must confess that I thought so—though, perhaps, that may have been because my feeling for him is so strong, and I have seen that he—"

"That he was fond of her?" Bertha put in, as he paused to reflect.

"I thought so," he said again. "I thought I was sure of it. He sees her often; he thinks of her frequently, it is plain; he speaks of her to me; he sees every charm and grace in her. I have never heard him speak of any other woman so."

"It would be a very suitable marriage," said Bertha; "I have felt that from the first. There is no one more beautiful than Agnes—no one sweeter—no one more fit—"

She pushed her seat back from the hearth and rose from it.

"The fire is too warm," she said. "I have been sitting before it too long."

There was some ice-water upon a side-table, and she went to it and poured out a glass, and drank it slowly. Then she took a seat by the center-table and spoke again, as she idly turned over the leaves of a magazine without looking at it.

"When first Agnes came here," she said, "I thought of it. I remember that when I presented Philip to her, I watched to see if she impressed him as she does most people."

"She did," said the Professor. "I remember his speaking of it afterward, and saying what a charm hers was, and that her beauty must touch a man's best nature."

"That was very good," said Bertha, faintly smiling. "And it was very like him. And since then," she added, "you say he has spoken of her often in the same way and as he speaks of no one else?"

"Again and again," answered the Professor. "The truth is, my dear, I am fond of speaking of her myself, and have occasionally led him in that direction. I have wished for him what you have wished."

"And we have both of us," she said, half sadly, "been unkind to poor Laurence."

She closed the magazine.

"Perhaps he will go, after all," she said. "He may see that it is best. He may be glad to go before the year is ended."

She left her book and her chair.

"I think I must go now," she said; "I am a little tired."

He thought that she looked so, and the shadow which for a moment had half lifted itself fell again.

"No," he thought, "she has not outlived it, and this is more bitter for her than the rest. It is only natural that it should be more bitter."

When he got up to bid her good-night, she put a hand upon either of his shoulders and kissed him.

"I am glad I was not invited to the grand party, dear," she said; "I have liked this better. It has been far better for me."

There were only a few yards of space between her father's house and her own, and in a few seconds she had ascended the steps and entered the door. As she did so she heard Richard in the parlor speaking rapidly and vehemently, and, entering, found that he was talking to Colonel Tredennis. The Colonel was standing at one end of the room, as if he had turned round with an abrupt movement; Richard was lying full length upon a sofa, looking uneasy and excited, his cushions tumbled about him. They ceased speaking the moment they saw her, and there was an odd pause, noticing which she came forward and spoke with an effort at appearing at ease.

"Do you know that this seems like contention," she said. "Are you quarreling with Richard, Colonel Tredennis, or is he quarreling with you? And why are you not at the reception?"

"We are quarreling with each other violently," said Richard, with a half laugh. "You arrived barely in time to prevent our coming to blows. And why are *you* not at the reception?"

Bertha turned to Tredennis, who for a moment seemed to have been struck dumb by the sight of her. The memories the slender gray figure had brought to the Professor rushed back upon him with a force that staggered him. It was as if the ghost of something dead had suddenly appeared before him and he was compelled to hold himself as if he did not see it. The little gray gown, the carelessly knotted kerchief,—it seemed so terrible to see them and to be forced to realize through them how changed she was. He had never seen her look so ill and fragile as she did when she turned to him and spoke in her quiet, unemotional voice.

"This is the result of political machination," she said. "He has forgotten that we were not invited. Being absorbed in affairs of state, he no longer keeps an account of the doings of the giddy throng."

Then he recovered himself.

"You were not invited!" he said. "Isn't there some mistake about that. I thought —"

"Your impression naturally was that we were the foundation-stone of all social occasions," she responded, "but this time they have dispensed with us. We were not invited."

"Say that you did not receive your invitation," put in Richard, restlessly. "The other way of stating it is nonsense."

She paused an instant, as if his manner suggested a new thought to her.

"I wonder," she said slowly, "if there *could* be a reason—but no, I think that is impossible. It must have been an accident. But you," she added to Tredennis, "have not told me why you are not with the rest of the world."

"I came away early," he answered. "I was there for an hour."

He was glad that she did not sit down—he wished that she would go away—it would be better if she would go away and leave them to themselves again.

"It was very gay, I suppose," she said. "And you saw Agnes?"

"I have just left her," he replied.

"You ought to have stayed," she said, turning away with a smile. "It would have been better than quarreling with Richard."

And she went out of the room and left them together, as he had told himself it would be best she should.

He did not look at her as she ascended the staircase; he stood with his back to the open door, and did not speak until he heard her go into the room above them. Then he addressed Richard.

"Do you understand me now?" he said, sternly. "This is the beginning!"

"The beginning!" exclaimed Richard, with a half frantic gesture. "If this is the beginning—and things go wrong—imagine what the end will be!"

The room Bertha had entered was the nursery. In the room opening out of it, Jack and Janey slept in their small beds. Upon the hearth-rug lay a broken toy. She bent to pick it up, and afterward stood a moment holding it in her hand without seeing it; she still held it as she sank into a chair which was near her.

"I will stay here a while," she said. "This is the best place for me."

For a few minutes she sat quite still, some-

thing like a stupor had settled upon her; she was thinking in a blind, disconnected way of Agnes Sylvestre. Everything would be right at last. Agnes would be happy. This was what she had wished—what she had intended from the first—when she had brought them together. It was she who had brought them together. And this was the plan she had had in her mind when she had done it; and she had known what it would cost her even then.

And then there came back to her the memory of the moment when she had turned away from them to pour out Laurence's coffee with hands she could not hold still, and whose tremor he saw and understood. Poor Laurence! he must suffer too! Poor Laurence!

She looked down suddenly at the broken toy in her hand.

"I will stay here more," she said. "It is better here. There is nothing else! And if I were a good woman I should want nothing else. If I had only not spoken to Agnes—that was the mistake; if she will only forget it! *Some* one should be happy—*some* one! It will be Agnes."

She got up and went into the children's room, and knelt down by Janey's bed, laying the toy on the coverlet. She put her arms round the child and spoke her name.

"Janey!" she said. "Janey."

The child stirred, opened her eyes, and put an arm sleepily about her neck.

"I said my prayers," she murmured. "God bless mamma and papa—and everybody. God bless Uncle Philip."

Bertha laid her face near her upon the pillow.

"Yes," she said, brokenly. "You belong to me and I belong to you. I will stay here, Janey—with you!"

#### CHAPTER XXX.

SOMETIMES during the winter, when she glanced around her parlor on the evenings of her receptions, Bertha felt as if she were in a waking dream. So many people of whom she seemed to know nothing were gathered about her; she saw strange faces on every side; a new element had appeared which was gradually crowding out the old, and she herself felt that she was almost a stranger in it. Day by day, and by almost imperceptible degrees at first, various mysterious duties had devolved upon her. She had found herself calling at one house because the head of it was a member of a committee, at another because its mistress was a person whose influence over her husband it would be well to consider; she had issued an invitation here because the recipients must be pleased, another there because somebody was to be biased in the right direction. The persons

thus to be pleased and biased were by no means invariably interesting. There was a stalwart Westerner or so, who made themselves almost too readily at home; an occasional rigid New Englander, who suspected a lack of purpose in the atmosphere; and a stray Southerner, who exhibited a tendency toward a large and rather exhaustive gallyantry. As a rule, too, Bertha was obliged to admit that she found the men more easily entertained than the women, who were most of them new to their surroundings, and privately determined to do themselves credit and not be imposed upon by appearances; and when this was not the case were either timorously overpowered by a sense of their inadequacy to the situation, or calmly intrenched behind a shield of impassive composure more discouraging than all else. It was not always easy to enliven such material: to be always ready with the right thing to say and do; to understand, as by inspiration, the intricacies of every occasion and the requirements of every mental condition; and while Bertha spared no effort, and used her every gift to the best of her ability, the result, even when comparatively successful, was rather productive of exhaustion, mental and physical.

"They don't care about me," she said to Arbuthnot one night, with a rueful laugh as she looked around her. "And I am always afraid of their privately suspecting that I don't care about them. Sometimes when I look at them, I cannot help being overpowered by a sense of there being a kind of ludicrousness in it all. Do you know, nearly every one of them has a reason for being here, and it is never by any chance connected with my reason for inviting them. I could give you some of the reasons. Shall I? Some of them are feminine reasons and some of them are masculine. That woman at the end of the sofa—the thin, eager-looking one—comes because she wishes to accustom herself to society. Her husband is a 'rising man,' and she is in love with him and has a hungry desire to keep pace with him. The woman she is talking to has a husband who wants something Senator Plane-field may be induced to give him—and Senator Plane-field is on his native heath here. That showy little Southern widow has a large claim against the government, and comes because she sees people she thinks it best to know. She is wanted because she has a favorite cousin who is given patriotically to opposing all measures not designed to benefit the South. It is rather fantastic when you reflect upon it, isn't it?"

"You know what I think about it without asking," answered Arbuthnot.

"Yes, you have told me," was her re-

sponse; "but it will be all over before long, and then—Ah! there is Senator Blundel! Do you know, it is always a relief to me when he comes;" and she went toward him with a brighter look than Arbuthnot had seen her wear at any time during the entire evening.

It had taken her some time herself to decide why it was that she liked Blundel and felt at ease with him; in fact, up to the present period she had scarcely done more than decide that she did like him. She had not found his manner become more polished as their acquaintance progressed; he was neither gallant nor accomplished; he was always rather full of himself, in a genuine, masculine way. He was blunt, and by no means tactful; but she had never objected to him from the first, and after a while she had become conscious of feeling relief, as she had put it to Arbuthnot, when his strong, rather aggressive personality presented itself upon the scene. He was not difficult to entertain, at least. Finding in her the best of listeners, he entertained himself by talking to her, and by making sharp jokes, at which they both laughed with equal appreciation. He knew what to talk about, too, and what subjects to joke on; and, however apparently communicative his mood might be, his opinions were always kept thriftily in hand.

"He seems to talk a good deal," Richard said testily; "but, after all, you don't find out much of what he really thinks."

Bertha had discovered this early in their acquaintance. If the object in making the house attractive to him was that he might be led to commit himself in any way during his visits, that object was scarcely attained. When at last it appeared feasible to discuss the Westoria lands project in his presence, he showed no unwillingness to listen or to ask questions; but, the discussion being at an end, if notes had been compared no one could have said that he had taken either side of the question.

"He's balancing things," Plane-field said. "I told you he would do it. You may trust him not to speak until he has made up his mind which side of the scale the weight is on."

When these discussions were being carried on Bertha had a fancy that he was more interested than he appeared outwardly. Several times she had observed that he asked her questions afterward which proved that no word had dropped on his ear unheeded, and that he had, for some reason best known to himself, reflected upon all he had heard. But their acquaintance had a side entirely untouched by worldly machinations, and it was this aspect of it which Bertha liked. There was something homely and genuine

about it. He paid her no compliments; he even occasionally found fault with her habits, and what he regarded as the unnecessary conventionality of some of her surroundings; but his good-natured egotism never offended her. A widower without family, and immersed in political business, he knew little of the comforts of home life. He lived in two or three rooms, full of papers, books, and pigeon-holes, and took his meals at a hotel. He found this convenient if not luxurious, and more than convenience it had never yet occurred to him to expect or demand. But he was not too dull to appreciate the good which fell in his way; and after spending an hour with the Amorys on two or three occasions, when he had left the scene of his political labors fagged and out of humor, he began to find pleasure and relief in his unceremonious visits, and to look forward to them. There came an evening when Bertha, in looking over some music, came upon a primitive ballad which proved to be among the recollections of his youth, and she aroused him to enthusiasm by singing it. His musical taste was not remarkable for its cultivation; he was strongly in favor of pronounced melody, and was disposed to regard a song as incomplete without a chorus; but he enjoyed himself when his prejudices were pandered to, and Bertha rather respected his courageous if benighted frankness, and his obstinate faith in his obsolete favorites. So she sang "Ben Bolt" to him, and "The Harp that once through Tara's Halls," and others far less classical and more florid; and while she sang he sat ungracefully but comfortably by the fire, his eyes twinkling less watchfully, the rugged lines of his blunt-featured face almost settling into repose, and sometimes when she ended he roused himself with something like a sigh.

"Do you like it?" she would say. "Does it make you forget 'the gentleman from Indiana' and 'the Senator from Connecticut'?"

"I don't want to forget them," he would reply with dogged good humor. "They are not the kind of fellows it is safe to forget, but it makes my recollections of them more agreeable."

But after a while there were times when he was not in the best of humors, and when Bertha had a fancy that he was not entirely at ease or pleased with herself. At such times his visits were brief and unsatisfactory, and she frequently discovered that he regarded her with a restless and perturbed expression, as if he was not quite certain of his own opinions of her.

"He looks at me," she said to Richard, "as if he had moments of suspecting me of something."

"Nonsense!" said Richard. "What could he suspect you of?"

"Of nothing," she answered. "I think that was what we agreed to call it."

But she never failed to shrink when the twinkling eyes rested upon her with the disturbed questioning in their glance, and the consciousness of this shrinking was very bitter to her in secret.

When her guest approached her on the evening before referred to, she detected at once that he was not in a condition of mind altogether unruffled. The glances he cast on those about him were not encouraging, and the few nods of recognition he bestowed were far from cordial; his hair stood on end a trifle more aggressively than usual, and his short, stout body expressed a degree of general dissatisfaction which it was next to impossible to ignore.

Bertha did not attempt to ignore it.

"I will tell you something before you speak to me," she said. "Something has put you out of humor."

He gave her a sharp glance and then looked away over the heads of the crowd.

"There is always enough to put a man out of humor," he said. "What a lot of people you have here to-night! What do they come for?"

"I have just been telling Mr. Arbuthnot some of the reasons," she answered. "They are very few of them good ones. You came hoping to recover your spirits."

"I came to look at you," he said.

He was frequently blunt, but there was a bluntness about this speech which surprised her. She answered him with a laugh, however.

"I am always worth looking at," she said. "And now you have seen me——?"

He was looking at her by this time, and even more sharply than before. It seemed as if he was bent upon reading in her face the answer to the question he had asked of it before, but he evidently did not find it.

"There's something wrong with you," he said. "I don't know what it is. I don't know what to make of you."

"If you could make anything of me but Bertha Amory," she replied, "you might do a service to society; but that is out of the question; and as to there being something wrong with me, there is something wrong with all of us. There is something wrong with Mr. Arbuthnot, he is not enjoying himself; there is something wrong with Senator Planefield, who has been gloomy all the evening."

"Planefield," he said. "Ah! yes, there he is! Here pretty often, isn't he?"

"He is a great friend of Richard's," she replied, with discretion.

"So I have heard," he returned. And then

he gave his attention to Planefteld for a few minutes, as if he found him also an object of deep interest. After this inspection, he turned to Bertha again.

"Well," he said, "I suppose you enjoy all this or you wouldn't do it?"

"You are not enjoying it," she replied. "It does not exhilarate you as I hoped it would."

"I'm out of humor," was his answer. "I told you so. I have just heard something I don't like. I dropped in here to stay five minutes and take a look at you and see if ——"

He checked himself and rubbed his upright hair impatiently, almost angrily.

"I am not sure that you mightn't be enjoying yourself better," he said, "and I should like to know something more of you than I do."

"If any information I can give you ——" she began.

"Come," he said, with a sudden effort at better humor, "that is the way you talk to Planefteld. We are too good friends for that."

His shrewd eyes fixed themselves on her as if asking the unanswered question again.

"Come!" he said. "I'm a blunt, old-fashioned foggy, but we are good, honest friends, — and always have been."

She glanced across the room at Richard, who was talking to a stubborn opposer of the great measure, and making himself delightful beyond description. She wished for the moment that he was not quite so picturesque and animated; then she gathered herself together.

"I think we have been," she said. "I hope you will believe so."

"Well," he answered, "I shouldn't like to believe anything else."

She thought that perhaps he had said more than he originally intended; he changed the subject abruptly, made a few comments upon people near them, asked a few questions, and finally went away, having scarcely spoken to any one but herself.

"Why did he not remain longer?" Richard asked afterward, when the guests were gone and they were talking the evening over.

"He was not in the mood to meet people," Bertha replied. "He said he had heard something he did not like, and it had put him out of humor. I think it was something about me."

"About you!" Richard exclaimed. "Why, in heaven's name, about you?"

"His manner made me think so," she answered, coldly. "And it would not be at all unnatural. I think we may begin to expect such things."

"Upon my word," said Richard, starting up, "I think that is going rather far. Don't you see?"—with righteous indignation—"what an imputation you are casting on me? Do

you suppose I would allow you to do anything that—that——"

She raised her eyes and met his with an unwavering glance.

"Certainly not," she said quickly. And his sentence remained unfinished, not because he felt that his point had been admitted, but because, for some mysterious reason, it suddenly became impossible for him to say more.

More than once of late, when he had launched into one of his spasmodic defenses of himself, he had found himself checked by this intangible power in her uplifted eyes, and he certainly did not feel his grievances the less for the experiences.

Until during the last few months he had always counted it as one of his wife's chief charms that there was nothing complicated about her, that her methods were as simple and direct as a child's. It had never seemed necessary to explain her. But he had not found this so of late. He had even begun to feel that though there was no outward breach in the tenor of their lives, an almost impalpable barrier had risen between them. He expressed no wish she did not endeavor to gratify; her manner toward himself—with the exception of the fleeting moments when he felt the check—was entirely unchanged. The spirit of her gayety ruled the house, as it had always done; and yet he was not always sure of the exact significance of her jests and laughter. The jests were clever, the laugh had a light ring, but there was a difference which puzzled him, and which—because he recognized in it some vague connection with himself—he tried in his moments of leisure to explain. He had even spoken of it to Colonel Tredennis on occasions when his mood was confidential.

"She used to be as frank as a child," he said, "and have the lightest way in the world; and I liked it. I am a rather feather-headed fellow myself, perhaps, and it suited me. But it is all gone now. When she laughs I don't feel sure of her, and when she is silent I begin to wonder what she is thinking of."

The thing she thought, the words she said to herself oftenest were: "It will not last very long." She said them over to herself at moments she could not have sustained herself under but for the consolation she found in them. Beyond this time, when what she faced from day to day would be over, she had not yet looked.

"It is a curious thing," she said to Arbuthnot, "but I seem to have ceased even to think of the future. I wonder sometimes if very old people do not feel so—as if there was nothing more to happen."

There was another person who found the

events of the present sufficient to exclude for the time being almost all thought of the future. This person was Colonel Tredennis, who had found his responsibilities increase upon him also,—not the least of these responsibilities being, it must be confessed, that intimacy with Mr. Richard Amory of which Bertha had spoken.

"He is very intimate with Richard," she had said, and she had every reason for making the comment.

At first it had been the Colonel who had made the advances for reasons of his own, but later it had not been necessary for him to make advances. Having found relief in making his first reluctant half-confidences, Richard had gradually fallen into making others. When he had been overpowered by secret anxiety and nervous distrust of everything, finding himself alone with the Colonel, and admiring and respecting above all things the self-control he saw in him,—a self-control which meant safety and silence under all temptations to betray the faintest shadow of a trust reposed in him,—it had been impossible for him to resist the impulse to speak of the trials which beset him; and having once spoken of them, it was again impossible not to go a little further, and say more than he had at first intended. So he had gone on, from one step to another, until there had come a day when the Colonel himself had checked him for an instant, feeling it only the part of honor in the man who was the cooler of the two, and who had nothing to risk or repent.

"Wait a moment," he said. "Remember, that though I have not asked questions so far, I am ready to hear anything you choose to say,—but don't tell me what you might wish you had kept back to-morrow."

"The devil take it all," cried Richard, dashing his fist on the table; "I must tell some one, or I shall go mad." Notwithstanding the misery which impelled him, he always told his story in his own way, and gave it a complexion more delicate than a less graceful historian might have been generous enough to bestow. He had been too sanguine and enthusiastic; he had made mistakes; he had been led by the duplicity of a wily world into follies; he had been unfortunate; those more experienced than himself had betrayed the confidence it had been only natural he should repose in them. And throughout the labyrinth of the relation he wound his way,—a graceful, agile, supple figure, lightly avoiding an obstacle here, dexterously overstepping a barrier there, and untouched by any shadow but that of misfortune.

At first he spoke chiefly of the complications which bore heavily upon him; and

these complications, arising entirely from the actions of others, committed him to so little that the Colonel listened with apprehension more grave than the open confession of greater blunders would have awakened in him. "He would tell more," he thought, "if there were less to tell."

The grim fancy came to him sometimes as he listened, that it was as if he watched a man circling about the edge of a volcano, drawing nearer and nearer, until, at last, in spite of himself, and impelled by some dread necessity, he must plunge headlong in. And so Richard circled about his crater: sometimes drawn nearer by the emotion and excitement of the moment, sometimes withdrawing a trifle through a caution as momentary, but in each of his circlings revealing a little more of the truth. The revelations were principally connected with the Westoria lands scheme, and were such in many instances as the Colonel was not wholly unprepared to hear. He had not looked on during the last year for nothing; and often, when Richard had been in gay good spirits, and had imagined himself telling nothing, his silent companion had heard his pleasantries with forebodings which he could not control. He was not deceived by any appearance of entire frankness, and knew that he had not been told all until one dark and stormy night, as he sat in his room, Richard was announced, and came in pallid, haggard, beaten by the rain, and at the lowest ebb of depression. He had had a hard and bitter day of it, and it had followed several others quite as hard and bitter; he had been fagging about the Capitol, going the old rounds, using the old arguments, trying new ones, overcoming one obstacle only to find himself confronted with another, feeling that he was losing ground where it was a matter of life and death that he should gain it; spirits and courage deserting him just when he needed them most; and all this being over, he dropped into his office to find awaiting him there letters containing news which gave the final blow.

He sat down by the table and began his outpourings, graceful, attractive, injured. The Colonel thought him so, as he watched him and listened, recognizing meanwhile the incompleteness of his recital, and making up his mind that the time had come when it was safer that the whole truth should be told. In the hours in which he had pondered upon the subject, he gradually decided that such an occasion would arrive; and here it was.

So, at a certain fitting juncture, just as Richard was lightly skirting a delicate point, Tredennis leaned forward and laid his open hand on the table.

"I think," he said, "you had better tell me the whole story. You have never done it yet. What do you say?"

The boarder on the floor below, who had heard him walking to and fro on the first New Year's night he had spent in Washington and on many a night since, heard his firm, regular tread again during the half hour in which Richard told, in fitful outbursts, what he had not found himself equal to telling before. It was not easy to tell it in a very clear and connected manner; it was necessary to interlard it with many explanations and extenuations; and even when these were supplied there was a baldness about the facts, as they gradually grouped themselves together, which it was not agreeable to contemplate; and Richard felt this himself gallingly.

"I know how it appears to you," he said; "I know how it sounds! That is the maddening side of it,—it looks so much worse than it really is! There is not a man living who would accuse me of intentional wrong. Confound it! I seem to have been forced into doing the very things it was least natural to me to do! Bertha herself would say it,—she would understand it. She is always just and generous!"

"Yes," said the Colonel; "I should say she had been generous."

"You mean that I have betrayed her generosity!" cried Richard. "That, of course! I expected it."

"You will find," said the Colonel, "that others will say the same thing."

He had heard even more than his worst misgivings had suggested to him, and the shock of it had destroyed something of his self-control. For the time being he was in no lenient mood.

"I know what people will say!" Richard exclaimed. "Do you suppose I have not thought of it a thousand times? I know what I should say if I did not know the circumstances. It is the circumstances that make the difference."

"The fact that they are your circumstances, and not another man's," began Tredennis; but there he checked himself. "I beg your pardon," he said, coldly. "I have no right to meet your confidence with blame. It will do no good. If I can give you no help, I might better be silent. There were circumstances which appeared extenuating to you, I suppose."

He was angered by his own anger, as he had often been before. He told himself that he was making the matter a personal cause, as usual; but how could he hear that her very generosity and simplicity had been used against her by the man who should have guarded her interests as his first duty, with-

out burning with sharp and fierce indignation.

"If I understand you," he said, "your only hope of recovering what you have lost lies in the success of the Westoria scheme?"

"Yes," answered Amory, with his forehead on his hands, "that is the diabolical truth!"

"And you have lost?"

"Once I was driven into saying to you that if the thing should fail it would mean ruin to me. That was the truth, too."

The Colonel stood still.

"Ruin to you!" he said. "Ruin to your wife—ruin to your children—serious loss to the old man who——"

"Who trusted me!" Richard finished, gnawing his white lips. "I see it in exactly the same light myself, and it does not make it easier to bear. That is the way a thing looks when it fails. Suppose it had succeeded. It may succeed yet. They trusted me, and, I tell you, I trusted myself."

It was easy to see just what despair would seize him if the worst came to the worst, and how powerless he would be in its clutches. He was like a reed beaten by the wind, even now. A sudden paroxysm of fear fell upon him.

"Great God!" he cried. "It can't fail! What could I say to them—how could I explain it?"

A thousand wild thoughts surged through Tredennis's brain as he heard him. The old sense of helplessness was strong upon him. To his upright strength there seemed no way of judging fairly of, or dealing practically with, such dishonor and weakness. What standard could be applied to a man who lied agreeably in his very thoughts of himself and his actions. He had scarcely made a statement during the last hour which had not contained some airy falsehood. Of whom was it he thought in his momentary anguish? Not of Bertha—not of her children—not of the gentle old scholar who had always been lenient with his faults. It was of himself he was thinking—of Richard Amory robbed of his refined picturesqueness by mere circumstance and placed by bad luck at a baleful disadvantage!

For a few minutes there was a silence. Richard sat with his brow upon his hands, his elbows on the table before him. Tredennis paced to and fro, looking downward. At length Richard raised his head. He did so because Tredennis had stopped his walk.

"What is it?" he asked.

Tredennis walked over to him and sat down. He was pale, and wore a set and rigid look, the chief characteristic of which was that it expressed absolutely nothing. His voice was just as hard and expressed as little when he spoke.

"I have a proposition to make to you,"

he said, "and I will preface it by the statement that, as a business man, I am perfectly well aware that it is almost madness to make it. I say 'almost.' Let it rest there. I will assume the risks you have run in the Westoria scheme. Invest the money you have charge of in something safer. You say there are chances of success. I will take those chances."

"What!" cried Richard. "What!"

He sat upright, staring. He did not believe the evidence of his senses, but Tredennis went on, without the quiver of a muscle, speaking steadily, almost monotonously.

"I have money," he said. "More than you know, perhaps. I have had recently a legacy which would of itself make me a comparatively rich man. That I was not dependent upon my pay you knew before. I have no family. I shall not marry. I am fond of your children, of Janey particularly. I should have provided for her future in any case. You have made a bad investment in these lands; transfer them to me and invest in something safer."

"And if the bill fails to pass!" exclaimed Richard.

"If it fails to pass, I shall have the land on my hands; if it passes, I shall have made something by a venture and Janey will be the richer; but, as it stands, the venture had better be mine than yours. You have lost enough."

Richard gave his hair an excited toss backward and stared at him as he had done before; a slight, cold moisture broke out on his forehead.

"You mean ——" he began, breathlessly.

"Do you remember," said Tredennis, "what I told you of the comments people were beginning to make? They have assumed the form I told you they would. It is best for—for your children that they should be put an end to. If I assume these risks, there will be no further need for you to use—to exert yourself." He began to look white about the mouth, and through his iron stolidity there was something revealed before which Richard felt himself quail. "The night that Blundel came in to your wife's reception, and remained so short a time, he had heard a remark upon the influence she was exerting over him, and it had had a bad effect. The remark was made publicly at one of the hotels." He turned a little whiter, and the something all the strength in him had held down at the outset leaped to the surface. "I have no wife to—to use," he said; "if I had, by heavens, I would have spared her!"

He had held himself in hand and been silent a long time, but he could not do it now.

"She is the mother of your children," he

cried, clenching his great hand. "And women are beginning to avoid her, and men to bandy her name to and fro. You have deceived her, you have thrown away her fortune; you have used her as an instrument in your schemes. I, who am only an outsider, with no right to defend her—I defend her for her father's sake, for her child's, for her own! You are on the verge of ruin and disgrace. I offer you the chance to retrieve yourself—to retrieve her! Take it, if you are a man!"

Richard had fallen back in his chair, breathless and ashen. In all his imaginings of what the future might hold, he had never thought of such a possibility as this,—that it should be this man who would turn upon him and place an interpretation so fiercely unsparing upon what he had done! Under all his admiration and respect for the Colonel there had been hidden, it must be admitted, an almost unconscious touch of contempt for him, as a rather heavy and unsophisticated personage, scarcely versatile or agile enough, and formed in a mold somewhat obsolete and quixotic,—a safe person to confide in, and one to invite confidence passively by his belief in what was presented to him; a man to make a good listener and to encourage one to believe in one's own statements, certainly not a man to embarrass and discourage a historian by asking difficult questions or translating too literally what was said. He had not asked questions until to-night, and his face had said very little for him on any occasion. Among other things, Richard had secretly—though leniently—felt him to be a trifle stolid, and had amiably forgiven him for it. It was this very thing which made the sudden change appear so keen an injustice and injury; it amounted to a breach of confidence, that *he* should have formed a deliberate and obstinate opinion of his own, entirely unbiased by the presentation of the case offered to him. He had spoken more than once, it was true, in a manner which had suggested prejudice, but it had been the prejudice of the primeval mind, unable to adjust itself to modern conditions and easily disregarded by more experienced. But now!—he was stolid no longer. His first words had startled Richard beyond expression. His face said more for him than his words; it burned white with the fire he had hidden so long; his great frame quivered with the passion of the moment; when he had clenched his hand it had been in the vain effort to hold it still; and yet, the man who saw it recognized in it only the wrath and scorn which had reference to himself. Perhaps it was best that it should have been so, best that his triviality was so complete that he could see nothing

which was not in some way connected with his own personality.

"Tredennis," he gasped out, "you are terribly harsh! I did not think you——"

"Even if I could lie and palter to you," said Tredennis, his clenched hand still on the table, "this is not the time for it. I have tried before to make you face the truth, but you have refused to do it. Perhaps you had made yourself believe what you told me—that no harm was meant or done. I know what harm has been done. I have heard the talk of the hotel corridors and clubs!" His hand clenched itself harder and he drew in a sharp breath.

"It is time that you should give this thing up," he continued, with deadly determination. "And I am willing to shoulder it. Who else would do the same thing?"

"No one else," said Richard, bitterly. "And it is not for my sake you do it, either; it is for the sake of some of your ideal fancies that are too fine for us worldlings to understand, I swear!" And he felt it specially hard that it was so.

"Yes," replied the Colonel, "I suppose you might call it that. It is not for your sake, as you say. It has been one of my fancies that a man might even deny himself for the sake of an—an idea, and I am not denying myself. I am only giving to your child, in one way, what I meant to give to her in another. She would be willing to share it with her mother, I think."

And then, somehow, Richard began to feel that this offer was a demand, and that, even if his sanguine mood should come upon him again, he would not find it exactly easy to avoid it. It seemed actually as if there was something in this man,—some principle of strength, of feeling, of conviction,—which almost constituted a right by which he might contend for what he asked; and before it, in his temporary abasement and anguish of mind, Richard Amory faltered. He said a great deal, it is true, and argued his case as he had argued it before, being betrayed in the course of the argument by the exigences of the case to add facts as well as fancies. He endeavored to adorn his position as much as possible, and, naturally, his failure was not entire. There were hopes of the passage of the bill, sometimes strong hopes, it seemed; if the money he had invested had been his own, if it had not been for the failure of his speculations in other quarters, if so much had not depended upon failure and success, he would have run all risks willingly. There were, indeed, moments when it almost appeared that his companion was on the point of making a capital investment, and being much favored thereby.

"It is really not half so bad as it seems," he said, gaining cheerfulness as he talked. But, after such a day as I have had, a man loses courage and cannot look at things collectedly. I have been up and down in the scale a score of times in the last eight hours. That is where the wear and tear comes in. A great deal depends on Blundel; and I had a talk with him which carried us further than we have ever been before."

"Further," said Tredennis. "In what direction?"

Richard flushed slightly.

"I think I sounded him pretty well," he said. "There is no use mincing matters; it has to be done. We have never been able to get at his views of things exactly, and I won't say he went very far this afternoon, but I was in a desperate mood, and—well, I think I reached bottom. He half promised to call at the house this evening. I dare say he is with Bertha now."

Something in his flush, which had a slightly excited and triumphant air, something in his look and tone, caused Tredennis to start in his chair.

"What is he there for?" he said. "What do you mean?"

Richard thrust his hands in his pockets. For a moment he seemed to have lost all his grace and refinement of charm—for the moment he was a distinctly coarse and undraped human being.

"He has gone to make an evening call," he said. "And if she manages him as well as she has managed him before,—as well as she can manage any man she chooses to take in hand, and yet not give him more than a smile or so,—your investment, if you make it, may not turn out such a bad one."

#### CHAPTER XXXI.

BERTHA had spent the greater part of the day with her children, as she had spent part of many days lately. She had gone up to the nursery after breakfast to see Jack and Janey at their lessons; and had remained with them and given herself up to their entertainment. She was not well; the weather was bad; she might give herself a holiday, and she would spend it in her own way, in the one refuge which never failed her.

"It is always quiet here," she said to herself. "If I could give up all the rest—all of it—and spend all my days here, and think of nothing else, I might be better. There are women who live so. I think they must be better in every way than I am,—and happier. I am sure I should have been happier if I had begun so long ago."

And as she sat, with Janey at her side, in

the large chair which held them both, her arm thrown round the child's waist, there came to her a vague thought of what the unknown future might form itself into when she "began again." It would be beginning again when the sea was between the new life and the old; everything would be left behind—but the children. She would live as she had lived in Virginia, always with the children—always with the children. "It is the only safe thing," she thought, clasping Janey closer. "Nothing else is safe for a woman who is unhappy. If one is happy one may be gay, and look on at the world with the rest; but there are some who must not look on,—who dare not."

"Mamma," said Janey, "you are holding me a little too close, and your face looks—it looks—as if you were thinking."

Bertha laughed to re-assure her. They were used to this gay, soft laugh of hers, as the rest of the world was. If she was silent, if the room was not bright with the merriment she had always filled it with, they felt themselves a trifle injured, and demanded their natural rights with juvenile imperiousness. "Mamma always laughs," Jack had once announced to a roomful of company. "She plays new games with us and laughs, and we laugh, too. Maria and Susan are not funny. Mamma is funny, and like a little girl grown up. We always have fun when she comes into the nursery." "It is something the same way in the parlor," Planefield had said, showing his teeth amiably; and Bertha, who was standing near Colonel Tredennis, had laughed in a manner to support her reputation, but had said nothing. So she laughed now, not very vivaciously, perhaps. "That was very improper, Janey," she said, "to look as if I was thinking. It is bad enough to be thinking. It must not occur again."

"But if you were thinking of a story to tell us," suggested Jack, graciously, "it wouldn't matter, you see. You might go on thinking."

"But the story was not a new one," she answered. "It was sad. I did not like it myself."

"We should like it," said Janey.

"If it's a story," remarked Jack, twisting the string round his top, "it's all right. There was a story Uncle Philip told us."

"Suppose you tell it to me," said Bertha.

"It was about a knight," said Janey, "who went to a great battle. It was very sorrowful. He was strong, and happy, and bold, and the king gave him a sword and armor that glittered and was beautiful. And his hair waved in the breeze. And he was young and brave. And his horse arched its neck. And the knight

longed to go and fight in the battle, and was glad and not afraid; and the people looked on and praised him, because they thought he would fight so well. But just as the battle began, before he had even drawn his sword, a stray shot came, and he fell. And while the battle went on he lay there dying, with his hand on his breast. And at night, when the battle was over, and the stars came out, he lay and looked up at them, and at the dark-blue sky, and wondered why he had been given his sword and armor, and why he had been allowed to feel so strong, and glad, and eager,—only for that. But he did not know. There was no one to tell him. And he died. And the stars shone down on his bright armor and his dead face."

"I didn't like it myself," commented Jack.

"It wasn't much of a story. I told him so."

"He was sorry he told it," said Janey, "because I cried. I don't think he meant to tell such a sad story."

"He wasn't funny that day," observed Jack. "Sometimes he isn't funny at all, and he sits and thinks about things; and then, if we make him tell us a story, he doesn't tell a good one. He used to be nicer than he is now."

"I love him," said Janey, faithfully; "I think he is nice all the time."

"It wasn't much of a story, that is true," said Bertha. "There was not enough of it."

"He died too soon," said Jack.

"Yes," said Bertha; "he died too soon, that was it,—too soon." And the laugh she ended with had a sound which made her shudder.

She got up from her rocking-chair quickly.

"We wont tell stories," she said. "We will play. We will play ball and blind-man's-buff—and run about and get warm. That will be better."

And she took out her handkerchief and tied it over her eyes with unsteady hands, laughing again,—laughing while the children laughed, too.

They played until the room rang with their merriment. They had not been so gay together for many a day, and when the game was at an end they tried another and another, until they were tired and ready for their nursery dinner. Bertha did not leave them even then. She did not expect Richard home until their own dinner-hour in the evening, so she sat at the children's table and helped them herself, in the nurse's place; and they were in high spirits, and loquacious and confidential.

When the meal was over, they sat by the nursery fire, and Meg fell asleep in her mother's arms; and after she had laid her on her bed, Bertha came back to Jack and Janey, and read and talked to them until dusk began

to close in about them. It was, as they sat so together, that a sealed package was brought to her by a servant, who said it had been left at the door by a messenger. It contained two letters,—one addressed to Senator Blundel, and one to herself,—and both were in Richard's hand.

"I suppose something has detained him, and I am not to wait dinner," she thought, as she opened the envelope bearing her own name.

The same thing had occurred once or twice before, so it made but little impression upon her. There were the usual perfectly natural excuses. He had been very hard at work and would be obliged to remain out until some time past their dinner hour. He had an engagement at one of the hotels, and could dine there; he was not quite sure that he should be home until late. Then he added, just before closing,—

"Blundel said something about calling this evening. He had been having a hard day of it, and said he wanted a change. I had a very satisfactory talk with him, and I think he begins to see the rights of our case. Entertain him as charmingly as possible, and if he is not too tired and is in a good humor, hand him the inclosed letter. It contains testimony which ought to be a strong argument, and I think it will be."

Bertha looked at the letter. It was not at all imposing, and seemed to contain nothing more than a slip of paper. She put it down on the mantel and sighed faintly.

"If he knew what a service he would do me by seeing the rights of the case," she said to herself, "I think he would listen to their arguments. I think he likes me well enough to do it. I believe he would enjoy being kind to me. If this should be the end of it all, it would be worth the trouble of being amusing and amiable one evening."

But she did not look forward with any great pleasure to the prospect of what was before her. Perhaps her day in the nursery had been a little too much for her; she was tired and would have been glad to be left alone. But this was not to be. She must attire herself, in all her bravery, and sing and laugh and be gay a little longer. How often had she done the same thing before? How often would she do it again?

"There are some people who are born to play comedy," she said afterward, as she stood before her mirror, dressing. "They can do nothing else. I am one of them. Very little is expected of me, only that I shall always laugh and make jokes. If I were to try tragedy, that would be a better jest than all the rest. If I were to be serious, what a joke that would be!"

She thought, as she had done a thousand times, of a portrait of herself which had been painted three years before. It had been her Christmas gift to Richard, and had been considered a great success. It was a wonderfully spirited likeness, and the artist had been fortunate in catching her brightest look.

"It is the expression that is so marvelous," Richard had often said. "When I look at it, I always expect to hear you laugh."

"Are they never tired of it," she said, "never tired of hearing me laugh? If I were to stop some day and say, 'See, I am tired of it myself. I have tears as well as the rest of you. Let me——'" She checked herself, her hands had begun to tremble,—her voice; she knew too well what was coming upon her. She looked at herself in the glass.

"I must dress myself carefully," she said, "if I am to look vivacious. One's attire is called upon to do a great deal for one when one has a face like that."

Outwardly her attire had done a great deal for her when, after she had dined alone, she sat awaiting her guest. The fire burned brightly, the old songs lay upon the piano, a low stand with a pretty coffee service upon it was drawn near her, a gay little work-basket containing some trifle of graceful work was on her knee. Outside, the night was decidedly unpleasant. "So unpleasant," she said to herself, "that it will surprise me if he comes." But though by eight o'clock the rain was coming down steadily, at half-past eight she heard the familiar heavy tread upon the door-step, and her visitor presented himself.

What sort of humor he was in when he made his entry, Bertha felt that it was not easy to decide; but it struck her that it was not a usual humor, and that the fatigues of the day had left their mark upon him. He looked by no means fresh, and, by the time he had seated himself, she felt that something had disturbed him, and that it was true that he needed distraction.

It had always been very simple distraction she offered him, he had never demanded subtleties from her or any very great intellectual effort; his ideas upon the subject of the feminine mind were, perhaps, not so advanced as they might have been, and belonged rather to the days and surroundings of his excellent, hard-worked mother and practical, unimaginative sisters than to a more brilliant world. Given a comfortable seat in the pretty room, the society of this pretty and smiling little person, who poured out his coffee for him, enjoyed his jokes, and prattled gayly of things pleasant and amusing, he was perfectly satisfied. What he felt the need of was rest and light recreation, cheer-

fulness and appreciation, a sense of relief from the turmoil and complications of the struggling, maneuvering, overreaching, ambitious world he lived in.

Knowing this, Bertha had given him what he enjoyed, and she offered him no other entertainment this evening. She gave him his cup of coffee and talked to him as he drank it, telling him an amusing story or so of the children or of people he knew.

"I have been in the nursery all day," she said. "I have been playing blind-man's-buff and telling stories. You have never been in the nursery, have you? You are not like Colonel Tredennis, who thinks the society there is better than that we have in the parlor."

"Perhaps he's not so far wrong," said her guest, bluntly, "though I have never been in the nursery myself. I have a nursery of my own up at the Capitol, and I don't always find it easy to manage."

"The children fight, I have heard," said Bertha, "and sometimes call each other names, and it is even reported that they snatch at each other's toys and break those they cannot appropriate. I am afraid the discipline is not good!"

"It isn't," he answered, "or there isn't enough of it."

He set his coffee-cup down and watched her as she leaned back in her chair and occupied herself with the contents of her work-basket.

"Do you go into the nursery often?" he asked, "or is it out of the fashion?"

"It is out of the fashion," she answered, "but——" She stopped and let her work rest on her knee as she held it. "Will you tell me why you ask me that?" she said, and her face changed as she spoke.

"I asked you because I didn't know," he answered. "It seemed to me you couldn't have much time for things of that sort. You generally seem to be pretty busy with one thing and another. I don't know much about fashionable life and fashionable women. The women I knew when I was a boy—my own mother and her sisters—spent the most of their time with their children; and it wasn't such a bad way, either. They were pretty good women."

"Perhaps it was the best way," said Bertha, "and I dare say they were better for it. I dare say we compare very unfavorably with them."

"You don't compare at all," he returned. "I should not compare you. I don't know how it would work with you. They got old pretty soon, and lost their good looks; but they were safe, kind-hearted creatures, who tried to do their duty and make the best of

things. I don't say they were altogether right in their views of life; they were narrow, I suppose, and ran into extremes; but they had ways a man likes to think of, and did very little mischief."

"I could scarcely estimate the amount of mischief I do," said Bertha, applying herself to her work cheerfully; "but I do not think my children are neglected. Colonel Tredennis would probably give a certificate to that effect. They are clothed quite warmly, and are occasionally allowed a meal, and I make a practice of recognizing them when I meet them on the street."

She was wondering if it would not be better to reserve the letter until some more auspicious occasion. It struck her that in the course of his day's fatigues he had encountered some problem of which he found it difficult to rid himself. There were signs of it in his manner. He wore a perturbed, preoccupied expression, and looked graver than she had ever seen him. He sat with his hands in his pockets, his hair on end, his bluff countenance a rather deeper color than usual, and his eyes resting upon her.

"This isn't an easy world," he said, "and I suppose it is no easier for women than for men. I shouldn't like to be a woman myself, and have to follow my leader and live in one groove from beginning to end. It is natural that some should feel the temptation to try to get out of it, and use their power as men use theirs; but it does not pay, it can't. Women were meant to be good,—to be good and honest and true, and—and innocent."

It was an amazingly ingenuous creed, and he presented it with a rough simplicity and awkwardness which might have been laughable but for their heavy sincerity. Bertha felt this seriousness instantaneously, and looking up, saw in his sharp little eyes a suggestion of feeling which startled her.

"Wondering what I'm thinking of?" he said. "Well, I am thinking of you. I've thought of you pretty often lately, and to-night I've a reason for having you in my mind."

"What is the reason?" she asked, more startled than before.

He thrust his hands deeper into his pockets; there was no mistaking the evidences of strong emotion in his face.

"I am a friend of yours," he said. "You know that; you've known it some time. My opinion of you is that you are a good little woman,—the right sort of a little woman,—and I have a great deal of confidence in you."

"I hope so," said Bertha.

She felt that as he gained warmth and color she lost them; she thought of the letter which

lay on the mantel-piece within a few feet of him, and wished that it was not so near. There had been evil spoken of her, and he had heard it. She realized that, and knew that she was upon her defense, even while she had no knowledge of what she was to defend herself against.

"I hope so," she said again, tremulously. "I hope so, indeed;" and her eyes met his with a helplessness more touching than any appeal she could have made.

It so moved him that he could remain quiet no longer, but sprang to his feet and drew his hand from his pocket and rubbed it excitedly over his upright hair.

"Damn it!" he broke forth, "let them say what they will,—let what will happen, I'll believe in you! Don't look at me like that; you are a good little woman, but you are in the wrong place. There are lies and intrigues going on about you, and you are too—too bright and pretty to be judged fairly by outsiders. You don't know what you are mixed up in; how should you? Who is to tell you? These fellows who dangle about and make fine speeches are too smooth-tongued even when they know enough. I'll tell you. I never paid you compliments or made love to you, did I? I'm no good at that, but I'll tell you the truth, and give you a bit of good advice. People are beginning to talk, you see, and tell lies. They have brought their lies to me; I don't believe them, but others will. There are men and women who come to your house, who will do you no good, and are more than likely to do you harm. They are a lot of intriguers and lobbyists. You don't want that set here. You want honest friends and an innocent, respectable home for your children, and a name they won't be ashamed of. Send the whole set packing, and cut yourself loose from them."

Bertha stood up also. She had forgotten the little work-basket, and still held it in her hands, suspended before her.

"Will you tell me," she said, "what the lies were,—the lies you heard?"

Perhaps she thought, with a hopeless pang, they were not lies at all; perhaps he had only heard what was the truth, that she had been told to try to please him, that his good-will might be gained to serve an end. Looked at from Richard's stand-point, that had been a very innocent thing; looked at from his stand-point, it might seem just what it had seemed to herself, even in the reckless, desperate moment when she had given way.

He paused a moment, barely a moment, and then answered her.

"Yes," he said, "I will tell you if you

want to know. There has been a big scheme on hand for some time,—there are men who must be influenced; I am one of them; and people say that the greater part of the work is carried on in your parlors here, and that you were set on me because you were a clever little maneuverer, and knew your business better than I should be likely to suspect. That is what they say, and that is what I must believe, because——"

He stopped short. He had drawn nearer the mantel-piece, and as he spoke some object lying upon it caught his eye. It was the letter directed to himself, lying with the address upward, and he took it in his hand.

"What is this?" he demanded. "Who left it here?"

Bertha stood perfectly motionless. Richard's words came back to her: "Give it to him if he is in a good humor. It contains arguments which I think will convince him." Then she looked at Blundel's face. If there could be any moment more unfit than another for the presentation of arguments it was this particular one. And never before had she liked him so well or valued his good opinion so highly as she did now, when he turned his common, angry, honest face upon her.

"What is it?" he said again. "Tell me."

She thought of Richard once more, and then of the children sleeping upstairs, and of the quiet, innocent day she had spent with them. They did not know that she was an intriguing woman whom people talked of; she had never realized it herself to the full until this moment. They had delicately forbore giving any name to the thing she had done; but this man, who judged matters in a straightforward fashion, would find a name for it. But there was only one answer for her to make.

"It is a letter I was to give you," she said.

"And it is from your husband?"

"I have not read it," she replied.

He stopped short a moment and looked at her—with a sudden suggestion of doubt and bewilderment that was as bad as a blow.

"Look here!" he said. "You were going to give it to me,—you intended to do it?"

"Yes."

He gave her another look,—amazement, anger, disbelief, struggling with each other in it,—and then thrust his obstinate fists into his pockets again and planted himself before her like a rock.

"By the Lord!" he said. "I won't believe it!"

The hard common sense which had been his stronghold and the stand-by of his constituents for many a year came to his rescue. He might not know much of women, but he

had seen intrigue, and trickery, and detected guilt, and it struck him if these things were here, they were before him in a new form.

"Now," he said, "tell me who gave it to you?"

"You will know that," she answered, "when you read it."

"Tell me," he demanded, "if you know what is in it?"

"I know something," she replied, "of what is in it."

"By Jove!" he exclaimed, "I'd give a great deal to know how much!"

Only Richard could have told him how much or how little; and he was not there.

"Come," he said, as she made no reply, "they might easily deceive you. Tell me what you know, and I will believe you,—and there are very few women in your place I would say as much to."

"I do not think," she answered, "that they have deceived me."

"Then," he returned, his face hardening, "*you* have deceived *me*!"

"Yes," she answered, turning white, "I suppose I have."

There was a moment of dead silence, in which his shrewd eyes did their work as well as they had done it at any time during his fifty years of life. Then he spoke to her again.

"They wanted me here because they wanted to make use of me," he said. "You knew that?"

"They did not put it in that way," she answered. "I dare say you know that."

"You were to befool me as far as you could, and make the place agreeable to me,—you knew that?"

She turned paler.

"I—I have liked you very sincerely!" she broke forth, piteously. "I have liked you! Out of all the rest, that one thing was true! Don't—ah, don't think it was not!"

His expression for a moment was a curiously undecided one; he was obliged to rally himself with a sharp rub at his hair.

"I'll tell you what I think of that when you have answered me another question," he said. "There is a person who has done a great deal of work in this matter, and has been very anxious about it, probably because he has invested in it more money than he can spare,—buying lands and doing one thing and another. That person is your husband, Mr. Richard Amory. Tell me if you knew that?"

The blood rushed to her face and then left it again.

"Richard!" she exclaimed. "Richard!" and she caught at the mantel and held to it.

His eyes did not leave her for an instant.

He nodded his head with a significance whose meaning was best known to himself.

"Sit down," he said. "I see you did not know that."

She did as he told her. It was as if such a flash of light had struck across her mental vision as half blinded her.

"Not Richard!" she cried out; and even as she said it a thousand proofs rushed back upon her and spoke the whole shameful truth for themselves.

Blundel came nearer to her, his homely, angry face, in spite of its anger, expressing honest good feeling as strongly as any much handsomer one might have done.

"I knew there had been deep work somewhere," he said. "I saw it from the first. As for you, you have been treated pretty badly. I supposed they persuaded you that you might as well amuse one man as another,—and I was the man. I dare say there is more behind than I can see. You had nothing to gain as far as you knew, that's plain enough to me."

"No," she exclaimed, "it was not I who was to gain! They did not think of—of me!"

"No," he went on, "they lost sight of you rather even when they had a use for you. It's apt to be the way. It's time some one should think of you, and I mean to do it. I am not going to say more against those who—made the mistake" (with a resentful shuffle of his shoulders as he put it thus mildly), "than I can help, but I am going to tell you the truth. I have heard ugly stories for some time, and I've had my suspicions of the truth of them, but I meant to wait for proof, and it was given me this afternoon. More was said to me than it was safe to say to an honest man, and I let the person who talked go as far as he would, and he was too desperate to be cautious. I knew a bold move was to be made, and I guessed it would be made to-night."

He took the envelope from his pocket where he had tucked it unopened. His face grew redder and hotter.

"If it were not for you," he said, "if I didn't have faith in your being the honest little woman I took you for, if I didn't believe you spoke the truth when you said you liked me as honestly as I liked you,—though the Lord knows there is no proof except that I do believe you in spite of everything,—I'd have the thing spread the length and breadth of the land by to-morrow morning, and there would be such an uproar as the country has not seen for a year or so."

"Wait!" said Bertha, half-starting from her seat. "I did not understand before! This is too much shame! I thought it was—only a letter! I did not know——"

He went to the fire.

"I believe that, too," he said grimly; "but it is not a little thing I'm doing. I'm denying myself a great deal. I'd give five years of my life ——" He straightened out his short, stout arm and closed hand with a robust gesture, and then checked himself. "You don't know what is in it. I don't know. I have not looked at it. There it goes," and he tossed it into the fire.

"The biggest fool of all," he said, "is the fool who takes every man for a knave. Do they think a country like this has been run for a century by liars and thieves? There have been liars and thieves enough, but not enough to bring it to a stand-still, and that seems to argue that there has been an honest man or so to keep a hand on their throats. When there are none left,—well, it won't be as safe to belong to the nation as it is to-day, in spite of all that's bad in it."

The envelope had flamed up, and then died down into tindery blackness. He pointed to it.

"You can say it is there," he said, "and that I didn't open it, and they may thank you for it. Now I am going."

Bertha rose. She put her hand on the mantel again.

"If I do not thank you as I ought," she said, brokenly, "you must forgive me. I see all that you have spared me, but—I have had a heavy blow." He paused to look at her, rubbing his upright hair for the last time, his little eyes twinkling with a suspicious brightness, which had its softness, too. He came back and took her hand, and held it in an awkward, kindly clasp.

"You are a good little woman," he said. "I'll say it to you again. You were not cut out to be made anything else of. You won't be anything else. You are young to be disappointed and unhappy. I know all that,—and there doesn't seem much to say. Advice wouldn't amount to much, and I don't know that there is any to give."

They moved slowly toward the door together. When they stood upon the threshold, he dropped her hand as awkwardly as he had taken it, and made a gesture toward the stair-way, the suspicious brightness of his eyes more manifest than ever.

"Your children are up there asleep," he said unsteadily. "Go to them."

He turned away and shrugged himself into his overcoat at the hat-stand, opened the door for himself, and went out of the house without another word.

(To be continued.)

## TOPICS OF THE TIME.

### A Modern Miracle.

WHO will ever contend again that the day of miracles is past? What skeptic will venture to dispute any story of sudden conversion? Neither in apostolic nor in mediæval times was there ever a greater marvel than that which has lately been wrought in the Congress of the United States. If six months ago any one had predicted that an adequate measure of civil service reform would be adopted by Congress within a year, his prediction would have called for no reply but an incredulous and pitiful smile. No advocate of the reform was so enthusiastic as to hope that such an event could happen. The most that any one expected was that the bills of Mr. Pendleton and Mr. Dawes, then before the Senate, would be discussed in that body, and that a respectable minority would be ready to vote in favor of one or the other of them. The decided probability was that the less efficacious of these two measures would command the greater number of votes, the study of the senators evidently being how not to do it. And now we see the more radical and thorough-going of the two bills pass the Senate by an overwhelming majority, to be taken up and rushed through the House of Representatives, out of the regular order,

almost without debate, by a vote of three to one. Mr. Dawes of Massachusetts, a somewhat prudent friend of civil service reform, declared a year ago that the people would never tolerate the appointment of a commission to take charge of the business and conduct the examinations; but the bill of Mr. Pendleton, providing for such a commission, has passed, and Mr. Dawes's name is recorded among the yeas. A year ago any man who argued in favor of civil service reform, and especially of the method of competitive examination, was at once written down as a doctrinaire or a "feather-head" by nearly all the partisan newspapers of both parties, and waved aside as a wholly unpractical person by three-fourths of the members of Congress. Now we see honorable gentlemen jumping upon their chairs and scrambling to get the start of one another in putting upon its passage the bill which embodies the very principles and methods for which these "feather-heads" have been contending, while a good share of the party newspapers fall into line and applaud. Able editors who have never deigned to give it any other name than "snivel service" reform, are now disputing in behalf of their respective parties for the honors of its parentage. Mr. Dawes declared a year or two ago that the difficulty

about civil service reform was that the people were opposed to it, or indifferent about it; that it was the clamor of the constituents for the offices that restrained senators and representatives from pushing the reform; that good congressmen were almost ready to cry for it. What is the matter now? Has there been a revolution in popular sentiment since that time? Is it the people, or their representatives, to whom this new revelation has been made? We are inclined to think that it is the representatives. The conversion of Saul of Tarsus was no more sudden, and not much more violent, than the change which has passed upon many of our political leaders.

No doubt it is a great wonder; but science insists on explaining many modern marvels, and it is possible that this one can be made to yield up its mystery. There be those who say that the fall elections were the occult cause of this notable miracle. The loss of their majority in Congress, and the fear that the next administration might be Democratic, is the great light above the brightness of the sun that has shone into the minds of the Republican leaders,—so some scoffers say. The reason why they were willing to relinquish their hold on the spoils was the fact that the spoils were slipping out of their hands. They would make haste and pass a reform bill, by which their own friends should be kept in office and the wicked Democrats kept out. This was the revelation that wrought in them so sudden and strong a conviction of the value of civil service reform. As for the Democrats, they have been resolving in their party platforms, for several quadrenniums, in favor of this measure, but we must do them the justice to say that a good share of them voted against Mr. Pendleton's bill. At the prospect of convalescence, the devil becomes less inclined to a monastic life. With loaves and fishes enough for five-score thousand in full view, how could these good Democrats think of abandoning the rights of succession? Was this the cordial to cure the sickness of a long deferred hope? They had not so learned politics.

As between the two parties in this game, therefore, honors are easy. Mr. Pendleton, a Democratic senator from Ohio, is the reputed author of the bill, though its natural parent is understood to be Mr. Dorman B. Eaton. To Mr. Pendleton, however, belongs the credit of introducing it, and of wisely managing the debate in the Senate; while Mr. Cox, a Democratic representative from New York, was quick enough to identify himself with its fortunes on its passage through the House. The Republicans, however, furnished most of the affirmative votes, and the Democrats most of those in the negative.

Intelligent and devoted friends the bill had, no doubt, on both sides of the House. Of those who voted for it, a few really believed in it. To the patient, resolute, and intelligent advocacy of these gentlemen the country owes much. Of those who voted against it, there may have been a small number who opposed it "on principle." But the majority, both of those who voted for it and of those who voted against it, as their open declarations in Congress and their past conduct abundantly prove, were governed by sheer selfishness. Most of the Republicans who voted for it did so because it seemed to be the best way of keeping their friends in office; most of the

Democrats who voted against it did so because it seemed to stand in the way of getting their friends into office. To all these the country can only say: "Gentlemen, thank you for nothing. We have the bill, and we shall make the most of it; but it is not to your good-will that we owe it. Neither of your parties can make any capital out of it; you have only furnished us another illustration of the lack of conscience in political contests."

One feature of the case is not at all marvelous. That men who were elected under the spoils system should act like mere politicians is the most natural thing in the world. The real wonder is that such a bill should ever have come out of such a Congress. If any one should soberly insist on calling this a miracle, it would be hard to dispute him. The thing that this Congress has done was nothing that this Congress meant to do. The Republicans meant to carry the fall elections, and, if they had carried them, this bill would not have been passed. The Democrats, too, meant to carry the fall elections, but they did not mean that their success should force the bill upon them. Some power working behind them all has thrust them into this conjuncture, where the conscience of some and the selfishness of many have joined to bring forth a result that the majority would have avoided if they could. It is no new thing under the sun. The power, not ourselves, that makes for righteousness often extorts great and beneficent measures from greedy and unscrupulous men. This is the perennial miracle of history.

But, by whatsoever means or agencies, we have the bill; and, while it will not make a millennium in our politics at once, we may trust that it will introduce reforms of a most salutary nature, and that its inherent reasonableness and righteousness will become more and more apparent the more fully it is tested. Its method has never failed to justify itself where it has been fairly tried. Its advocates have been called doctrinaires, but they have always rested their arguments on an ample and unvarying experience.

The bill will lift a great load at once from the shoulders of the President, and of his Cabinet, and of the members of Congress. The new law will tend ultimately to retire those members of Congress whose main interest in public life has been the distribution of the spoils. It is to be hoped that their places may be filled by others who will be able to deal intelligently with national affairs. That would be an important gain.

It only remains to perfect this system of appointment, to extend it to all parts of the civil service, and to introduce it into State and municipal governments. There is need of civil service reform, not only at Washington and in the great national offices, but at Albany and Harrisburg and Columbus, and in New York and Brooklyn and Philadelphia and Chicago. All appointive offices should be obtainable by merit and not by favor, and should be open to all who choose to compete for them, without distinction of party. To take the appointive offices of such cities as New York and Brooklyn out of politics would wonderfully simplify the problem of municipal government. The need of such a universal reform is making itself more evident daily, and when we shall have secured it, the marvel will be that we lived so long without it.

## The New Political Era.

It is universally recognized that the American people have entered on a new era in their political history, but it is not so generally perceived that they have entered on a new era in the history of the world; yet such is really the case. For twenty-five hundred years the chief interest of political history has lain in the struggle on the part of the people to gain freedom and political power, and it is only in our own time that this struggle seems approaching its end. Beginning in the cities of ancient Greece, the conflict raged with varying success through the whole of the prosperous period of ancient history, until the liberties of all nations were crushed by the world-wide empire of Rome. Then, as the modern nations emerged from the darkness of the middle ages, the same great struggle had to be entered on anew; and after the lapse of centuries, and after labors and martyrdoms untold, the contest has at last resulted in the substantial triumph of the popular cause. In half-barbarous Russia, indeed, the people's cause has made little headway, and even in Germany and Austria its success is far from complete; but throughout the greater portion of the European world the full establishment of free government is only a question of time.

Meanwhile the people of the United States, having inherited the liberties and the popular institutions of the leading free state of Europe, and having left behind them the feudal and monarchical establishments of the Old World, have carried the principles of popular government to their extreme and logical conclusion, and have reached a condition of things in which nothing remains to be done to extend the liberties or increase the political power of the masses of the people. The extinction of negro slavery and the conferring of the right of suffrage on the emancipated slaves were the final steps, so far as we are concerned, in the long-continued struggle for freedom and human rights; and there is nothing in our politics or our social condition now to indicate that the ground thus won will ever again be lost.

Now that the people have got their freedom, what will they do with it? and how will they succeed in the task they have undertaken of governing the world?

It is one thing to gain political power and keep it when it is gained, and quite another thing to wield it in accordance with wisdom and justice. It has, at all times, been asserted by the opponents of popular government that, even if the people were successful in getting control of affairs, they were wholly incompetent to conduct them even in their own best interest, and instances are not wanting to give some support to this assertion. There have been free governments that were by no means a success, and in ancient times, particularly, many a state, after winning both freedom and glory, lost its freedom by corruption or eternal dissension, and its glory departed with it. We Americans, however, are in little danger of losing our freedom, and what we have now to do is to use our freedom and our power so as to promote the highest good; this it is that makes the opening era so different from all the eras that have gone before, and renders it at once so interesting and so important. The difficulties that lie before us are neither few nor small, and we are beginning to realize that the task that is laid upon us is not going

to be so easy as thoughtless American patriots have sometimes supposed.

There are two points to which we would call attention as likely to be of special importance in the politics of this country and of every civilized state where popular government exists. There is one abuse against which we shall have to guard, and one requirement we shall have to meet if our attempt at self-government is to be a full success.

In the first place, we have to protect ourselves against extortion at the hands of our rulers and of men in private life in collusion with them. The leading abuse in our public affairs to-day is the use of political power and influence to make money out of the people and to plunder the public under the forms of law; and unless we can put an end to this, in great part at least, we shall have gained much less than we ought by our political freedom. The evil appears in various shapes, and under many disguises, and its worst forms are not always those most obvious to the careless eye. We need not dwell here on the various schemes by which the people are defrauded. The reckless system of subsidies and land grants, the making of fraudulent contracts, the river and harbor jobbery, are familiar to us all, yet these are far surpassed in deleterious influence by the unjust privileges often granted to corporate bodies, and by that great system of monopoly known as protection to native industry—a system which, whatever may have been its earlier uses, is now constantly invoked in the interests of the few against those of the many. In all these ways, and many more, the American people are plundered for the benefit of a favored few.

Yet it will not be an easy task to make the people understand how some of these things affect them. Nevertheless, the people must be enlightened and the abuses be brought to an end, lest the gain of our liberty be followed by the loss of our property, and we come at last under a new tyranny scarcely less fatal than the old.

Again, the times demand, and the country will have to supply, a more scientific system of legislation than that which now prevails, if our government is to keep pace with the progress of civilization. It may be said, perhaps, that the world has not had much perfect legislation in ages past, and that the democracies that are now taking charge of affairs can hardly govern worse than the monarchies and aristocracies that have gone before them. But then, the democracies ought to govern better than the class governments of the past, and besides, the need of scientific legislation is now greater than ever before, owing to the vast development of industry, the greater freedom of action now enjoyed by all classes of men, and the great and increasing complexity of social relations. The democracies must supply this need or fail in their self-appointed task of governing the world. Such are some of the problems that lie before us in the new political era, and it is evident that their solution will demand both higher governing capacity and greater purity of character in the actual holders of power, as well as a higher level of intelligence among the people at large, than have been found heretofore in any nation of the world. The recent enactment looking to a reform in the Civil Service (referred to in the preceding article), is a step in the right direction—but it is only a step.

## Sunday Rest.

THERE are two solid grounds on which Sunday laws rest: one, the right of the prevailing religion of the country (be it Jewish, Christian, or Pagan) to have its day of worship free from disturbance; and the other, the right of every man to an equal share in a rest-day from toil.

As regards the first, if this country were a Jewish country the Jewish worship on Saturday should be peculiarly protected from molestation. If it were a Mohammedan country, the Friday should be in like manner protected. This is simple common sense applied to things as they are, and no action of doctrinaire theory. Where there is a conflict of sacred days, as among Jew, Christian, and Mohammedan, all cannot be protected, and hence the majority must determine the question. This certainly distinguishes the sacred day, but does no harm to those who do not count it sacred. It only obliges them to be courteous. The inequality in the matter is only such as in some things must obtain among the freest people.

As regards the second ground: physiologists, physicians, statisticians, and sensible observers in general, have agreed that man's body and mind need a complete rest at an interval of about seven days. But man will not take that rest from labor unless he is obliged by law to do so. His greed for gain will make him ruin health in his own case, or (worse still) make him force his employes to ruin theirs by continuous work. The law, therefore, must make and enforce a rest-day. But what day shall it take? Again: common sense says, "Take the day which the mass of the community, from religious reasons, already regard as a rest-day." So the civil law, providing for men's physical well-being, appoints and enforces a rest-day from labor, which is the same day on which the great Christian community worship, and in which the same law, for other reasons, protects them in worship.

There is the whole of the Sunday question in a nutshell. There is no compelling men to be religious, no supporting a state church, no puritanical blue-law. The Jew, or Mohammedan, or Pagan simply must not make a boisterous demonstration, such as a noisy parade, on Sunday. Why? Because the vast majority of the people see fit to worship on that day. The Jew, or Mohammedan, or Pagan must not keep open shop that day. Why? Because the people have decreed a rest-day from labor once a week to help humanity, and that is the day.

The only objection that has any color in it is that the Jew then must keep two rest-days in the week, and hence is at a disadvantage with his neighbor. Well, as we have already said, in the most equal administrations, there must, in the nature of things, be some inequality. Laws, for example, require a notice of "danger" to be put up in dangerous places in the city; but, alas! blind men cannot read the notices. The laws are unequal to the blind man. They have to be. So here the Jew's conscience tells him to keep from working Saturday. The law tells him to keep from working Sunday. It is a pity; but it cannot be helped. The other alternative would be "no rest-day," and that would be destructive to the whole community. We must all bear some burdens for the public good.

Our American liberties are largely connected with the weekly day of rest. This day has given the people time to think, and read, and enjoy family life, and without it we should have become an ignorant, brutish, machine-people, like the low peasantry of Continental Europe. Take away this rest-day, and you undermine our high moral and educational condition as a people. You turn us into a nation of mere "workies." The cry of religious oppression, as against Sunday observance, is a device of the enemy. It is but the voice of soulless corporations, and of the proprietors of drinking-saloons and other demoralizing places, who wish to make their great gains on Sunday, and care nothing for the welfare and happiness of the people. They are the oppressors, and the advocates of a day of rest are the staunch supporters of a true freedom.

America has three bulwarks of liberty—a free ballot, a free school, and a free Sunday, and neither domestic treachery nor foreign impudence should be permitted to break them down.

## Stealing a Minister.

THE great deep of Protestant ecclesiasticism is often vexed by no small tempest of talk about the relations of vacant churches to settled pastors. It frequently happens that a clergyman, supposed to be happily and permanently located, is called away from his work to a new field of labor, amid loud complaints of the injury done to the church left pastorless. Even when a decorous silence is maintained before the public, there is often not a little suppressed resentment; and the opinion that no church has a right to disturb a settled pastor by calling him into its service finds angry expression. The act is denounced as a species of larceny, and laws to punish the crime of stealing a minister are feelingly invoked. Several flagrant cases of this sort have recently occurred, arousing unwonted ire in the breasts of staid parishioners, and no week passes that does not witness griefs of this nature in some part of the land. The ethics of this relation deserve, therefore, a little careful study. It is a subject in which good Methodists are supposed to have no interest.

Without doubt it is a hardship that a church should be deprived, for any reason, of the services of a teacher to whom it has become attached, and who seems to be contented and successful in his work. The wish to be protected against such a loss is one which the members of a church naturally entertain. But the question has two sides, and the irate church whose pulpit has just been emptied is not apt to see more than one of them. The welfare of the minister, as well as of the church, must be considered. Now, it is unquestionable that the welfare of the minister sometimes requires him to change his field of labor. A life-long pastorate may be the ideal, but it is impossible, in many cases, to realize it. A change is sometimes demanded, not chiefly for an increase of salary, but for relief from burdens of labor and care that have grown intolerable, or to preserve health and power of work. In these exacting times, when the pulpit must grapple with so many great questions, and when the condition of power is wide and constant study, this necessity frequently occurs. There are ministers who,

by dint of tough constitutions, and by the allowance of liberal and frequent vacations, continue to do severe and thorough work in the same field for a long time; but there are many whose health is less firm and whose congregations are less liberal.

Another fact to be considered is that ministers who, for any reason, are out of service, are not generally wanted. The vacant pulpits do not affect the unemployed parsons. The church that has just been raging about the "stealing" of its own minister will pass by scores of clergymen who are seeking places, and fix its choice on some pastor whose hands are full of work. Among the unemployed clergymen capable and excellent men may often be found; but no fact is more familiar to those who are acquainted with ecclesiastical affairs than that the unemployed clergyman, whatever may be his merits, is at a great disadvantage in seeking a parish. This is a state of things for which the ministers are not responsible; the churches themselves have established this rule, by which it has generally come to be understood that a minister who wants a place is a minister whom no place wants.

It is not, therefore, prudent for the minister to resign his charge, even when he feels that a change is imperative. Even if he were known to be seeking a place, the committees of supply would steel their hearts against him. His only hope is in quietly staying where he is, and doing his work as well as he can. Peradventure some vacant church may spy him out and come to his relief.

Churches are not always so considerate and generous as they ought to be in their treatment of their ministers. The ministers are willing to work, and the churches are willing to let them. The harder they work the heavier are the burdens laid on them. The contracts, on the part of the churches, are not scrupulously kept; and if the minister is good-natured and does not complain, it is assumed that there is no reason for complaint. Probably, if he should complain, nothing would be done; he thinks it wiser, therefore, to go on with his work and wait until relief shall come to him from some other quarter.

If, therefore, it should be established as a rule that vacant churches must make no overtures to settled ministers, it would go hard with scores of overworked men who ought to find respite in a change of labor. The churches have already made it difficult for a minister without charge to gain employment; if they could create a sentiment which would prevent a settled minister from receiving a call, the ministers would be left in an embarrassing position. The attempt to create such a sentiment is an attempt to form a kind of ecclesiastical trades-union, under which ministers shall be wholly at the mercy of the churches. It is not likely to succeed, but those who are calling for it ought to be aware of the nature of the demand which they are making.

The truth is that the labor market ought to be as free in the clerical profession as in any other business, and attempts to restrict the freedom of movement in this calling are not in the interests of justice and fair play. Granted that there ought to be something other than a business relation between pastor and people; it still remains true that that higher relation must in no wise contravene those principles of justice and freedom on which all contracts are based.

A vacant church has a right to ask any settled pastor whether he desires to change his field of labor. If he does not wish to change he will say so, and no harm will be done. Such a negative reply is often made, even when a great increase of salary is offered. The minister who can be toled away by a bigger salary—with whom the salary is the paramount consideration—is not worth getting or keeping. The church is the gainer that loses him. Doubtless there are such clergymen, but they are not all such: there is no other class of men with whom pecuniary considerations have so little influence. The church whose minister is worth keeping ought to be willing, therefore, that any committee of supply should have free access to him. If the church has confidence enough in its pastor's judgment and integrity to desire his services as a religious teacher, it must believe that he will not encourage any such approaches, unless it is necessary, for some reason, that he should seek another field. And when, for any good reason, such a change becomes necessary, the church should put no obstacle in his way.

The estimate of the ministerial character which is implied in all this clamor of the injured churches, is the reverse of flattering. It seems to be assumed that he is not a free and responsible being; that he is the victim or the dupe of those who have beguiled him away. "It is mean to steal a sheep; but meaner to steal a shepherd," is a common saying of those who thus complain. The saying uncovers the fallacy of the whole case. A sheep can be stolen, because it is a chattel; but a shepherd cannot. The shepherd makes his own contracts, in this country, and so does the minister. His place of labor is not likely to be changed without his own free choice.

Another similitude commonly quoted in such cases is equally lacking in pertinence. The church that calls a settled minister is said to be guilty of an act precisely like that of the woman who hires your cook out of your kitchen. But if there is any wrong in this case, it is in the fact that your cook is ignorant and easily imposed upon; that the woman who has coaxed her away offers her no better place, and thus injures you without benefiting your servant. If the servant is able to judge for herself, and knows that she is improving her condition by the change, what right have you to stand in the way of her going, or to complain of another for giving her what you withheld? This kind of outcry is never heard concerning any class of employes save those who are assumed to be unable to choose wisely for themselves. The cashier of a bank, the superintendent of a railroad, is called from one place to another, and nobody ever thinks of questioning his right to go, or the right of another employer to offer him employment. There seems to be no good reason why the minister should not be credited with as much judgment, and allowed as much liberty, as is granted to a bank cashier or a railroad superintendent.

There seems, then, to be no other method for a church to pursue, if it wishes to keep its minister, than that which every employer must pursue who wishes to retain a valued servant. The church must keep its part of the contract, must see that its minister is not overworked, must coöperate with him in all possible ways, must show him that his labors are

appreciated and that his welfare is fairly considered. If, after the church has done all this, the minister goes away, common sense will bring the church to one of two conclusions: it will either bow to the providential decree that has removed a faithful teacher, or it will thank God that it is rid of a trifler.

#### Our Printers.

OUR readers will have noticed that the imprint of Francis Hart & Co., as printers of THE CENTURY MAGAZINE and ST. NICHOLAS, has recently given way to that of Theo. L. De Vinne & Co. This is a change in name, but not entirely a change in fact. Since the death of Mr. Hart, Mr. De Vinne has for years carried on the business of "the firm" under the old style. Mr. De Vinne has an individual reputation as the author of a work entitled "The Invention of Printing," and of various essays in this and other periodicals on the history and art of printing. It is known to many, moreover, and should be known to all, that it is mainly to Mr. De Vinne that credit is

due for the high reputation of American printing of wood-cuts. The refinement to which wood-engraving has been carried in America would have come to naught if the printing of the wood-cuts—the rapid steam-printing required by the periodicals—had not kept pace with the advance in wood-engraving. This corresponding excellence of printing has not been reached without a long and difficult struggle. An interesting chapter might indeed be made of the experiments and devices resorted to during many years, of endeavors and accomplishments requiring, no one can imagine how much intelligence, patience, forbearance,—how much knowledge, and how many of the Christian virtues as well. Mr. De Vinne has given some points of this history himself in his articles on "The Growth of Wood-Cut Printing," in this magazine for April and May, 1880; but he has not told how much should be placed to the credit of his own individual account. In the name of the readers of THE CENTURY (who have good reason to be interested in the fortunes of the new firm), we wish long life and prosperity to "our printers."

---

## LITERATURE.

### Lounsbury's "James Fenimore Cooper."\*

PROFESSOR LOUNSBURY'S life of Cooper is, so far, the most important contribution to this series. The lives of Irving and Thoreau had already been written, so that the work of their biographers consisted largely in selection and condensation; while Noah Webster and George Ripley occupy hardly any position in the history of American *literature*, as distinguished from scholarship and journalism. Cooper remains the most popular of all native writers of fiction; and, with the possible exception of "Uncle Tom's Cabin," and portions of the writings of Irving and Longfellow, his books are still more universally read than those of any American author whatever. A generation has passed since his death, and yet this is the first biography of him, if we except the slight and inaccurate sketches of his life in cyclopedias and periodicals, and Bryant's funeral oration delivered at New York, in 1852.

"When Cooper lay on his death-bed," says Professor Lounsbury in his prefatory note, "he enjoined his family to permit no authorized account of his life to be prepared. \* \* \* It is a necessary result of this dying injunction that the direct and authoritative sources of information contained in family papers are closed to the biographer." The men of Cooper's own age, who might have furnished personal reminiscences, are long since dead. Hardly anything in the shape of diaries or private correspondence is obtainable.

Such material as exists is widely scattered, and is mainly in the form of references in contemporary newspapers, or in the prefaces and introductions to the novelist's own books. The biographer was, therefore, driven to take the line of Cooper's public career, and especially of his career as an author. This is, however, the line which has been adopted in all the lives of the present series, and is perhaps the one which Professor Lounsbury might have deliberately chosen as appropriate to the design of the series, even had matter been at hand sufficient to furnish forth a more personal and private memoir.

In one respect the biographer has been fortunate in his subject. Cooper was a man who fairly bristled with characteristics. His views were strong, and his expression of them decided. His prejudices were many and frequently diverting. His walk was upon the toes of his contemporaries, and of the British and American public, and loud were the screams which attended his progress. Perhaps no other writer except Byron has been at once so eagerly read and so shrilly cursed by his own countrymen. One of the most striking episodes in his life was the war which he waged for years against the leading Whig newspapers of the State of New York, assailing them one after another with libel suits, which in nearly every instance he carried to a triumphant conclusion, conducting his own cases and securing damages varying from fifty to four hundred dollars. The chapters devoted to these conflicts are written with force and humor, and form a dramatic narrative. The reader may doubt whether Cooper's

\* James Fenimore Cooper. By Thomas R. Lounsbury. [American Men of Letters Series.] Boston: Houghton, Mifflin & Co.

game was worth the candle, but he cannot fail to bestow his admiration upon the pluck, tenacity, and ability with which the noble old Roman maintained the fight, or to sympathize with his joy of battle and his final victory.

The biographer has handled his material skillfully. It is a pleasure to meet with such a thorough and well-constructed piece of work. There is no padding in the volume, and no riding of hobbies,—defects from which some of the lives in the series have been by no means free. The perspective is correct, the method judicious, and the narrative clear and sensible. In literary quality, and as a specimen of the art of biography, Mr. Scudder's "Webster" is the only book in the series which compares with this; and Mr. Scudder, though a charming writer, labored under the disadvantage of a dry subject into which he was forced to instill juice from sources outside. Professor Lounsbury is the master of a vigorous, perhaps, at times, rather over-emphatic style. His pages abound with epigrammatic sayings, some of which we venture to quote. Speaking of Cooper's career at Yale, he says: "We need not feel any distrust of his declaration that little learning of any kind found its way into his head. Least of all will he be inclined to doubt it whom extended experience in the class-room has taught to view with profoundest respect the infinite capability of the human mind to resist the introduction of knowledge." Alluding to Bryant's remark that, "to a casual inspection," the revised edition of "Precaution" seemed almost another work, he says: "The inspection which could come to such a conclusion must have been of that exceedingly casual kind which contents itself with contemplating the outside of a book." He describes "The North American Review" in its earlier years as "ponderously revolving through space." Of William Sotheby, an English friend of Cooper, he writes that "he had to endure the double degradation of being called a small poet by the small poets themselves." Of Mrs. Wilson, a character in Cooper's novel "Precaution": "This lady is the widow of a general officer, who, the reader comes heartily to feel, has, most fortunately for himself, fallen in the Peninsular War." Of "General" George P. Morris, one of the editors of the "New York Mirror": "Besides being an editor he had the position of general of militia; accordingly, he was often styled by his admirers 'he of the sword and pen,' which was just and appropriate to this extent, that he did as much execution with the one as with the other."

These instances of the author's cleverness are taken nearly at random, and as being easily quotable. They do not of course represent the keen remark and serious discussion which could only be exhibited by the citation of continuous passages. An important part of the biographer's task has been the vindication of his subject against the personal detraction of the man and the hostile criticism of the author, which Cooper's everlasting quarrels provoked. In the former of these he has succeeded fully, and it is fair to say that the prejudiced reader—if there be any such at this late day—will be ready, when he reaches the last chapter, to join heartily in the eloquent tribute to Cooper's real nobility of character with which the volume closes. Whether he has succeeded equally well in rescuing

the novelist from the hands of the critics, we must leave the individual reader to judge for himself. The circulation of the best of Cooper's novels is still large, and their popularity seemingly unabated. Professor Lounsbury is rather severe on the critics, and particularly on the New England critics. In his analysis and comparative estimate of Cooper's too numerous writings, he seems to us nearly always right, and he is not sparing of their many and obvious faults when separately considered. His general estimate of Cooper as a writer is nowhere summed up, and is perhaps rather implied than expressed. We can only say, therefore, that so far as we gather an impression of it from the book as a whole, it seems to us too high.

The truth in this matter of criticism *vs.* popularity appears to be about as follows: Criticism is the articulate judgment of the few; popularity the inarticulate judgment of the many. Both are liable to be mistaken, the former through narrowness, pedantry, and the crotchets which beset the minds of the merely literary; the latter because it is heedless and unintellectual, and in search of nothing better than amusement. To afford any criterion of the final rank which an author will obtain, criticism must be consenting and popularity must be lasting. Kotzebue is held up by Carlyle as an awful example of the fallacy of popularity as an ultimate test. "Helen's Babies" has reached its *n<sup>th</sup>* edition; but is "Helen's Babies" really a work of superior genius? Popularity is, in fact, the judgment of the many in one particular only: it pronounces a book *readable*,—nothing more. Doubtless the very critics who undervalue Cooper have read his novels with breathless interest; but when they come to ask themselves whether those same novels possess high and enduring qualities, they have to say no. We think it likely that "The Leatherstocking Tales," "The Spy," and the best of the sea stories, such as "The Pilot" and "The Red Rover," will be read for many years to come, and will go through numerous editions; but the estimate of them will hardly be higher than it is to-day, and probably not so high.

If statistics were obtainable, it would doubtless be found that the great majority of Cooper's readers are boys, or men whose intellectual development is not much in advance of boys. We have all enjoyed Cooper in our early youth. When we reach a more reflective stage his novels fail to satisfy. The reason of this is obvious. They address themselves mainly to our curiosity. It is the story that we are after. They belong to the same class with the books of Marryat, Simms, and Mayne Reid, though they are, of course, much the best of the class. In the invention of incidents and situations, in the narrative of wild adventure at once natural and exciting, Cooper has no superior. He was the inventor of the sea-novel and the Indian novel. He originated the Indian himself, the Indian of literature. He created Leatherstocking, who, with much about him that is improbable, is, in truth, as Professor Lounsbury pronounces him, a great original character.

It is in the dynamical part of his work that Cooper is at his best,—in the movement and the action. He is frankly external. In the strict sense he is hardly a novelist at all, but an epic or story-teller. The weakness of his dramatic portions has been too much

enlarged upon to make further discussion necessary: the stilted dialogues, the tedious love-passages, the insipid heroines,—“young and ingenuous persons of the female sex,”—and the *mangue* humorists, like Master Cap in “The Pathfinder,” whose humor consists, for the most part, in harping on the word “circumstance.” The question then arises whether the novel of adventure is *ipso facto* inferior to the novel of character. “There can be no greater absurdity,” says Professor Lounsbury, “than to speak of this kind of story, as is sometimes done, as being inferior in itself to those devoted exclusively to the delineation of manners or character, or even of the subtler motives which act upon the heart and life. As well might one say that the ‘Iliad’ is a poem of inferior type to the ‘Excursion.’” This may pass as a comparison between the types, but as between, say “The Spy” and Hawthorne’s “Scarlet Letter,” *e. g.*, we think it misleading. The “Iliad” is superior to the “Excursion” on its own ground. It is better poetry, better art, more perfect in plan, more beautiful in language and verse, more imaginative in style, and fully equal in its power to touch the deeper springs of emotion. If the “Iliad” were merely a story of adventure like “The Spy,” the comparison might stand. But it is because Cooper fails to do what Homer and Hawthorne both can do, that “The Spy” is inferior to “The Scarlet Letter.” He is not master of laughter and of tears; neither the secrets of passion nor the secrets of thought are his. Nor has his workmanship that fineness of grain which, in the absence of other qualities, will sometimes secure immortality.

Professor Lounsbury quotes Balzac’s saying that, “if Cooper had succeeded in the painting of character to the same extent that he did in the painting of the phenomena of nature, he would have uttered the last word of our art.” This strikes us as smelling of the asphalt of the boulevards. The great Parisian cockney’s conception of American nature was doubtless taken from Chateaubriand,—whom Lowell has termed “the inventor of the primitive forest.” That Cooper loved the wilderness and the sea is true, and much of their freshness breathes from his pages. The air of the frontier, the raw edge of civilization, he caught and reproduced wonderfully. His “Leatherstocking Tales” have, in this particular, a genuine historical value. But of his descriptions of nature it is fair to say, using Balzac’s language, that they are “paintings.” They are precisely that, and distemper paintings, moreover. As you come close to them the perspective vanishes, and you see a flat surface rudely daubed. Of that more intimate and imaginatively suggestive handling of nature, that poetic and spiritual insight which looks into it and through it, there is nothing in Cooper. Therefore, even as mere description, we would rather have a few pages of “Walden” or “The Maine Woods” than all the pictures of lake, and sea, and forest that Cooper ever drew.

#### Adams’s “John Randolph.”\*

THE interest which attaches to the life of Randolph is mainly now an interest springing from curiosity.

The record which he has left behind him is so full of eccentricity, inconsistency, and irrationality that it is a constant surprise to the reader of any life of him that he should ever have been a political leader of sane men. Toward the end of his life, indeed, even his contemporaries and admirers failed to be able to follow the rambling rhodomontade with which he puzzled the reporters of the Congressional debates; but there was a long period during which he exercised a powerful influence at Washington,—an influence recognized then as legitimate. Possibly the explanation is to be found not so much in Randolph as in the circumstances of the country in his time. The United States was, intellectually and morally, in the early part of this century, much more provincial than it is easy for us now to picture to ourselves. It had, in fact, just ceased being a province and just begun to be a country. It was thinly settled and poor, and yet conscious of its coming greatness. It was intensely conscious of everything about itself, and, among other things, of its new race of politicians. The stage was a small one, but a great drama was to be enacted upon it; no one knew how soon or precisely what it was to be, and consequently every one who approached the foot-lights was received with an attention which now often seems out of proportion to the part in which he was cast. It is no wonder, therefore, that Randolph, with his daring and presumption, should have persuaded the audience, for a time, as he did himself for his whole life, that he was one of the heroes of the plot, and that any one who wished to understand its development would do well to listen attentively to him.

It is hardly possible to go over the events of his political life and come to the conclusion that he had any definite principles of action. Quarrelsome and combative, he was far more at the mercy of his passions than Jackson ever was; and it is for this reason, not from any want of painstaking on his biographer’s part, that the latter fails to put before us anything that can really be called a political career. His political life began and ended with the assertion of himself, and it is impossible to-day to see how the course of American history would have been appreciably affected one way or the other had John Randolph never been born. Mr. Adams does, indeed, make him out an earlier Calhoun in his views on the position of the South; but in this respect he was so far ahead of his time that his opinions produced no impression, and now possess merely an antiquarian interest.

If Randolph’s life could be said to be connected with any great human cause or interest, or if he had been anything more than the representative of a decaying provincial aristocracy, it would possess a much deeper pathetic interest than can actually be said to attach to it. It was a sad enough life, from any point of view. He was probably born with the seeds of madness in his brain, and he was certainly doomed to failure and final ruin by nature and circumstances. Allied by birth and traditions to the aristocratic order which was passing away, he was, by the vices of his mind and character, well calculated to do what he could to assist it in its downward career. Even his better impulses and thoughts may be said to have been devoted to making this work more complete. It is impossible to feel much sympathy

\* John Randolph. By Henry Adams (American Statesmen Series). Boston: Houghton, Mifflin & Co. 1882.

for him. He was a lonely man during a great part of his life, and the causes which produced his loneliness then contribute to leave his memory in a species of isolated and historical limbo now. We feel, as we read his life, that in some way he is not like enough to the common human type for us to altogether understand him; and understanding is necessary to sympathy. His changes of opinion are so rapid and inexplicable that we cannot feel sure that he had what we should call belief on any subject. He was an *ami des noirs*; and yet he was the earlier Calhoun. He was a Democrat by profession, and yet he was in deadly hostility to half the Democrats of his party, for reasons which are quite beyond our comprehension. His friendship had the same unsubstantial character as his opinions. He quarreled with everybody, and quarreled irrationally. He had all the materials of a most interesting character, without having a character. He impressed his contemporaries first as a great man, then as an unreliable man, finally as a madman. His life is rather a puzzle for alienists than good material for a biographer.

Mr. Adams, at any rate, though he has evidently tried, has not succeeded in inspiring himself with much of that enthusiasm for his subject which is so essential to successful biography. He records faithfully the freaks and whims, the pyrotechnic displays of rhetoric, the useless quarrels that make up Randolph's life; but they follow each other with so little connection of cause and effect that we feel that the biographer himself is lost in a sort of maze. Of Randolph's rhetoric, both before and after it degenerated into gibberish, he gives some specimens. It is evident that Randolph's hold upon his audience must have come from this source, and a very cursory examination of his speeches is enough to show that he was, at his best, powerful and effective in debate. Had it been possible for him to act steadily with any political party, or even faction, he might have come down to us with a great reputation. But rhetorical powers alone will not make a man a great political orator. He must have some well-defined object to attain, and must know how to explain it, and must be able to fill others with feelings like his own about it. But what was Randolph's object? He seems to have enjoyed discussions as an end in themselves, and, provided he had an opportunity to quarrel and free his mind, cared little which side he was on. And so, in the end, even his admirers came to care as little as he.

St. John's "Natural History and Sport in Moray."\*

AMONG the crowds of red-handed sportsmen that Britain turns out,—men with an instinct for game like that of a terrier for rats,—there occasionally appears one touched to finer issues. Such was Charles St. John, who died in 1856, and whose "Natural History and Sport in Moray," compiled and arranged from his journals and from his "Wild Sports in the Highlands," by C. Innes, is now before us. A more happy combination of the two pursuits was, perhaps, never put together; and such a picture of wild life in the High-

lands of Scotland we remember nowhere else to have seen. It is a worthy companion to White's "Natural History of Selborne," and through its record of personal adventure in pursuit of the creatures whose haunts and habits it describes, appeals to a much larger class of readers than that famous book.

St. John was indeed the ideal sportsman. He had a poet's sensibilities and love for nature, while he was a very close and accurate observer. The mountain, the moor, the lake, the tarn, the shore, had attractions for him that made the presence of game there a secondary consideration. When the season for grouse-shooting arrived, instead of bending all his energies to the slaughter of a great number of birds, he preferred "a good stretch across a range of valley and mountain," usually fixing upon "some burn, some cool and grassy spring, or some hill-summit which commands a fine view," as the limit of his day's excursion, knocking down enough birds to fill his game-bag, happy in the companionship of his dogs, and noting the fine instinct and skill with which they did their work: happy, above all, in the companionship of wild nature about him. The much-abused race of sporting dogs never found a more kind and considerate master. He always had a biscuit for his retriever when he came out of the cold water, and would strip the plaid off his own back to cover him on all occasions when the water was icy, favoring him as much as possible. "It is amusing enough to see the retriever wrapped in plaid, with only his head out of it, watching eagerly for the appearance of a flock of widgeon or ducks, which he often sees before I do myself." The dog knows what game his master is hunting. "The sea-gull or heron may pass, and he takes no notice of them; but the moment that a wild duck's quack or the whistle of his wings is heard, the dog's ears erect themselves, and he watches my face with a look of the most inquiring eagerness."

There was no wild creature he did not treat tenderly and with an amusing fondness, when chance placed it at his mercy. One day his dog brought him a little water-rail alive. He took it home to show his children.

"When I took him out of my pocket, in which most unaccustomed situation he had been for two hours, the strange little creature looked about him with the greatest nonchalance possible, showing fight at everything that came near him; and when, after having gratified the curiosity of the children, we turned him loose in a ditch of running water, he went away jerking up his tail, and not seeming to hurry himself, or to be in the least disconcerted."

The young curlews, which he comes upon in his walk, he looks upon with the same fond, curious eyes.

"When you catch one, and hold him up for examination, the poor little bird looks at you with such an expression of half-confident inquiry in his large, prominent dark eye, that the most determined collector of birds could scarcely refrain from putting him carefully on the ground again, when he runs to the top of some grassy hillock and looks round at his screaming parent."

St. John was a careful observer, and it would appear that in these journals he had not gone to the bottom of his knowledge of the wild creatures. For instance, he says on page 290: "From what I have myself seen of the cunning of the fox, I can believe almost any story of his powers of deceiving and inveigling animals into

\*Natural History and Sport in Moray. By Charles St. John, Author of "Wild Sports of the Highlands," "Tour in Sutherland," etc. Edinburgh: David Douglas.

his clutches." And yet just this proof he withholds from us. Again, on page 27, in the same manner, he provokes, without satisfying, our curiosity: "For my own part, indeed, having devoted many happy years to wandering in the woods and fields, at all hours and at all seasons, I have seen so many strange and unaccountable things connected with animal life, that now nothing appears to me to be too wonderful to be believed." Those "strange and unaccountable things" are what the reader hungers and thirsts for, but gets little of. One of the most incredible things he relates is the fact that the sea-gulls, amid the swarming thousands of others of exactly the same age, color, etc., always distinguish their own young, and with the same unerring instinct the young distinguish their own parents. He says the only time the crab grows, or increases in size, is immediately after it has cast its shell, and before the new one is yet formed. It then concentrates the year's growth into a few hours. While in its shellless condition, it would fall an easy prey to its natural enemies; but the male crab, which, it seems, does not cast its shell at the same time, defends the female, covering her with his body and claws, and will die rather than leave his helpless charge. It would be interesting to know if she does the same service for him when he drops his armor.

With such minute and curious information does the book abound. The chapters are arranged under the different months of the year, recording observations and excursions appropriate to each. The work is richly illustrated, both by elaborate etchings and by the hasty off-hand, but very vivid and effective draughts, of St. John himself, who could hit off the attitude of bird, stag, or dog, of a hawk seizing a duck in the air, or pouncing upon a rabbit, to the life.

#### Bigelow's "Molinos the Quietist."\*

To the student of theology, and not less to the student of psychology, the rise of the doctrine of Quietism in the Roman Catholic Church presents a most interesting phenomenon. Quietism is, philosophically, the assertion of the efficiency and the supremacy of a subjective law of conduct; the power against which Quietism was a vain protest always resisted this assumption, and taught the duty of dependence upon objective guidance in forming opinion and in determining duties. Each of these theories is one-sided; the truth is that ordinary men need some degree of restraint and direction imposed upon them from without, and need also to have some measure of liberty within which their minds may freely work out the questions of life. Some room for inspiration there must be, and there must also be some bounds for conduct. The adjustment of these two conflicting demands is the problem of the religious reformer.

The Roman Catholic Church always magnifies the law which it imposes on the thought and conscience of its communicants, and leaves scant space for the exercise of any inspirable faculties in the worshiper. Against this rigid rule there have been many protests within the bosom of the Church, and none more notable than that of the Spanish monk Michel de

Molinos, who found his way to Rome about the middle of the seventeenth century, and who, after a remarkable career of popularity, was brought before the Inquisition, condemned as a heretic, and, after ten years' confinement, perished in prison in 1696, being then seventy years of age. The well-attested historical facts respecting Molinos are not abundant; we know but little of him except what we learn from those who had many reasons for misrepresenting him and apparently no disposition to do him justice. Mr. Bigelow brings together enough evidence to make it plain that the propositions on which he was condemned were but perversions of his teachings, and that the story of his recantation is untrue. It was not asserted that the monstrous doctrines anathematized by Pope Innocent were contained in any of the published books of Molinos; they were said to be drawn from his private letters, and from the admissions of his intimates. The "Spiritual Guide," in which his doctrine of the "interior way" is most fully set forth, contains no doctrines more extravagant than those taught by saints of the Church—Bonaventura, Theresa, and François de Sales; but the day for the indulgence of such notions was past. The reformation in Germany and in England had shown what fruit might grow from this subjective piety, and it was time for the Church to exterminate a doctrine that threatened its supremacy.

That the historical genesis of Quietism was the reaction of the human soul against a too rigid external rule is not to be doubted; nevertheless there is a subtle fascination for many minds in its mystical theories of man's relation to God. The Nirvana of Buddhism is not simply an Oriental extravagance; it has its roots in human nature. "By the way of nothing," says Molinos, "thou must come to lose thyself in God (which is the last degree of perfection), and happy wilt thou be if thou canst so lose thyself. In the same shop of nothing simplicity is made, interior and infused recollection is possessed, quiet is obtained, and the heart is cleansed from all imperfection." In all ages of the world there have been lofty and devout souls to whom such attainments seemed possible. There is a great danger, however, that a piety wholly divorced from objective rules will become a wild and dangerous fanaticism. People who become a law to themselves and who renounce every other law, are apt to become extremely lawless. It may well be doubted whether the intelligence and the morality of the seventeenth century were sufficiently advanced to render safe the method proposed by Molinos. Mr. Bigelow, with the author of "John Inglesant," esteems the Spanish monk as a pure and spiritual-minded man, hopelessly at odds with his time, and entangled in the net of tradition that he was trying to break. The materials of the writer are scanty, but he has given us a spirited and suggestive sketch.

#### Boyesen's "Idyls of Norway."\*

THE idyls from which this volume takes its name are, poetically considered, so slight, and in fact so juvenile, a portion of its contents, that it is to be regretted that they were not entirely omitted along with

\* Molinos the Quietist. By John Bigelow. New York: Charles Scribner's Sons.

\* Idyls of Norway and Other Poems. By Hjalmar Hjorth Boyesen. New York: Charles Scribner's Sons.

the Garfield elegy, "An Every-day Tragedy," and a few other pieces which the grace of a complete edition alone admits. The only part of the Norse contributions which seems to stand the test of book-publication are the songs and catches pure and simple, such as "Tell me, Ilka," the stave from that frosty prose idyl, "Gunnar," with perhaps the addition of the ballad of "Jarl Sigurd's Christmas Eve," which has the spirit and clanking of marching troops. Mr. Boyesen's lyrical work is so spontaneous, and so far superior to the idyllic, that the reader is surprised to find it so small. Indeed, the omission of the idyls, which are lacking in narrative skill, in flavor, and in the perfection and grace of poetic mold, and of "Calpurnia," in which the hexameter makes too great a demand upon the author's metrical accomplishments, would greatly have raised the average standard without dropping a note from the register of the singer's voice.

Of the rest, nothing is weak, and much is of a rare intellectual and masculine strength. The high-water mark is indicated by "The Lost Hellas" and half a dozen of the sonnets. The former is especially remarkable for a liquid ease of flow, a directness and strength of narrative, and a largeness which finds no less adequate source of inspiration than the Homeric poems. Especially is it to be noted that it is free from the weakness of poets who set out to imitate the Greek,—the floridness into which even Keats sometimes fell in treating such themes. In general Mr. Boyesen's imagery is not delicate in shading, but rather leans heavily on the abundant strength of a general conception; his palette is meager and his vocabulary small, and the reader misses the note of surprise which marks a revealing originality. But the purity of poetic tone and the precision of epithet in "The Lost Hellas" make it in American poetry a singularly truthful embodiment of the Greek spirit:

"Oh, for a breath of myrtle and of bay,  
And glints of sunny skies through dark leaves flashing,  
And dimpling seas beneath a golden day,  
Against the strand with soft susurrus flashing!  
And fair nude youths, with shouts and laughter dashing  
Along the shining beach in martial play!  
And rearing 'gainst the sky their snowy portals,  
The temples of the glorious Immortals!

"Thus oft thou risest, Hellas, from my soul—  
A vision of the happy vernal ages,  
When men first strove to read life's mystic scroll,  
But with the torch of joy lit up its pages;  
Then with untroubled front the cheerful sages  
Serenely wandered toward their shadowy goal,  
And praised the gods in dance of stately measure,  
And stooped to pluck the harmless bud of pleasure.

"Out of the darkness of the primal night,  
Like as a dewy Delos from the ocean,  
Thy glory rose,—a birthplace for the bright  
Sun-god of thought. And freedom, high devotion,  
And song, sprung from the fount of pure emotion,  
Bloomed in the footsteps of the God of light.

And Night shrank back before the joyous pæan,  
And flushed with morning rolled the blue Ægean.

"And sweet it is to hear the noble tongue,  
Pure Attic Greek with soft precision spoken!  
And ah! to hear its liquid music flung,  
In rocking chords and melodies unbroken,  
From Homer's stormy harp—the deathless token  
That Hellas' Titan soul is strong and young—  
Young as the spring that's past whose name assuages  
The gloom and sorrow of the sunless ages."

The sonnets are not less admirable for intellectual and poetic qualities. Those to the Juno Ludovisi and on Evolution have a speculative repose in keeping with the lines just quoted, while the passionate sonnets have the buoyant surge of a spring freshet. Read, for instance, the last of the Evolution series:

"Sublime is life, though in beginnings base  
At first enkindled. In this clod of mold  
Beats with faint spirit-pulse the heart of gold  
That warms the lily's cheek; its silent grace  
Dwells unborn 'neath this sod. Fain would I trace  
The potent mystery which, like Midas' hand,  
Thrills the mean clay into refulgence grand:  
For, gazing down the misty aisles of space  
And time, upon my sight vast visions throng  
Of the imperial destiny of man.  
The life that throbbed in plant and beast ere long  
Will break still wider orbits in its van,—  
A race of peace-robed conquerors and kings,  
Achieving evermore diviner things."

Contrast the mood of this with that of the following from the sonnets "To Lillie":

"Within the rose I found a trembling tear,  
Close curtained in a gloom of crimson night  
By tender petals from the outer light.  
I plucked the flower and held it to my ear,  
And thought within its fervid breast to hear  
A smothered heart-beat throbbing soft and low.  
I heard its busy life-blood gently flow,  
Now far away and now so strangely near.  
Ah, thought I, if these silent lips of flame  
Could be unsealed and fling upon the air  
Their woe, their passion, and in speech proclaim  
Their warm intoxication of despair;—  
Then would I give the rose into thy hand;  
Thou couldst its voice, beloved, not withstand."

In the lines we have quoted, the sincerity of the author's inspiration is unmistakable; the poetic product of his genuine impulses being so rich, he may well accept the consolation and warning of Sidney's

"Look in thy heart and write."

WE wish to acknowledge our indebtedness to the publisher of etchings, Mr. Robert Dunthorne, Vigo street, corner Saville Row, London W., England, for his courteous permission to engrave the etching "Riva degli Schiavoni," by Frank Duveneck, which appeared in connection with the article on "American Etchers" in *THE CENTURY* for February, and of which he owns the copyright.

## HOME AND SOCIETY.

### American Children at Home and in Society.

THE "Children's century,"\* ours is called, by that keen observer, Mr. Henry James, Jr., while entering his protest against the all-pervading American little girl who flies through society on roller-skates, bidding everybody get out of her way. What shall we answer to this, and to many satires of like nature? That the stimulus of this energetic age is felt in our nurseries, none will deny. Behind us we have a throng of eager, nervous, wide-awake little beings pressing forward to the light. That a large measure of our difficulty in training children is due to the defective nursery system in America, is also evident. At a very early age, the child learns to distinguish between the cheerful variety and animation of the down-stairs atmosphere, as opposed to the monotonous limit of nursery entertainment. The average nurse is too often narrow-minded, ignorant, and indifferent to aught in the fulfillment of her duty save what is absolutely nominated in the bond. Her charges, washed, combed, and fed, are abandoned to seek amusement or occupation as they may; and how many lonely hours a solitary child may spend under such circumstances, is not a pleasant subject for contemplation. The governess, like the housekeeper, is, for purely domestic reasons, not apt to be a success when introduced into our ordinary city homes. We therefore regard with astonishment the pictures drawn by our critics of the English girl and boy, conducted along the path of childhood with demure propriety by hired hands. With us, the system is a simple impossibility.

And so, in America, our children are always with us. Strain and chafe as we may against the responsibility, there are the eager eyes and tongues to satisfy, the quick intelligence to feed, the heart and soul like wax awaiting an impression at our hands. In the system of development, the father has, of necessity, an unequal share; his duties are almost confined to a general supervision, a review from week to week of progress made. Upon the mother the burden of this important task devolves; her children are apt not only to reflect, but to exaggerate her methods. What seems a labor of love in the nursery days, becomes increasingly difficult as the children pass into the school-room. Her boys and girls think and act with astonishing independence, long before they are emancipated from the earliest leading-strings. She finds them picking up the books that fall from her hands, learning to discuss the questions that employ her thoughts, sharpening wits with their elders, inhaling with eager zest the exhilarating atmosphere of modern eclecticism. Influenced by the too common apprehension lest her children may not have all the advantages of their contemporaries, encouraged by the plaudits of injudicious bystanders, she is led into doubling their occupations. She forgets that the tendency of this flood of light, turned upon the child from all sides, is to make him superficial,—however it may be urged that an interest in a great variety of questions has the result of cultivating his faculties and of developing his nature.

\* See "The Point of View" in this magazine for December, 1882.

Education and entertainment seem to go hand-in-hand for our fortunate children, and it is hard to separate them. Luckily for the mother, who ponders over the most sensible method of securing reasonable diversion for her young, the boy, aided by restless Dame Nature, takes this matter into his own hands. The gymnasium, the swimming-school, the military drill, the foot-ball match, are powerful and wholesome auxiliaries of the mental education of our city-bred boys, and, for a comparatively small outlay of money, are accessible to all. In its moral aspect, the boys' play-ground is no small adjunct to education. Truth and courage are exacted with unflinching zeal by the code which rules their turbulent ranks.

With the daughter there is far more danger of going astray at the outset. American girls are more flattered and indulged, than respected, from their cradle up. They are set by common consent upon so many little pedestals; and the brothers are taught not to argue, but to give up a point at issue, "because she is a girl." Instead of making reason and clear understanding of a subject the basis of her dawning ideas, she is handicapped at the outset by the discovery that, unless a thing is amusing or easily attainable by mental grasp, she may let it go, "because she is a girl." She is brought early into the drawing-room. She is heralded as a prodigy to her mother's friends, most often in her hearing. Her witty sayings are duly repeated to every visitor, and listened to by no one with admiration greater than her own. On occasions when her mother forgets to bring her into conversation, the young lady does not hesitate to supply the invitation.

Often the parents of this small unfortunate one are tempted to indulge her desire to visit places of public amusement. Who has not seen pale, heavy-eyed, overdressed children sitting through the performance at opera or theater? If there were no moral question involved in this, the physical side should be studied. A wise man has said that all the people that ever were supposed to die of poison in the middle ages—and that means nearly everybody whose death was worth speculating about—are not so many as those who die poisoned by bad air in the course of any given year.

Again, at dancing-school, the girl's vanity is fostered. The matter of dress is made of first importance, and the ignoble suggestion "What will people think of you if you don't do this or that?" is made her ruling motive. All the petty jealousies, spites, and feuds hereafter to be developed in the great arena of society are set in action here. The wonder is that, from it all, so many sweet and simple-hearted girls as we are fortunate enough to possess, escape unspoiled.

*Constance Cary Harrison.*

### Women as Piano-Tuners.

EVERY piano has one inherent weakness, which has to be repaired once or twice every year. Under the stress of time, use, and the weather, it loses tune. To restore the instrument to its proper condition is the art of the tuner. In the smaller cities and in the

country, it often happens that the tuner is also obliged to be a repairer of the actions of pianos.

The business of piano-tuning is another of the employments to which women are beginning to aspire. There is in Boston a school where, for some time, tuning has been regularly taught to both men and women. The objection that women have not the requisite fineness of ear is met by the fact that of the applicants for admission to this school only a small proportion fail to enter by reason of any aural defect. The sense of tune or harmony appears to exist in greater or less degree in the majority of civilized people, and, if there is but a germ, it can be educated into something practically useful, be the pupil man or woman. The objection that women have not the strength required in the art is nonsense, for, with the proper tools, a child can break a piano-string with ease. The time required by a young woman to perfect herself in the art of tuning the piano, the pipe and reed organ, is about one year. The course of study begins with a systematic training of the ear in pure unison. For this purpose the pupil is provided with a piano from which the action has been removed. The three strings for each note are plucked with the fingers, and alternately tightened or loosened with the proper lever or key, till the pupil's ear clearly apprehends the difference between unison and discord. No attention is paid to pitch, as the sole aim is to train the ear to a true unison of tones. If the pupil fails in this stage of the work, it is hopeless to go on. She is simply "harmony-blind," precisely as one may be color-blind.

The next step is the training of the ear in pure harmony. For this work a piano is used having a worm and gear in place of the usual friction-pin for tightening the strings, so that the work of tuning is

very light, the slightest movement of the hand controlling the instrument perfectly. The pupil now learns the relations of tones in a true major third. Then thirds are added together till the (tempered) octave is reached. Here the pupil discovers that the pure harmony does not bring the unison she had expected (from her previous studies) in the octave. In this manner the pupil discovers for herself the science of temperament. She soon hears the growl of the "wolf," and learns to catch the wailing "beats" of the interfering sounds. Then the science of tuning must be explained, and this leads to the study of acoustics in their relation to keyed instruments. Lectures and demonstrations in harmony and music are a part of the course. Having made some progress in tuning pianos, the pupil then takes up the tuning of the reed and pipe organ, with daily practice upon both instruments. During the entire course there is also drill in the gymnasium, with proper appliances for strengthening the hands and wrist. A good tuner also should know how to repair a piano. To equip the young woman for this work, there is regular practice upon models of all kinds of piano and organ actions. These are taken to pieces and put together with the usual tools till the mechanism is clearly understood. The action of a piano is easily taken out for repairs, and, as all the parts are interchangeable (for the same style and manufacture), it is not difficult to purchase the various parts and put them in their place when necessary. It is true the action is heavy, but there is always some one near who will lend a hand in lifting it out of the instrument. Piano-tuning is both a healthful and a profitable occupation, and a study of tuning trains the ear to good music.

*Charles Barnard.*

## THE WORLD'S WORK.

### Substitute for Hydrogen in the Lime-Light.

THE rapidly increasing use of the lantern in schools, public lectures, and exhibitions has led to a number of experiments to reduce the cost of the lime-light. In point of power and general usefulness nothing better, except electricity, has been found than the combination of hydrogen and oxygen in a single flame thrown against a piece of lime. In a few large cities the gases are easily obtained in commercial quantities, stored in iron tanks, ready for use, and at comparatively low prices. The tanks are troublesome to carry, and in smaller towns the gases must be made on the spot as required, and this involves expensive and troublesome apparatus. Every effort has been made to find a substitute for one of the gases. Street-gas, alcohol, and other things have been tried in place of the hydrogen, but with a decided loss of light. Common ether has been tried several times, but has been considered too dangerous. More recently an apparatus for saturating the oxygen with the vapor of ether has been devised, that appears to remove all

danger of explosion and to give an excellent light. The apparatus consists of two strong brass cylinders, placed side by side upon a wooden support. These are open at one end, and have brass nipples at the opposite ends for receiving the gas-tubes. In each tube is placed a cylinder or roll of loose fabric, like flannel, having a small hole in the middle. These rolls fill the cylinders completely, fitting tight, and leaving only the small passage for the gas through the center of the material. Common photographic ether may then be poured into the cylinders till the wick-like filling is completely saturated, and then the excess of liquid is poured off and put back in its bottle. Two rubber caps, joined together by a short tube, are then fitted over the ends of the cylinders, and to one of the nipples is fitted the gas-tube from the oxygen-holder or tank, and to the other a tube leading to the burner. The oxygen for the burner is supplied by a third pipe. To use the light the oxygen is first turned through the cylinders, entering the rear of one and passing, by means of the short tube,

to the next, and so on to the light. On its passage enough vapor is absorbed from the wicking to give a good flame at the jet, and when the oxygen jet is added to it, a light is obtained that, as far as observation goes, is quite as good as the ordinary lime-light. The striking back of the flame, and consequent explosion of the ether gas, when the gas is suddenly shut off, is said to occur but rarely, and with proper care it need never happen. However, to prevent all serious results of such an explosion, the rubber caps and tube joining the two cylinders are put on very lightly, and if there is an explosion the caps will be blown off before any dangerous pressure is reached. The invention has the merit of saving all the trouble of making or carrying hydrogen, as the whole apparatus can be carried in the hand, while ether can be obtained anywhere. One filling of the cylinders will last about ninety minutes, and a quart of ether will give a light for five hours.

#### Fire-Proof Construction.

THE objection commonly raised against fire-proof materials and systems for dwellings is their cost. Wooden floor-beams and lath-and-plaster partitions are so much cheaper than any of the excellent fire-proof materials that have been described here within the last few years, that it is difficult to find any ordinary city dwelling that is in any sense fire-safe. To meet this objection a new system has been introduced, that aims to make ordinary floor-beams and walls fairly proof against fire. Nothing is absolutely fire-proof, and the aim of all methods now is to prevent the spread of fire by confining it to one place, and checking the actual speed of combustion. To accomplish this, it appears only necessary to exclude the air as nearly as may be from all wooden surfaces. In the new system the beams are laid in the ordinary manner, pains being taken to have the under side of the floor perfectly level. On each side of every beam next the lower edge is nailed a narrow strip or ledge. The fire-proof protection consists of slabs of plaster-of-Paris and broken coke or cinders, resembling the plaster slabs used for partitions, but somewhat lighter, thinner, and finer in texture. For protecting the sides of the beams the slabs, having a step or rabbet on one edge, are placed against the beams, supported by the ledge which fits the step on the slab, and are nailed securely to the beam. The slabs are of the same width as the beam, and when in place, and when the cracks between the slabs have been stopped with liquid plaster, the beam is cased in an air-tight covering on two sides. The top is protected by the floor, which rests on both beam and slabs: for it has been found that wood protected from the air at the sides burns very slowly downward from the top. Beneath, the beams are protected by nailing larger and thicker slabs directly to the under side of the beams. Each slab covers three beams in width, breaking joints in the middle of the beams, and when all the beams are covered and the cracks made air-tight, the unbroken sheet of plaster slabs may then be used as the ceiling of the room below, a finishing coat being all that is needed. As a further protection, and to deaden the

floors, another slab is inserted between the beams a short distance above the lower slab, and resting on a ledge formed on the side slabs. This arrangement divides the floor into two parts or hollow air-spaces, and effectually prevents sounds from passing from one floor to another. It also serves as an additional protection. In case of a severe fire under the floor, the nails supporting the lower slabs might become heated, char the wood, and drop out, letting the slabs fall. The second slabs would prevent the flames from passing between the beams, and only the lower edges of the beams could burn. As the slabs can be easily cut and repaired, there is no difficulty in making repairs of the gas or water-pipes that may be laid in the floors, and in case of leaking gas, or even of fire from electric light wires laid in the floors, no harm can follow, as the pipes and wires are inclosed in the air-tight space between the slabs. At an experimental test of this system of fire protection a number of common floor-beams, protected by the slabs and a floor above, were exposed to a fierce fire below for over an hour without injury to the floor. A portion of the lower slabs then fell off, exposing the lower edges of two beams to the fire. They were burned somewhat, but the progress of the fire was so slow that the strength of the beam was not appreciably impaired, though the fire below was kept up twenty-five minutes longer. A fire was then built on top, and allowed to burn till the floor was destroyed. On putting out the fire the beams were found to be only slightly charred on the upper edge, and to be practically as strong as ever. As far as our inspection of the beams that were exposed to the fire on both edges could decide, they seemed to be sufficiently strong after the fire to carry any ordinary load that could be put upon them. Given sufficient time and heat, of course such a system would fail. This is not the aim. If the fire is checked, and the strength of the floor maintained till help arrives and the fire can be put out, the construction meets all practical requirements. This appears to be accomplished. To make a slow-burning partition, the usual scantling is replaced by rough boards, tongued and grooved and fitted together, and making a solid but thin wall of wood. At intervals on each side of the partition is nailed lathing, placed vertically and in the middle of a board. Upon these are nailed horizontally the ordinary lathing. This gives a lath-and-plaster wall, but with no large, hollow places in which fire may spread unseen. The rough coat is put on as soft as possible, and the mortar is forced between the laths, filling all the narrow space behind them. This gives a wall of solid plaster, with a solid wooden core, the laths and boarding being covered air-tight on both sides. An inspection of some partitions built in this way seemed to indicate that the system is as valuable as that just described. The wall was firm, solid, and stiff, and showed a decided gain in thickness over the ordinary style of partition. The plaster was carried close to the floor and ceiling to prevent the intrusion of fire and rats behind the mop-board and cornice, and the door-jambs were made solid to exclude the air from the ends of the wall. Both of these methods of construction are cheap, the cost of a fire-proof wall being only a trifle more than an ordinary lath-and-plaster partition.

## The Electric Light in Photography.

THE arc light has already been made the subject of experiment in photographic portraiture, and is now regularly used to illuminate a number of studios in Europe. By a new arrangement of the lights and the studio, the source of light is placed completely within the control of the operator, and effects are obtained that cannot be secured in any other way. The studio examined is at the end of a low, dark store on the ground floor, and there is no dependence whatever upon daylight. Upon the sides of the room near the ceiling are two tracks carrying a wooden car that reaches from side to side of the room. On this car are laid tracks for a smaller car, that travels on across the room in the opposite direction. The arrangement, it will be seen, is the same as that used in stone-yards and machine-shops, and known as an overhead crane. On this crane is suspended a powerful arc light, and, by pulling cords at the side of the room, the light can be moved to any part of the ceiling, or raised and lowered, as may be desired. In front of this crane is another having only one motion, across the room, the car on top carrying five arc lights suspended beneath it. This crane is also controlled by cords in easy reach of the operator. The subject sits in front of these six lights, and by moving the lamps perfect control of the illumination is secured. The light may be concentrated at one side, or spread out in front, or distributed in any manner that the artistic treatment requires. To secure still more complete control of the light, a platform is placed in the middle of the room before the lights. This platform is large enough to contain a seat for the subject and the camera. It is also pivoted at the center, so that it can be turned completely round in a horizontal plane. In taking a portrait, the subject sits upon the platform facing the camera, and the lights are raised, lowered, or moved about till just the effects of lighting that are desired are obtained. The operator stands on the floor behind the camera, with one hand resting on a handle fastened to the platform. The instant the exposure begins, the operator slowly turns the platform round, keeping it in motion while the exposure lasts. It is plain that the camera keeps the same relative position to the subject during the time of exposure and while the platform is moving, while the relation of the subject to the light is continually changing. This arrangement gives a continually shifting play of light on the subject, and secures a portrait having a fine gradation of tone and excellent modeling of the features. Only dry plates are used with the apparatus, and the exposure is a trifle longer than with daylight. To secure a like degree of definition the plate must be exposed five seconds, where a dry plate in sunlight would require three seconds. The portraits made by this arrangement of electric lights were marked by an excellent degree of finish, so that retouching did not appear to be necessary. The complete control of the light makes it possible to carry on work at all hours of the day or night, and in any weather. For copying, the electric light appears to be excellent, a single arc lamp with a reflector of white paper being all that is required.

## Rain-band Spectroscopes.

WHILE the spectroscope has proved to be one of the most remarkable inventions of modern times, and while it is an invaluable aid to nearly all scientific research, it has not proved of general use in the daily work of the world. It is too costly, and can only be employed in the study of light, and, withal, the spectroscopic department of this branch of physics is a limited one. In the use of the spectroscope in studying the light of the sun there has been noticed a peculiar darkening of the solar spectrum, that appeared to be due to causes in the air, and not in the sun. In the colored band of the solar spectrum there appear, between the orange and yellow, a group of dark lines, the largest of which is known as the sodium line, and is marked "D" on the spectrum maps. This line is due to the presence of sodium in the sun, and is one of the most familiar of the absorption bands. Near this line is the group of lines known as the rain-band, a series of absorption lines due to the presence of invisible watery vapor in the atmosphere. In large spectroscopes this rain-band, when at its best, appears as a group of lines and hazy bars, and, by studying the changes in the number and intensity of these lines, something can be learned directly of the amount of watery vapor in the air, and indirectly concerning the weather for the next following day. If all the lines are visible, there is much vapor in the air, and, though the sky may be cloudless, rain may be expected very soon. If all, or nearly all, disappear, the following day will be pleasant. From this study of the rain-band in the spectroscope, it appears possible to predict the weather one or two days in advance with tolerable certainty. A spectroscope showing all the details of the rain-band group of lines would cost too much for ordinary purposes, and smaller and cheaper instruments have been recently introduced. These are not intended to show a very fine spectrum, but only enough of the red and green where the rain-band may be found. These spectroscopes are inserted in a small brass tube, about three inches long, that can be easily carried in the vest pocket. In the one examined, provision is made for adjusting the focus of the eye-piece by drawing out a telescopic slide. To adjust the slit of the prism, a small screw is placed at the side of the tube. It was dull and cloudy at the time, but on pointing it to the sky and looking through it, the rain-band could be seen as a thin line between the orange and yellow. Heavy rain followed the next day. It was not convenient to make further study of the subject with the instrument, but it appeared to be well made and properly adjusted to its work. In using this form of spectroscope, it should be pointed to the sky at a few degrees above the horizon, a north or west aspect being the best. No rules appear to be laid down as to the study of the band seen in these small spectroscopes, for the group of lines is here condensed into a single band; yet there seems to be no difficulty, after a little practice, in learning to judge of the amount of vapor in the air, and from this to infer the probable behavior of the weather.

## BRIC-À-BRAC.

### Swedenborg on Civil Service Reform.

"THERE appeared to me some spirits \* \* \* who said that, when in the world, they had been in stations of great dignity, and that they deserved to be preferred to others, and to command them. They were examined by the angels, to ascertain what their character intrinsically was; and it was found that, in discharging the duties of the offices which they had filled in the world, they had not had regard to uses, but to themselves, and thus that they had preferred themselves to uses. But as they intensely desired, and were urgently solicitous, to be set over others, it was granted to them to take a place among some whose office it was to consult about matters of superior importance; when it was perceived that they were unable to attend at all to the business that was being considered, or to see things interiorly in themselves, and that, in their speeches, they did not regard the use of the matter in question, but some use connected with themselves; and further, that they wished to act from their arbitrary pleasure, according to personal favor. They were therefore dismissed from that function, and left to seek employment for themselves elsewhere. They went on, therefore, \* \* \* and were occasionally received upon trial; but they were everywhere told that they thought of nothing but themselves, and of no matter of business except with a view to themselves; consequently, that they were stupid, and were only like corporeal, sensual spirits. On which account, wherever they went, they were soon sent away again. After some time, I saw them reduced to the greatest destitution, so as to ask for alms."—[Swedenborg's "Treatise on Hell," paragraph 563.]

### "Nigger Mighty Happy."

#### PLANTATION SONG.

Hog start a-runnin' when de overseer callin';  
Whipperwill holler when de jew-draps fallin';  
Duck keep a-quackin' when de hard rain po'in';  
Crows flock togedder when de young corn growin';  
Pig gwine to squeal when de milk-maid churnin';  
Nigger mighty happy when de blackberries turnin'!

Squ'el go to jumpin' when de scaly-barks comin';  
Bee-martin sail when de honey-bee hummin';  
Lean horse nicker when de punkin-vine spreadin';  
Rabbit back his ear when de cabbage-stalk headin';  
Rooster start a-crowin' when de broad day breakin';  
Nigger mighty happy when de hoe-cake bakin'!

Big fish flutter when he done catch de cricket;  
Bullfrog libely when he singin' in de thicket;  
Mule git slicker when de plantin'-time over;  
Colt mighty ga'ly when you turn him in de clover;  
An' it come mighty handy to de nigger man nater  
When he soppin' in de gravy wid a big yam 'tater!

Black-snake waitin' while de old hen hatchin';  
Sparrer-hawk lookin' while de little chicken scratchin';  
Big owl jolly when de little bird singin';  
'Possum gwine to clam whar de ripe 'simmons  
    swingin';  
Nigger mighty happy—ef he aint wuf a dollar,—  
When he startin' out co'tin' wid a tall stan'in' collar!

*J. A. Macon.*

#### Free.

A DOVE lay caught in a fowler's snare;  
By cruel cords her wings were pressed,  
Ruffled was all her plumage fair,  
And her heart beat fast in her panting breast.

But the fowler loosened each cord and twist,  
He smoothed her ruffled plumes, and then  
Her snowy bosom he gently kissed  
And bade her seek the skies again.

And the fowler sighed; for, safe and fair  
In summer skies, he knew that she  
Would think of the cord and the cruel snare,  
But not of the hand that set her free.

*Walter Learned.*

#### Ballade of Rhyme.

WHEN blossoms born of balmy spring  
Breathe fragrance in the pleasant shade  
Of branches where the blue-birds sing,  
Their hearts with music overweighed;  
When brooks go babbling through the glade,  
And over rocks the grasses climb  
To greet the sunshine, half-afraid,—  
How easy 'tis to write a rhyme!

When invitations are a-wing  
For gay Terpsichore's parade;  
When dreamy waltzes stir the string  
And jewels flash on rich brocade,  
Where Paris dresses are displayed,  
And slippered feet keep careful time;—  
In winter, when the roses fade,  
How easy 'tis to write a rhyme!

When by your side, with graceful swing,  
Some fair-faced, gentle girl has strayed,  
Willing and glad to have you bring  
Your claims for love and get them paid  
In kisses, smiles, and words that aid  
The bells of bliss to better chime;—  
When Cupid's rules are first obeyed,  
How easy 'tis to write a rhyme!

#### ENVOY.

Reader, forgive me, man or maid,  
Against Calliope this crime;  
And let this brief ballade persuade  
How easy 'tis to write a rhyme!

*Frank Dempster Sherman.*

## THE CAPITOL AT WASHINGTON.

WHEN in the early days Congress turned its back upon the cities in which it had been hospitably entertained, to adopt Washington's cherished idea of founding a "Federal City" on the bank of the Potomac, no time was lost in inviting proposals for a plan of a "Congress House." The architectural competition thus solicited was a serious disappointment to the young French engineer who had laid out the future city—Major Pierre Charles L'Enfant. He had served gallantly under Baron Von Steuben in the Revolutionary War,—his artistic taste had been recognized by the Society of the Cincinnati when it had adopted his designs for its insignia,—and his architectural ability had been formally approved by Congress, after he had fitted up a building for its accommodation in the city of New York. Commissioned by President Washington as the engineer who was to plot the Federal city, Major L'Enfant had selected the most commanding spot as the site for the legislative halls, which he was the first to designate, on his map, as "the Capitol." From this site, and from that selected for the erection of an executive mansion, a mile and a quarter distant, radiated broad avenues, intersecting at a variety of angles, rectangular streets laid out like those of ancient Babylon and modern Philadelphia.

President Washington approved Major L'Enfant's plan as well adapted for a great city of the future, and was especially pleased at the adoption of his suggestion that the Capitol should be placed at such a distance from the executive offices as to prevent the too frequent visits of congressmen. East of the site of the proposed Capitol was a broad plateau, where it was expected that the finest residences would be erected. The

greater portion of this land, therefore, was immediately purchased by the agents of foreign capitalists, who then asked such high prices for building-lots that no one would purchase, and it was for this reason that the new city was begun in the swamps and on the hillocks west of Capitol Hill, and now lies mainly at the back door of the Capitol. Major L'Enfant meanwhile quarreled with the commissioners, and one of the rebukes which they administered to him was their advertisement for designs for the "Congress House," offering a premium of five hundred dollars, or a gold medal, for the best plans offered. Sixteen designs were submitted, and they have all been pronounced by modern architects very bad,—many of them below contempt, and some bordering on the ludicrous. When they were shown to President Washington, he was "more agreeably struck with Judge Turner's plan than with any other," as it embraced a dome, which, in his opinion, "would give a beauty and grandeur to the pile." The President finally gave his formal approval to a plan drawn by Dr. William Thornton, a native of one of the British West India Islands, who had been made the first clerk in charge of patents, and who possessed many accomplishments, among them an acquaintance with architectural drawing. Of his water-color sketch of the proposed edifice, showing a central rotunda, crowned by a dome, Washington wrote that, in it "grandeur, simplicity, and convenience were combined." But Thornton was not a practical architect, and the commissioners were obliged to engage Stephen Hallett, a professional French architect, to reduce Thornton's designs to practical form.

President Washington, aided by his brother Freemasons of Georgetown and Alexandria, laid the corner-stone of the Capitol under what is now the Law Library, on the 18th day of September, 1793. The exterior walls were constructed of yellow sandstone, from a quarry opened for the purpose on a small island at the mouth of Acquia Creek, where it empties into the Potomac River. The brick for the interior work was made and burned in kilns upon the spot, and much of the timber was cut on the neighboring hills. The north or Senate wing was first erected. The architect and the commissioners soon disagreed, and Hallett was superseded by James Hoban, an Irishman, who had come from Charleston to superintend the erection of the President's house. Nor was it long before Hoban was in turn superseded by George Hatfield, an Englishman, who was recommended by Benjamin West as possessing a knowledge of the theory of civil architecture superior to that of any other young man in England.

The Federal Government migrated from Philadelphia to Washington in October, 1800, and it became necessary to crowd both Houses of Congress into the north wing, which was the only finished portion of the building. The Senate Chamber was an imposing and beautiful apartment, modeled after the ancient Greek theaters, with a gallery behind the chair of the presiding officer, supported by caryatides representing the States. North

and South Carolina stood as sisters, with interlocked arms, while Massachusetts led, as a child, Maine, then a district dependent on her. When Thomas Jefferson, as Vice-President of the United States, called the Senate to order for the first time in its new chamber, on the 17th of November, 1800, there were only thirty-two senators representing the sixteen States. Now there are seventy-six senators, representing thirty-eight States. As the Senate generally sat with closed doors, all that is known of its deliberations is what has been preserved in the private journals kept by some of the senators. These show that the men who are now alluded to as dignified and patriotic statesmen, who shaped with unswerving purpose and firm hands the new system of national government, were very much like the senators of to-day,—some of them possessing fiery tempers, great personal ambition, sensitiveness to criticism, and obstinate adherence to hastily formed opinions. Speeches were then never written in advance of their delivery, to be read from the manuscript or from printed slips; but it was a common thing for senators to write full reports of what they had said, for publication in the newspapers. The first House of Representatives which met at Washington had Theodore Sedgwick of Massachusetts as its Speaker, and was, as a legislative body, far abler than the Senate.

The grounds around the Capitol were roughly graded, and stables were erected for

THE CAPITOL AT WASHINGTON (EAST FRONT).

THE CAPITOL, FROM PENNSYLVANIA AVENUE (WEST FRONT).

the accommodation of those congressmen who came from Georgetown to attend the daily sessions on horseback, or in the English mail-coach belonging to the Union Tavern there, with seats on the top and behind, which John Randolph christened "The Royal George." Near the Senate wing of the Capitol was a barber's shop, the interior of which was surrounded by glass cases filled with the wigs belonging to those senators and representatives who had not discarded them. They would visit the barber's shop in the morning, be shaved, and have a freshly dressed wig put on, leaving the wigs that they had worn to be combed, oiled, and brushed for the next day.

The House of Representatives, at first located in a room designed for the Secretary of the Senate, removed in 1801 into a low building of elliptical shape, which had been temporarily erected within the foundations of the external walls of the south wing, and which, from its general appearance, was familiarly known as "the oven." Seven years

later, the House took possession of the majestic hall designed for it, although the decorations had not been completed. This hall, which is modeled after the theaters of ancient Greece, is now the National Statuary Gallery, containing what a wag told a verdant sight-seer were "the United States statutes at large."

The central rotunda (*rotundo* it was always called in the "National Intelligencer") had not then been begun, and the extremities of the Capitol, in which the Houses of Congress were located, were connected by a covered wooden passage-way. President Jefferson appointed Benjamin Henry Latrobe, a well-educated Englishman, architect, under whose direction a great deal of ornamental work was sculptured in freestone by a number of Italians imported from Rome. Jefferson, when President, used personally to supervise the work of these sculptors, in which he took a great interest, especially in the columns supporting the dome of what is now the vestibule to the Law Library. The design for these was composed of a bundle of corn-stalks with

LATROBE'S CORN COLUMN.

the half-husked ears as the capitals—"the corn-cob capitals," as John Randolph called them. The suggestion of this "American order" came from Mr. Latrobe, who also designed some capitals in a measure resembling the Corinthian, but composed of the leaves and blossoms of cotton, and of tobacco, instead of the traditional acanthus.

As there were no stationery shops in the then infant city, the officers of each House of Congress used to make annual purchases in the northern cities of stocks of stationery, penknives, scissors, pocket-books, etc., which were disposed of to Congressmen at

cost,—a practice which has been continued to this day. It also appears, by the accounts of the "contingent expenses" of Congress early in the present century, that large quantities of "sirup" were purchased for consumption at the Capitol; and there is a tradition that this "sirup" was French brandy, Holland gin, and Jamaica rum. Each House had among its officials "pen-makers," who became acquainted with the exact kind of pen used by the senator or representative whose goose-quills were intrusted to their care, making or mending pens which had "fine points" or "broad nibs." There was also in an anteroom of each House a "sealer," who stood behind a table on which was a lighted candle, and sealed with red wax packages or letters brought him, using the private seal of the member sending them, or an official seal.

The impeachment of Judge Samuel Chase of Maryland, in 1805, marks an era in the chronicles of the Capitol. The Senate chamber was elaborately fitted up as a high court of impeachment, with the senators sitting as judges on a semicircular platform on either side of the Vice-President presiding,—Aaron Burr. Places were assigned for the members of the House, the Diplomatic Corps, and a few spectators. The trial demonstrated the violence of party feeling, and showed that while Judge Chase was an arrogant and impulsive man, with strong political prejudices, he had not rendered himself liable to dismissal from the bench. It was said of Aaron Burr at this trial, that he "presided with the dig-

nity and the impartiality of an angel, but with the vigor of a devil." A few years later he was himself on trial for treason, while Senator John Smith, of Ohio, one of those who had sat in judgment in the Chase impeachment trial, only missed by one vote expulsion for his connection with Burr and Blennerhassett.

The "War of 1812," as it was called, gave great importance to Congress, and both Houses often sat with closed doors, discussing plans submitted by the Executive for organizing success. In August, 1814, an invading force ascended Chesapeake Bay, landed without opposition, and marched on Washington. After the main body of the British troops had reached the Capitol, Admiral Cockburn (who commanded jointly with General Ross), ordered a regiment to march into the hall of the House of Representatives, the drums and fifes playing "The British Grenadiers." When the hall was filled with troops, Admiral Cockburn seated himself in the Speaker's chair and said: "Attention! Shall this harbor of Yankee Democracy be burned? All for it

will say Aye! Contrary opinion, No!" There was an affirmative shout, and the soldiers soon scattered themselves through the building, firing army rockets through the roof and building fires on the floors with the books, papers, and furniture. Much of the lumber which had been used in the interior construction was pitch-pine, which burned freely, while the columns and ornamental work of sandstone were calcined into dust.

The people in every section of the United States appeared to feel deeply the wanton and barbarous destruction of the Capitol and other public buildings at Washington, and urged their reconstruction in accordance with the original plans. Liberal appropriations for this purpose were voted with great unanimity, and Latrobe, who had gone West, was recalled to superintend the rebuilding of the Capitol. He resigned, however, in 1817, and Charles Bulfinch, of Massachusetts, an educated and accomplished architect, was placed in charge of the work.

The halls of the Senate and of the House of Representatives were immediately rebuilt,

Congress meanwhile occupying a structure erected by the citizens of Washington for their temporary use. The Senate chamber, now the Supreme Court room, was the first portion of the Capitol reconstructed, and it became the scene of the famous oratorical contests that took place between the intellectual giants who occupied its curule chairs, whose memories, like the remains of the mastodon, will long excite the wonder and admiration of posterity. Generally speaking, the proceedings in the Senate were colloquial, resembling the meetings of boards of directors of banks or similar institutions. A resolution would be offered, amended, discussed, and passed, within a quarter of an hour; and the Senate, with an occasional day for set speeches, managed to transact its business between twelve and three o'clock, invariably adjourning over from Thursday until the following Monday. This dispatch of the real business of the session was ended when the proceedings were reported verbatim by stenographers. When every word was recorded, to be printed and distributed over the land at public expense, senators became prolix.

This was the beginning of the period of great constitutional debates, in which the prominent figure was Daniel Webster. When it was known that he was to have the floor in the Senate chamber, it would be crowded by people who often cared but little for the subject under discussion, but wanted to see and to hear Webster. Nor were they ever disappointed, either in the personal appearance of the orator or the intellectual banquet which he provided. His stalwart figure was always arrayed in the old Whig colors of "blue and buff"; his massive head was firmly set on his square shoulders; his swarthy complexion was at times radiant with smiles, displaying his excellent teeth; his black, wily eyes gleamed in cavernous recesses beneath shaggy eyebrows, and his firm jaws showed his mastiff-like grip on whatever question he took hold of. He rarely spoke in the Senate without preparation, and he would never permit the publication of the reports made of his remarks by the stenographers until he had carefully revised them, often rejecting pages and substituting new sentences. His genial and liberal nature made him a great favorite among the senators, who were always ready to enjoy his hospitality, either at Washington or at Marshfield.

Henry Clay, who left a seat in the Senate for one in the House, but after many years' service at the other end of the Capitol returned to the Senate chamber, exercised a powerful control over the politics of the re-

public. Idolized by the Whig party, his wonderful powers of personal magnetism, and his rich, manly voice would enable him to hold an audience for hours. He made but little preparation, and used but few notes in speaking; but when he wrote out his remarks for the press, his manuscript was remarkably neat, without interlineations or blots. He seldom indulged in classical allusions, and his occasional attempts to make quotations of English poetry were generally failures. On one occasion, he used the well-known phrase from Hamlet, "Let the galled jade wince, our withers are unwrung," but misquoted the last syllable, calling it "un-strung." The gentlemen who sat on either side of him noticed the error, and simultaneously whispered "unwrung." This double prompting confused "Young Harry of the West," who straightened himself, and with stronger emphasis repeated "unhung." This raised a general laugh, at the close of which Clay, who had meanwhile ascertained his mistake, shook his head, and said with one of his inimitable smiles: "Ah! murder will out! Unwrung's the word." The fascination which he exercised over all with whom he had personal intercourse,—even his political adversaries,—was remarkable; but he was imperious and domineering, exacting unconditional and unqualified support as the price of his friendship.

John C. Calhoun was among the purest of American statesmen. His political enemies could find no opprobrious epithet for him but "Catiline," and could accuse him of no crime but an inordinate political ambition. As Webster said, when pronouncing his eulogy: "He had no recreations, and he never seemed to feel the necessity for amusements." He never was subjected to that ordeal of newspaper slander through which nearly all of our public men have had to pass, and his only fault was a thirst for political power, to gratify which he would rather "reign in hell than serve in heaven." When he last entered the Senate chamber, during the discussion of the compromise measures of 1850, he looked like a skeleton summoned from the tomb and inspired by indomitable zeal. Unable to speak audibly, he gave the argument which he had prepared to Senator Mason to read, but his eagle eyes followed the utterance of every word, occasionally glancing at Clay and Webster as if to note the effect produced on them. Not many days had elapsed before they were called upon to eulogize him in the Capitol.

Inferior in intellectual ability to Webster, Clay, or Calhoun, Thomas Hart Benton had no superior as a man of iron will and haughty

disposition, during the twenty-nine years and seven months that he served continuously in the United States Senate. Aggressive, bold, and defiant, he would occasionally strike out recklessly at everything and everybody about him, like the huge wild buffaloes of the Missouri prairies, treading his opponents beneath his feet in his angry rush. His greatest display of ungovernable rage in the Senate chamber was when, in an angry debate, he advanced with threatening gestures toward Senator Foote, of Mississippi, who, fearing that he was to be attacked, drew a small pocket-pistol. The sight of this weapon made Benton uncontrollable, and, endeavoring to shake off the

VICE-PRESIDENT DAVID DAVIS.

grasp of friends who seized him, he shouted: "The cowardly assassin, let him shoot me if he dares. I never carry arms, and he knows it. Let the assassin fire!" After quiet was somewhat restored, Clay suggested that both senators should enter into bonds to keep the peace, upon which Benton rose and exclaimed: "I will rot in jail, sir, before I will do it! No, sir! I will rot in jail first!" and he proceeded to pour forth a torrent of bitter invective on Foote before he could be quieted. Even when he was defeated in seeking a reelection for the sixth time to the Senate, and was forced to accept a seat in the House of Representatives, Benton failed to display a chastened ambition or a softened heart.

There were other senators who were dwarfed by the great reputations of the four great leaders, but who were far above the average senator of to-day as orators and useful legislators. Preston of South Carolina, and Pinckney of Maryland, silver-tongued speakers, would hurl their well-rounded sentences upon their audiences, like the discharge of shot from a Gatling gun. Silas Wright, making no pretensions to oratory, dealt with facts as he found them, and made speeches that the farmers and mechanics of the country regarded as judicial decisions. From the South and West came other noted senators, some of them spicing their sentences with the idiosyncrasies of the "stump" oratory of their respective localities,—men whose utterances exercised a potent influence in

shaping the destinies of the republic. The senators always spoke extemporaneously until Isaac Hill, of New Hampshire,

an editor by profession, set the example of reading long speeches.

The old hall of the House of Representatives, now the National Gallery of Statuary, was rebuilt, after having been destroyed by the British troops, in its original fine proportions, except that the semicircular colonnade was ornamented with columns of breccia, or "pudding-stone," with capitals of white Italian marble, modeled after those in the temple of Jupiter Stator, at Rome. They were once referred to in debate as "colossal Bologna sausages, with the upper ends dipped in table-salt." Noble as are the proportions of this grand old hall, it was found ill-adapted for legislative debate. The representatives could hear the Speaker, but they could not hear each other, and there were perplexing echoes which still remain, and are revealed to visitors by the attendants, who also show curious resemblances to distinguished faces in the cemented pebbles which form the columns.

It was in this old hall that Henry Clay,

JOHN RANDOLPH.

then Speaker of the House, welcomed Lafayette as the nation's guest, and John Quincy Adams pronounced the gallant Frenchman's eulogy. There, the great parliamentary battles were fought over the admission of Missouri, the tariff, the United States Bank, and nullification, with their kindred issues. There, that pernicious doctrine, "To the victors belong the spoils," was infused like a malig-

nant poison into our body politic. There, the old Whig party had its rise and fall, and there the Republican party was launched upon the stormiest of political seas.

The despot of the debates for many years was the eccentric John Randolph, who would ride on horseback from his lodgings in Georgetown to the Capitol, and enter the House, wearing a fur cap with a large visor, a heavy great-coat

over a suit of Virginia homespun, and white-topped boots with jingling silver spurs. Striding down the main aisle, followed by his brace of pointer-dogs, he would stop before his desk, upon which he would deliberately place his cap, his gloves, and his riding-whip, listening meanwhile to the debate. If he took any interest in it, he would begin to speak at the first opportunity, without any regard to what had previously been said. After he had uttered a few sentences (and had drunk a glass of porter, which an assistant door-keeper had orders to bring whenever he rose to speak), his tall, meager form would writhe with passion; his long, bony index-finger would be pointed at those on whom he poured his wrath; and the expression of his

beardless, high-cheeked, and sallow countenance would give additional force to the brilliant and beautiful sentences which he would rapidly utter, full of stinging witticisms and angry sarcasm. So distinct was his enunciation, that his shrill voice could be heard in every part of the hall; his words were select and strictly grammatical, and the arrangement of his remarks was always harmonious and effective.

Randolph, having had a dinner-table difficulty with Willis Alston, of North Carolina, never let pass an opportunity for alluding to him in the most bitter and contemptuous manner. Alston, enraged one day by some language used by Randolph in debate,

SKETCH OF THE SCENE IN THE HALL OF REPRESENTATIVES

said, as the representatives were leaving the hall and Randolph was passing him: "The puppy has still some respect shown him." Whether the allusion referred to Randolph or to one of his pointer-dogs, which was following him, was afterward a question, but Randolph immediately began beating Alston over the head with the handle of his heavy riding-whip, inflicting several wounds. The next day the Grand Jury, which was in session, indicted Randolph for a breach of the peace, but the court allowed him to offer the remark about the puppy as evidence in extenuation, and inflicted a fine of twenty dollars.

Among a little corps of Congressional

PART OF BRONZE STAIRCASE BY BAUDIN IN THE SENATE WING.

adherents which Randolph ruled with a scepter of iron, was Daniel Sheffey, one of his Virginian colleagues in the House, who had risen by his ability and his industry from a shoe-maker's bench to a seat in Congress. After having obediently followed Randolph's lead for some time, Sheffey ventured, during a debate, to speak and to act for himself in opposition to the "Lord of Roanoke." This Randolph resented, making a personal attack upon the deserting henchman, in which he upbraided him with his low origin, and quoted the Latin proverb: "*Ne sutor ultra crepidam*,"—"The cobbler should stick to his last." Sheffey did not receive his punishment with humility, but retorted pluckily, admitting his humble origin, but asserting that, had Mr. Randolph been in his place, he never would have risen from it, but would have remained a cobbler all his life. Replies and rejoinders were kept up for nearly two days, and the once friendly leader and follower worried each other like angry bull-dogs, until the House dragged them apart.

During the debate on the Missouri question, Mr. Philemon Beecher, a native of Connecticut who had emigrated to Ohio, and had there been elected a representative, became somewhat impatient as his dinner-hour approached, and at last, when Randolph made a somewhat lengthy pause, moved "the

The President.

DURING THE GARFIELD MEMORIAL SERVICES.

Mr. Blaine.

previous question." The Speaker said, "The gentleman from Virginia has the floor," and Randolph proceeded, to be again interrupted when he paused again to collect his thoughts, by a demand for "the previous question"; nor was it long before the demand was made for the third time. Randolph could stand it no longer, but said, in a voice as shrill as the cry of a peacock: "Mr. Speaker, in the Netherlands, a man of small capacity, with bits of wood and leather, will in a few moments construct that which, with the pressure of the finger and thumb, will cry 'Cuckoo! cuckoo!' With less ingenuity and with inferior materials, the people of Ohio have made a toy that will, without much pressure, cry, 'Previous question! previous question!'" and, as he spoke, Randolph pointed with his attenuated index-finger at Beecher, who did not attempt a reply.

Years afterward, John Quincy Adams rivaled Randolph as a fomenter of discord, whose delight it was to raise a storm of debate. When "the old man eloquent" would rise to address the House, during one of the cyclones of sectional passion which he had started, his bald head resembled a polished globe of white marble; but, as he proceeded (assailed on all sides, but standing like a sturdy oak in a tempest), it began to assume a scarlet look, and would at last be-

come a bright crimson. Cold-blooded, clear-headed, logical, and merciless,—caring nothing about consistency or inconsistency, except as a weapon to use against others,—no insinuation or sarcasm exasperated him, and attacks on him were like throwing fire-crackers at an iceberg.

It was in the old hall of the House that Caleb Cushing displayed that political sleight-of-hand which enabled him to make the flimsiest supposition appear like a "fixed fact"; and there Robert Toombs, towering above those around him like a Titan, poured forth with rapid utterance his caustic antagonism to the budding doctrines of emancipation. There Corwin convulsed his hearers with his wit and humor, and Edward Everett, fresh

THE MACE.

IN THE ROTUNDA.

from his pulpit, established his reputation as an accomplished orator.

When the old hall was first occupied by the House, many of the representatives came from the backwoods, and were but little acquainted with the courtesies and refinements of civilized life. There was a striking difference between them and the dignified, polite, soldier-statesmen of the Revolutionary epoch, and occasionally, when angry, they would draw in debate the weapons which they invariably carried, while the sergeant-at-arms, bearing aloft his "mace," would hasten

to place himself between the excited combatants. Yet this type of an American citizen, which has been portrayed in fiction as "Nimrod Wildfire" and "Roaring Ralph Stackpole," possessed many of those stern Roman virtues that teach the personal sacrifice of the legislator to the rights, the interests, and the welfare of his constituents.

It was not until 1818 that Congress made the necessary appropriations for building the central rotunda. When its eastern portico was completed, its tympanum was adorned by an allegorical group, sculptured in high relief from designs by John Quincy Adams, when Secretary of State. Beneath this group, on a temporary platform built over the broad stair-way, the oath of office has been administered to each successive President during the past half-century. The impressive scene reminds one who has passed Holy Week in Rome of the assembled populace congregated before St. Peter's on Easter Sunday to receive the blessing of the Pope. The resemblance is heightened by a salute from a light battery stationed near by, which is echoed by the great guns at the Navy Yard, at the Arsenal, and at Fort Washington.

In the central portion of the Capitol, west

OLD MIRROR IN THE VICE-PRESIDENT'S ROOM. [SEE P. 817.]

of the rotunda, is the Library of Congress. After the destruction of the original library by the British, Congress purchased the collection of books made by Mr. Jefferson, and there are now about six hundred thousand books and pamphlets, many of which are piled up, waiting for shelf-room in the proposed new Library building. For many years, the Library, —with its portico overlooking the city,—its books, and its engravings, was the favorite morning resort of the literary and fashionable society congregated at Washington during the sessions of Congress.

In 1827 Mr. Bulfinch, the architect of the Capitol, reported the edifice completed, and returned to Boston. The stately building, with its low dome and its ranges of columns, was the admiration of architects; and William H. Seward once spoke of it as "perfect in design, perfect in proportion, perfect in all its adaptations." Even Mrs. Trollope, mother of the recently deceased novelist (and the author of a sarcastic book of travels in the United States), was impressed with "the beauty and majesty of the Capitol, standing so finely high and alone,—an object of imposing beauty to the whole country adjacent."

As the nation increased in size and in importance, the Capitol became too circumscribed for the use of Congress, and it was thought by many devoted friends of the Union that the enlargement of the edifice might serve as an additional tie to bind the country together. Several plans were presented, but the first suggestion that north and south wings should be added was made by Jefferson Davis, then a senator from Mississippi, and a member of the committee on public buildings and grounds. Mr. Mills, a Washington architect, adopting this suggestion, submitted to Congress designs for the proposed wings and a new dome. The necessary appropriations for commencing the wings were made, and the corner-stone of one of them was laid with Masonic ceremonies on the 4th of July, 1851, Daniel Webster delivering an appropriate oration. The construction was begun by contract, under the direction of Thomas A. Walter, a Philadelphia architect; but great abuses were discovered, and the inspection of the work was given to Captain M. C. Meigs, of the United States Engineer Corps, an honest and efficient officer, who sacrificed the comfort of the congressmen by so changing the plans as to immure the two Houses in the centers of their respective wings, thus forming two hollow squares, in accordance with military tactics. The wings are built of white marble from the quarries at Lee, Massachusetts, with monolithic columns from Cockeysville, Maryland. The Senate cham-

ber has room on its floor for one hundred and twenty senators, and its galleries will accommodate a thousand spectators. The hall of the House is much larger than the Senate chamber, and will accommodate four hundred representatives on its floor, and two thousand spectators in its galleries.

Each House has its "Diplomatic Gallery," set apart for the diplomatic representatives of foreign powers, who, however, are rarely seen there. Above and back of the chairs of the presiding officers are the "Press Galleries," with adjacent telegraph offices, frequented by some sixty quick-witted and generally well-informed representatives of the leading journals of the country, who, like the Athenians, "spend their time in nothing else but either to tell or to hear some new thing." Through the afternoon and late into the night the telegraph wires leading from the Capitol are busy with the reports of these correspondents, from which millions of citizens derive their daily information concerning legislative action.

The offices and committee-rooms of the Senate and the House, in the new wings, are elegant apartments, handsomely furnished, some of them having ceilings elaborately decorated in fresco. In the Vice-President's room (where Henry Wilson closed his active and useful life), visitors are shown in a closet the modest mirror, used half a century ago, the purchase of which was denounced in debate as a piece of extravagance. The committee-rooms are the hot-beds of legislation, in which the seed sown in the shape of petitions and memorials grows into bills and resolutions.

Descending into the subterranean regions of the Capitol, visitors find themselves in the heating and ventilating departments, where they are shown the intricate machinery, propelled by steam-engines, for removing the foul atmosphere from the legislative halls, and replacing it with pure air, heated in winter and cooled in summer.

During the great and angry discussions of the Kansas-Nebraska questions, the architect of the Capitol gave a supper at a night-session, at which he asked for an appropriation of one hundred thousand dollars for removing the old dome of the Capitol and beginning the construction of one better suited to the proportions of the enlarged edifice. The desired appropriation was made that night, and when Congress re-assembled the following December, the old dome had been removed, and every cent of the appropriation had been expended. There was much grumbling by the economists when another hundred thousand dollars was asked for, for the construction of a new dome; but the money was voted, and

the new structure was constructed of large plates of cast iron, bolted together on huge upright iron ribs, like those of a vessel. Its total weight is nine millions of pounds, and it is crowned with a bronze figure of America, by Crawford, which weighs nearly fifteen thousand pounds more, and stands about three hundred feet above the earth. The statue faces the east, turning its back upon the present location of the city, and looking down on the level plain where it was meant to be.

While the new dome was unfinished, the war of Secession broke out, and the Capitol grounds became the rendezvous of numerous regiments of loyal soldiers, who had hastened to the defense of the city. Many of these militiamen were quartered in the Capitol. Every pleasant afternoon they were drilled, and they were often visited by a tall, gaunt, ungainly man, whose high silk hat towered above helmets and pompons, and whose kind words to the soldiers secured their devotion to "Honest Old Abe," as they called him. Twice, during the first years of the war, the Capitol was used as a hospital, and scores of brave fellows died there.

The daily sessions of Congress are much the same. As the hour of noon approaches, the senators begin to congregate in their chamber. Sometimes little groups are formed, which chat merrily until a rap from the presiding officer commands silence. A prayer is then offered by the chaplain, who does not always have many devout hearers, and his "amen" is echoed by an order from the presiding officer that the journal of the last day's proceedings be read. Before he has concluded, nearly every senator is sure to be in his seat. Petitions are presented by senators, received, and referred by the presiding officer to the appropriate committees—usually never to be heard from again. Bills are introduced and ordered to be printed. Executive communications are received and referred to committees, and reports are made by committees on subjects which have been previously intrusted to them, often accompanied by bills which are at once considered and passed, or placed on the calendar, to be taken up in their order. After this routine business, bills on the calendar are successively considered until two o'clock, when the bill which has been made the order of the day is taken up. There is no limit to speaking in the Senate, and entire days are often occupied by a senator in giving his views on some measure which he regards as of importance to his constituents, although he may not have a dozen listeners.

Usually, one of the private secretaries of the President presents himself in the main aisle of

the Senate chamber about two o'clock in the afternoon. The assistant door-keeper stands at his right hand, and the presiding officer, availing himself of the first pause in the remarks of the senator having the floor, arrests him by saying: "The Senate will receive a message from the President of the United States!" The assistant door-keeper, making a profound obeisance, announces "A message from the President of the United States," and the secretary then says: "Mr. President, I am instructed by the President of the United States to present a message in writing." He then bows and hands his package of manuscript to the assistant door-keeper, who carries it to the presiding officer, after which the senator whose remarks were interrupted resumes them. Messages brought from the House of Representatives by its clerk are received with similar formalities. Later in the afternoon, a motion is generally made that the Senate proceed to the consideration of executive business. If it is carried, as is generally the case, the presiding officer directs the sergeant-at-arms to "clear the galleries and close the doors!" Then the proceedings of the Senate, relieved from the restraint of spectators and of newspaper correspondents, become somewhat free and easy. Cigars are lighted, comfortable positions are assumed, and often a good deal of humor—with an occasional dash of bad temper—is displayed in the confidential canvass of the history and the qualifications of the presidential nominees. The proceedings of the Senate while in executive session are regarded as confidential; but senators are often willing to tell correspondents what has happened, in order that they and their political friends may be placed advantageously before the country.

The House of Representatives is opened in the same manner as the Senate, except that after prayers the sergeant-at-arms places on a stand, at the Speaker's right hand, the mace which is his emblem of authority. Petitions are presented in the House by placing them, without any announcement, in a box, from which they are distributed by the clerk among the committees. The order of morning business is unintelligible to strangers, and is merely the successive recognition, by the Speaker, of those members who have obtained from him a promise that they can have the floor. In keeping these promises, the Speaker often pays no heed to members in the front seats who are endeavoring to attract his attention by cries of "Mister Speaker!" in every note in the gamut, accompanied by frantic gesticulations, and "recognizes" some quiet person beyond them.

"I have been a member of this House three successive sessions," said an indignant Tennessean who had vainly tried to obtain the floor, "and during that time I have caught the measles, the whooping-cough, and the influenza, but I have never been able to catch the Speaker's eye."

In the debates on appropriation bills, each member has the right to speak for five minutes, and those closing the debate have an hour each, parts of which they often farm out to their friends. When a member takes the floor for a long speech, especially if he reads it, he receives but little attention. A few of his colleagues and friends, tipping their chairs back to an angle which they suppose is comfortable, pretend to listen; but a large majority of the representatives go on reading the newspapers and writing letters, or retire to the cloak-rooms. When a vote is taken by tellers, a member of each party is named by the presiding officer, and the two take positions in front of the Speaker's table facing each other. Here they shake hands, and the voters pass between them—first those voting in the affirmative, and then those voting in the negative. The voters are counted by each teller as they pass, and a report of the result is made by one of the tellers to the presiding officer.

The proceedings of the Senate and of the House are taken down in short-hand by the experienced official reporters, revised in man-

uscript when those reported so desire, and promptly put in type at the Government Printing Office. Proof-slips are sent out when asked for, and some congressmen change, correct, and polish their sentences until but little of what they originally said remains; while others, notably Senator Edmunds, never look at a proof. The proceedings of each day, no matter how voluminous they may be, appear in the "Congressional Record" of the following morning, when another opportunity is given for correction before the pages are stereotyped for the bound edition. Each congressman receives twenty-four copies of the "Congressional Record." The revised edition is thoroughly indexed, and is bound in volumes at the close of a session.

It is a curious fact that a number of the present senators and representatives were, earlier in life, employés of Congress. Senator Gorman, of Maryland, was a page, and rose by promotion to be postmaster of the Senate. Representatives R. R. Hitt, of Illinois, and Samuel F. Barr, of Pennsylvania, were clerks of senate committees, and Representative N. F. Deering was a clerk in the office of the Secretary of the Senate; while Representatives R. W. Townshend, of Illinois, and George D. Wise, of Virginia, were pages in the House of Representatives. The transfer of these gentlemen from humble positions in the Capitol to seats in Congress illustrates the simplicity of our republican institutions.

## REMONSTRANCE.

OPINION, let me alone; I am not thine.  
 Prim Creed, with categoric point, forbear  
 To feature me my Lord by rule and line.  
 Thou canst not measure Mistress Nature's hair,  
 Not one sweet inch: nay, if thy sight is sharp,  
 Would'st count the strings upon an angel's harp?  
 Forbear, forbear.

Oh, let me love my Lord more fathom deep  
 Than there is line to sound with: let me love  
 My fellow not as men that mandates keep:  
 Yea, all that's lovable, below, above,  
 That let me love by heart, by heart, because  
 (Free from the penal pressure of the laws)  
 I find it fair.

The tears I weep by day and bitter night,  
 Opinion! for thy sole salt vintage fall.  
 —As morn by morn I rise with fresh delight,

## REMONSTRANCE.

Time through my casement cheerily doth call  
 "Nature is new, 'tis birthday every day,  
 Come feast with me, let no man say me nay,  
 Whate'er befall."

So fare I forth to feast: I sit beside  
 Some brother bright: but ere good morrow's passed,  
 Burly Opinion wedging in hath cried  
 "Thou shalt not sit by us, to break thy fast,  
 Save to our Rubric thou subscribe and swear—  
*Religion hath blue eyes and yellow hair:*  
 She's Saxon, all."

Then, hard a-hungered for my brother's grace  
 Till well-nigh fain to swear his folly's true,  
 In sad dissent I turn my longing face  
 To him that sits on the left: "Brother,—with you?"  
 —"Nay, not with me, save thou subscribe and swear  
*Religion hath black eyes and raven hair;*  
 Naught else is true."

Debarred of banquets that my heart could make  
 With every man on every day of life,  
 I homeward turn, my fires of pain to slake  
 In deep endearments of a worshiped wife.  
 "I love thee well, dear Love," quoth she, "and yet  
 Would that thy creed with mine completely met,  
 As one, not two."

Assassin! Thief! Opinion, 'tis thy work.  
 By Church, by throne, by hearth, by every good  
 That's in the Town of Time, I see thee lurk,  
 And e'er some shadow stays where thou hast stood.  
 Thou hand'st sweet Socrates his hemlock sour;  
 Thou sav'st Barabbas in that hideous hour,  
 And stabb'st the good

Deliverer Christ; thou rack'st the souls of men;  
 Thou tосsest girls to lions and boys to flames;  
 Thou hewest Crusader down by Saracen;  
 Thou buildest closets full of secret shames;  
 Indifferent cruel, thou dost blow the blaze  
 Round Ridley or Servetus; all thy days  
 Smell scorched; I would

—Thou base-born Accident of time and place—  
 Bigot Pretender unto Judgment's throne—  
 Bastard, that claimest with a cunning face  
 Those rights the true, true Son of Man doth own  
 By Love's authority—thou Rebel cold  
 At head of civil wars and quarrels old—  
 Thou Knife on a throne—

I would thou left'st me free, to live with love,  
 And faith, that through the love of love doth find  
 My Lord's dear presence in the stars above,  
 The clouds below, the flesh without, the mind  
 Within, the bread, the tear, the smile.  
 Opinion, damned Intriguer, gray with guile,  
 Let me alone.

*Sidney Lanier.*

## THE SONG OF SONGS.

THIS scholarly article discusses the Canticles from the point of view now dominant in Biblical criticism. A view different, in certain particulars, from that here presented, is given in Professor W. Robertson Smith's article, "Canticles," in the new edition of the "Enc. Britt.," Vol. V. The history of the interpretation of the book is also furnished in Smith's "Dictionary of the Bible" (Art. "Canticles"), Am. ed., Vol. I. There is an excellent translation of the poem into English by Ginsburg (1857).—Ed.

IN one of the English universities divine service was held in a large room which served the purposes of a chapel to one of the colleges,—a bare, whitewashed room with narrow splits in the wall, or here and there a rudely shaped aperture for windows. It being necessary to fix some gas-pipes into the wall, a workman struck his chisel in, when, to his surprise, a portion of the plaster crumbled off, revealing beneath the beautiful moldings of an arch. Curiosity being now excited, further explorations were made by the authorities, and it was found that a perfect little Early English chapel was walled and plastered up in that room so bare of beauty. Bit by bit fair molding and fretwork were discovered; whitewash and plaster melted away like the snows of many winters from about the lovely sculptured leaves; the long, shapeless splits in the walls became the delicate lanceolate windows, caught by our forefathers from narrowing glimpses of the sky in our light spring woods; the long-lost jeweled panes and richly woven stuffs, thick with sacred symbol and fair embroidery, were restored,—until there it rose, that buried chapel, like "frozen music," an exquisite little shrine, with all its delicate harmonies of form and color, a vision of beauty.

Perhaps no more apt illustration could present itself of one of the books in our Bible than this walled-up chapel. Most of us, I suppose, have, from time to time, perused "the Song of Songs, which is Solomon's," as it stands in the authorized version, with a perplexed feeling as to what it all means. Perhaps, if we were honest enough, we should confess also to some feeling of violated good taste and delicacy. Should we have turned in our perplexity to an orthodox commentator, these feelings would scarcely have been relieved by finding language of a confessedly erotic character and of doubtful propriety—some of it addressed by a voluptuous king to an inmate of his harem—transferred entire to the mouth of Christ as his language in addressing his Church.

It has, however, been reserved for modern Hebraists to restore this lovely little epithalamium to its proper place, and, scraping away

the accumulated whitewash and plaster of ages,—the mistranslations and misunderstandings of centuries,—to reveal it as it is, an exquisite little shrine of the affections, embedded in the very heart of our Bibles, aflush with passionate color, but pure and chaste and enduring as sculptured marble.

Before giving our readers a sketch of the Song, it would be best to premise where its difficulties lie, and, even after the research and critical acumen that have been lavished upon it by Jacobi, Herder, Ewald, De Wette, Renan, etc., we think will continue to lie. Its obscurity is not in the language, which, with some exceptions, is simple enough; but, in the absence of any names to the *dramatis personæ*, or any indication except such as can be drawn from internal evidence as to who it is that is speaking—a difficulty enhanced by our being unable to compare it with any other Hebrew dramatic poem, and our consequent inability to come to any definite conclusion as to the exact form the drama assumed among the Jews at this early date of their history, the time, probably, of their freest development. "We cannot frame thought of one term only," says Herbert Spencer; but, unfortunately, the Song of Songs is the "one term only" out of which we have to frame our conceptions of this Hebrew drama, no other dramatic poem having come down to us. Whether we are to hold, with Ewald,\* that the Semitic author of the Song had the distinct conception of a sustained plot and a gradual working out of the situation in five acts, or whether we are to hold, with Renan,† that his dramatic conceptions were of the rudest, and that the *dénouement* is anticipated at the end of each act, will probably remain a disputed point.

We will take the two best-known translations, Ewald's and Renan's, as the basis of our sketch, confining ourselves, to begin with, chiefly to Ewald's, as that which carries the highest Hebraistic authority, and also as the most comprehensible to a European mind, and then illustrating the difficulties we have

\* "Die Dichter des Alten Bundes." Von H. Ewald.

† "Étude sur le Cantique des Cantiques," par Ernest Renan. 2d ed.

touched on by stating in what particulars the French scholar differs from him in his interpretation of the Song.

The plot or argument of the poem is this: King Solomon, on one of his numerous pleasure excursions, accompanied, as usual, by his court, is passing through the north of his kingdom,—a land rich in vineyards, and fair pastoral beauty,—when they perceive, in a neighboring nut-garden, a beautiful girl, singing and dancing to herself in the joy of the spring. She has come down to the garden to look at the tender opening buds, and in the gladness of her own opening life and the happiness of first love she has thrown aside her veil, and is singing with the birds and dancing with the dancing lights. They watch her, lost in admiration, when, suddenly perceiving she is observed, she makes a shy movement of flight, arrested for a moment by the entreating voices with which they call her back. The king, at once deeply enamored of the beautiful stranger, leaves orders that she shall be transferred to his harem, her dress denoting that she was unmarried and unpledged. On inquiry it is found that the maiden—the Sulammite, as she is called throughout the poem. from her native village, Sulem—is the only daughter of her mother. Her father is dead, and her step-brothers, the sons of a former marriage, exercise his authority in his stead. They treat her with great harshness and make her the keeper of one of their vineyards. There she meets with a young shepherd and keeper of gardens like herself, on whom she pours out her “forgotten heart,”—a love which he returns, but without, as yet, having gained the consent of the brothers to their betrothal. They, on the contrary, very much prefer the advantageous offers of the king, and she is at once transferred to the harem at Jerusalem. There the great king woos the simple village maiden, and she has to endure every seduction that wealth and luxury and rank can bring to bear upon her. But she remains faithful to her shepherd-lover, preferring true love to worldly advancement. Finding her obdurate, the king at last resolves to pay her the highest honor of all. He resolves to marry her and make her one of his queens; but with no better result. His advances are always stopped by her fainting away with the despairing cry on her lips: “My beloved is mine, and I am his.” Till at length, since the worship of Jehovah puts bounds to even the passions of a king and forbids the use of violence, he suffers her to depart to her shepherd-lover. The poem ends in the gardens of the north, with the reunion of the lovers and their approaching marriage, and with the great

unveiled utterance and key-note of the poem, “Love is as strong as death” and “many waters” (even the deep waters of trial through which the Sulammite had passed) “cannot drown it,” followed by a little mirthful song of triumph on her part, and a mocking allusion to the failure of the great king to bribe her from her faithfulness.

We will attempt a rough translation, that the reader may see how this is worked out by the poet, keeping as near the authorized version as we can consistent with the sense of the original. The poem is divided into five days, which, with ancient simplicity, are marked off by the recurrence of “the love sickness.”

#### FIRST DAY.

THE opening of the first scene shows us the Sulammite surrounded by the ladies of the harem. Her beauty is enriched with costly attire and precious jewels. She has already tasted that voluptuous life, heavy with fragrance, rich with sparkling wines, languid with sweet, enervating strains; but her heart only reverts the more to her shepherd-lover. The poem opens with a passionate invocation to him, yet couched in indirect terms, followed by a cry for deliverance.

Becoming conscious of the wondering glances of the court ladies, in her village simplicity she conceives that they are staring at the rich dark brown of her skin in such singular contrast to themselves, and pleads with them not to despise her on that account, since hers had been no sheltered court-life, but one of hard toil, which had forced her to neglect her own vineyard, her beauty.

Then again she sinks into delicious reverie, unconsciously uttering words that can no longer admit of misapprehension; and the odalisques taunt her, that if, indeed, she can be so simple as to prefer a shepherd-lover to the caresses of a king, she had better return to her old life.

#### SULAMMITE.

Let him kiss me with the kisses of his mouth!  
For thy caresses are better than wine.  
Sweet is the breath of thine odors,  
Thou that art sweetest spikenard named!  
Therefore do the maidens love thee.

#### SULAMMITE (*after a pause*).

Draw me after thee, O let us fly!—  
The king has brought me into his harem—  
We will be glad and rejoice in thee,  
Will find thy caresses sweeter than wine.  
Well may the maidens love thee!

SULAMMITE (*perceiving that the ladies of the harem are looking wonderingly at her*).

Dark am I, but beautiful, O daughters of Jerusalem,  
As Kedar's tents, and as the pavilions of Solomon.

Look not upon me because I am dusky-skinned,  
For the sun has scorched me at noon.  
The sons of my mother wished me evil;  
Made me a keeper of vineyards;  
Mine own vineyard have I not kept.

Tell me, O thou whom my soul loveth,  
Where thou feedest, where thou makest thy flock to  
rest at noon!  
That I be not as one who wanders forgotten by the  
flocks of thy companions.

## THE DAUGHTERS OF JERUSALEM.

Art thou so simple, O thou fairest of women?  
Then go hence, and follow the track of the flocks,  
And pasture thy goats by the huts of the shepherds.

The king now enters, and makes his first advances to her. Throughout he is made to use the language of mere sensual love, with a certain clumsy heaviness of metaphor, by which the poet doubtless meant to express the want of true inspiration in mere sensual passion, and its essentially lowering character in contrast with the spiritual beauty of the utterances of true love.\* The Sulammite, on the other hand, here receives the first compliments and promises of her royal lover with a thinly veiled rebuff; it was in the king's absence that her spikenard, the thought of her beloved, gave forth its fragrance. Then ensues a curious dialogue, in which the king addresses her, while she in answer addresses her absent lover. Her fresh young heart, sick with the languid, heavy-scented atmosphere of the court, and a love that rings false to her ear, turns back to the sweet open-air life she had lived with him whom her soul loved, reclining side by side on the flowery field-beds, and gazing up at the living roof of the mighty cedars above them, or wandering through the trellised vines with his arms around her—slipping back into those delightful days in the very presence of the king, till, overpowered with these memories and the sense of her captivity, she faints away, pleading, as consciousness goes from her, that her helplessness may be held sacred, as one who is "sick of love."

## SOLOMON.

Unto my charger in Pharaoh's stud  
I would compare thee, O my friend!  
Fair, fair are thy cheeks with golden rings,

\* Professor W. Robertson Smith differs with this view of the character of Solomon's addresses. "It is remarkable," he says, "that the only passage which can hardly be freed from a charge of sensuality [vii. 1-9] hangs so entirely loose from the proper action of the poem." This passage is regarded by Professor Smith as an interpolation. The king's admiration, he says, "does not reach the pitch of passion, and his sensuousness nowhere degenerates into grossness, except in the imagination of commentators, who have been apt to detect a *double entendre* in every passage they did not understand."—*Enc. Britt.*, vol. v., p. 36.—ED.

Thy neck with strings of coral.\*  
Lo, golden rings will we make for thee,  
Studded with many a silver bell.

## SULAMMITE.

So long as the king still sat at table,  
My spikenard gave forth her fragrance.  
My beloved is to me a nosegay of myrrh,  
That close to my bosom rests;  
A cluster of alhenna to me is my beloved,  
In the vineyards of Engedi.

## SOLOMON.

Behold, thou art fair, O my friend!  
Behold, thou art fair, and thine eyes as doves.

SULAMMITE (*to her absent lover*).

Behold, thou art fair, yea, delightful, O my beloved!  
Lo, too, our bed growth green;  
The beams of our house are the cedars,  
And our ceiling the cypress,  
I am the Narcissus of Saron,†  
And a lily of the valley.

## SOLOMON.

As a lily among thorns  
So is my friend among the daughters.

## SULAMMITE.

As an apple-tree among the trees of the wood  
So is my beloved among the sons;  
In his shadow I sat down with great delight  
And his fruit was sweet to my taste;  
He led me in among the trellised vines‡  
And his banner over me was Love.

Strengthen me with raisin-cakes,  
Refresh me with apples!  
For I am sick of love.  
His left arm under my head,  
And his right embraces me!  
I charge you, O ye daughters of Jerusalem!  
By the gazelles, and by the hinds of the field,  
That ye awake not,  
Nor arouse,  
The loved one till she please.

## SECOND DAY.

THE second day shows us the Sulammite alone with the ladies of the harem, undisturbed by the king. Though consciousness has returned, the "love sickness" is still at its height, and her fevered imagination transplants her wholly into the past, as it was with her in the first days of spring, when her lover came to the cottage where she dwelt with her mother and called her out into the sunshine. And as her thoughts by day are his, so are her dreams by night—troubled dreams, which are but the reverberation of the hopes and fears of her captive days.

\* Renan's translation.

† Renan. But, according to Ewald, "meadow saffron of the plain." The exact flower probably cannot be ascertained.

‡ The word used in the original denotes the vineyard cellars, but, according to Ewald, like the German *Weinhof*, had come to mean the whole vineyard.

THE SULAMMITE (*alone with the ladies of the court*).

The voice of my beloved! behold he cometh  
Bounding over the mountains, leaping over the hills;  
My beloved is like the gazelle, or the fawn of the hinds;  
Behold he standeth behind our wall,  
Looking through the casement, shining through the  
lattice.

My beloved spake and said unto me:  
"Rise up, rise up, my love,  
My fair one, and come away!  
For lo, the winter is past,  
The rain is over and gone;  
The flowers appear on the earth,  
The time of the singing of birds is come,  
And the voice of the turtle is heard in our land.

"The young shoots of the fig-tree are beginning to  
redden  
And sweet are the blossoming vines;  
Rise up, rise up, my love,  
My fair one, and come away.  
My dove in the caves of the rock, in the clefts of  
the crag,  
Show me thy face and sing unto me with thy voice,  
For sweet is thy voice and fair is thy face."

(*She sings one of the vineyard songs.*)

"Take us the foxes,  
The little foxes that ravage the vines,  
For our vineyard is in flower."

My beloved is mine and I am his;  
He pastures his flocks among the lilies.  
Ere the day cool, and the shadows flee away,  
Turn, my beloved, and be thou like  
The gazelle or the fawn of the hind  
Over the mountain ravines.

By night on my bed I sought him whom my soul loveth.  
I sought him, but I found him not!  
"Rise will I now and go about the city, the streets,  
and the market,  
Will seek him whom my soul loveth!"  
I sought him, but I found him not.  
Found me the watchmen who go round the city,  
"Saw ye him whom my soul loveth?"  
Scarce had I passed them by when I found him  
whom my soul loveth,  
I held him and would not let him go,  
Till I had brought him into the house of my mother,  
Into the house of her who brought me forth.

I charge you, O ye daughters of Jerusalem!  
By the gazelles and the hinds of the fields,  
That ye awake not,  
Nor arouse,  
The loved one till she please.

### THIRD DAY.

IN the third act Solomon has resolved to overcome the Sulammite's reluctance by offering her the highest honor of making her one of his queens, and it accordingly opens with his public marriage procession, followed by the king again wooing the Sulammite, and his departure, after promising to return in the evening and claim her as his own. But now, in the very crisis of her fate, the very hopelessness of the entanglement in which she finds herself, awakes in her the thought of her lover as saving her from even these

heights of Lebanon, these caves of the lion, and makes her realize more than ever that in heart she is married to him, and to him only, with a love that must triumph in the end, and then follows a dream which reflects her ever deepening conflict.

### CITIZENS OF JERUSALEM.—A VOICE.

What is this going up from the desert like a pillar  
of smoke,  
Exhaling the fragrance of myrrh, and all the spicy  
powders of the merchant?

### ANOTHER.

Lo, Solomon's palanquin!  
Fifty mighty men are about it of the valiant of  
Israel,  
Each with a sword on his thigh to ward off the  
fears of the night.

### A THIRD.

A state-litter King Solomon wrought for himself of  
the wood of Lebanon,  
With pillars of silver, and golden the couch and  
cushioned with purple,  
In its midst a beautiful damsel, one of Jerusalem's  
daughters.  
Go forth, O ye daughters of Zion, and behold King  
Solomon  
Crowned with the crown his mother crowned him  
withal  
On the day of his espousals, the day of his glad-  
ness of heart.

### SOLOMON—THE SULAMMITE AND LADIES IN THE HAREM.

### SOLOMON.

Behold, thou art fair, O my friend!  
Behold, thou art fair, and thine eyes as doves gleam  
from the midst of thy locks.  
Thy tresses are as a flock of goats on the slopes  
of Mount Gilead.  
Thy teeth are like newly-shorn sheep that come up  
from the water,  
Each the mother of twins, not one of them sterile;  
Thy lips like crimson threads, and thy mouth most  
comely;  
Thy cheeks like pomegranates in the midst of thy  
locks;  
Thy neck as the tower of David, built for an ar-  
mory  
Where a thousand shields are suspended, and the  
arms of the mighty;  
Thy breasts as two young gazelles that feed among  
the lilies.

Ere the day cool and the shadows flee away  
I will get me to my mountain of myrrh and hill  
of sweet frankincense.  
Thou art all fair, O my friend!  
No spot is in thee.

(*The king departs.*)

### THE SULAMMITE AND THE LADIES OF THE HAREM.

### THE SULAMMITE.

The voice of my beloved! Behold! how he cometh!  
Give ear to the words that he saith unto me.  
"Away with me from Lebanon, my bride, with me  
from Lebanon;

Escape from the heights of Amana, from the heights  
of Shenir and Hermon,  
Out of the caves of the lion, from mountains the  
haunt of the leopard!

Thou hast ravished my heart, my sister, my bride,  
Thou hast ravished my heart with a glance of thine  
eyes,  
With one chain of thy neck.

"Fairer are thy caresses, my sister, my bride;  
Fairer are thy caresses than wine;  
And thy spikenard more fragrant than spices,  
Thy lips, O my bride, drop with honey,  
Honey and milk are under thy tongue,  
And the smell of thy garments as Lebanon!  
O garden enclosed, my sister, my bride,  
O fountain enclosed, O well-head fast sealed!  
Thy plants are a park of pomegranates, with fruits  
of the noblest,  
Alhenna with spikenard.  
Spikenard and krokus, kalmus and sweet frankin-  
cense,  
Aloe and myrrh, together with costliest spices,  
Thou fountain of gardens, well-head of waters,  
And streams from Lebanon."

Awake, O North wind, and come, O thou South!  
Blow upon my garden that the spices thereof may  
flow out,  
Let my beloved come to his garden and take of his  
costliest fruits.

I come to my garden, I gather my myrrh and my  
spices;  
I eat my honey and grapes, I drink my wine and  
my milk;  
Eat, O my friends; drink, yea drink abundantly, O  
ye loved of my soul!

I sleep but my heart waketh; it is my beloved that  
knocketh.

"Open to me, my sister, my bride, my dove, mine  
undefiled!

For my head is filled with dew and my locks with  
the drops of night."

I have put off my garments, how shall I clothe me  
again?

I have washed my feet, how shall I defile them  
afresh?

My beloved reached in his hand through the lattice  
And my heart within me was moved!

I rose up to open to my beloved, and my hands  
dropped with myrrh,

And my fingers with myrrh that flowed from the  
latch.\*

I opened to my beloved, but lo! my beloved had  
vanished,—was gone.

My soul fainted within me as he departed;  
I sought him but found him not; called him and he  
answered me not.

The watchmen found me that go round the city:  
they wounded and smote me,

The watchmen of the ramparts took away my veil.

I charge you, O ye daughters of Jerusalem!  
If ye find my beloved what will ye tell him,  
That I am sick of love?

## FOURTH DAY.

THE third day having again closed with a  
renewal of the "love sickness" and a conse-  
quent interruption of the king's designs, the

\* At lacrimans exclusus amator limina saepe  
Floribus et sertis operit posteisque superbos  
Unguit amaracino.—*Lucretius*, IV. 1177-79.

fourth act witnesses a renewal of his advances,  
after an impassioned description of her beloved  
from the Sulammite to the women of the  
harem. Undismayed by the hard, defiant look  
with which she now receives him, the king  
woos her in two songs, in which he endeavors  
to rival the language of the unknown and  
obscure lover, in one of which he dramatic-  
ally describes the circumstances of his first  
meeting with the Sulammite; and in the  
second sinks into the only sensual utterances  
to be found in the poem. But he only wins a  
renewed protestation of her faithfulness to her  
lover. To all the king's seductions she has  
but one answer: "I am my beloved's and he  
is mine," followed by a passionate invocation  
to him to come and take her away; after  
which she again sinks into unconsciousness.

## THE LADIES OF THE COURT AND THE SULAMMITE.

## THE LADIES OF THE COURT.

What is thy beloved more than another, O fairest  
of women?  
What is thy beloved more than another, that thou  
dost so charge us?

## SULAMMITE.

My beloved is white and ruddy, chiefest among ten  
thousand;  
His head is of pure gold, his locks like vine-tendrils,  
black as the raven;  
His eyes as doves in the beds of the river, washed  
in milk laid smooth in a vessel;  
His cheeks are as beds of spices, a plot of sweet-  
smelling flowers;  
His lips like lilies dripping with odorous myrrh;  
His hands are as golden rings set with the beryl;  
His body as fine wrought ivory, overlaid with sap-  
phires;  
His legs are as marble pillars, based in sockets of  
gold;  
His form is as Lebanon, a youth like the cedars;  
His mouth is most sweet, yea he is altogether  
lovely,  
This is my beloved, and this is my friend,  
O ye daughters of Jerusalem!

## THE COURT LADIES.

Whither is thy beloved gone, O thou fairest of  
women?  
Whither hath he turned, that we may seek him  
with thee?

## THE SULAMMITE.

My beloved is gone down into his garden, to the  
beds of the spices,  
To feed in the garden, and gather the lilies.  
I am my beloved's, and my beloved is mine!  
He pastures his flock among the lilies.

(*The king enters.*)

## SOLOMON.

Thou art lovely, O my friend, as Thirza, fair as  
Jerusalem, fearful as an army in battle—  
Turn away thine eyes for they make me to fear,—  
Thy tresses are as a herd of goats on the sides of  
Mount Gilead;

Thy teeth as a flock of ewes that come up from  
the water,  
Each the mother of twins, not one of them sterile;  
Thy cheeks as pomegranates in the midst of thy  
locks,—  
Three score the queens,  
Four score the concubines,  
And virgins without number!  
But one is my dove, mine undefiled,  
The only one of her mother, and dear to her who  
bore her.  
The daughters saw her, and blessed her;  
The queens and the concubines, and they praised  
her.  
Who is this that looketh forth as the dawn, fair as  
the moon,  
Clear as the sun, fearful as an army in battle?  
“I went down into the garden of nuts to see the  
herbs of the valley,  
To see whether the tender vine-shoot had budded  
and bloomed the pomegranates,  
And lo! unawares, I fell in with the chariots of the  
princes of Israel.”  
“Return, return, O Sulammite, return, return, that he  
may behold thee.”  
“What will ye see in the Sulammite?” “What  
equals the dance of Mahanaim.”\*

(Here follows the passage (ch. vii. 1-9), the only passage, according to Prof. W. Robertson Smith, which is really chargeable with grossness, and which he considers, on grounds of internal evidence, an interpolation.—ED.)

## SULAMMITE.

I am my beloved's, and my beloved is mine,  
And unto me his desire!  
Come my beloved, let us go forth to the fields and  
abide under boughs of the cypress;  
Let us betimes to the vineyard, and see if the vine  
stock has sprouted;  
Whether the blossom has opened,—bloom the pome-  
granates.  
There will I give thee myself.  
The love-apples smell sweet, and over our door  
all manner of fruit,  
New and old, which I have laid up for thee.  
O that thou wert as a brother, that sucked the  
breasts of my mother,  
That I might find thee without, and kiss thee,  
and not be despised;  
That I might bring thee into my mother's house,  
and thou mightest instruct me;  
And that I might cause thee to drink my spiced  
wines, my pomegranate juice.

His left arm under my head,  
And his right embraces me.  
I charge you, O ye daughters of Jerusalem!  
By the gazelles and by the hinds of the field,  
That ye awake not  
Nor arouse  
The loved one till she please.

## FIFTH DAY.

At last she has conquered. The king perceives that she cannot be moved, and as the true religion to which he belongs forbids the use of force, he sees that he has no choice but to send her back to her shepherd-lover. The scene accordingly changes to the north

\* An ancient city celebrated for its dances.

of the country, and shows us the Sulammite leaning on her beloved, and a band of shepherds coming out to meet them. She pauses under an apple-tree consecrated by precious memories in the past, and there bids him cherish her as one who has been tried to the uttermost, and not found wanting, uttering the great key-note of the poem,—the unconquerable nature and lofty incorruptibility of true love,—a grand climax in which for the first and only time the name of God occurs. Then, turning to the shepherds, she entertains them with a little Eastern apologue, doubtless drawn from some discussion between those hard elder brothers of hers (overheard while she was yet a child), as to what they would do with her when she came to a marriageable age. If she proved a wall, resisting all attempts on her virtue, they would crown the wall with battlements of silver, procure her an honorable marriage; but if she proved too accessible, then they would board up the wall with cedar, marry her to some hard rich man, who would effectually shut her up from the effects of her own lightness and folly. Then suddenly the girl bursts out into the jubilant cry of triumph, “I am a wall, resisting even the seductions of a king”; and she ends with a little taunting allusion to the wealth and power of that king, the owner of many vineyards, who yet had not been able to purchase of her that little vineyard she owned, her beauty and chastity.

The bridegroom, with the friends who have come to assist at their betrothal, then request her to sing to them. But this unconquerable maiden is not to be won too easily even by him whom her soul loveth; and the poem closes with the half mocking, half tender words,

“Too tender  
Not to be seeming bitter to the ear,”

in which she bids him “turn, and be like the gazelle or the fawn of the hinds,” no longer on the dark mountain ravines that part them, but on the hills that are all fragrant with love and reunion.

## SHEPHERDS—THE SULAMMITE—HER LOVER.

## SHEPHERDS.

Who is this that cometh up from the desert  
Leaning on her beloved?

SULAMMITE (*to her lover*).

Under this apple-tree I awoke thee,  
There thy mother brought thee forth, there she bore  
thee in anguish.

Set me as a seal on thine heart, as a seal on thine arm,  
For love is as strong as death, unconquerable as the  
grave.

The flame thereof is as fire, even the fire of God!  
 Many waters cannot quench love, nor the rivers over-  
 flow it,  
 Though a man give all his possessions for love, he  
 would be but contemned.

(Turning to the shepherds.)

We have a little sister who is yet without breasts;  
 What shall we do with our sister in the day when  
 men woo her?  
 If she be a wall we will crown her with battle-  
 ments of silver;  
 If she be a door we will bar her with strong planks  
 of cedar.  
 I am a wall, and my breasts are strong towers,  
 For thus I obtained that he should leave me at peace.

A vineyard hath Solomon in Baal-hamon;  
 He let out the vineyard unto keepers;  
 A thousand pieces of silver they brought for the  
 fruit.  
 But my vineyard, mine, is before me!  
 The thousand pieces hast thou, O Solomon!  
 And the keepers two hundred pieces each.

THE LOVER.

O thou that dwellest in the gardens  
 My companions wait for thy voice.  
 Thy voice let me hear.

THE SULAMMITE.

Turn thou, my beloved, and be thou like  
 The gazelle, or the fawn of the hind,  
 On the spicy mountains afar.

In the rough sketch we have now given of this song, drawn almost entirely from Ewald's version, except in a word here and there where Renan seems to have rendered the sense of the original more accurately, we have purposely refrained from perplexing the reader with difficulties, in order that he might form some undisturbed idea of the beauty of the poem as a whole. But probably to the thoughtful reader the difficulties have already suggested themselves, and we will therefore proceed to touch lightly upon them.

It must, first of all, be remembered that the drama grew out of the song publicly sung or recited by one or more voices in succession at religious or marriage festivals. In our present poem we have the transition from the one to the other, the drama not yet wholly differentiated from the song or lyrical recital. On the one hand, Solomon's marriage procession, witnessed by the citizens of Jerusalem, points to some sort of *mise en scène*; and probably the scene again changes in the fifth act to some sort of rude representation of vineyards and gardens. On the other hand, unquestionably, in the lovely little scene II., 3, where the Sulammite recalls how her lover came to her cottage in the first warm days of spring and called her out, she recites the dialogue between herself

and her lover—in other words, performs two parts, altogether unallowable in the drama proper. The same in II., 4. Indeed, in Ewald's version, a large part of the Song is rather lyrical recital than drama properly so called. But, as to whether Ewald has not carried this method of interpretation too far, especially when he places the words "Away with me from Lebanon, my bride!" (III., 7), in the mouth of the Sulammite, and before which he has, accordingly, to interpolate the words we have put into brackets, or when he makes the account of her capture part of a song the king sings to her, we cannot but think very problematical.

Renan goes on altogether a different supposition. According to him, the shepherd-lover first makes his appearance in the words, "As a lily among thorns, so is my friend among the daughters," though this is very improbable, owing to the occurrences of the word *raïati*, the name by which Solomon is always made to address the Sulammite; and he contends that the final *dénouement* is anticipated at the end of each act, each day being the account of some particular attempt of the king's on the Sulammite's faithfulness, ending with the ever-recurring triumph of the lovers, the adjuration "I charge you, O ye daughters of Jerusalem!" being put into the shepherd's mouth, and not the Sulammite's. The Hebrew mind, in Renan's view, is incapable of working out a sustained plot, preferring a foregone conclusion, round and round which it wheels in circular flights of fancy. The stage, as he pictures it, consisted of some rude scenes but seldom shifted, the Sulammite seated in front, with the shepherd-lover on one side and the king on the other, by whom she is alternately addressed with an utter disregard of dramatic possibilities of time and place, the final taunt at the king, accordingly, hitting him "*en pleine poitrine*," doubtless to the great delight of the audience. In the background a group of men were placed who form a sort of chorus, and alternately represent the friends of the shepherd, the citizens of Jerusalem, or the watchmen of the wall; and a similar band of women, to impersonate either the daughters of Jerusalem or the daughters of Zion. For one great principle in interpreting the song must be carefully observed. The author, in the absence of names to the *dramatis personæ* and in the paucity of actors, takes care to denote who it is that is speaking, by especial methods of accost. The Sulammite, with Solomon, is always "my friend"; with the women of the harem she is the fairest of women: with her lover she is "my sister," "my bride," "my dove," "mine undefiled"; he himself is always "my be-

loved"; Solomon is "the king," or sometimes "King Solomon," or briefly "Solomon"; the ladies of the harem are "the daughters of Jerusalem," "the women of Jerusalem," "the daughters of Zion." But even with these internal guides it seems to us quite impossible to come to any final decision as to the exact form and arrangement of this beautiful ancient epithalamium, which probably was performed during the prolonged marriage feasts of the East.

With regard to the approximate age of the poem, the data are more satisfactory. The poem itself is sufficient to prove that it was not written by Solomon. The great king would certainly not have satirized himself so severely. All the internal evidence points to the poem having its birthplace in the north of the country, whence we also have the Song of Deborah, the prophecies of Hosea, the history of Gideon, of Jephthah, of Samson, of Elijah and Elisha. Not only is the imagery of the poem that of the rich pastoral vine-clad district of Lebanon, but, with the exception of Jerusalem, Heshon and Engedi, all the localities named in the poem,—Saron, Gilead, Thirzah, Senir, Carmel, Sulem, Baal-hamon,—belong to the north of the country. Indeed, it is to this richness of local coloring that we owe an illusion which enables us to fix the date of the poem within narrow limits. The Sulammite is compared for her beauty to Thirzah and to Jerusalem. The author here contrasts the capitals of Judah and Israel. Now we know that Thirzah was the capital of the kingdom of Israel from the reign of Jeroboam to that of Omri, from 975 to 924 B. C. In 923, Omri built Samaria, which thenceforth became the capital of the northern kingdom, Thirzah disappearing from history—its decline and fall being so rapid and complete that its very site is unknown.

This allusion alone, as both Renan and Ewald point out, authorizes us in placing the first redaction of the poem anterior to 924 B. C. But the same evidence places it after the death of Solomon, and the schism which took place in 936 B. C. Other evidence might be adduced, but we think this is sufficient. The Song would be therefore contemporary with the probable date of Homer.\*

But a question of far wider interest and importance is the purpose of the Song of Songs in the sacred canon. How came it in our Bibles? To those of us who recognize the Bible to be emphatically the book of man,

and God revealing Himself in and through man, its presence should be no difficulty. If in the sacred page man is portrayed on all sides of his moral and spiritual nature,—now his wide national and political life, and now the narrow, peaceful life of homesteads set among their golden corn-fields, now in his sickness and sorrow uttering the divine cry, "Though He slay me, yet will I trust in Him," and now in his weariness, wailing "Vanity of vanities, all is vanity," now pouring forth his aspirations after the unseen in hymns and sacred songs, and now affirming the eternal laws of right and duty in lofty prophecy,—to those, I say, who recognize this, it would be an insuperable difficulty if the master passion, Love, alone found no place, or was but indirectly represented. To all Teutonic nations especially it ought to be a welcome discovery to find that the principles on which we base the purity of our homes, the inviolable sanctity of the love of one man for one woman, should find its recognition in our Bible, and receive the sanction of the "Oracles of God," even though they had their birthplace in the heart of a polygamous nation. We can but echo the words of the illustrious Niebuhr, when a young minister was lamenting the necessity of having to admit a mere love poem into the sacred canon: "For my part," he said emphatically, "I should feel that there was something wanting in the Bible, did I not find in it an expression for the deepest and strongest of the feelings of humanity."

A far more difficult question is the religious use the Church has always made of the Canticles. The limits of this brief sketch will not permit our entering on the curious history of the gradual allegorization of the Song as the true comprehension of it faded out of men's minds. We can only touch upon the question how far the allegorical interpretation of it can be maintained. We believe that any such systematic method of interpretation is incompatible with the nature of the poem, and must be surrendered with so much of the early allegorizing of the fathers. There is no evidence that the poem originally had a mystical meaning, and there is every internal evidence to the contrary.\* But so long as marriage remains the type of the union of the soul

\* "A poem in the northern dialect, with a northern heroine and scenery, contrasting the pure simplicity of Galilee with the corrupt splendor of the Court of Solomon, is clearly the embodiment of one phase of the feeling which separated the ten tribes from the house of David." So writes Prof. W. Robertson Smith, "Enc. Britt.," vol. v., p. 36.—Ed.

\* The allegorical interpretation, it is curious to discover, was not given to the poem by the Alexandrian Jews, who were such devotees of allegory. The symbolical view (beginning in the Jewish Talmud) was brought into the Church by the school of Origen. This interpretation, now apparently obsolescent, was defended in this country by Professor Stuart. It is set forth in the ingenious commentary of Dr. L. Withington (1861). It is vigorously opposed in a work of the late Professor Noyes, of Cambridge.—Ed.

with God, of Christ with the Church; so long as the faithful attachment of one soul to another shadows forth the love of the heavenly Lover who "loved us and gave himself for us," so long will religious feeling express itself

in the language of the Canticles, so long will the soul that "is joined to the Lord" utter, as its deepest cry of adoration to its Redeemer, the words of the Song of Songs, "My Beloved is mine and I am His."

*Ellice Hopkins.*

---

NEAR SUNSET.

SOMETIMES, from fields grown sadly strange  
Since robins fled, by woodland path,  
Straight up the valley-head I range  
To reap the day's poor aftermath.

I climb the hill: the top draws nigh;  
The path grows light again, and lo,  
The pale new moon, the crimson sky,  
The village on the plain below!

The spiders spin across my face;  
The startled partridge, fleeing, makes  
A sudden silence in the place  
The rasping cricket scarcely breaks.

And weary huskers, binding long  
On dusky slopes, still bind by night,  
While, like the murmur of a song,  
Their talk is blown across the height.

*L. Frank Tooker.*

---

EUGÈNE FROMENTIN.

IN one of the tall buildings on lower Broadway,—that rear their fronts of cast-iron with pitiless regularity of design and repetition of ornament before the ever-shifting crowd,—are hundreds of rugs and carpets disposed on bare benches flooded with light from high, bald windows. They have come all the way from Cashmere and Bokhara, from Mesopotamia and Kurdistan, some of them from India and Indo-China. They fill the cold, square rooms with the colors of candied fruits and of those preserves which are made from roses and violets. Deep and rich tones, in which a distinct pattern is often lost and almost never a thing or a living creature certainly imitated, caress the glance with double effect as the eyes come to them weary from the sight of our barbarous iron architecture and the alternately sordid and ungainly garments of our fellow-citizens. A dreary multitude shuffles and scuffles along outside of windows that stand plumb with an irritating exactness. A German Oriental, with a flash coat and with cheap jewelry in his necktie, is crying out in a voice rougher than that of the native American the numbers and prices of an auction which has lately taken place. How comes it that merchants find a profit in importing these bales and bales of Turkish and Persian carpets, rugs, prayer-mats, and shawls? How comes it that the same people that build the iron boxes which line the business thoroughfares have enough taste and discrimination to encourage imports of articles so fine? For hardly three are alike. Every tenth piece is strong in make,

durable, fine in colors; every twentieth is a veritable work of art. And yet these fabrics are not woven by machinery. The vast majority are true hand-made work. Over nearly every one the pale and half-starved children of Persia or of Kurdistan have labored slowly and sadly, letting their fingernails grow long, as the latest traveler through Persia has noticed, in order to separate the colored threads more readily; racking their young memories with the rules by which those threads are laid in place, and breathing an air that gives them one more push toward their early graves. And yet these fabrics take several years to complete, and in the cities where they are made cannot be bought for the price at which they are likely to go when brought to the hammer in New York. How does it happen that the tide of export sets this way so strongly that many reach here only to be disposed of at a loss? Writers not a few, travelers, novelists, poets, have had a hand in bringing this about. Perhaps no one of our time has had more influence in accelerating the movement, if not in initiating it, than the writer and painter, Eugène Fromentin.

Taste for Oriental things rests on sound principles. It is not affectation to value an article because the maker has put the impress of his own individuality on it, and to turn away from another because it is the thousandth out-put of a loom run by steam. At a certain remote period, when only a part of France was Frankish, the architects of churches painted walls, clerestories, ceilings,

and pillars boldly with bright designs, that were copied literally, without much regard to the needs of the decorated surface, from Oriental rugs and hangings. That architecture has disappeared, leaving only an obscure record in history; but the taste remains among the barbarians of the later centuries, chastened, let us hope, by a wider and saner understanding of the fitness of things and of the limitations and proprieties of different branches of the fine arts. At the present day the pictures that reproduce the figures of Orientals, their dresses, horses, arms, implements, and surrounding objects, have a deep interest that cannot be explained merely by love for the picturesque. The Oriental, even when gathered into the net of conquerors like Jengis and Timur, retained his individuality as the modern man of the West does not. He has his national, tribal, individual dress, arms, accouterments; one fashion does not sway a whole country, nor one tailoring establishment clothe a whole army, nor one arsenal turn out the same kind of arms for an entire nation. The variety and profusion of invention, which are the result of labor more loving than acute, that one sees in the work of our later middle ages, re-appear when one searches the Orient. Thence the middle ages got their ideas; there such ideas, such processes, such arts have lingered on and thriven in spite of the asceticism, amounting to stupidity, of which Mohammed was guilty. It is only the cheap steam-fabricated articles of Western Europe that have really undermined and begun to destroy the arts of the East; and as we are apt to begin to appreciate a man to his right measure when we are in danger of losing him, it has not been until late in this century, when the decay of the Orient has startled the traveler, that the remnants of Oriental art have received their proper valuation. Hence the discovery by the poets that the eastern nations are full of sentiment and human emotion; hence the reverential procession of artists to the East, to catch on their canvases the strange scenes of patriarchal life, the wonderful colors of Eastern robes; hence the passion for Eastern furniture, hangings, and bric-à-brac that has increased until the sharp mechanics of Paris and Manchester find it to their profit to fabricate genuine Damascus blades on the Seine and genuine Daghestan carpets on the Irwell. Fromentin was neither the first nor the last to make the pilgrimage to Mecca and return Hadji of Oriental art. Napoleon the Great may be said to have shown the way from political reasons; with him went the scientific men who opened Egypt again to Europe, after whom came Victor Hugo, writing of the

Orient without going thither, and Lamartine, who journeyed to the East in his own ship, surrounded by his family, his library, his works of art. Neither was Fromentin the first or last among the artists. The strange and stirring oil-sketches of poor Marilhat, who ended in madness, and his clear, pure atmospheres in finished work; the deep, robust landscapes and mournful figures of Orientals by Decamps; the singular pictures full of sentiment and impatient handiwork by Delacroix, were made and shown before Fromentin was famous. But when his turn came, what sort of preparation for the task did Fromentin have?

He was bred to the bar, but forsook early the dryest, most Philistine of French professions for what was then considered one of the most Bohemian. The state of the artistic profession has changed widely since then. Nowadays there is none, even in the city where Murger wrote his famous novels of Bohemia, which contains more respectable, steady-going citizens. The Romanticists had fought and won while he was still a boy. Lamartine had sailed on his visits to sultans and sheiks when Fromentin was but twelve years old, and eight years later the youth who was to develop a passion for the scenery of the Sahara was haunting a studio and beginning to study landscape under the painter Louis Cabat. He did not have to wait until he had made his mark, and, by catering to the public, hoard money enough to travel. At the age of twenty-two, an archaeological society sent him to Algiers, where he found the Orient preserved even better as regards its old romantic vigor and color than in Asia Minor. Northern Africa has always been able to escape the worst effects of the great waves of conquest, and has been spared by many that submerged Asia and Europe. When Fromentin arrived, public attention in France was already strongly attracted to Northern Africa. Not so many years before, the Mediterranean had been unsafe through the depredations of the corsairs of that coast. With him came to Algiers a number of scientific men, of the army and not of the army, who were to write the magnificent series of the "*Exploration Scientifique de l'Algérie*,"—a preparation to the foundation of that imperial colony in Africa which the French have never ceased to dream of, and for which it used to be said that they neglected their defenses on the side of Germany. Eighteen months of travel and notes in Algiers made Fromentin decide to devote all his energies to the painting of Oriental subjects. It was characteristic of him that, having soberly made up his mind, he adhered to the

fixed plan until success began to wane at home, and he was convinced that there is an end even to the making of Oriental pictures. Was it that the French no longer cared for Algiers as much as before, or that he had worked out the vein? His critics, being Frenchmen, are apt to take the latter view; to foreigners there is some weight in the former. Whichever be correct,—and it is possible that there is truth in both views,—it was some years after the publication by the Government of the first volumes of the “*Exploration Scientifique*,” and the appearance of books on Algiers by Colonel Daumas and others, that the public began to take heed of the existence of Fromentin. From between 1855 and 1860 dates his influence on the Western world,—an influence which did not disdain to exert itself in other directions, namely, so far as regards the art of Holland and Belgium, and at one time with a glance at Venice, but which held mainly to the Orient. Beginning, in 1847, with the “*Gorges de la Chiffa*,” and two other pictures, the list of thirty or forty pictures shown is closed in 1876 with “*Le Nil*,” and the “*Souvenir d’Esneh*.” In 1849 a second medal was given him, in 1859 a first medal and the cross of the Legion of Honor; in 1867 another first, and in 1869 the officer’s cross of the Legion. In 1876 he died in Rochelle, the city of his birth, at the age of fifty-six.

George Sand described Fromentin in these words: “He is small and delicate in build. His countenance is strikingly expressive, and his eyes are magnificent. His conversation is like his painting and his writing, brilliant and strong, solid, colored, full. You could listen to him all your life. He was held in well-merited consideration because his life, like his temperament, was a model of delicacy, taste, perseverance, and distinction.” The verdict of George Sand is corroborated by the face that appears in the work of Louis Gonse,\* etched by Gilbert. In a few clearly reasoned and clean-cut lines, the portrait describes the character and life of the man. Fromentin was a literary artist in the high sense of the term, not in the mocking sense one hears in the studio. Very much of a painter, and very much of a *littérateur*, though he used his knowledge of art in his books, and turned his literary accomplishments to account in his pictures, he did not mingle and confuse the two. His mind was too

clear and analytical for that. His father was a physician who showed at one time a leaning to the arts. Yet Fromentin did not tend at first to the fine arts so much as to literature. He neglected the law for letters, and letters for art. His biographer, who had access to a great mass of material, consisting of notes, drafts for a book on Egypt which was never written, and early manuscripts, selects from the writings of the period before he left the law a piece that gives a pretty exact and methodical statement of his views on letters and the fine arts. It not only asserts his own leaning toward the latter, but draws an outline of the future. Was Fromentin something of a prophet, or was he a Roman so firm and wise that at twenty-one he could chalk out his future, and then carry through, step by step, the plan of his early life? The piece of verse is not bad. Naturally enough, Victor Hugo is on his mind. Hugo had just passed the ten most prolific years of his life, and had won his way into the French Academy. In this *Mot sur l’Art Contemporain*, the young advocate describes himself as an ardent follower of Hugo, but goes on to say that a greater than Hugo has cast the great literary leader from his throne; that one who is greater is Nature. Listen to a few couplets of the youthful production found among his papers:

“Chantre orphique, éternel, dont la voix nous captive,  
C’est lui qui jour et nuit tient notre âme attentive,  
Lui qui fait, sous ses doigts, sans mesurer les vers,  
Comme un orgue divin, palpiter l’univers.  
La Nature! oh! voilà le seul et le grand maître!  
Diapason auquel il faut monter son mètre;  
Caucase universel où chaque siècle alla  
Diviniser son œuvre; et l’urne est toujours là;  
Et toujours l’homme et Dieu sur la source écumante  
Sont penchés; l’un y puise et l’autre l’alimente.”

Twenty years later Fromentin found in Corot an artist who looked at nature in the way he thought right, and great was his applause of Corot till the day of his death. Would that he had found time to do what he proposed,—write an analysis of and commentary on the paintings of Corot. All we have are the hints of his opinion in “*Les Maîtres d’autrefois*.”

Besides nature and Victor Hugo, the young painter had a passion for Dutch art, already foreshadowing the writing of “*Maîtres d’Autrefois*” and the still unpublished material accumulated during various visits to Holland. Were it not for that keen and charming book it would be hard to realize that he delighted in Ruysdael, Hobbema, Metz, and Franz Hals. To judge only from his brilliant and spirited pictures of Arab life, from his Algerine falconers and Numidian lion-hunters, one would

\* Eugène Fromentin, Peintre et Écrivain. Par M. Louis Gonse. Augmenté d’un Voyage en Égypte. Paris: A. Quantin. New York: J. W. Bouton. This work is to be published in translation in America by James R. Osgood & Co.

hardly imagine that the staid and apparently unideal Dutch painters had been his earliest, as they were his latest, loves. But may we not trace in the sober measure of this early verse what we see in the etched portrait and read in George Sand's paragraph, what we find in "L'Été dans le Sahara," that delightful book of the desert, and in "Une Année dans le Sahel," hardly less pleasing? May we not already find the workman-like spirit joined to the dilettante hand, the thoughtful critic allied to the gentleman-amateur, the man possessed of literary sense conjoined to the lavish rhymester? Fastidiousness and a fine critical faculty are noticed at the outset; for a young writer the verse is above the average. But he dwells too long on one thought, and uses too many words to express it; he is too long in working up to his expression. Might not something very similar be said of Fromentin's painting? His care in the study of preparations are well known; the neatness and delicacy of his work are not to be too much praised. But does he in the end strike the highest note in art? Is he not always the fastidious critic rather than the hot-blooded genius? Without plainly stating it, M. Gonse allows one to guess as much, to infer as much from what he says when trying to define the style of Fromentin in painting. "Beginning to work at art comparatively late in life," remarks M. Gonse, "he never had the early drill that the great masters almost always obtained. Because he was a *littérateur*, to begin with, and at the same time a born painter (*de race*), something complex insinuated itself into his painting, and the result was a kind of art by no means such as the crowd enjoys." It was a kind of art that one needed to taste in small sips. This was particularly the case with his execution. At first it seemed neither very strong nor very striking, but the combination of qualities it contained becomes rarer every year, and perhaps will soon be entirely lost. The landscape-painter has to go to nature again and ever again, and we see what Fromentin says of nature. Hence it is that in landscape he is always marvelous. For the drawing of the human face and of animals a long, patient apprenticeship in the atelier is needed, and that Fromentin did not get. "Impressionism," says M. Gonse, "in the recent sense of the term, is a Utopia. Velasquez is an impressionist. Be it so; but an impressionist whose agile hand worked upon the canvas with an irreproachable skill and science." The biographer states that Fromentin was never satisfied with himself in regard to an animal seldom absent from his pictures, and which certainly adds a great charm

to the scenes. The beauty and movement of the Arabian horses were studied incessantly. He was always watching them in Algiers; he owned several in France. One of his fellow-painters has said that Fromentin drew horses much oftener and much better from memory or intuition than from life. M. Gonse insinuates that he did them better from *chic*, a word that has almost always a slightly disparaging meaning, since it refers to work done quickly, off-hand, without recourse to models. Lack of early drill in the profession is the explanation. Writing to a friend, Fromentin mentions his attempts to master the drawing of horses: "You know I had 'Euloge' and an Arab horse. I have used both, unfortunately without much system, learning everything and studying nothing really to the bottom; so that, after I have worked very, very hard, I am not in the least pleased with myself. I am no further along in the exact knowledge of my animal. He is a whole world in himself to study. I have scarcely begun, not to render a horse, but to comprehend his proportions; as for the knowledge of details most necessary to merely build him up, I am as ignorant of that as possible. Possibly the only use of the many studies and sketches which I bring back is the change I have made in air and in my studio, and the fact that I have had at Paris, under my eyes, in order to support and guide me, something which recalls nature a little bit." He used to have his horses led and ridden up and down before him in the hope of seizing the secret of their motion. Luckily for Fromentin, the photographic secret of the motion of the horse was not yet published when he died. Had he seen the distorted legs of trotters, as the instantaneous photograph faithfully reports them, and had he heard the chorus of wisecracks applauding these curiosities for the good effect they are expected to have on art, it is likely that he would not have waited till 1876 to die. He loved the Arabian mare. "Gentle and courageous beast!" he cries in "Une Année dans le Sahel." "As soon as the rider has placed his hand on her neck to seize the mane, her eye flashes and a thrill passes through her hocks. Once in saddle and the reins raised, the rider has no need to give her the spur. She shakes her head a moment, making the copper or silver of the harness rattle; her neck is thrust backward, and swells in a haughty curve. Then look how she rises under the rider and bears him off with those fine movements of the body which they give to equestrian statues!" Perhaps M. Gonse has laid too much stress on the inadequacy of Fromentin in painting his favorite animal, on the strictures made

THE QUARRY.

on Fromentin and lack of early drill in art. Criticism and explanations are likely to satisfy, or not to satisfy, the reader, according as he belongs to one party or the other,—according as he believes that inspiration can make up for the treadmill work of a profession, or insists that no amount of genius can overcome want of early training. Far be it from us to accept everything that M. Gonse says of Fromentin; for though a clear and agreeable critic, the biographer is by no means a powerful, luminous, or liberal one. But let us hear what are the traits he finds most evident in Fromentin. He is a delicate spirit among the most delicate, and to appreciate him one has to be a delicate person oneself. He is a painter who is sensitive in the finest meaning of the term, and therefore nervous, tender, and a little restless. His aims possess the highest distinction, and he remains purely an idealist while in pursuit of true expressiveness in nature. He never sacrificed the landscape of a picture to its subject or to its human element; nor, on the other hand, did he sacrifice the figure to the landscape. He always and everywhere sought to put his finger on the most intimate point of union between mankind and external nature. His dominant qualities as a painter are a refined sentiment for gesture and movement, a lively imagination, a happy gift of composition, in which he used choice and elegant forms, and the ability to render effects of light in their infinitude of surprises. His virtues consisted of an aristocratic form of private tastes, of reserve in manners, of absolute respect for himself and his talents, and, perhaps, excessive dislike to noise and pugnacity. His special mark will always be an extraordinary power of memory, a power that was at once that of the spirit and that of the hand. As a painter he had more instinct than education, and very often his instinct guided him better than patient studies. The goal he fixed before him was clear and simple—to make men actually live in the life of the nature about them. Seldom is he naïf; but he is always sincere. His influence on the art of his contemporaries was neither very loud nor very apparent, but it was strong and continuous. His words, his counsels, his encouragements, were not lost upon a group of young artists whom he took under his patronage. Perhaps he would have had a wider effect had he lived a few years longer, for he left among his papers a manifesto incomplete, but written with great care and sincerity, on the æsthetics of modern art. It was the basis of a lecture which he at one time projected, and contains many neat and ingenious sayings without evincing great originality or eloquence. The

style is more remarkable than the thought; and while the reader's heart never beats at a great or novel suggestion, it is impossible not to be filled with admiration at the workmanlike spirit, the finely poised temperament, that presided over its unfinished pages.

It was almost at the close of his life that Fromentin wrote "*Les Maîtres d'autrefois*," that most suggestive book,—of an artist, about artists, for artists and amateurs. It has appeared recently at Boston, in English.\* It is a series of brilliant studies of Rubens and Rembrandt, put together in an apparently hasty way and with a good deal of apology on the part of Fromentin. Here are, says he of the works of these two masters, two arts, distinct, perfectly complete, entirely independent of each other, and very brilliant, which require to be studied at once by an historian, a thinker, and a painter. That the work should be properly done requires the union of these three men in one; and I have nothing in common with the first two, while as to the painter, however a man may have a feeling for distances, he ceases to be one when he approaches the least known of the masters of these privileged countries. One may take Fromentin at his word, and yet derive the utmost pleasure from "*Les Maîtres d'autrefois*." It is true enough that his study is incomplete; nay, it is often hasty and in minor points inaccurate; it is sometimes superficial. But there are abundant signs that both Rembrandt and Rubens—the latter, perhaps, more than the former—excited his critical faculties to the utmost, and in consequence his pages are alive with earnestness. One feels him groping for the truth, and groping not merely to show his skill in criticising masters whose work few critics dare to analyze; but with the zeal of a man who may have it on his mind to apply to his own painting some of the discoveries he made. Not the least curious thing in this book is to note the reaction on the style of the critic of the spirit of the master he was writing about. Thus, about Rubens the writing is bold and decided, like the work of that genius; but about Rembrandt it is comparatively timid and sometimes really confused. On the whole the effect of the book is not that of a product of a mind thoroughly informed with its subject and entirely settled in its conclusions. Fromentin distinctly avers this, and in part assumes it intentionally. Yet one cannot avoid the

(AFTER AN ETCHING BY LEOPOLD FLAMENG. FROM A PAINTING BY EUGÈNE FROMENTIN.)

inference that if he had lived ten years longer, and allowed the effervescence of the powerful impressions made by the old Dutch masters on his lively, responsive, artistic temperament to subside, he would have made of this charming and brilliant series of sketches a work far more rounded, far more profound. We hesitate at his dicta about Franz Hals; we decline to go his lengths concerning Rembrandt as a painter, and even fancy that much that he writes about him is ill-digested and confused. It is picturesque, but not to be thoroughly trusted. Yet what are we saying? It sounds like a piece of flagrant ingratitude to quarrel with a book so full of delicate and independent research as "*Les Maîtres d'Autrefois*." When one reflects that the enthusiast, the sympathetic reporter of Oriental life in Northern Africa, is able to enter into and enjoy the entirely different art of Holland, respect must be felt for Fromentin's breadth of mind and acumen.

If Fromentin did not have a vivifying effect on the painters about him, his pictures and his books on the East told strongly on the public. The books were so charming in their descriptions of scenery, so full of enthusiasm for the Orient, so eloquent, that they made their way without an effort, after having been well received in their less perfect form in the *feuilleton* of the "*Pays*." The pictures won him friends and fame. Three were purchased by the French Government. Duplicates were sold without much scruple, and many of his pictures went to Great Britain and the United States. Their effect was quiet, but it was penetrating. There is no mistaking the earnestness and sincerity of a painter who does not, like Benjamin Constant, for example, use the Orient as an excuse for cloying pictures of odalisks, nor wearies one with an Orientalism that is false. The Eastern paintings of Gérôme, though sometimes cleverer, do not afford so much pleasure to gentle minds. Fromentin had none of the hardness of Gérôme, and lacked some of his smartness. His methods of work, both literary and artistic, may be seen in the fragmentary "*Voyage en Égypte*," which M. Gonse has printed just as he left it, in the short, but apparently far from hurried, notes of a traveler. Only Hawthorne could have exceeded Fromentin in the minuteness of his record, and in the curious fashion of talking to himself in his notes, and jogging his own memory, telling himself to be sure not to forget this or that point. In every Egyptian town he visits the quarter of the Almehs, and jots down the shades of color in their brilliant dresses, notes the effect of the gold coins strung in their hair, and the glittering of their eye-balls and white teeth.

The attention to colors is close and intelligent. This may be taken as a specimen from the Nile trip near Luxor. "Very near the Libyan chain, lofty, rosy, fallow-colored, fully lit by the morning sun, magnificent in outline. The Nile is evidently lower. It has recovered its large banks — (*reflections entire*). A pelican close by. Four shots at him — missed. The Nile like a mirror, all rose and *pale blue*. The greatest possible pallor. Banks should be ochre, bitumen, provided it is in the light. One little sail on a Nile boat shines white in the immensity of that blonde light. As strong as you will, so long as it is blonde, limpid, clear, flat, in every way pure. *Make it pure, never too much so!* Not to fear dryness, avoid it by the modeling of objects, choice of values, *thickness of tone*. Avoid reds. There are none. Measure distances by values, intensity of tones by one or two dominant spots, which are nothing but *blacks*, browns, blues; as a high light, a whitish blue, a cotton white. This on a pale river. Mountains *cendré* or rose, modeled or not, according to the hour. A soft sky. There is the whole of Egypt!" On the journey during which this was written he had the good fortune to witness the *fête* given by the Viceroy of Egypt to the Empress and the Emperor of Austria on the opening of the Suez Canal. The short, telling phrases bring the scenes before one quite as well as a careful rewriting would. It shows how seriously Fromentin took both his writing and his painting. Nothing was neglected that could be done to make each perfect, and the result was that in art he approached the best of his contemporaries, and that in literature he has been placed with justice beside Alfred de Musset and Prosper Mérimée. There was indeed a decided likeness between the personalities of these sensitive and fastidious men. The reward of all this taste, earnestness in work, all this prudence and thoughtfulness, was a quick and substantial appreciation at home and abroad, and the agreeable consciousness on the part of the painter and author that he was helping thousands of people to widen their intellectual horizon and enjoy with him that Orient which he studied and adored.

Nevertheless there are moments when one doubts whether Fromentin looked very deep into the life or the landscape of the East, notwithstanding the pleasant things said of him by his biographers and the delightful passages written by himself in more than one attractive volume. He was more occupied with externals than anything else. The colors of dresses made him give less attention to the expression of faces and the thoughts of the Orientals. The necessity to register in the

memory changing effects of landscape scattered his observation still more. One is inclined to wonder often whether, after all, it was not a loss to Fromentin to have been so highly gifted in two directions; whether, in fact, he did not suffer from dividing his forces. When one broods long over his Oriental paintings, this is what one comes to: they are beautiful, charming, fresh, individual, and most undoubtedly correct in their sweet, elegant, and delicate view. Of course they do not say all; but they do not say the best. They are not profound. They do not grapple with great thoughts or stir great emotions. They please; they do not thrill you with the indescribable feeling that comes at sight of a piece of great art. It would be expecting too much to demand this from Fromentin; but that is not the point. The question is raised by way of defining his position and separating him from other writers and painters who have worked in the same field, and also in order to mark the difference between a man who sets a fashion going and a man who aids a fashion. Fromentin did not discover the East in art, nor did he profoundly understand it; but probably he did more to popularize the Orient and the products thereof than any originator could. His work does not show the sturdy, deep-hued quality of a collection of rugs and carpets from Persia, in which usefulness seems to have been thought of first and beauty second. It is much lighter, finer, more gentlemanly, but it is far more open to the appreciation of Europeans and Americans in general. If not the prophet, then his nephew. Why, indeed, should any one demand of Fromentin the religious fervor and depth of thought of J. F. Millet, or the depth of tenderness and the originality of Corot? He was only too well aware of his own limitations, and he knew how to admire another painter without envy. He began by admiring Marilhat, and perhaps, on the whole, his work is nearer to the effects which Marilhat sought than the paintings of any other. But toward the close of his life it was Corot to whom his heart warmed, when, we may suppose, it was too late to enter the path which Corot pointed out. He loved him, Gonse says; he comprehended and admired him with an enthusiasm which was catching. Without beating about the bush, and almost with violence, he asserted that Corot was the Great Master, the living and generous fountain from which the school should drink. He believed him an innovator of the greatest boldness, a painter who had an incomparable delicacy of sentiment for light, one who possessed the highest degree of sensitiveness for what is just tone in painting. Instead of imitating

Corot, however, Fromentin merely varied his scenes when the public taste, or his own failing powers of invention and work, told him that the Orient of Africa would no longer do. In Europe there is no place, unless it be Constantinople, which has more of the Orient than Venice. The very gondolas one may guess to be imitations of the ancient boats that appear on the bas-reliefs of Egypt and Mesopotamia; the rowers stand, steer, and at the same time propel them in the very way we see them do when the Egyptian prince of five or six thousands of years ago is rowed out for a day's havoc among the cranes and geese in the long reeds of the Nile. So it was to Venice that Fromentin turned for new subjects, making there many sketches and exposing at the Salons for several years very charming pictures. But the public is always a queer monster. It seemed to have had no pity for a man who sought to please it with other fare, now that the old had palled. The Venetian pictures made no special mark. Destructive and humiliating war intervened. Fromentin was not destined to be one of the writers and painters who rode the waves as bravely after that crisis as they did before. His prime was passed as an artist, and, although Government continued to recompense him and the Institute accepted him, it was after the usual fashion of such distributors of rewards,—either as a payment for past merits, or else as an incisive and original critic, not for present eminence as a painter. Only as a critic he remained at a level equal with himself in earlier years, and we may believe that such regret for his loss as is purely selfish should apply to him as a writer, not as a painter. Suppose he had put his cool, clear, delicate mind on the subject of Venetian art? What a delightful pendant to his "*Maitres d'Autrefois*" would he not have composed! In view of his great services as a critic; in view of the intellectual pleasure afforded by his books on the desert and on Holland; finally, in view of the enjoyment he has given through his beautiful pictures, it is a little hard that one should be driven to assume an apologetic tone about him at all. He used his talents to their fullest extent and always aimed at the highest of which he was capable. So, when we enter a shop of bric-à-brac, and see among the tasteless and ugly things articles of real beauty; when we look about us, in the rooms of persons of good taste, at the strange and strangely charming products of Northern Africa, we might do worse than to think of Fromentin as a captain in the cause of the popularization of art.

*Henry Eckford.*

## ANASTASIA.

### I.

MR. FREDERICK HOUSTON entered the world at an inopportune moment, while his father was having dealings with the bankruptcy courts. One or two failures, however, were in Clayville among the normal incidents of a well-regulated existence, and were not even remotely associated with dark visions of ruin and despair. The unfortunate merchant shut his shop with a jolly bang, sold out his old goods at auction prices, closed with his creditors at ten or fifteen cents on the dollar, and within a month or two was again started on the high road to prosperity. The arrival of a son at this juncture seemed to Mr. Houston rather a happy omen; it roused his ambition by reminding him that he had a stake in the future.

The first memorable incident in the career of the youthful Frederick was a concert which Ole Bull chanced to give in the town of which he had the misfortune to be a native. The musician, who knew nothing of this western town except that it was named Clayville and had two thousand inhabitants, succeeded in mustering a sober and stolid-looking audience of about fifty persons, who sat staring before them in apathetic silence, and seemed as unmoved by the alluring melodies as if they had been figures carved in wood or stone. His agent was heard to say the next morning, at the Tompkins House, that they were out of pocket, and that his "boss" was in ill-humor. Nevertheless, I venture to believe that the famous violinist would not have regretted his visit to Clayville if he had known that he had awakened the immortal spark in one youthful bosom, and lifted a humdrum life into a nobler and purer atmosphere. Frederick Houston, who had been admitted to the concert-hall by the special favor of the door-keeper, lay awake all that night rehearsing the *Carnaval de Venise*. Frederick was then fourteen years old, and had just quit-  
ted the public school for the purpose of learning business in his father's store, where all the commodities of life, from dry-goods and ready-made clothing to drugs and groceries, were exchanged for cash, or for grain, flour, pork, or any merchantable product of the surrounding country. Now, however, he took a sudden dislike to "business," and could not be persuaded to entertain the thought of a mercantile career. He devoted himself with greater energy to the construction of certain enigmatical musi-

cal instruments, and finally composed a harp which became the dread of the neighborhood. It was therefore purely in self-defense that his father bought a harmonium of three octaves and a half, which to him represented the final achievement of the race in the way of musical perfection.

It was about this time that Mr. Houston, senior, surprised the community by erecting a palatial residence with a mansard roof, Gothic windows, and a spacious porch supported on Corinthian columns. Possibly this unwonted exertion, and the restless anticipation of his triumph, exhausted his slender vitality, for he had hardly time to move into his new palace before death overtook him. His eldest son was then, at his own request and by the advice of the minister, sent to the East to prepare for college. Mrs. Houston and the second son, Joshua, who for some indefinable reason had accepted the nickname "Bruin," continued the business, and, by shrewd and fortunate investments, rose rapidly in prosperity and social importance. Frederick, in the meanwhile, learned to scan *Arma virumque cano* and *Integer vixit*, perspired profusely over dactyls, anapests, and other metrical intricacies, but failed to extract either comfort or edification from his novel accomplishments. After all, it was but a divided allegiance he could offer to the Greek and Roman classics. He never spent an hour over a book without feeling that it was a loss of time which might be more profitably employed at the piano. Themes for sonatas, nocturnes, and impromptus were continually humming in the background of his mind, and he sometimes found himself unconsciously intoning the text of Livy or Cicero to the air of a Mendelssohnian oratorio. He took two music-lessons daily, and on Sundays three, composed tremendous conglomerations of sound, which he very appropriately styled "fantasias," and made himself an affliction to every one who had the misfortune to reside under the same roof with him, when finally he departed with his piano for Harvard. There was some talk among his fellow-boarders of accompanying him to the depot with a brass band; but the project was in the end abandoned, probably because there was not a person in the house who did not at heart have a liking for the guileless and generous enthusiast.

After a five years' residence in Cambridge,

during which he organized all manner of musical and dramatic diversions, and even composed an overture to Æschylus's "Prometheus," Houston scraped through his examinations and received the long-coveted diploma. He then obtained his mother's consent to visit Europe, where he hoped to spend three or four years and complete his musical education. After a long and not unprofitable sojourn in Leipsic and Paris, he was one day seized with a yearning for Italy, and, having convinced himself that France had nothing new to teach him in his art, he packed his trunks hastily and took the first train for Marseilles, whence again he embarked precipitously for Rome.

## II.

THE *palazzo* opposite to the house in which Houston had installed himself for the winter excited his liveliest curiosity. It had a severe and forbidding air, as if it were gathering up its skirts to avoid contact with its plebeian neighbors. There was a coat-of-arms (and, as he soon learned, a very famous one) carved in stone over the *portone*, and there were heavy iron gratings before all the windows on the first floor. In a niche in the wall stood a weather-stained marble statuette of the Madonna, with two swords (whose gilded hilts were much tarnished) piercing her heart; and at her feet burned a feebly flickering lamp whose yellow flame was completely drowned in the broad glare of the sun. The stucco of the wall, where it had not fallen off, was of a dirty yellowish color; but it had a certain rich tone of venerable decay, which would have made the house an object of benevolent interest if it had not been for the sinister stare of the upper windows, which immediately chilled one's neighborly sympathies.

Houston was fully conscious of the look of haughty reserve which he received in return for every friendly glance which he sent across the street; but he was not in the least discouraged, and always returned with persistent good-humor to his post of observation after his daily excursions among the ruins of the Forum and the Campagna. He became possessed with the idea that this very intangible look, which haunted him early and late, might be expressed in music, and he forthwith resolved to embody it in the introduction to an immortal sonata. It must be an *andante* movement full of vague and remotely expressive chords in some grave and not too complex major key; then, as the theme gathered intensity and fullness, a transition might be made into a more tangible emotion—a

proud and solitary grief which nurses its own misery and scorns the comfort of human pity and fellowship. Whether in the end this frozen sorrow should be dissolved in penitential tears was as yet undecided. Houston believed in a very sparing use of the minor keys, and was inclined to guard the honor of his palace by according it a tearless and unrepentant decay.

One evening, in the middle of November, Frederick was walking up and down in the street in front of his lodgings, laboring desperately with the opening bars of the immortal sonata. His chords, which now and then he stopped to jot down in his note-book, persisted in assuming an air of mere commonplace and ostentatious *hauteur*; and when occasionally he found a combination of notes of a sufficiently ethereal quality, he remembered in the next moment that he was unconsciously echoing Chopin. It was in one of these moments of despairing humility that he turned about and cast a glance of hopeless appeal at the façade of the palace, which rose calm and stately in its decay (like a monarch in a ragged toga) out of the misty, shimmering moonlight. A breath of wind stole down the street, and the long, fine grass which depended from the crevices of the coat-of-arms and half draped the cornice of the *portone*, waved him a silent greeting. The pansies, too, which grew on the ledges of the window-caps, shook in the wind and looked as if they took a modest pleasure in the motion. Houston stood long questioning the unresponsive walls; he felt their character intensely; but the gate of communication between the realm of vision and that of sound seemed absolutely closed. He could not translate the language of the one into that of the other.

Suddenly he became aware of a presence near by; he turned his head and saw a young girl standing at the great gate of the palace, and apparently trying to raise the enormous brass knocker, whose grotesque, faun-like features smiled grimly at her in the moonlight. Houston, without much ceremony, approached her and offered her his assistance, which she readily accepted. He gave two emphatic raps, which startled a mighty resonance from within and rumbled away through the empty halls and corridors. The girl in the meanwhile had stepped into the middle of the street, and stood gazing with a look of anxious expectancy toward the upper windows. She was of middle height, not ungraceful, but almost preternaturally slender. Her face, which was pale and thin, but showed traces of exquisite modeling, wore an expression of pathetic helplessness which could not fail to touch our sympathetic traveler. There was in her large black eyes something of

that ethereal and rather unhealthy glow which he had observed in Carlo Dolce's madonnas. The contrast, moreover, between the refinement of her features and the extreme shabbiness of her attire stirred all the romantic possibilities of his nature.

Presently footsteps were heard from within, the heavy gate creaked on its hinges, and a stout, austere-looking domestic with a powdered wig and a lantern in his hand appeared in the opening.

Houston moved discreetly away, while the girl drew timidly nearer.

"Monsignore is not at home," he heard the servant saying, "and moreover, he does not like to be disturbed at this hour."

"But I must see him, Pietro," the girl pleaded with a pitiful quiver in her voice; "if he is not at home, I shall wait until he arrives."

"A curse on your impudence, wench!" grumbled the servant. "Have I not told you that Monsignore does not wish to be disturbed?"

The girl made hastily the sign of the cross on her forehead and breast, to counteract the effect of the curse.

"We are dying of hunger," she said, bursting into tears. "Monsignore has been away for five months, and he has sent us nothing."

"Why don't you go a-begging then? Better folks than you have taken to it. Bind up one of your legs under your dress, and get a pair of crutches, and nobody will guess that you are not a born cripple. Take your station on the road to San Pietro in Montorio, where all the foreigners go in their carriages. That is an excellent neighborhood. Cry to every carriage that passes, 'I am dying of hunger,' and with your big eyes and piteous face you will make an easy and honest livelihood. Now you must hurry away. *Ecco*, I have counseled you well."

The girl stood weeping silently, but did not stir.

"Quick now, I must close the gate."

"Have pity on me, Pietro, and allow me to speak to Monsignore."

"*Santissima!* A thousand devils have possessed you. If you do not go, I shall strike you,—I shall fling you out into the street!"

The words were accompanied by a threatening gesture; and the girl, expecting a blow, gave a shriek which resounded sharply through the still and empty street. Houston, who was only a few feet distant, turned abruptly about, and yielding to his chivalrous impulse rushed against the portly figure at the gate.

"You contemptible coward!" he cried, clutching the powdered gentleman by the throat. "Get down on your knees, I tell you, and beg the child's pardon."

There was an animated scuffle which lasted several minutes; then the assailed, in his enforced backward march, stumbled over a stone and fell on the marble pavement. His lantern, which had fallen from his hand, had burst open and lay faintly flickering at his side. He breathed heavily and fixed a terrified stare on Houston, whose features were but vaguely defined to him under the dusky archway. Then with a startling suddenness he found his voice, and gave a yell which went careering with increasing violence under the vaults of the stairway and the upper galleries.

"You are at liberty to rise," said Houston quietly. "I don't want to kill you; I only wished to give you a lesson, which I trust you will remember, not to vent your brutal strength on defenseless women and children."

The servant, with a shamefaced air, picked himself up, rubbed his hand over his close-cropped scalp, which he now found to be minus its wig, stooped to re-adjust the wick in his lantern, and finally turned to mount the stairs. But at that moment the glare of a lamp fell from above, and a tall, thin figure in knee-breeches and a short ecclesiastical *talare*, was seen slowly descending. He held in one hand a Roman brass lamp of the Pompeian pattern, and in the other a gold-headed cane, upon which he leaned heavily. He moved with difficulty, and yet with a certain worldly elegance, and there was something extremely genteel in his very decrepitude.

"Pietro," he cried, in a voice which resembled the creaking of a door, "I heard a scream as of one in distress. What has happened?"

He had stopped at the foot of the broad staircase and had lifted the lamp to the level of his head, in which Rembrandt-like illumination the sharp lines of his face became doubly emphasized.

"Pardon me, Monsignore," said Houston, stepping forward and politely lifting his hat, "if I address you without your invitation. I was passing your house by accident, when I heard the shriek of a young girl, and supposing that your servant here had struck her, I took upon myself the duty of chastising him. My name is Mr. Frederick Houston, an American, and I live in No. 134 of this street. If you desire to call me to account, I shall be at your service."

"I desire to have nothing whatever to do with you, sir," answered Monsignore, with a snarl; "if you have no objection, I will bid you good-evening."

Houston lifted his hat once more, and was about to retire, when the young girl, of whose presence he had not been aware, stepped out of the darkness and tremblingly approached the ecclesiastic.

"*Eccellenza*," she said, seizing him by the hem of his robe, "we are dying of hunger. We have been quiet as long as we could, but now death is stealing upon us, and we have no strength nor courage left."

A cloud gathered on Monsignore's forehead, the deep wrinkles of his brow grew deeper, and his lips assumed a fixed and inexorable look. Then, as if by chance, his eyes strayed toward Houston, who had taken his station at the girl's side.

"You have not yet done me the favor to betake yourself away," he said, with studied courtesy.

"Nor do I intend to do you that favor," replied the American firmly, "until I see what becomes of this child. If you do not help her, I shall myself see that she suffers no want."

"It would be cruel to question the probity of your intentions," remarked the other, with a sneer. "But you may safely leave this girl's future to me. A worthy pauper never calls upon me in vain."

So saying, he pulled a very elegant pocket-book from an inner pocket and handed two five-franc notes to the girl. She kissed his hand dutifully and moved away, followed by Houston. He hailed a *fiacre* from a neighboring street-corner, paid the coachman, and, as she showed some reluctance to enter the vehicle, almost lifted her into it. He listened intently to the address she gave to the driver, made a memorandum of it in his note-book, bade his *protégée* a friendly good-night, and crossed the street to his lodgings.

### III.

THREE days had passed since Houston's interview with Monsignore. The immortal sonata was yet unfinished, but the haunting visions of sound, as yet uncrystallized in melodies, had lost something of their tantalizing remoteness, and had approached the domain of definite sensations. The theme itself, as expressed in the opening *andante*, was superbly, yet unaffectedly, original, and had, moreover, that rare poetic afflatus which among modern composers is found only in Chopin and Schubert. It was his preoccupation with this sonata which had prevented him from going in search of the young girl, whose address he still carried in his breast-pocket. To be frank, the personality of the decrepit

ecclesiastic had during these three days exerted a much stronger fascination over his mind than that of the pale, dark-eyed girl. The impression grew upon him that Monsignore was but an epitome or personification of the dismal and haughty palace, and that, on account of his consequent semi-unreality and undeniable picturesqueness, he could hardly be held responsible for his presumable wickedness to the same extent as ordinary mortals. I am ashamed to admit that Houston, on purely æsthetic grounds, found himself on the point of transferring his sympathies from his helpless *protégée* to her supposed persecutor.

It was already deep in the night, and a misty stream of Roman moonlight poured in through the uncurtained windows. Houston was sitting at his piano, his head thrown backward, his fine eyes now half closed, now lifted ecstatically toward the ceiling. The *andante* was completed, and he was giving vent to his happiness in an improvisation full of capricious transitions from bubbling, boyish glee to deep, transcendent joy. He was just in the midst of a jubilant strain, when suddenly a hoarse shriek rose in the night, followed by a long, smothered groan. Houston sprang to the window and gazed across the street. He observed that one of Monsignore's windows was wide open, and that the Venetian blind had apparently been torn down from the top; for it covered only the lower half of the opening, and was at a very acute angle to the frame. This circumstance seemed somewhat suspicious; but the young man still hesitated, hardly knowing whether so slight an irregularity would warrant him in intruding. Several minutes elapsed in silence; only the Venetian blind seemed occasionally to give a sudden jerk, and to strike forcibly against the window-frame. Houston seized his hat and a revolver which his mother had urged upon him at parting, but paused again, irresolute, in the middle of the floor. Then he saw distinctly a head, black-haired and evidently the head of a young man—appearing above the top of the blind. In a few moments he had reached the street, dashed against the *portone* of the palace, which, to his surprise, he found unlocked, and reached breathless the top of the marble staircase. The robber, whoever he was, had taken few precautions; the outer door was ajar, and a dim, moon-like lamp burned under the ceiling in the hall. Houston leveled his pistol and tore open the door which he supposed led to Monsignore's study. A tremendous Italian oath was his greeting; the black-haired youth whom he had observed from beyond the street rushed against him with clenched fists,

but, seeing his weapon, started back with another imprecation.

"Sit down!" commanded Houston, pointing to a large easy-chair in the remotest corner of the room. The young man sulkily obeyed, then buried his face in his hands and burst into tears.

Houston, from his safe station at the door, cast a glance around the apartment, all the appointments of which had an air of grand and scholarly elegance. A splendidly carved desk, which stood between the windows, had been broken open, and the contents of the small drawers had been scattered about on the floor. Near this desk, half hidden under the blind and a heap of papers, a pair of slippered feet were visible, to which was attached the general outline of a long and bony figure. Frederick, still with one eye on his prisoner, approached the window, lifted the blind, and beheld Monsignore lying on his back, with his hands and feet tied, and a handkerchief thrust into his throat. He still breathed, though with much difficulty, and the effort had swelled the veins on his brow, and made his face a dark copper color. He fixed his gray eyes on Houston, not beseechingly, but with an expression of cold reserve, as if he were rather inclined to resent his intrusion. Nevertheless, the American stooped down and snatched the handkerchief from his mouth, being for the moment quite forgetful of the robber, who still sat sobbing in the corner. The situation seemed to Houston most extraordinary: a weeping criminal, who neglected his chance of escape, and a victim who resented his rescue from the jaws of death.

"Vittorio," whispered Monsignore, feebly; and, as there came no response, he cleared his throat and repeated more loudly: "Vittorio!"

The young man arose, wiped away his tears with a large yellow handkerchief, and, with a half defiant, half respectful manner, approached the window where Monsignore was lying. He was a beautiful lad, about twenty years old, of light, graceful build, and with a face of the Masaniello or Fra Diavolo type, as idealized in a romantic opera. There was a sort of reckless, dare-devil expression in his features which was extremely becoming to him, and the *tout ensemble* of his personality reminded one strikingly of a Mercury from the best Greek period.

"Vittorio," said the ecclesiastic, "untie these cords immediately. Then betake thyself away, and we will not further trouble the Signore Americano."

"My one thousand francs, first!" cried Vittorio, flinging out both his hands, with a gesture of defiant appeal. "*Santa Madre*

*di Dio!* I am poorer than St. Anthony in the wilderness; and you, Monsignore, you dine with the Holy Father and ride in a *coupé*, and live in a splendid palace. But the devil has stretched out his claws to grab you, Monsignore, because you have denied your own flesh and blood, and starved your children, and trodden them in the dust. If you think that you can place a gentleman of my pretensions in the world and not pay for it, you make a miscalculation, Monsignore. I want one thousand francs, and not a *soldo* less; and I want them to-night, because your promises, Monsignore, are not worth a puff of smoke."

"Remember the presence of the Signore Americano, Vittorio," said the ecclesiastic, in a warning voice. "I have but five hundred francs in the house, and I will give them to you if you will untie these cords immediately; otherwise I shall ask the Signore Americano to assist me."

"Ah, *Santissima!*" cried Vittorio, with a gesture of passionate remonstrance. "You are a cunning old fox, Monsignore, and if you were not my father I should have plunged a dagger into your throat instead of a handkerchief. There was Anastasia, my sister, the miserable thing, she wept and begged you for money because my mother and the two little ones were starving. And your servant struck her, Monsignore, and you gave her two contemptible five-franc notes, because the Signore Americano refused to go away until she was satisfied."

"*Vittorio mio,*" interrupted Monsignore, in a dry, dispassionate tone, "I have told thee that I have only five hundred francs. Behold, thou shalt have them."

"*Bene, benissimo!*" ejaculated Vittorio, pouncing upon a magnificent bronze figure of the young Narcissus, which stood on a porphyry pedestal, against the wall. "I will take this as security for the remaining five hundred. You can redeem it, Monsignore, within a week; and if you fail to call, you will find it at the '*Monte di Pietà.*'" \*

Monsignore gave a groan, and now, for the first time, looked appealingly at Houston.

"Signore Americano," he said, half hesitatingly, "I am compelled to ask a favor of you. Will you force this young miscreant to replace the Narcissus on its pedestal?"

"He seems to have a claim on you, reverend sir," answered Houston, "and I am not at all sure but that the right is on his side. I came here to protect you from physical maltreatment, and I am willing to free your limbs, if you desire it. Even though I

\* The great municipal pawn-office.

disapprove of the young man's resort to violence, I intend to place no further obstacles in his way."

Monsignore lay silent for a minute or two, during which Vittorio flashed a succession of most significant glances at Houston; the first expressed gratitude, the second contempt for the miserable old miser, the third triumph, and the fourth had apparently a more sinister meaning, which the American failed to interpret.

"Vittorio," began Monsignore at last. "Go out into the hall for a moment and remain there until I call thee."

Vittorio, feeling now a complete confidence in Houston, gave the latter another brilliant look, and did as he was commanded.

"Signore Americano," whispered the old man, beckoning Frederick nearer to him. "I know that you are a *galantuomo*—a man in whom I can trust. You will not abuse the confidence of a helpless old man. Go to the pedestal of the Narcissus and push it aside. Then lift up the tile on the floor and bring me the roll of gold which you will find there. I would do it myself, but the pedestal is too heavy, and I cannot move it without Pietro's assistance; and the vagabond has gone to see his wife to-night, and will not return before morning."

Houston stooped and gently untied the cords, then, without much difficulty, lifted the pedestal and the tile, and uncovered a heap of shining Napoleons; he was just about to put his hand on one of the rolls, when Monsignore, suddenly repenting of his rashness, came creeping rapidly toward him and flung himself, with an air of breathless anxiety, over his treasure. His haughty mien had entirely vanished; he seemed no longer the splendid aristocrat he had been but a few days before, but only a feeble and contemptible old man. Raising himself on his elbow, he took the gold pieces one by one from their hiding-place, counted them slowly and reluctantly, while his eyes now and then sought Houston's face with a frightened and distrustful look which was truly pitiful.

"I will bid you good-night now, Monsignore," said Frederick, when he had lifted the pedestal back into its place. "You need not fear my betraying you, and I hope I shall never incommode you again."

Monsignore stared, but did not speak.

"Wait one moment," he said at last, hoarsely. "Wait till the young miscreant has gone. Do not leave me alone with him."

Houston went to the door and called Vittorio, who, without much ceremony, swept the money into the palm of his hand and then jingled it delightedly in his pockets.

They then both made a profound bow to Monsignore and took their leave.

#### IV.

It was about sunset the next day that Houston found himself strolling across the Ponte Sisto toward that part of the city which is called the Trastevere. The sky was clear and warm, and the saffron gilding of the sunset lingered along the western horizon. A pine to the westward lifted its broad crown against the golden blue air, like a saint in a preraphaelite picture, and seemed ablaze with a deep, subdued glory. The bells of the Santa Maria in Trastevere, sent forth now and then a drowsy and listless sound, which blended well with the calm mood of the evening. Houston had never felt the peculiar fascination of Rome so intensely as he did at this moment. Each successive impression stole with a soft and noiseless tread into his soul, and again glided out to give place to something still rarer and more beautiful. Alured by a tempting vista of crumbling walls, quaint doorways, and ragged children, he turned into a side-street which runs up along the bank of the river and presently loses itself in the labyrinth of narrow *vicoli*. Here there was yet a flavor of the old papal Rome, the gradual disappearance of which foreign artists and tourists are bewailing. Here clotheslines are strung across the street from wall to wall, and the wet linen deposits occasionally a startling drop on the top of your hat; shrines of the most primitive kind, with rude wax figures and ornaments of pathetic tawdriness, meet you at every corner; all species of dirt flourish in broad publicity, and, finally, the streets themselves have been suffered to retain the names of their favorite saints, probably because they are too mean to be honored by those of Italian patriots. There was to Houston something very beautiful in the *naïveté* which enables a Roman without profanity to call the street in which he lives The Street of Jesus (*via del Gesù*) or The Street of the Holy Spirit, and aesthetically it seemed to him a loss to exchange such names for *via Garibaldi* and *Corso Vittorio Emmanuele*, which, after all, belong to the same class as *Franklin* and *Adams* and *Washington Street*. It was some such reflection as this that was passing through his brain as he accidentally stopped to read the inscription on a street corner and found it to correspond exactly with the address which he carried in his pocket-book. It was here, then, that Anastasia lived, and very likely Vittorio too.

"Can you tell me, Signorina," he said to

a young girl who was just passing with a pitcher of water on her head, "if a youth named Vittorio lives in this street?"

"In sooth, Signore, there are two Vittorios living in this street," she answered, with a look and a voice which, it is said, are not found outside of the Trastevere. "Vittorio the Blond and Vittorio the Black."

"Vittorio the Black is undoubtedly my man," replied he, smiling at the ardor of her manner.

"Ah, the Black Vittorio!—he lives in the house there with the gate, and the flower-pots on the wall."

Houston approached the gate which she had pointed out to him and cautiously pushed it open. He saw before him a small rectangular court, in which fragments of ancient marble lay scattered about, and in the corner of which stood a crude statue, apparently of the Emperor Commodus, with a much-battered nose and a generally humid and earth-stained look, as if it had been recently excavated. On the imperial head a piece of baby linen had been hung out to dry, and over the outstretched arm was flung some article of feminine apparel. The walls had once had a coating of stucco, but it seemed a century or more since this had disappeared; the gray stones were now distinctly visible, and the whole house had an aged and time-eaten look. A much-worn stone staircase ran up to the second floor, where there were two windows, protected by wooden lattice-work; but, as far as Houston could discover, there were no window-panes. As he was mounting the steps, he perceived that a thick volume of smoke was issuing from the chimney, and he heard voices in animated conversation.

"We will make St. Magdalen blacker than sin had made her," said a male voice, which he instantly recognized as that of his acquaintance of yesterday. "Her newly discovered modesty needs protection. We will wrap her in a robe of smoke."

"Fie! for shame, Vittorio," cried a softer voice, in rich cadence. "If you don't beware, St. Magdalen will singe your own flesh and burn it with fever, in order to repay you for your mockery."

"The Virgin preserve me from singeing her flesh!" said Vittorio, laughing. "That would be a clear loss to me of at least five hundred francs. I only want to brown her so as to make her look three or four hundred years old, and then sell her to some wealthy American as a Correggio or a Battoni."

"But surely that would be a great sin, Vittorio," said the voice of Anastasia. "If I had known that that was the use you wanted to make of the picture I should never have copied it for you."

"But, Anastasia *mia!*" ejaculated her brother, "if the Holy Virgin did not wish her faithful ones to profit by the ignorance of the heretics, why then should she send them by the thousands to our very doors, with their purses bursting with Napoleons! Does she wish needlessly to tempt us, and to entice us to sin?"

That was a puzzling problem to Anastasia, and she was not equal to its solution.

"Is there, then, another god who takes care of the foreigners, Vittorio?" she asked, in the tone of one who is anxious to be instructed.

"No, you foolish child. The devil takes care of them while they are in this world. How else do you suppose they could get so much money?"

Houston was too much entertained by this conversation to have any scruple about playing the eavesdropper. Now, however, as Anastasia did not seem disposed to continue the argument, he gave three smart raps on the door, whereupon a solitary black eye appeared at a hole in the panel, and three excited voices within were heard exclaiming: "The Signore Americano." Then there came a sound as of hurried sweeping and moving about of furniture, and finally, at the end of a few minutes, the door was opened by Vittorio, who smiled and bowed and showed his white teeth in a very distressing manner.

"Signore must excuse the smoke in the room," he said, blandly. "When the wind is from the east our chimney always smokes."

It occurred to Houston, as he seated himself on a low chair near the door, that his visit must appear very extraordinary to these people. He was just beginning to feel awkward, when fortunately he had a happy inspiration.

"I have heard," he remarked, "that the signorina" (he called every unmarried Italian woman signorina) "is very skillful in copying old paintings. There is in the Borghese Gallery a Danaë by Correggio, of which I am very anxious to procure a good copy. If the Signorina Anastasia would undertake to copy it for me, I should be happy to give her the order."

This proposal was made the subject of a long and lively debate. Anastasia insisted that she was not able to make a really good copy of so great a work; Vittorio was even more emphatic in his assertions to the contrary, and finally the mother, a tall, serious woman, with a four-year-old child on her arm, entered upon the scene, and mildly persuaded her daughter to accept this providential chance of earning some money, of which they were greatly in need. Before Houston took

his leave, it was decided that he was to meet Anastasia the next morning in the Borghese Gallery.

## v.

DURING the month that followed, Frederick became very familiar with the street which, under two different names, leads from the Piazza di Spagna to the Piazza Borghese; and the jewellers and dealers in antiquities, who stood in their doorways as he passed, smoking their morning cigars, began to nod to him as to an old acquaintance, and to hail him with some sonorous Italian greeting. He found it hard to restrain his impatience and wait for the time when the gallery was to be opened, and he was thus frequently compelled to spend a dreary half-hour in one of the curiosity shops around the palace, admiring with one eye an ancient snuff-box or cameo, and with the other casting furtive glances toward the nearest street-corner. He flattered himself that his conduct was the perfection of diplomatic duplicity, and yet there was hardly a tradesman in the Via della Fontanella di Borghese who had not long ago guessed his transparent secret.

Anastasia's appearance had undergone a marked change since the day when he first met her. Her dress, though yet simple, was beginning to show occasional touches of prosperity: a modest little round hat took the place of the unpretending red and yellow kerchief, and bits of picturesqueness, neatly disposed with a view both to economy and effect, and pathetic imitations of fashionable novelties, indicated plainly that her courage and hope were reviving. There was even at times a faint suggestion of color in her pale cheek, and the unearthly glow in her eyes was quenched or receded out of sight; then a touchingly childlike expression of happiness would beam out of her countenance, and she would chat in a gay, but subdued fashion, while she bent over her canvas or stood off to measure an effect, by looking with narrowing eyes over the back of her uplifted hand. At such moments Houston would find her absolutely bewitching. If he succeeded in making her laugh, he felt as pleased with himself as if he had made a witty repartee at a dinner-party. There was in her whole personality something hushed and subdued, from which he inferred that she had been tyrannized over and needed tenderness and cautious encouragement before she could bloom out into her natural self.

Their talk was usually about art and artists; but sometimes, when the opportunity seemed favorable, he would indulge in an au-

tobiographical retrospect, and relate to her scenes and incidents of his early life, hoping thereby to beguile her into similar disclosures. But in these efforts he was signally unsuccessful. She seemed to feel honored by his own confidences, and listened to them with a shy and grateful interest which was charming to behold; but she never volunteered to give parallel passages from her own experience. He hardly knew how to interpret this cautious reserve of hers in all things relating to her personal history. He was at first inclined to attribute it to excessive modesty; but the recollection of her mysterious visit to Monsignore soon convinced him that she had a secret to guard, which perhaps he had no right to pry into. She did not know, of course, that Vittorio in his wrath had betrayed their true relation to Monsignore, and Houston was not the man to allow her to suspect that her efforts at concealment were of no avail.

At the end of five weeks the picture was completed. It was a delicate and conscientious piece of work, minutely studied, exquisitely correct, and yet lacking withal the joyous Pagan spirit of the Renaissance. As a piece of color it was admirable. The beautiful and allusive *chiaro oscuro* was rendered with a skill which was fairly astonishing, and the difficult modeling displayed a feeling and a delicacy of treatment which were far beyond anything which Houston had dared to expect; and, for all that, it was easy to discover that the picture in its *tout ensemble* had remained a riddle to the fair copyist.

"Tell me, Signorina," said the American, as he stood before the completed picture, congratulating himself on the excellence of his investment, "where and how did you learn to paint?"

"I went for four years to Gigi's and learned to draw," she answered in her usual hushed voice. "Then I went for two years more to the *Accademia di San Luca*."

"Pardon me," he said, with a kind of appealing tenderness, "but you need not answer me unless you are perfectly willing. I supposed you were very poor, Signorina."

"So we are," she replied, with an effort, while a deep blush spread over her cheeks. "It was Monsignore who sent me to the drawing-school and to the academy."

He felt as if this first personal confession were an indication that he had made a great advance in her favor; and then for the first time it occurred to him that he had during these five weeks (although he had played the part of a patron) been assiduously endeavoring to establish himself in her confidence and friendship. He was astonished at his own energy and perseverance. He did not belong to the

type of man who conquers by dash and bold assumption of superiority; he had not the slightest pride in his appearance, although he was a refined and fairly good-looking fellow; he rather relied upon his intellectual advantages, in which he did take a little innocent pride, and his unconquerable kindness and good nature.

They lingered for more than an hour before Titian's Earthly and Heavenly Love, not so much because the picture interested them as because they were loth to part. There were no other visitors in the gallery; only the custodian walked up and down on the floor, shaking his keys impatiently.

"I may have chosen an inopportune moment for paying you," said Houston; "but now the picture is mine, and, unless you allow me to come to your house, I may never see you again."

He handed her five hundred lire in Italian paper.

"That is too much of a golden rain!" she exclaimed, smiling with an embarrassed air. "I cannot consent to take so much, Signore. My picture is not worth it."

"It is worth ten times that amount to me," replied he, with ardor. "Your money is well earned, Signorina. Take it and enjoy it. I only regret that by paying you I lose my last hold upon you. I shall have no excuse for going to see you again."

She took the crisp bills half reluctantly, folded them deliberately, and put them into her bosom. At the gate they shook hands and parted. She had never yet allowed him to escort her through the streets, and the way in which she ignored his desire to accompany her was sufficiently pointed to amount to a dismissal.

## VI.

THE rest of that day was intolerably long to Houston. He played, but even Beethoven seemed trite and meaningless. He began to read in an exquisite little vellum-bound copy of Tasso, but Tasso was dull and his sonnets seemed pointless. To kill the time he went down to the American banker's, on the Piazza di Spagna, stared blankly at the newspapers, and now and then exchanged a vapid remark with some compatriot who found that "Rome was a fraud," and that the Coliseum and the Forum had been very much overrated. He lounged for an hour in the bronze shops of the Via del Babuino, drank a cup of chocolate at Nazzari's, and finally went to Spillmann's to dine. Here he met two American friends, who persuaded him, for want of better occupation, to spend the even-

ing with them at a *café chantant*, where the latest French and Italian songs were warbled by young ladies in a variety of airy costumes. It was about nine o'clock when they entered. The café was crowded with Italian officers and foreign pleasure-seekers. Houston sat down with his companions at one of the small round tables, and listened languidly to the shrill and jerky melodies:

"Io vado in gondola, vado a Venezia,  
La mia amorosa vado a trovar."

Just as the song was at an end and he had risen to go, he heard voices in vehement altercation in an adjoining room.

"Let us stay and enjoy the fun," cried one of his comrades. "Let us go and see what the rumpus is."

In jolly humor they pushed through the crowd and forced the door open to a smaller apartment, where a dozen men were gathered about a gaming-table. One young man, in whom Houston instantly recognized his friend Vittorio, had clutched a handful of bank-notes in his left hand, while with the right he was gesticulating furiously, shouting all the while at the top of his voice. The tears flashed in his brilliant eyes as he demonstrated to the bystanders how his opponent—a small, sullen-looking man—had cheated him out of his hard-earned money, and meant to snatch the bread out of the mouth of his poor mother (upon whom he lavished endearing and commiserating adjectives), and his feeble sister, whom he was supporting by the sweat of his brow, etc. He was just in the midst of this touching harangue when his eye suddenly caught Houston's glance; he grew pale, stammered, and cleared his throat with a confused expression. Then, precipitating himself again into the midst of the argument, he advanced boldly toward the American, and shook his hand with extreme cordiality.

"This gentleman here," he said, "can vouch for the truth of what I have been saying. He knows that I am an honest and upright man."

The daring ingenuity of this stratagem quite took Houston's breath away.

"The question is not whether you are honest or not, Vittorio," he said. "If you have lost your money to this man, you must of course pay him; and, as I was not present, I cannot tell who is in the right. By the way," he went on, after a pause, "allow me to look at those bills. I shall return them to you on the spot."

"And why do you want to look at the bills, pray?"

"Just from curiosity. I suppose you had put them up as a stake."

"And how does that concern you, Signore?"

"It might concern me more than you think, Signor Vittorio."

"You shall pay dearly for that, Signor Americano."

A menacing glance shot forth from under the thick, Italian eyebrows, and Houston, having lost all inclination to act as umpire, slipped out through the crowd and into the street. He had no longer any doubt that Vittorio had stolen his sister's money. They were the same bills, all in fifty-lire notes, which she had received from him that very morning.

Frederick walked rapidly down the Ripetta toward the Tiber, crossed the Ponte Sisto, and plunged into the labyrinth of the Trastevere. The streets were almost deserted; only now and then some stately figure in rags would come stalking out of the darkness, loom up for an instant in the moonlight, and again vanish in the dense shadow. The house in which Anastasia lived was situated in a narrow *vicolo*, which ran down to the river, and terminated abruptly in a steep embankment; this embankment had once been surmounted by a low stone wall, of which yet some few scattered fragments remained; underneath, the current ran swift and silent, except when a swirling eddy swung in toward the shore with a fierce serpentine whisper. From the upper part of the street, where Houston was standing, meditating whether he should venture to rouse Anastasia, he could hear the hissing sound of the rapids, as they whirled and seethed and boiled, and then rolled out into the middle of the hurrying current. His indignation was still burning in his veins, and no sobering second thought, or conventional sense of propriety could convince him that it was not his duty to see Anastasia at once, and reveal to her her brother's villainy. He went to the gate and pressed gently against it; with a rusty creak it swung open. In the little court-yard the stately Commodus was still stretching out his arm with an imperial gesture toward the uninviting hen-coop. The moonlight flooded the narrow inclosure, and lent its radiance to the somber stone walls and the earth-stained marble of the emperor. Houston mounted the well-worn stone steps and knocked gently at the door. Light footsteps were heard within, the door was opened, and Anastasia appeared, barefooted, and with her black hair rolling down over her shoulders.

"Holy mother of God!" she cried, drawing her gown up around her neck. "What do you wish at this time of night, Signore Americano?"

"Do not be frightened, Anastasia," he hastened to reassure her. "I'll do you no harm. Put on your dress, please, and come out. I must see you. I have something very important to relate to you."

"I do not comprehend your words, Signore. How can you have any important message for me?"

"Believe me, I pray you, Anastasia. Before God, I would never harm you. I have seen your brother to-night, and what I have to say relates to him."

"Ah! Vittorio," she exclaimed, with a quick look of alarm. "I'll be with you in a moment, Signore."

Within a few minutes she re-appeared, neatly attired in her round hat and her demure little black gown. She led the way rapidly into the street, where she paused, and let her eyes wander uneasily up and down its dusky, tortuous length. "Come this way, Signore," she whispered, as a subdued male voice and a titter of girls reached her from a neighboring court, "this way, quick! or they will see us."

She seized him gently by the arm, and drew him into a narrow *vicolo*, which led down to the embankment of the river. Then she stood still, and riveted her eyes on him, with a gaze of anxious expectancy.

"My message is not a cheerful one," he began, folding his arms, and leaning against a projecting fragment of wall, "and I fear it will grieve you."

"Speak," she gasped! "is Vittorio dead?"

"No, he is not dead; but I saw him an hour ago in a gambling-house, where he was quarrelling violently—"

"Ah! then he is wounded," she interrupted breathlessly. "Tell me at once if it is mortal, —if it is dangerous."

"He is not wounded either," resumed Houston gravely.

She drew a long breath of relief. To her Italian mind there were no misfortunes comparable with physical injuries.

"What is it, then?" she asked in a lighter tone.

"You must pardon me, and allow me to tell you the whole story."

And he described the scene at the *café*, and the part he had himself taken in it.

"I dare hardly say what I think," he concluded by saying; "but I am positive, Signorina, that the bills which Vittorio held in his hand were the very ones I gave you this morning."

"And what if they were?" she whispered tremulously.

"Then I should conclude that he had stolen them from you?"

"No, he did not steal them from me. I gave them to him."

"Willingly, and of your own accord?"

"No, he struck me, and forced me to give them to him."

Here her voice shook still more perceptibly, and the tears gathered in her eyes.

"Does Vittorio often strike you?"

"Yes, whenever he wants money. I copy pictures and he smokes them and sells them as old masters; or, if I sell the copies, he takes my money."

She began to sob as if her heart would break. Houston seized her hand, drew her up to him, and strove to comfort her.

"Your lot is a hard one, Anastasia," he said, tenderly. "I wish I could help you and protect you."

"You cannot, Signore. No one can help me."

He was about to remonstrate, when he heard rapid footsteps approaching from the upper part of the street. He had hardly time to drop Anastasia's hand and retire to a proper distance (of both of which acts he was inwardly ashamed), when he saw a slender and agile figure rushing against him with uplifted fists. Houston, by a swift movement, evaded the blow, then laid both his hands on Vittorio's shoulders and held him tightly in his grasp. The Italian, hissing out an oath, tore himself loose, and, with a tiger-like leap, sprang back toward the brink of the river; and Anastasia saw something bright flashing in his hand. She started with a cry, and saw instantly that life and death depended upon her choice. And the impulse to choose flashed through her mind with terrible distinctness. She flung herself forward with uplifted arms, and Vittorio, being unprepared for an attack from that side, reeled backward, stumbled, and vanished over the edge of the embankment. It was the work of one breathless moment. There came a stifled cry from below; then a low gurgle.

Houston sprang to the edge of the declivity; the brown waters wrestled and writhed as if in dumb pain. Far out in the whirling liquid chaos a white arm rose for an instant—then vanished. A swift, angrily whispering eddy swept over the spot where it had appeared, and the great river rolled silently onward.

A slow shiver crept through his limbs. He turned sadly away, not feeling where he trod. His feet were benumbed, and his hands, too, seemed strangely dead to his own touch. He had hardly thought of Anastasia; the terrible sight filled his soul to the exclusion of every other thought. He now saw her lying motionless where she had fallen, and with her face down. Stooping over her, he

lifted her up in his arms; she clung close to him, as if for protection from some unseen avenging hand.

"Vittorio," she whispered, hoarsely. "Is Vittorio dead?"

A convulsive shudder shook her slender frame, and she hid her face in the folds of his coat. There was something shy, and yet clinging in her manner, and in her fright something abject and imploring which made him for an instant shrink from her; she seemed to have lost that coy remoteness in which lay her dignity and her chief charm.

"Anastasia," he began—

His voice vibrated through her like an electric shock.

"Do not leave me, Signore," she begged piteously. "They will come and kill me. I shall die if you leave me."

He stood for a moment pondering. Then, with slow deliberation, wound his arm protectingly about her and drew her closely to him.

## VII.

It was three weeks after that day that Houston and Anastasia landed in New York. It was a dreary December day, and the sky was one vast leaden expanse, which sent down, from time to time, cold and dismal showers. Anastasia was quite stunned by the noise of Broadway, and her sweet, pale face wore a puzzled and timid expression. She held Houston's arm very tightly, and sent him now and then an appealing glance as if to implore him not to leave her. They had taken a carriage from the hotel the very morning after their arrival, and were now in search of a minister who would assume the responsibility of pronouncing them man and wife. Anastasia had yielded very reluctantly to this arrangement, not because she was loath to become Frederick's wife, but because, in her Old World simplicity, she feared that his union with one of her lowly birth would ruin his social position and place obstacles in the way of his future success as a musician. She wept a great deal in church during the ceremony, and pronounced her quaint little "Yes," and "I will," which she had been rehearsing all the way up the avenue, in a subdued and frightened whisper. Two days later they arrived, toward evening, in Clayville, and Bruin was at the station with a carriage to receive them. As this was the muddy season of the year, the aspect of the town did not tend to dispel the bride's sadness; she sat gazing at the uncouth Bruin with the most undisguised astonishment, and found it hard to believe that he was her husband's brother.

During the first week of her sojourn in Clayville, three ministers, of different denominations, called on Anastasia and invited her to join their Sunday-schools—an offer which her husband found it hard to paraphrase in the sonorous harmonies of her beautiful mother-tongue. Poor Anastasia smiled in a gentle and conciliatory manner at the zealous gentlemen, and said "Yess," and "I owill," and "Good-by," quite oblivious of the meaning which these words conveyed. It did not flatter her in the least to find herself an object of universal interest in the town, and the incessant stream of female callers who dropped in upon her in the most surprising manner, at all hours of the day, bewildered and distressed her.

"Poor little thing!" they would say, as they went away. "Poor little thing!"

They all pitied her, though they hardly knew why. They did not know the trouble that gnawed at the roots of Anastasia's heart. How could they?

The winter dragged along slowly, with rain and sleet and snow. Anastasia sat at the window of her handsomely furnished room upstairs, and, although there was a cheerful fire in the grate, she shivered. She gazed listlessly at the frost-flowers on the window-pane, traced their outlines with her little finger—and shivered again. Where was Frederick? She saw him so rarely now. His grand piano stood open against the wall, but it was seldom touched. He had developed a passion for horseback riding of late; he rode horseback all day long, scoured the country far and wide, and came home at night besplashed with mud and foam from head to foot. Then he was very tired, he said, and went to bed. She too was weary,—weary unto death, although she had done nothing except note the frost-flowers on the window-pane.

"Why do you sit up so late, Anastasia?" he would say, as he entered, and flung his whip and riding-gloves into a corner. "Why don't you go to bed?"

"I was waiting for you, Frederick," she would answer timidly, watching him all the while anxiously, with her large, lustrous eyes.

"You needn't wait for me," he would say curtly. "I am old enough to take care of myself."

Was that Frederick's voice—the grave and tender voice to which her heart had always responded with a joyous flutter? There was nothing harsh in it now; it was kindly enough—impatient and kindly. How could she expect him to dote on her all his life long, as he had done in those happy, foolish days in the Borghese Gallery? And

yet it seemed, at times, as if he shrank from her, as if her touch made him shudder. But that may have been merely a foolish fancy. He had had her copy of *Danaë* splendidly framed and hung up over the writing-desk in his library. Did not that show that he loved her?

Frederick had asked himself that same question a hundred times. "I certainly do love her," he would reply to his own query. "At all events, I do my duty by her; and what more can she expect? She has all that she wants, and I never yet said an unfriendly word to her. If it were not for that confounded affair with Vittorio, I have no doubt we should be a very happy couple."

Yes, that affair with Vittorio! It had never been even remotely alluded to since the day when he bore her away in his arms from the embankment of the Tiber. And yet the memory of it rose between them like a threatening shadow, every day and every hour of their lives. The brown, writhing waters, and the white arm rising out of the whirling tide,—the picture haunted him like a nightmare; and in the moment when she yearned from the depth of her lonely heart for a caressing touch of his hand, or one of those sweet pet-names in which the Italian tongue is so rich, he would hear the gurgle of the water in Vittorio's throat, and he would turn away from her and wring his hands till each joint seemed on the point of breaking.

"Is she then a murderess?" he would ask himself, shuddering even at the thought,—"because by saving my life she ended that of her miserable brother? I, at any rate, ought to be the last one to accuse her. If she had remained passive, I should myself have been whirled through the dark eddies of the Tiber with a gaping wound in my breast."

The month of March had come. Frederick had been on a long excursion into the country, and had spent the greater part of the day in bidding on a horse which, in the end, he had not ventured to purchase. It was late in the night when he returned, and he was damp and hungry and tired. As he sat down to his cold supper, Bruin, who had been attending to his horse, entered and seated himself at the other end of the table.

"How is Anastasia, Bruin?" asked Frederick, half mechanically, in order to say something. "I suppose you or mother has been up to see her."

Bruin colored slowly to the edge of his hair, and seemed to be collecting himself for the purpose of replying with due emphasis.

"If she aint dead," he blurted out, angrily, "it aint your fault. I once took you to be a kind-hearted, but wrong-headed fellow.

D—— me if I don't now think you are a cold-hearted villain—that is, judging by the way you treat that poor little sick wife of yours!”

Bruin kicked away the chair from under him and marched out, closing the door with a slam. Frederick did not attempt to reply. He was utterly dumbfounded at his brother's manner. That was not the way he had been accustomed to be addressed by the uncouth and unpretending Bruin. And Bruin thought that he maltreated his wife! He had never given Bruin credit for being an acute observer, but the more reason there was for assuming that the observations which he did make were usually correct. He put down his knife and fork and rested his head on his hand, pondering. Could it be possible that Anastasia was ill? She had never complained of illness, and he had himself never observed in her any alarming symptom. An irresistible yearning for her suddenly took possession of him, and the old tenderness began to revive within him. He rose from the table, hurried up the stairs, and softly entered their bed-chamber. He walked on tip-toe up to the bed where she lay in troubled slumber. How pale and wan she looked! Her cheeks were sunken, and her clear brow had a waxen tint, through which the bluish veins were visible. Where had his eyes been, that he had not seen before that she was ill? He bent down over her and heard her muttering in her sleep.

“Vittorio! Vittorio! Vittorio!” she whispered, with a breathless and distressed voice. “I took your life, Vittorio, and—and—you stole mine. You—you—stole his heart away from me, Vittorio.”

Again she struggled and writhed on her pillow, and large drops of perspiration gathered on her brow. Frederick knelt down at the side of the bed, put his hand on her forehead and kissed her.

“Anastasia, my darling!” he murmured, “my sweet wife!”

She opened her eyes and gazed incredulously at him; she put her transparent little finger on his cheek, as if to ascertain that it was really he, then flung her arms about his neck and nestled closely up to him.

“Hold me close, Frederick,” she begged, “I had such a bad dream.”

“My poor little darling!” he whispered, soothingly, and pressed her cheek against his own.

“I want to ask you something, Frederick,” she said, after a pause, filled up with mutual caresses. “Lift me up and put me on your lap. I want to talk to you as in days of old.”

He lifted her up, and her little, supple body

felt in his arms like the body of a child. How she had wasted away under his very eyes, and he had not seen it! The thought wrung his soul with remorse, and an overwhelming love, and pity, and tenderness filled his heart. He stirred up the fire and seated himself before it, holding her close to his breast. Her black, luxuriant hair fell in a wavy stream down over her back, and the thin little face looked doubly white and tiny in its thick, dark frame.

“I have been very cruel to you, Anastasia,” he said, sadly. “I hardly dare ask you to forgive me.”

She was so intent upon her own thoughts that she hardly appeared to hear him.

“Frederick,” she whispered, drawing his head down so that his ear touched her mouth, “You have always looked upon me as—as—a criminal.”

She thrust out the last word with a fearful effort; the veins swelled on her forehead, and a strange glow burned in her eyes.

“No, my sweet child!” he answered, calmly and soothingly. “I have been foolish and restless and unhappy, and I have been a bad husband to you, Anastasia; but now that is all to be changed. From this day we shall live with each other happily and lovingly, and you will regain your strength, and bloom out in health and beauty.”

She smiled mournfully, and shook her head.

“It is too late,” she murmured, “too late.”

The fire was flickering low. He felt a quiver run through her frame, and he carried her back to bed and covered her with blankets.

“Play to me, Frederick,” she begged. “It is so long since you played to me.”

He stooped to kiss her once more; then seated himself at the piano in the twilight, and began the stately *andante* of the sonata in which he had endeavored to express his emotion on the night of his first meeting with her.

“*Roma*,” she whispered, as he struck the opening chords. “*La bella Italia*.”

He played until far into the night. His soul fled to the shores of the Tiber, and strayed in happy oblivion of the present through the tangled labyrinth of the Trastevere. The rusty, time-stained walls, the picturesque confusion of the streets, the isolated pines lifting their dense crowns against the horizon, and the sun-steeped blue of the Italian sky—all blended softly together in his bright, melodious reverie. He wandered away in a light legato movement through the beautiful days of dawning love; then gathered up the theme more forcibly, in an intenser and more accentuated variation; a note

of sadness shivered faintly through the chords, then grew into an audible undertone, and at last became the pervading mood. In his tune-ful retrospect he saw his own life and hers spread out before him, and his passionate repentance of the wrong he had done her became an inspiring force, and gave fervor and grandeur to its utterance.

The "immortal sonata" was completed. He arose slowly; the drowsy logs in the fire-

place flared up with a sudden crackling. He went to the bed and stooped down.

"Anastasia *mia*," he said, in an affectionate whisper, "let us rest now, and to-morrow we will begin our life anew. We have conquered the past, and laid it behind us."

He listened, but there came no reply.

She lay as in deep, happy repose. His music had lulled her into the eternal slumber.

*Hjalmar Hjorth Boyesen.*

## PLOTTERS AND PIRATES OF LOUISIANA.

BY GEORGE W. CABLE,

Author of "Old Creole Days," "The Grandissimes," etc.

### I.

#### NEW ORLEANS IN 1803.

NEW ORLEANS had been under the actual sway of the Spaniard for thirty-four years. Ten thousand inhabitants were gathered in and about its walls. Most of the whites were Creoles. Even in the province at large these were three in every four. Immigrants from Malaga, the Canaries, and Nova Scotia had passed on through the town and into the rural districts. Of the thousands of Americans, only a few scores of mercantile pioneers came as far as the town—sometimes with families, but generally without. Free trade with France had brought some French merchants and the Reign of Terror had driven here a few royalists. The town had filled and overflowed its original boundaries. From the mast-head of a ship in the harbor one looked down upon a gathering of from twelve hundred to fourteen hundred dwellings and stores, or say four thousand roofs—to such an extent did slavery multiply outhouses. They were of many kinds, covered with half-cylindrical or with flat tiles, with shingles, or with slates, and showed an endless variety in height and in bright confusion of color and form—verandas and balconies, dormer windows, lattices and belvederes. Under the river bank, "within ten steps of Tchoupitoulas street," where land has since formed and been covered with brick stores for several squares, the fleets of barges and flat-boats from the West moored and unloaded, or retailed their contents at the water's edge. Farther down, immediately abreast of the town, between the upper limits and the Place d'Armes, lay the shipping—twenty or more vessels of from 100 to 200 tons burden, hauled close against the bank. Still farther on, beyond the

Government warehouses, was the mooring-place of the vessels of war. Looking down into the streets—Toulouse, St. Peter, Conti, St. Louis, Royale, Chartres—one caught the brisk movements of a commercial port. They were straight, and fairly spacious, for the times; but unpaved, ill-drained, filthy, poorly lighted, and often impassable for the mire.

The town was fast becoming one of the chief sea-ports of America. Already, in 1802, 158 American merchantmen, 104 Spanish, and 3 French, registering 31,241 tons, had sailed from her harbor, loaded. The incoming tonnage for 1803 promised an increase of over 37 per cent. It exported of the products of the province alone over \$2,000,000 value. Its imports reached \$2,500,000. Thirty-four thousand bales of cotton; 4500 hogsheads of sugar; 800 casks—equivalent to 2,000 barrels—of molasses; rice, peltries, indigo, lumber, and sundries, to the value of \$500,000; 50,000 barrels of flour; 3000 barrels of beef and pork; 2000 hogsheads of tobacco; and smaller quantities of corn, butter, hams, meal, lard, beans, hides, staves, and cordage, had passed in 1802 across its famous levee.

Everywhere the restless American was conspicuous, and, with the Englishman and the Irishman, composed the majority of the commercial class. The French, except a few, had subsided into the retail trade or the mechanical callings. The Spaniards not in military or civil service were generally humble Catalans, keepers of shops, and of the low cabarets that occupied almost every street corner. The Creole was on every side,—handsome, proud, illiterate, elegant in manner, slow, a seeker of office and military commission, ruling society with fierce exclusiveness, looking upon toil as the slave's proper badge, lending

money now at twelve and now at twenty-four per cent., and taking but a secondary and unsympathetic part in the commercial life from which was springing the future greatness of his town. What could he do? The American filled the upper Mississippi valley. England and the Atlantic States, no longer France and Spain, took its products and supplied its wants. The Anglo-Saxon and the Irishman held every advantage; and, ill-equipped and uncommercial, the Creole was fortunate to secure even a third or fourth mercantile rank in the city of his birth. But he had one stronghold. He owned the urban and suburban real estate, and presently took high rank as the seller of lots and as a *rentier*. The confiscated plantations of the Jesuits had been, or were being, gradually laid out in streets. From 1801, when Faubourg St. Mary contained only five houses, it had grown with great rapidity.

Other faubourgs were about springing up. The high roofs of the aristocratic suburb St. Jean could be seen stretching away among their groves of evergreen along the Bayou road, and clustering presently into a village near where a "Bayou bridge" still crosses the stream, some two hundred yards below the site of the old one. Here gathered the larger craft of the lake trade, while the smaller still pushed its way up Carondelet's shoaled and neglected, yet busy canal.

Outwardly the Creoles of the Delta had become a graceful, well-knit race, in full keeping with the freedom of their surroundings. Their complexion lacked color, but it was free from the sallowness of the Indies. There was a much larger proportion of blondes among them than is commonly supposed. Generally their hair was of a chestnut, or but little deeper tint, except that in the city a Spanish tincture now and then asserted itself in black hair and eyes. The women were fair, symmetrical, with pleasing features, lively, expressive eyes, well-rounded throats, and superb hair; vivacious, decorous, exceedingly tasteful in dress, adorning themselves with superior effect in draperies of muslin enriched with embroideries and much garniture of lace, but with a more moderate display of jewels, which indicated a community of limited wealth. They were much superior to the men in quickness of wit, and excelled them in amiability and in many other good qualities. The more pronounced faults of the men were generally those moral provincialisms which travelers recount with undue impatience. They are said to have been coarse, boastful, vain; and they were, also, deficient in energy and application, without well-directed ambition, unskillful in handi-

craft—doubtless through negligence only—and totally wanting in that community feeling which begets the study of reciprocal rights and obligations, and reveals the individual's advantage in the promotion of the common interest. Hence, the Creoles were fonder of pleasant fictions regarding the salubrity, beauty, good order, and advantages of their town, than of measures to justify their assumptions. With African slavery they were, of course, licentious, and they were always ready for the dueling-ground; yet it need not seem surprising that a people so beset by evil influences from every direction were generally unconscious of a reprehensible state of affairs, and preserved their self-respect and a proud belief in their moral excellence. Easily inflamed, they were as easily discouraged, thrown into confusion, and overpowered, and they expended the best of their energies in trivial pleasures, especially the masque and the dance; yet they were kind parents, affectionate wives, tractable children, and enthusiastic patriots.

## II.

### FROM SUBJECTS TO CITIZENS.

LITTLE wonder that it is said the Creoles wept as they stood on the Place d'Armes and saw the standard of a people, whose national existence was a mere twenty-years' experiment, taking the place of that tricolor on which perched the glory of a regenerated France. On that very spot some of them had taken part in the armed repudiation of the first cession. The two attitudes and the two events differed alike. The earlier transfer had come loaded with drawbacks and tyrannous exactions; the latter came freighted with long-coveted benefits and with some of the dearest rights of man. This second, therefore, might bring tears of tender regret; it might force the Creole into civil and political fellowship with the detested *Américain*; but it could not rouse the sense of outrage produced by the cession to Spain. O'Reilly, the Spanish Captain-General, had established a government whose only excellence lay in its strength; Claiborne came to set up a power whose only strength lay in its excellence. His task was difficult mainly because it was to be done among a people distempered by the earlier rule, and diligently wrought upon by intriguing Frenchmen and Spanish officials. His wisest measures, equally with his broadest mistakes, were wordily resented. His ignorance of the French language, his large official powers, Wilkinson's bad habits, a scarcity of money, the introduction of the English tongue, and of a just proportion of American appointees into the new

TOMB OF GOVERNOR CLAIBORNE'S FAMILY.

courts and public offices, the use of bayonets to suppress disorder at public balls, a supposed partiality for Americans in court, the personal character of officials, the formation of American militia companies and their parades in the streets—all alike fed the flames of the Creoles' vehement indignation.

In March, 1804, Congress passed an act dividing the province into two parts on the present northern boundary of Louisiana, giving each a distinct government, and to the lower the title of the territory of Orleans. This act, which was to take effect the following October, interdicted the slave-trade. Then, indeed, anger burned. Insurrectionary sentiments were placarded on the street corners, crowds copied them, and public officers attempting to remove them were driven away. But that was all. Claiborne— young, like Bienville and like Galvez, but benevolent, wise, and patient—soon saw it was not the Government, but only some of its measures, that caused so much heat. The merchants, who in 1768 had incited revolt against legalized ruin, saw, now, on the other hand, that American rule had lifted them out of commercial serfdom, and that, as a port of the United States, and only as such, their crescent city could enter upon the great future which was hers by her geographical position. But we have seen that the merchants were not principally Creoles.

Although the Creoles looked for a French

or Spanish re-cession, yet both interest and probability were so plainly against it that they were presently demanding impatiently, if not imperiously, the rights of American citizens as pledged to them in the treaty. They made no appeal to that France which had a second time cast them off; but at three public meetings, in June and July, petitioned Congress not to rescind the cession but to leave Louisiana undivided, and so hasten their admission into the Union. This appeal was fruitless, and the territorial government went into operation, Claiborne being retained as governor. The partition, the presidential appointment of a legislative council instead of its election by the people, the nullification of certain Spanish land-grants, and an official re-inspection of all titles, were accepted, if not with patience, at least with that grace which the Creole assumes before the inevitable. But his respect was not always forthcoming toward laws that could be opposed or evaded. "This city," wrote Claiborne, "requires a

strict police: the inhabitants are of various descriptions; many highly respectable, and some of them very degenerate." A sheriff and posse attempted to arrest a Spanish officer. Two hundred men interfered; swords were drawn, and resistance ceased only when a detachment of United States troops were seen hurrying to the rescue. Above all, the slave-trade—"all-important to the existence of the country"—was diligently plied through the lakes and the inlets of Barataria.

The winter of 1804-05 was freer from bickerings than the last had been. The intrigues of Spanish officials who lingered in the district were unavailable, and the Governor reported a gratifying state of order. On the 2d of March, with many unwelcome safeguards and limitations, the right was accorded the people to elect a House of Representatives, and "to form for themselves a constitution and State government so soon as the free population of the territory should reach sixty thousand souls, in order to be admitted into the Union."

For a time following there was feverishness rather than events. Great Britain and Spain were at war; Havana was open to neutral vessels; the commerce of New Orleans was stimulated. But the pertinacious lingering of Casa-Calvo, Morales, and others,—whom Claiborne at last had to force away in February, 1806,—the rumors they kept alive, the fear of war with Spain, doubts as to how the

Creoles would or should stand, party strife among the Americans in New Orleans, and a fierce quarrel in the Church between the vicar-general and the famed Père Antoine, pastor of the cathedral, kept the public mind in a perpetual ferment. Still, in all these things there was only restiveness and discord, not revolution. The Creoles had at length undergone their last transplanting, and taken root in American privileges and principles. From

Orleans "an elegant barge," equipped with sails and colors, and impelled by the stroke of ten picked oarsmen. It came down the harbor, drew in to the bank, and presently set ashore a small, slender, extremely handsome man, its only passenger. He bore letters from General Wilkinson, introducing him in New Orleans, and one, especially, to Daniel Clark, Wilkinson's agent, stating that "this great and honorable man would communicate

IN RUE DU MAINE.

the guilt of the plot whose events were now impending the Creole's hand is clean. We have Claiborne's testimony:

"Were it not for the calumnies of some Frenchmen who are among us, and the intrigues of a few ambitious, unprincipled men whose native language is English, I do believe that the Louisianians would be very soon the most zealous and faithful members of our republic."

On the 4th of November, 1811, a convention elected by the people of Orleans Territory met in New Orleans, and on the 28th of the following January adopted a State constitution; and on the 30th of April, 1812, Louisiana entered the Union.

### III.

#### BURR'S CONSPIRACY.

ON one of those summer evenings when the Creoles, in the early years of the century, were wont to seek the river air in domestic and social groups under the willow and china trees of their levee, there glided around the last bend of the Mississippi above New

to him many things improper to letter, and which he would not say to any other." Claiborne, the young Virginian whom President Jefferson had made Governor of Louisiana, wrote to Secretary Madison, "Colonel Burr arrived in this city on this evening."

The date was June 26, 1805. The distinguished visitor, a day or two later, sat down to a banquet given to him by the unsuspecting Governor. He was now in full downward career. Only a few years before, he had failed of the presidency by but one electoral vote. Only a few months had passed since, on completing his term, he had vacated the vice-presidency. In the last year of that term Alexander Hamilton had fallen by his hand. Friends and power, both, were lost. But he yet had strength in the West. Its people were still wild, restless, and eager for adventure. The conquest of "Orleans" was a traditional idea. Its banks were full of specie. Clouds of revolution were gathering all around the Gulf. The regions beyond the Red and Sabine rivers invited conquest. The earlier schemes of Adams and Hamilton, to seize Orleans Island and the Floridas for the

PÈRE ANTOINE.

United States; that of Miranda, to expel the Spanish power from the farther shores of the Gulf; the plottings of Wilkinson, to surrender the West into the hands of Spain—all these abandoned projects seem to have cast their shadows on the mind of Burr and colored his designs.

The stern patriotism of the older States had weighed him in its balances and rejected him. He had turned with a vagueness of plan that waited for clearer definition on the chances of the future, and, pledged to no principle, had set out in quest of aggrandizement and empire, either on the Mississippi or among the civilizations that encircle the Gulf of Mexico, as the turn of events might decree. In the West he had met Wilkinson, and was now in correspondence with him.

The Governor who had feasted him moved much in the gay society of the Creoles. It was not giddiness, but anxious thought and care that pushed him into such scenes. Troubles and afflictions marked his footsteps; his wife and child stricken down by yellow fever, her young brother-in-law rashly championing him against the sneers of his enemies, fallen in a duel—but it was necessary to avoid the error—Ulloa's earlier error—of self-isolation. He wisely studied the social side of the people, and so viewed public questions from behind.

The question ever before him—which he was incessantly asking himself, and which he showed an almost morbid wish to be always answering to the heads of departments at

Washington—was whether the Creoles over whom he was set to rule were loyal to the government of the nation. It was a vital question. The bonds of the Union, even outside of Louisiana, were as yet slender and frail. The whole Mississippi valley was full of designing adventurers, suspected and unsuspected, ready to reap any advantage whatever of any disaffection of the people. He knew there were such in New Orleans.

The difficulty of answering this question lay in one single, broad difference between Claiborne himself and the civilization which he had been sent to reconstruct into harmony with North American thought and action. With him loyalty to the state meant obedience to its laws. The Creole had never been taught that there was any necessary connection between the two. The Governor's young Virginian spirit assumed it as self-evident that a man would either keep the laws or overturn them. It was a strange state of society to him, where one could be a patriot and yet ignore, evade, and override the laws. "Occasionally, in conversation with ladies,"—so he writes—"I have denounced smuggling as dishonest, and very generally a reply, in substance as follows, would be returned: 'That is impossible, for my grandfather, or my father, or my husband was, under the Spanish Government, a great smuggler, and he was always esteemed an honest man.'" They might have added, "and loyal to the king."

With some men Claiborne had had no trouble. "A beginning must be made," said Poydras, a wealthy and benevolent Frenchman; "we must be initiated into the sacred duties of freemen and the practices of liberty." But the mass, both high and low, saw in the abandonment of smuggling or of the slave-trade only a surrender of existence—an existence to which their own consciences and the ladies at the ball gave them a clean patent. These, by their angry obduracy, harassed their governor with ungrounded fears of sedition.

In fact, the issue before governor and people was one to which the question of fealty to government was quite subordinate. It was the struggle of a North American against a Spanish American civilization. Burr must have seen this; and probably at this date there was nothing clearly and absolutely fixed in his mind but this, that the former civilization had cast him off, and that he was about to offer himself to the latter. Now events were to answer the Governor's haunting question, and to give a new phase to the struggle between these two civilizations in the Mississippi valley.

Colonel Burr remained in New Orleans

ten or twelve days, receiving much social attention, and then left for St. Louis, saying he would return in October. But he did not appear.

During the winter the question of boundaries threatened war with Spain, and the anger of Spain rose high when, in February, 1806, Claiborne expelled Casa Calvo and Morales, her agents, from the territory. Her governor stopped the transmission of the United States mails through Florida. Outside, the Spaniards threatened; inside, certain Americans of influence did hardly less. The Creoles were again supine. Père Antoine, the beloved pastor of the cathedral, was suspected—unjustly—of sedition; Wilkinson with his forces was unaccountably idle. "All is not right," wrote Claiborne; "I know not whom to censure; but it seems to me that there is wrong somewhere."

The strange character of the Creole people perplexed and wearied Claiborne. Unstable and whimsical, public-spirited and sordid by turns, a display of their patriotism caused a certain day to be "among the happiest of his life"; and when autumn passed and toward its close their enthusiasm disappeared in the passion for money-getting, he "began to despair." But, alike unknown in the Creole town—to money-getters and to patriots—the only real danger had passed. Wilkinson had decided to betray Burr.

Late in September the General had arrived at Natchitoches, and had taken chief command of the troops confronting the Spanish forces. On the 8th of October, one Samuel Swartwout brought him a confidential letter from Colonel Burr. He was received by Wilkinson with much attention, stayed eight days, and then left for New Orleans. On the 21st, Wilkinson determined to expose the plot. He dispatched a messenger to the President of the United States, bearing a letter which apprised him of Colonel Burr's contemplated descent of the Mississippi with an armed force. Eight days later, the General arranged with the Spaniards for the troops under each flag to withdraw from the contested boundary, leaving its location to be settled by the two governments, and hastened toward New Orleans, hurrying on in advance of him a force of artificers and a company of soldiers.

Presently the people of New Orleans were startled from apathetic tranquillity into a state of panic. All unexplained, these troops had arrived, others had reënforced them; there was hurried repair and preparation; and the air was agitated with rumors. To Claiborne, the revelation had at length come from various directions that Aaron Burr was plotting treason. Thousands were said to be

involved with him; the first outbreak was expected to be in New Orleans.

Wilkinson had arrived in the town. In the bombastic style of one who plays a part, he demanded of Claiborne the proclamation of martial law. Claiborne kindly, and with expressions of confidence in the General, refused; but the two met the city's chamber of commerce, laid the plot before it, and explained the needs of defense. Several thousand dollars were at once subscribed, and a transient embargo of the port recommended, for the purpose of procuring sailors for the four gun-boats and two bomb-ketches lying in the harbor.

There were others in whose confidence Wilkinson held no place. The acting-governor of Mississippi wrote to Claiborne: "Should he [Colonel Burr] pass us, your fate will depend on the General, not on the Colonel. If I stop Burr, this may hold the General in his allegiance to the United States. But if Burr passes the territory with two thousand men, I have no doubt but the General will be your worst enemy. Be on your guard against the wily General. He is not much better than Catiline. Consider him a traitor and act as if certain thereof. You may save yourself by it."

On Sunday, the 14th of December, a Dr. Erick Bollman was arrested by Wilkinson's order. Swartwout and one Ogden had already been apprehended at Fort Adams, and were then confined on one of the bomb-ketches in the harbor. On the 16th, a court-officer, armed with writs of *habeas corpus*, sought in vain to hire a boat to carry him off to the bomb-ketch, and on the next day, when one could be procured, only Ogden could be found.

He was liberated, but only to be re-arrested with one Alexander, and held in the face of the *habeas corpus*. The court issued an attachment against Wilkinson. It was powerless. The Judge—Workman—appealed to Claiborne to sustain it with force. The Governor promptly declined, the Judge resigned, and Wilkinson ruled.

One of Burr's intimates was General Adair. On the 14th of January, 1807, he appeared in New Orleans unannounced. Colonel Burr, he said, with only a servant, would arrive in a few days. As he was sitting at dinner, his hotel was surrounded by regulars, an aide of Wilkinson appeared and arrested him; he was confined, and presently was sent away. The troops beat to arms, regulars and militia paraded through the terrified city, and Judge Workman, with two others, were thrown into confinement. They were released within twenty-four hours; but to intensify the general alarm, four hundred Spaniards from Pensa-

cola arrived at the mouth of Bayou St. John, a few miles from the city, on their way to Baton Rouge, and their commander asked of Claiborne that he and his staff might pass through New Orleans. He was refused the liberty.

All this time the Creoles had been silent. Now, however, through their legislature, they addressed their governor. They washed their hands of the treason which threatened the peace and safety of Louisiana, but boldly announced their intention to investigate the "extraordinary measures" of Wilkinson and to complain to Congress.

Burr, meanwhile, with the mere nucleus of a force, had set his expedition in motion, and at length, after twenty years' threatening by the Americans of the West, a fleet of boats actually bore an armed expedition down the Ohio and out into the Mississippi, bent on conquest.

But disaster lay in wait for it. It failed to gather weight as it came, and on the 28th of January the news reached New Orleans that Burr, having arrived at a point near Natchez with fourteen boats and about a hundred men, had been met by Mississippi militia, arrested, taken to Natchez, and released on bond to appear for trial at the next term of the Territorial Court.

This bond Burr ignored, and left the Territory. The Governor of Mississippi offered \$2000 for his apprehension, and on the 3d of March the welcome word came to New Orleans that he had been detected in disguise and re-arrested at Fort Stoddart, Alabama.

About the middle of May, Wilkinson sailed from New Orleans to Virginia to testify in that noted trial which, though it did not end in the conviction of Burr, made final wreck of his designs, restored public tranquillity, and assured the country of the loyalty not only of the West, but also of the Creoles of Louisiana. The struggle between the two civilizations withdrew finally into the narrowest limits of the Delta, and Spanish American thought found its next and last exponent in an individual without the ambition of empire,—a man polished, brave, and chivalrous; a patriot, and yet a contrabandist; an outlaw, and in the end a pirate.

#### IV.

##### THE WEST INDIAN IMMIGRATION.

BETWEEN 1804 and 1810, New Orleans doubled its population. The common notion is that there was a large influx of Americans. This was not the case. A careful estimate shows not more than 3100 of these in the city in 1809, yet in the following year the whole population, including the suburbs, was 24,552. The Americans, therefore, were

numerically feeble. The increase came from another direction.

Napoleon's wars were convulsing Europe. The navies of his enemies fell upon the French West Indies. In Cuba large numbers of white and mulatto refugees who, in the St. Domingan insurrection, had escaped across to Cuba with their slaves, were now, by hostilities between France and Spain, forced again to become exiles. Within sixty days, between May and July, 1809, thirty-four vessels from Cuba set ashore in the streets of New Orleans nearly fifty-eight hundred persons,—whites, free mulattoes, and black slaves in almost equal numbers. Others came later, from Cuba, Guadaloupe, and other islands, until they amounted to ten thousand. Nearly all settled permanently in New Orleans.

The Creoles of Louisiana received the Creoles of the West Indies with tender welcomes. The state of society in the islands from which these had come needs no description. As late as 1871, '72, and '73, there were in the island of Guadaloupe only three marriages to a thousand inhabitants. But they came to their better cousins with the ties of a common religion, a common tongue, much common sentiment, misfortunes that may have had some resemblance, and with the poetry of exile. They were reënforcements, too, at a moment when the power of the Americans—few in number, but potent in energies and advantages—was looked upon with hot jealousy.

The Americans clamored against them, for they came in swarms. They brought little money or goods. They raised the price of bread and of rent. They lowered morals and disturbed order. Yet it was certainly true the Americans had done little to improve either of these. Some had come to stay; many more to make a fortune and get away; both sorts were simply and only seeking wealth.

The West Indians had not come to a city whose civilization could afford to absorb them. The Creole element needed a better infusion, and yet it was probably the best in the community. The Spaniards were few and bad, described by one as capable of the vilest depredations, "a nuisance to the country," and even by the mild Claiborne as "for the most part \* \* \* well suited for mischievous and wicked enterprises." The free people of color were about two thousand, unaspiring, corrupted, and feeble. The floating population was extremely bad. Sailors from all parts of the world took sides, according to nationality, in bloody street riots and night brawls; and bargemen, flat-boatmen, and raftsmen, from the wild banks of the Ohio, Tennessee, and Cumberland, abandoned themselves at

the end of their journey to the most shameful and reckless excesses. The spirit of strife ran up into the better classes. A newspaper article reflecting upon Napoleon all but caused a riot. A public uprising was hardly prevented when three young navy officers released a slave girl who was being whipped. In September, 1807, occurred the "batture riots." The *batture* was the sandy deposits made by the Mississippi in front of the Faubourg St. Marie. The noted jurist, Edward Livingston, representing private claimants, took possession of this ground, and was opposed by the public in two distinct outbreaks. In the second, the Creoles, ignoring the decision of the Supreme Court, rallied to the spot by thousands, and were quieted only by the patient appeals of Claiborne, addressed to them on the spot, and by the recommittal of the contest to the United States Courts, in whose annals it is so well-known a cause. Preparations for war with Spain heightened the general fever. Claiborne's letters dwell on the sad mixture of society. "England," he writes, "has her partisans; Ferdinand the Seventh, some faithful subjects; Bonaparte, his admirers; and there is a fourth description of men, commonly called *Burrites*, who would join any standard which would promise rapine and plunder." These last had a newspaper, "*La Lanterne Magique*," whose libels gave the executive much anxiety.

Now, into such a city—say of fourteen thousand inhabitants, at most—swarm ten thousand white, yellow, and black West India islanders; some with means, others in absolute destitution, and "many \* \* \* of doubtful character and desperate fortune." Americans, English, Spanish, cry aloud; the laws forbid the importation of slaves; Claiborne adjures the American consuls at Havana and Santiago de Cuba to stop the movement; the free people of color are ordered point-blank to leave the country; the actual effort is made to put the order into execution; and still all three classes continue to pour into the streets, to throw themselves upon the town's hospitality, and daily to increase the cost of living and the number of distressed poor.

They came and they staid, all too readily dissolving into the corresponding parts of the native Creole community, and it is easier to underestimate than to exaggerate the silent results of an event that gave the French-speaking Louisianians twice the numerical power with which they had begun to wage their long battle against American absorption.

## V.

## THE PIRATES OF BARATARIA.

THE whole Gulf coast of Louisiana is an immense, wet, level expanse, covered every-

where, shoulder-high, with marsh-grasses, and indented by extensive bays that receive the rivers and larger bayous. For some sixty miles on either side of the Mississippi's mouth, it breaks into a grotesquely contorted shoreline and into bright archipelagoes of hundreds of small, reedy islands, with narrow and obscure channels writhing hither and thither between them. These mysterious passages, hidden from the eye that overglances the seemingly unbroken sunny leagues of surrounding distance, are threaded only by the far-seen white or red lateen-sail of the oystergatherer, or by the pirogue of the hunter stealing upon the myriads of wild fowl that in winter haunt these vast green wastes.

To such are known the courses that enable them to avoid the frequent *culs-de-sac* of the devious shore, and that lead to the bayous which open the way to the inhabited interior. They lead through miles of clear, brown, silent waters, between low banks fringed with dwarf oaks, across pale distances of "quaking prairie," and at length, under the solemn shades of cypress swamps, to the near neighborhood of the Mississippi, from whose flood the process of delta-growth has cut the bayou off. Across the mouths of the frequent bays that indent this marshy coast-line stretch long, slender keys of dazzling, storm-heaped sand—sometimes of cultivable soil.

About sixty miles south from the bank of the Mississippi, opposite New Orleans, lies Grande Terre, a very small island of this class, scarce two miles long, and a fourth as wide, stretching across two-thirds of the entrance of Barataria Bay, but leaving a pass of about a mile width at its western end, with a navigable channel. Behind this island the waters of the bay give a safe, deep harbor. At the west of the bay lies a multitude of small, fenny islands, interwoven with lakes, bays, and passes, named and unnamed, affording cunning exit to the bayous La Fourche and Terre Bonne and the waters still beyond. Northward the bay extends some sixteen miles, and then breaks in every direction into lakes and bayous. Through one of these—the bayou Barataria, with various other local names—a way opens irregularly northward. Now and then it widens into a lake, and narrows again, each time more than the last, until near its head a short canal is entered on the left, and six miles farther on you are stopped abruptly by the levee of the Mississippi. You mount its crown, and see opposite the low-lying city, with its spires peering up from the sunken plain; its few wreaths of manufactory smoke, and the silent stir of its winding harbor. Canal street, its former upper boundary, is hidden two miles and a half away

down the stream. There are other Baratarian routes, through lakes Salvador or Des Allemands, and many obscure avenues of return toward the Gulf of Mexico or the maze of wet lands intervening.

In the first decade of the century the wars of France had filled this gulf with her privateers. Spain's rich commerce was the prey around which they hovered, and Guadaloupe and Martinique their island haunts. From these the English, operating in the West Indies, drove them out, and when in February, 1810, Guadaloupe completed the list of their conquests, the French privateers were as homeless as Noah's raven.

They were exiled on the open Gulf, with the Spaniards lining its every shore, except one, where American neutrality motioned them austere away. This was Louisiana. But this, of all shores, suited them best. Thousands of their brethren already filled the streets of New Orleans, and commanded the sympathies of the native Creoles. The tangled water-ways of Barataria, so well known to smugglers and slavers, and to so few beside, leading by countless windings and intersections to the markets of the thriving city, offered the rarest facilities for their purposes. Between this shelter and the distant harbors of France there could be no question of choice.

Hither they came, fortified Grande Terre, built store-houses, sailed away upon the Gulf, and re-appeared with prizes which it seems were not always Spanish. The most seductive auctions followed. All along this coast there are high, probably natural, heaps of a species of small clam-shell. The aborigines, mound-builders, used them for temple-sites. A notable group of these mounds on one of the islands of Barataria became the privateers' chief place of sale and barter. There was no scarcity of buyers from New Orleans and the surrounding country. Goods were also smuggled up the various bayous, especially La Fourche. Then the captured vessels were burned or refitted, sails were spread again and prows were pointed toward the Spanish Main. The Baratarians had virtually revived, in miniature, the life of the long-extinct buccaneers.

Their fame spread far and wide; and while in neighboring States the scandalous openness of their traffic brought loud condemnation upon Louisiana citizens and officials alike, the merchants and planters of the Delta, profiting by these practices, with the general public as well, screened the contrabandists and defended their character.

Much ink has been spilled from that day to this to maintain that they sailed under letters of marque. But certainly no commission could be worth the unrolling when car-

ried by men who had removed themselves beyond all the restraints that even seem to distinguish privateering from piracy. They were often overstocked with vessels and booty, but they seem never to have been embarrassed with the care of prisoners.

There lived at this time, in New Orleans, John and Pierre Lafitte. John, the younger, but more conspicuous of the two, was a handsome man, fair, with black hair and eyes, wearing his beard, as the fashion was, shaven neatly back from the front of his face. His manner was generally courteous, though he was irascible and in graver moments somewhat harsh. He spoke fluently English, Spanish, Italian, and French, using them with much affability at the hotel where he resided, and indicating, in the peculiarities of his French, his nativity in the city of Bordeaux.

The elder brother was a sea-faring man and had served in the French navy. He appears to have been every way less showy than the other; but beyond doubt both men were above the occupation with which they began life in Louisiana. This was the trade of blacksmith, though at their forge, on the corner of St. Philip and Bourbon streets, probably none but slave hands swung the sledge or shaped the horseshoe.

It was during the embargo, enforced by the United States Government in 1808, that John Lafitte began to be a merchant. His store was in Royal street, where, behind a show of legitimate trade, he was busy running the embargo with goods and Africans. He wore the disguise carelessly. He was cool and intrepid and had only the courts to evade, and his unlawful adventures did not lift his name from the published lists of managers of society balls or break his acquaintance with prominent legislators.

In 1810 came the West Indian refugees and the Guadaloupian privateers. The struggle between the North American and the West Indian ideas of public order and morals took new energy on the moment. The plans of the "set of bandits who infested the coast and overran the country" were described by Government as "extensive and well laid," and the confession made that "so general seemed the disposition to aid in their concealment, that but faint hopes were entertained of detecting the parties and bringing them to justice."

Their trade was impudently open. Merchants gave and took orders for their goods in the streets of the town as frankly as for the merchandise of Philadelphia or New York. Frequent seizures lent zest to adventure without greatly impairing the extravagant profits of a commerce that paid neither duties nor first cost.

John and Pierre Lafitte became the commercial agents of the "privateers." By and by they were their actual chiefs. They won great prosperity for the band; prizes were rich and frequent, and slave cargoes profitable. John Lafitte did not at this time go to sea. He equipped vessels, sent them on their cruises, sold their prizes and slaves, and moved hither and thither throughout the Delta, administering affairs with boldness and sagacity. The Mississippi's "coasts" in the parishes of St. James and St. John the Baptist were often astir with his known presence, and his smaller vessels sometimes pierced the interior as far as Lac des Allemands. He knew the value of popular admiration, and was often at country balls, where he enjoyed the fame of great riches and courage, and seduced many of the simple Acadian youth to sail in his cruises. His two principal captains were Beluche and Dominique You. "Captain Dominique" was small, graceful, fair, of a pleasant, even attractive face, and a skillful sailor. There were also Gambi, a handsome Italian, who died only a few years ago at the old pirate village of Chenière Caminada; and Rigoult, a dark Frenchman, whose ancient house still stands on Grande Isle, the island next to Grande Terre on the west. And yet again Johnness and Johannot, unless—which appears likely—these were only the real names of Dominique and Beluche.

Expeditions went out against these men more than once; but the Government was pre-occupied and embarrassed and the expeditions seemed feebly conceived. They only harassed the Baratarians, drove them to the mouth of La Fourche in vessels too well armed to be attacked in transports, and did not prevent their prompt return to Grande Terre.

The revolution for the independence of the Colombian States of South America began. Venezuela declared her independence in July, 1811. The Baratarians procured letters of marque from the patriots in Carthage, lowered the French flag, ran up the new standard, and thus far and no farther joined the precarious fortunes of the new states, while Barataria continued to be their haunt and booty their only object.

They reached the height of their fortune in 1813. Their moral condition had declined in proportion. "Among them," says the Governor, "are some St. Domingo negroes of the most desperate character, and no worse than most of their white associates." Their avowed purpose, he says, was to cruise on the high seas and commit "depredations and piracies on the vessels of nations in peace with the United States."

One of these nations was the British. Its

merchantmen were captured in the Gulf and sold behind Grande Terre. The English more than once sought redress with their own powder and shot. On the 23d of June, 1813, a British sloop-of-war anchored off the outer end of the channel at the mouth of La Fourche and sent her boats to attack two privateers lying under the lee of Cat Island; but the pirates stood ground and repulsed them with considerable loss.

Spain, England, and the United States were now their enemies; yet they grew bolder and more outrageous. Smuggling increased. The Government was "set at defiance in broad daylight." "I remember," reads a manuscript kindly furnished the present writer, "when three Spanish vessels were brought in to Caillou Islands. They were laden with a certain Spanish wine, and the citizens of Attakapas went out to see them and purchased part of the captured cargoes. There were no traces of the former crews."

In October, 1813, a revenue officer seized some contraband goods near New Orleans. He was fired upon by a party under John Lafitte, one of his men wounded, and the goods taken from him. The Governor offered \$500 for Lafitte's apprehension, but without avail.

The shell-mound where the Baratarians held their sales was called "the Temple." In January, 1814, four hundred and fifteen negroes, consigned to John and Pierre Lafitte, were to be auctioned at this place. An inspector of customs and twelve men were stationed at the spot. John Lafitte attacked them, killed the inspector, wounded two men, and made the rest prisoners.

Still he was not arrested. His island was fortified, his schooners and feluccas were swift, his men were well organized and numbered four hundred, the Federal Government was getting the worst of it in war with Great Britain, and, above all, the prevalence of West Indian ideas in New Orleans was a secure shelter. He sent his spoils daily up La Fourche to Donaldsonville on the Mississippi, and to other points. Strong, well-armed escorts protected them. Claiborne asked the legislature to raise one hundred men for six months' service. The request was neglected. At the same time a filibustering expedition against Texas was only stopped by energetic measures. The Federal courts could effect nothing. An expedition captured both Lafittes, but they disappeared, and the writs were returned "not found."

But now the tide turned. Society began to repudiate the outlaws. In July, 1814, a grand jury denounced them as pirates, and exhorted the people "to remove the stain that has fallen on all classes of society in the minds of the

good people of the sister States." Indictments were found against one Johnness and one Johannot for piracies in the Gulf, and against Pierre Lafitte as accessory. Lafitte was arrested, bail was refused, and he found himself at last shut up in the calabozo.

## VI.

## BARATARIA DESTROYED.

WEIGHING all the facts, it is small wonder that the Delta Creoles coquetted with the Baratarians. To say no more of Spanish American or French West Indian tincture, there was the embargo. There were the war-ships of Europe skimming ever to and fro in the entrances and exits of the Gulf. Rarely in days of French or Spanish rule had this purely agricultural country and non-manufacturing town been so removed to the world's end as just at this time. The Mississippi, northward, was free; but its perils had hardly lessened since the days of Spanish rule. Then it was said, in a curious old Western advertisement of 1797, whose English is worthy of notice:

"No danger need be apprehended from the enemy, as every person whatever will be under cover, made proof against rifle or musket balls, and convenient port-holes for firing out of. Each of the boats are armed with six pieces, carry a pound ball, also a number of muskets, and amply supplied with plenty of ammunition, strongly manned with choice hands, and masters of approved knowledge."

Scarcely any journey, now, outside of Asia and Africa, is more arduous than was then the trip from St. Louis to New Orleans. Vagabond Indians, white marauders, Spanish-armed extortion and arrest, and the natural perils of the stream, made the river little, if any, less dangerous than the Gulf. Culbert and Maglibray were the baser Lafittes of the Mississippi, and Cottonwood Creek their Barataria.

And the labors and privations were greater than the dangers. The conveyances were keel-boats, barges, and flat-boats. The flat-boats, at New Orleans, were broken up for their lumber, their slimy gunwales forming along the open gutter's edge in many of the streets a narrow and treacherous substitute for a pavement. The keel-boats and barges returned up-stream, propelled now by sweeps and now by warping or by *cortelle* (hand tow-ropes), consuming "three or four months of the most painful toil that can be imagined." Exposure and bad diet "ordinarily destroyed one-third of the crew."

But on the 10th of January, 1812, there had pushed in to the landing at New Orleans a sky-blue thing with a long bowsprit, "built after the fashion of a ship, with port-holes in the side," and her cabin in the hold. She

was the precursor of the city's future greatness, the *Orleans*, from Pittsburg, the first steam vessel on the Mississippi.

Here was a second freedom of the great river mightier than that wrested from Spain. Commercial grandeur seemed just at hand. All Spanish America was asserting its independence; Whitney's genius was making cotton the world's greatest staple; immigrants were swarming into the West; the Mississippi valley would be the provision-house of Europe, the importer of untold millions of manufactures; New Orleans would keep the only gate. Instead of this, in June, 1812, Congress declared war against Great Britain. Barataria seemed indispensable, and New Orleans was infested with dangers.

In 1813, Wilkinson, still commanding in the West, marched to the Mobile; in April he drove the Spaniards out of Fort Charlotte and raised a small fortification, Fort Bowyer, to command the entrance of Mobile Bay. Thus the Spanish, neighbors only less objectionable than the British, were crowded back to Pensacola. But, this done, Wilkinson was ordered to the Canadian frontier, and even took part of his few regulars with him.

The English were already in the Gulf; the Indians were growing offensive; in July seven hundred crossed the Perdido into Mississippi; in September massacred three hundred and fifty whites at Fort Mimms, and opened the Creek war. Within New Orleans bands of drunken Choctaws roamed the streets. The Baratarians were seen daily in the public resorts. Incendiary fires became alarmingly common, and the *batture* troubles again sprang up. Naturally, at such a junction, Lafitte and his men reached the summit of power.

In February, 1814, four hundred country militia reported at Magazine Barracks, opposite New Orleans. The Governor tried to force out the city militia. He got only clamorous denunciation and refusal to obey. The country muster offered their aid to enforce the order. The city companies heard of it, and only Claiborne's discreetness averted the mortifying disaster of a battle without an enemy. The country militia, already deserting, was disbanded. Even the legislature withheld its support, and Claiborne was everywhere denounced as a traitor. He had to report to the President his complete failure. Still, he insisted apologetically, the people were emphatically ready to "turn out in case of actual invasion." Only so patient a man could understand that the Creoles were conscientious in their lethargy. Fortunately the invasion did not come until the Creek war had brought to view the genius of Andrew Jackson.

In April, Government raised the embargo.

But the relief was tardy; the banks suspended. Word came that Paris had fallen. Napoleon had abdicated. England would throw new vigor into the war with America, and could spare troops for the conquest of Louisiana.

In August the Creeks made peace. Some British officers landed at Apalachicola, Florida, bringing artillery. Some disaffected Creeks joined them and were by them armed and drilled. But now, at length, the Government took steps to defend the South-west.

General Jackson was given the undertaking. He wrote to Claiborne to hold his militia ready to march—an order very easy to give. In September he repaired to Mobile, which was already threatened. The British Colonel Nicholls had landed at Pensacola with some companies of infantry, from two sloops-of-war. The officers from Apalachicola and a considerable body of Indians had joined him, without objection from the Spaniards.

Suddenly attention was drawn to the Baratarians. On the third of September an armed brig had appeared off Grande Terre. She fired on an inbound vessel, forcing her to run aground, tacked, and presently anchored some six miles from shore. Certain of the islanders went off in a boat, ventured too near, and, turning to retreat, were overhauled by the brig's pinnace, carrying British colors and a white flag. In the pinnace were two naval officers and a captain of infantry. They asked for Mr. Lafitte, one officer speaking in French for the other.

"He is ashore," said the chief person in the island boat, and received a packet addressed "To Mr. Lafitte, Barataria." The officers asked that it be carefully delivered to him in person. The receiver of it, however, induced them to continue on, and when they were plainly in his power revealed himself.

"I, myself, am Mr. Lafitte." As they drew near the shore, he counseled them to conceal their business from his men. More than two hundred Baratarians lined the beach clamoring for the arrest of the "spies," but Lafitte contrived to get them safely to his dwelling, quieted his men, and opened the packet.

There were four papers in it. First, Colonel Nicholls's appeal to the Creoles to help restore Louisiana to Spain; to Spaniards, French, Italians, and Britons, to aid in abolishing American usurpation; and to Kentuckians, to exchange supplies for money, and neutrality for an open Mississippi. Second, his letter to Lafitte offering a naval captain's commission to him, lands to all his followers, and protection in persons and property to all, if the pirates, with their fleet, would put themselves under the British naval commander,

and announcing the early invasion of Louisiana with a powerful force. Third, an order from the naval commander in Pensacola Bay, to Captain Lockyer, the bearer of the packet, to procure restitution at Barataria for certain late piracies, or to "carry destruction over the whole place"; but also repeating Colonel Nicholls's overtures. And fourth, a copy of the orders under which Captain Lockyer had come. He was to secure the Baratarians' coöperation in an attack on Mobile, or, at all events, their neutrality. According to Lafitte, the captain added verbally the offer of \$30,000 and many other showy inducements.

Lafitte asked time to consider. He withdrew; when in a moment the three officers and their crew were seized by the pirates and imprisoned. They were kept in confinement all night. In the morning Lafitte appeared, and, with many apologies for the rudeness of his men, conducted the officers to their pinnace, and they went off to the brig. The same day he addressed a letter to Captain Lockyer asking a fortnight to "put his affairs in order," when he would be "entirely at his disposal." It is noticeable for its polished dignity and the purity of its English.

Was this anything more than stratagem? The Spaniard and Englishman were his foe and his prey. The Creoles were his friends. His own large interests were scattered all over Lower Louisiana. His patriotism has been overpraised; and yet we may allow him patriotism. His whole war, on the main-land side, was only with a set of ideas not superficially fairer than his own. They seemed to him unsuited to the exigencies of the times and the country. Thousands of Louisianians thought as he did. They and he—to borrow from a distance the phrase of another—were "polished, agreeable, dignified, averse to baseness and vulgarity." They accepted friendship, honor, and party faith as sufficient springs of action, and only dispensed with the sterner question of right and wrong. True, Pierre, his brother, and Dominique, his most intrepid captain, lay then in the calabozos. Yet should he, so able to take care of himself against all comers and all fates, so scornful of all subordination, for a paltry captain's commission and a doubtful thirty thousand, help his life-time enemies to invade the country and city of his commercial and social intimates?

He sat down and penned a letter to his friend Blanque, of the legislature, and sent the entire British packet, asking but one favor, the "amelioration of the situation of his unhappy brother"; and the next morning one of the New Orleans papers contained the following advertisement:

## \$1000 REWARD

WILL be paid for the apprehending of PIERRE LAFITTE, who broke and escaped last night from the prison of the parish. Said Pierre Lafitte is about five feet ten inches height, stout made, light complexion, and somewhat cross-eyed, further description is considered unnecessary, as he is very well known in the city.

Said Lafitte took with him three negroes, to wit: [giving their names and those of their owners]; the above reward will be paid to any person delivering the said Lafitte to the subscriber.

J. H. HOLLAND,  
*Keeper of the Prison.*

On the 7th, John Lafitte wrote again to Blanque,—the British brig and two sloops-of-war still hovered in the offing,—should he make overtures to the United States Government? Blanque's advice is not known; but on the 10th, Lafitte made such overtures by letter to Claiborne, inclosed in one from Pierre Lafitte—who had joined him—to M. Blanque.

The outlawed brothers offered themselves and their men to defend Baratania, asking only oblivion of the past. The high-spirited periods of John Lafitte challenge admiration, even while they betray tinges of sophistry that may or may not have been apparent to the writer. "All the offense I have committed," wrote he, "I was forced to by certain vices in our laws."

The heads of the small naval and military force then near New Orleans were Commodore Paterson and Colonel Ross. They had organized and were hurriedly preparing a descent upon the Baratarians. A general of the Creole militia was Villeré, son of the unhappy patriot of 1768. Claiborne, with these three officers, met in council, with the Lafittes' letters and the British overtures before them, and debated the question whether the pirates' services should be accepted. Villeré voted yea, but Ross and Paterson stoutly nay, and thus it was decided. Nor did the British send ashore for Lafitte's final answer; but lingered distantly for some days and then vanished.

Presently the expedition of Ross and Paterson was ready. Stealing down the Mississippi, it was joined at the mouth by some gun-vessels, sailed westward into the Gulf, and headed for Baratania. There was the schooner *Carolina*, six gun-vessels, a tender, and a launch. On the 16th of September they sighted Grande Terre, formed in line of battle, and stood for the entrance of the bay.

Within the harbor, behind the low island, the pirate fleet was soon descried forming in line. Counting all, schooners and feluccas, there were ten vessels. Two miles from shore the *Carolina* was stopped by shoal water, and the two heavier gun-vessels grounded.

But armed boats were launched, and the attack entered the pass and moved on into the harbor.

Soon two of the Baratarians' vessels were seen to be on fire; another, attempting to escape, grounded, and the pirates, except a few brave leaders, were flying. One of the fired vessels burned, the other was boarded and saved, the one which grounded got off again and escaped. All the rest were presently captured. At this moment, a fine, fully-armed schooner appeared outside the island, was chased and taken. Scarcely was this done when another showed herself to eastward. The *Carolina* gave chase. The stranger stood for Grande Terre, and ran into water where the *Carolina* could not follow. Four boats were launched; whereupon the chase opened fire on the *Carolina*, and the gun-vessels in turn upon the chase, firing across the island from inside, and in half an hour she surrendered. She proved to be the *General Bolivar*, armed with one eighteen, two twelve, and one six-pounder.

The nest was broken up. "All their buildings and establishments at Grande Terre and Grand Isle, with their telegraph and stores at Chenière Caminada, were destroyed. On the last day of September, the elated squadron, with their prizes,—seven cruisers of Lafitte, and three armed schooners under Carthaginian colors,—arrived in New Orleans harbor amid the peal of guns from the old barracks and Fort St. Charles.

But among the prisoners the commanding countenance of John Lafitte and the cross-eyed visage of his brother Pierre were not to be seen. Both men had escaped up Bayou La Fourche to the "German Coast." Others who had had like fortune by and by gathered on Last Island, some sixty miles west of Grande Terre, and others found asylum in New Orleans, where they increased the fear of internal disorder.

Paterson and Ross struck the Baratarians just in time. The fortnight asked of the British by Lafitte expired the next day. The British themselves were far away eastward, drawing off from an engagement of the day before, badly worsted. A force of seven hundred British troops, six hundred Indians, and four vessels of war had attacked Fort Bowyer, commanding the entrances of Mobile Bay and Mississippi Sound. Its small garrison had repulsed them and they retired again to Pensacola with serious loss, including a sloop-of-war grounded and burned.

Now General Jackson gathered four thousand men on the Alabama River, regulars, Tennesseans, and Mississippi dragoons, and early in November attacked Pensacola with

great spirit, took the two forts,—which the Spaniards had allowed the English to garrison,—drove the English to their shipping and the Indians into the interior, and returned to Mobile. Here he again called on Claiborne

under "Captains" Beluche and Dominique. One of the general's later reports alludes to the Baratarians as "these gentlemen." The battle was fought on the 8th of January.

New Orleans emerged from the smoke

THE VILLERÉ PLANTATION HOUSE, HEAD-QUARTERS OF PACKENHAM.

to muster his militia. Claiborne convened the legislature and laid the call before it.

It was easy to count up the resources of defense: Patterson's feeble navy, the weak Fort St. Philip on the river, the unfinished Fort Petites Coquilles on the Rigolets, Ross's seven hundred regulars, a thousand militia, mustered at last after three imperative calls, a wretchedly short supply of ammunition—nothing more. "Our situation," says La Carrière Latour, "seemed desperate." Twelve thousand chosen British troops were known to have sailed for Louisiana.

Measures of defense were pushed on. Forts and stockades were manned, new companies and battalions were mustered, among them one of Choctaw Indians and two of free men of color. Jails were emptied to swell the ranks.

And now John Lafitte, encouraged by Claiborne and the legislature, came forward again. Jackson, in one of his proclamations, had called the Baratarians "hellish banditti," whose aid he spurned. But now these two intrepid leaders met face to face in a room that may still be pointed out in the old cabildo, and the services of Lafitte and his skilled artillerists were offered and accepted for the defense of the city. All proceedings against them were suspended; some were sent to man the siege-guns of Forts Petites Coquilles, St. John, and St. Philip, and others were enrolled in a body of artillery

of General Jackson's great victory comparatively Americanized. Peace followed, or rather the tardy news of peace, which had been sealed at Ghent more than a fortnight before the battle. With peace came open ports. The highways of commercial greatness crossed each other in the custom-house, not behind it, as in Spanish or embargo days, and the Baratarians were no longer esteemed a public necessity. Scattered, used, and pardoned, they passed into eclipse—not total, but fatally visible where they most desired to shine. The ill-founded tradition that the Lafittes were never seen after the battle of New Orleans had thus a figurative reality.

In Jackson's general order of January 21st, Captains Dominique and Beluche, "with part of their former crew," were gratefully mentioned for their gallantry in the field, and the brothers Lafitte for "the same courage and fidelity." On these laurels Dominique You rested and settled down to quiet life in New Orleans, enjoying the vulgar admiration which is given to the survivor of lawless adventures. It may seem superfluous to add that he became a leader in ward politics.

In the spring of 1815, Jackson, for certain imprisonments of men who boldly opposed the severity of his prolonged dictatorship in New Orleans, was forced at length to regard the decrees of court. It was then that his "hellish banditti," turned "Jacksonites," did

OLD SPANISH COTTAGE IN ROYALE STREET, SCENE OF ANDREW JACKSON'S TRIAL.

their last swaggering in the famous Exchange Coffee-house, at the corner of St. Louis and Chartres streets, and when he was fined \$1000 for contempt of court, aided in drawing his carriage by hand through the streets.

Of Beluche or of Pierre Lafitte little or nothing more is known. But John Lafitte continued to have a record. After the city's deliverance a ball was given to officers of the army. General Coffee was present. So, too, was Lafitte. On their being brought together and introduced, the General showed some hesitation of manner, whereupon the touchy Baratarian advanced haughtily and said, with emphasis, "Lafitte, the pirate." Thus, unconsciously, it may be, he foretold that part of his life which still lay in the future.

That future belongs properly to the history of Texas. Galveston Island had early been

one of Lafitte's stations, and now became his permanent depot, whence he carried on extensive operations, contraband and piratical. His principal cruiser was the *Jupiter*. She sailed under a Texan commission. Under the filibuster Long, who ruled at Nacogdoches, Lafitte became governor of Galveston.

An American ship was robbed of a quantity of specie on the high seas. Shortly afterward the *Jupiter* came into Galveston with a similar quantity on board. A United States cruiser accordingly was sent to lay off the coast, and watch her maneuvers. Lafitte took offense at this, and sent to the American commander to demand explanation. His letter, marked with more haughtiness, as well as with more ill-concealed cunning than his earlier correspondence with the British and Americans, was not answered.

THE BATTLE-GROUND.

In 1818 a storm destroyed four of his fleet. He sent one Lafage to New Orleans, who brought out thence a new schooner of two guns, manned by fifty men. He presently took a prize; but had hardly done so, when he was met by the revenue cutter *Alabama*, answered her challenge with a broadside, engaged her in a hard battle, and only surrendered after heavy loss. The schooner and prize were carried into Bayou St. John, the crew taken to New Orleans, tried in the United States Court, condemned and executed.

Once more Lafitte took the disguise of a Colombian commission and fitted out three vessels. The name of one is not known. Another was the *General Victoria*, and a third the schooner *Blank*—or, we may venture to spell it *Blanque*. He coasted westward and southward as far as Sisal, Yucatan, taking several small prizes, and one that was very valuable, a schooner that had been a slaver. Thence he turned toward Cape Antonio, Cuba, and in the open gulf disclosed to his followers that his Colombian commission had expired.

Forty-one men insisted on leaving him. He removed the guns of the *General Victoria*, crippled her rigging, and gave her into their hands. They sailed for the Mississippi, and after three weeks arrived there and surrendered to the officers of the customs. The Spanish Consul claimed the vessel, but she was decided to belong to the men who had fitted her out.

Lafitte seems now to have become an open pirate. Villeré, Governor of Louisiana after

Claiborne, and the same who had counseled the acceptance of Lafitte's first overtures in 1819, spoke in no measured terms of "those men who lately, under the false pretext of serving the cause of the Spanish patriots, scoured the Gulf of Mexico, making its waves groan," etc. It seems many of them had found homes in New Orleans, making it "the seat of disorders and crimes which he would not attempt to describe."

The end of this uncommon man is lost in a confusion of improbable traditions. As late as 1822 his name, if not his person, was the terror of the Gulf and the Straits of Florida. But in that year the United States navy swept those waters with vigor, and presently reduced the perils of the Gulf—for the first time in its history—to the hazard of wind and wave.

A few steps down the central walk of the middle cemetery of those that lie along Claiborne street, from Custom-house down to Conti, on the right-hand side, stands the low, stuccoed tomb of Dominique You. The tablet bears his name surmounted by the emblem of Free Masonry. Some one takes good care of it. An epitaph below proclaims him, in French verse, the intrepid hero of a hundred battles on land and sea; who, without fear and without reproach, will one day view, unmoved, the destruction of the world. To this spot, in 1830, he was followed on his way by the Louisiana Legion (city militia), and laid to rest with military honors, at the expense of the town council.

---

## AT SEA.

ONE does not seem really to have got out of doors till he goes to sea. On the land he is shut in by the hills, or the forests, or more or less housed by the sharp lines of his horizon. But at sea he finds the roof taken off, the walls taken down; he is no longer in the hollow of the earth's hand, but upon its naked back, with nothing between him and the immensities. He is in the great cosmic out-of-doors, as much so as if voyaging to the moon or to Mars. An astronomic solitude and vacuity surrounds him; his only guides and landmarks are stellar; the earth has disappeared; the horizon has gone; he has only the sky and its orbs left; this cold, vitreous, blue-black liquid through which the ship plows is not water, but some denser form of

the cosmic ether. He can now see the curve of the sphere which the hills hid from him; he can study astronomy under improved conditions. If he was being borne through the interplanetary spaces on an immense shield, his impressions would not perhaps be much different. He would find the same vacuity, the same blank or negative space, the same empty, indefinite, oppressive out-of-doors.

For it must be admitted that a voyage at sea is more impressive to the imagination than to the actual sense. The world is left behind; all standards of size, of magnitude, of distance, are vanished; there is no size, no form, no perspective; the universe has dwindled to a little circle of crumpled water, that journeys with you day after day, and to which you

AT SEA.

seem bound by some enchantment. The sky becomes a shallow, close-fitting dome, or else a pall of cloud that seems ready to descend upon you. You cannot see or realize the vast and vacant surrounding; there is nothing to define it or set it off. Three thousand miles of ocean space are less impressive than three miles bounded by rugged mountain walls. Indeed, the grandeur of form, of magnitude, of distance, of proportion, etc., are only upon shore. A voyage across the Atlantic is a ten-day sail through vacancy. There is no sensible progress; you pass no fixed points. Is it the steamer that is moving, or is it the sea? or is it all a dance and illusion of the troubled brain? Yesterday, to-day, and to-morrow, you are in the same parenthesis of nowhere. The three hundred or more miles the ship daily makes is ideal, not real. Every night the stars dance and reel there in the same place amid the rigging; every morning the sun comes up from behind the same wave, and staggers slowly across the sinister sky. The eye becomes a-hunger for form, for permanent lines, for a horizon wall to lift up and keep off the sky, and give it a sense of room. One understands why sailors become an imaginative and superstitious race; it is the reaction from this narrow horizon in which they are put—this ring of fate surrounds and oppresses them. They escape by invoking the aid of the supernatural. In the sea itself there is far less to stimulate the imagination than in the varied forms and colors of the land. How cold, how merciless, how elemental it looks!

The only things that look familiar at sea are the clouds. These are messengers from home, and how weary and disconsolate they appear, stretching out along the horizon, as if looking for a hill or mountain top to rest upon,—nothing to hold them up,—a roof without walls, a span without piers. One gets the impression that they are grown faint, and must presently, if they reach much farther, fall into the sea. But when the rain came, it seemed like mockery, or irony on the part of the clouds. Did one vaguely believe, then, that the clouds would respect the sea, and withhold their needless rain? No, they treated it as if it was a mill-pond, or a spring-run, too insignificant to make any exceptions to.

One bright Sunday, when the surface of the sea was like glass, a long chain of cloud-mountains lay to the south of us all day, while the rest of the sky was clear. How they glowed in the strong sunlight, their summits shining like a bouquet of full moons, and making a broad, white, or golden path upon the water! They came out of the south-west, an endless procession of them, and tapered

away in the east. They were the piled, convoluted, indolent clouds of mid-summer—thunder-clouds that had retired from business; the captains of the storm in easy undress. All day they filed along there, keeping the ship company. How the eye reveled in their firm, yet ever-changing forms! Their under or base line was as straight and continuous as the rim of the ocean. The substratum of air upon which they rested was like a uniform layer of granite rock, invisible, but all-resisting; not one particle of these vast cloud mountains, so broken and irregular in their summits, sank below this aerial granite boundary. The equilibrium of the air is frequently such that the under surface of the clouds is like a ceiling. It is a fair-weather sign, whether upon the sea or upon the land. One may frequently see it in a mountainous district, when the fog-clouds settle down, and blot out all the tops of the mountains without one fleck of vapor going below a given line which runs above every valley, as uniform as the sea level. It is probable that in fair weather the atmosphere always lies in regular strata in this way, and that it is the displacement and mixing up of these by some unknown cause that produces storms.

As the sun neared the horizon these cloud masses threw great blue shadows athwart each other, which afforded the eye a new pleasure.

Late one afternoon the clouds assumed a still more friendly and welcome shape. A long, purple, irregular range of them rose up from the horizon in the north-west, exactly simulating distant mountains. The sun sank behind them, and threw out great spokes of light as from behind my native Catskills. Then gradually a low, wooded shore came into view along their base. It proved to be a fog-bank lying low upon the water, but it copied exactly, in its forms and outlines, a flat, umbrageous coast. You could see distinctly where it ended, and where the water began. I sat long on that side of the ship, and let my willing eyes deceive themselves. I could not divest myself of the comfortable feeling inspired by the prospect. It was to the outward sense what dreams and reveries are to the inward. That blind, instinctive love of the land,—I did not know how masterful and involuntary the impulse was, till I found myself warming up toward that phantom coast. The empty void of the sea was partly filled, if only with a shadow. The inhuman desolation of the ocean was blotted out for a moment in that direction at least. What phantom-huggers we are upon sea or upon land. It made no difference that I knew this to be a sham coast. I could feel its friendly influence all the same, even when my back was turned.

In summer, fog seems to lie upon the Atlantic in great patches, looking, perhaps, like spots of mold or mildew from an elevation of a few miles. One may see these patches far ahead looking so shallow that it seems as if the great steamer must carry her head above them. But she does not quite do it. When she enters this obscurity there begins the hoarse bellowing of her great whistle. As one dozes in his berth or sits in the cabin reading, there comes a vague impression that we are entering some port or harbor, the sound is so welcome, and is so suggestive of the proximity of other vessels. But only once did our loud and repeated hallooing awaken any response. Everybody heard the answering whistle out of the thick obscurity ahead and was on the alert. Our steamer instantly slowed her engines and redoubled her tootings. The two vessels soon got the bearing of each other, and the stranger passed us on the starboard side, the hoarse voice of her whistle alone revealing her course to us.

Late one afternoon, as we neared the Banks, the word spread on deck that the knobs and pinnacles of a thunder-cloud sunk below the horizon, that deeply and sharply notched the western rim of the sea, were icebergs. The captain was quoted as authority. He probably encouraged the delusion. The jaded passengers wanted a new sensation. Everybody was willing, even anxious, to believe them icebergs, and some persons would have them so, and listened coldly and reluctantly to any proof to the contrary. What we want to believe, what it suits our convenience, or pleasure, or prejudice, to believe, one need not go to sea to learn what slender logic will incline us to believe. To a firm, steady gaze, these icebergs were seen to be momentarily changing their forms, new chasms opening, new pinnacles rising; but these appearances were easily accounted for by the credulous: they were rolling over, or splitting asunder. One of the rarest things in the average cultivated man or woman is the capacity to receive and weigh evidence touching any natural phenomenon, especially at sea. If the captain had deliberately said that the shifting forms there on the horizon were only a school of whales playing at leap-frog, all the women and half the men among the passengers would have believed it.

In going to England in early May, we encountered the fine weather, the warmth, and the sunshine as of June that had been "central" over the British Islands for a week or more, five or six hundred miles from shore. We had come up from lower latitudes, and it was as if we had ascended a hill and found summer at the top, while a cold, backward spring yet lingered in the valley. But on our return in

early August, the positions of spring and summer were reversed. Scotland was cold and rainy, and for several days at sea you could in the distance hardly tell the sea from the sky, all was so gray and misty. In mid-Atlantic we ran into the American climate. The great continent, basking there in the western sun, and glowing with midsummer heat, made itself felt to the center of this briny void. The sea detached itself sharply from the sky and became like a shield of burnished steel, which the sky surrounded like a dome of glass. For four successive nights the sun sank clear in the wave, sometimes seeming to melt and mingle with the ocean. One night a bank of mist seemed to impede his setting. He lingered a long while partly buried in it, then slowly disappeared as through a slit in the vapor, which glowed red-hot, a mere line of fire for some moments afterward.

As we neared home the heat became severe. We were going down the hill into a fiery valley. Vast stretches of the sea were like glass bending above the long, slow heaving of the primal ocean. Sword-fish lay basking here and there on the surface, too lazy to get out of the way of the ship. Occasionally a whale would blow, or show his glistening back, attracting a crowd to the railing. One morning a whale plunged spitefully through the track of the ship but a few hundred yards away.

But the prettiest sight in the way of animated nature was the shoals of dolphins occasionally seen during these brilliant torrid days, leaping and sporting, and apparently racing with the vessel. They would leap in pairs from the glassy surface of one swell of the steamer across the polished chasm into the next swell, frisking their tails and doing their best not to be beaten. They were like fawns or young kine sporting in a summer meadow. It was the only touch of mirth, or youth and jollity, I saw in the grim sea. Savagery and desolation make up the prevailing expression here. The sea-fowls have weird and disconsolate cries, and appear doomed to perpetual solitude. But these dolphins know what companionship is, and are in their own demesne. When one sees them bursting out of the waves, the impression is that school is just out; there come the boys, skipping and laughing, and, seeing us just passing, cry to one another: "Now for a race! Hurrah, boys! We can beat 'em!"

One notices any change in the course of the ship by the stars at night. For nearly a week Venus sank nightly into the sea far to the north of us. Our course coming home is south-south-west. Then, one night, as you promenade the deck, you see, with a keen

pleasure, Venus through the rigging, dead ahead. The good ship has turned the corner, she has scented New York Harbor, and is making straight for it, with New England far away there on her right. Now sails and smoke-funnels begin to appear. All ocean paths converge here; full-rigged ships, piled with canvas, are passed, rocking idly upon the polished surface; sails are seen just dropping below the horizon, phantom ships without hulls, while here and there the black smoke of some steamer tarnishes the sky. Now we pass steamers that left New York but yester-

day; the *City of Rome*—looking, with her three smoke-stacks and her long hull, like two steamers together—creeps along the southern horizon, just ready to vanish behind it. Now she stands in the reflected light of a great white cloud which makes a broad track upon the water like the full moon. Then she slides on into the dim and even dimmer distance, and we slide on over the tropic sea, and, by a splendid run, just catch the tide at the moment of its full early the next morning, and pass the bar off Sandy Hook without a moment or an inch of water to spare.

*John Burroughs.*

### MOTHER AND CHILD.

BITTER blasts and vapors dim—  
What had they to do with him?  
Spring, though she was far away,  
Took dominion for a day,  
Filled the air with breathings soft,  
Bade a skylark sing aloft,  
When we laid him in his bed,  
Cloudless blue above his head.

It was not for him to reach  
Manly height, and thought, and speech,  
Not to climb untrodden steeps,  
Not to search out unknown deeps,  
Not through warring joy and pain  
Kingliness of soul to gain.  
He had only baby words,  
Little music, like the birds,  
Sweetly inarticulate,  
Nothing wise, nor high, nor great.  
Sunny smiles and kisses sweet—  
White and softly childish feet—  
Curls that floated on the breeze—  
We remember him for these.

They are weary who are wise.  
He looked up with happy eyes,  
Little knowing, little seeing,  
Only praising God by being.

Oh, the life we could not save!  
Do not say, above his grave,  
That the fair and darling face  
Was but lent a little space  
Till the Father called him back,  
By an unknown homeward track.  
No, though Death came darkly chill—  
Bade the beating heart be still,

Touching him with fingers cold—  
What was given still we hold;  
Though he died, as die the flowers,  
He for evermore is ours.

Ours, though we must travel soon  
Onward through Life's afternoon;  
Shadows, falling long and gray,  
Gather round the western day,  
And our twilight visions show  
How the years shall come and go.

Little maids, with tangled curls,  
Change to slender, dreamy girls;  
Chubby rogues grow tall, and then  
Go their way as bearded men.  
And the mother stands aside,  
With an ache beneath her pride,  
And a sorrow 'mid her joys,  
For the vanished babes and boys;  
So the earlier gladness wanes—  
But the little one remains.

For a house that once has known  
Tiny feet on stair and stone—  
Steps that never more shall sound,  
Feet at rest beneath the ground—  
Keeps remembrance of the dead,  
And the music of their tread.  
Not at noonday, busy, bright,  
Only in the quiet night,  
With a thrill of sweetest pain,  
Comes that music once again,  
Heard in stillness and apart  
Echoed from his mother's heart.

*Margaret Veley.*

## EMERSON.

THE grasses have scarcely taken root on Emerson's grave among the pines, yet so instant and continuous has been the discussion of his genius that we already are asking Lowell's question concerning Shakspeare,—Can anything new be said of him? One thing, it seems to me, may be said at least in a new way, and as a clew to his work as a poet. While, of all his brotherhood, he is the radiant exemplar of his own statement, that in spirit "the true poet and the true philosopher are one," nevertheless, of all verse his own shows most clearly that the Method of the poet not only is not one with that of the philosopher, but is in fact directly opposed to it. The poet, as an artist, does not move in the direction which was Emerson's by instinct and selection. The Ideal philosophy scrutinizes every phase of Nature to find the originating sense, the universal soul, the pure identity; it follows Nature's trails to their common beginning, inverting her process of evolution, working back from infinite variety to the primal unity. This, too, is the spirit of the poet,—to find the soul of things. But in method he is an artist: his poetry is an art that imitates Nature's own habit. He works from unity to countless results and formations, from the pure thought to visible symbols, from the ideal to the concrete. As a poet, Emerson found himself in a state, not of distraction, but often of indecision, *between the methods of philosophy and art*. To bear this in mind is to account more readily for the peculiar beauties and deficiencies of his verse,—and thus to accept it as it is, and not without some understanding of its value.

Hermann Grimm recurs to the dispute whether our sage was a poet, a philosopher, or a prophet. The fact is that he was born with certain notes of song; he had the poet's eye and ear, and was a poet just so far as, being a philosopher, he accepted poetry as the expression of thought in its rare and prophetic moods, and just so far as, in exquisite moments, he had the mastery of this form of expression.

Emerson's prose is full of poetry, and his poems are light and air. But this statement, like so many of his own, gives only one side of a truth. His prose is just as full of everyday sense and wisdom; and something different from prose, however sublunary and imaginative, is needed to constitute a poem. His verse, often diamond-like in contrast

with the feldspar of others, at times is ill-cut and beclouded. His prose, then, is that of a wise man, plus a poet; and his verse, by turns, light and twilight, air and vapor. Yet we never feel, as in reading Wordsworth, that certain of his measures are wholly prosaic. He was so careless of ordinary standards, that few of his own craft have held his verse at its worth. It is said that his influence was chiefly, like that of Socrates, upon the sensitive and young, and such is the case with all fresh influences; but I take it that those who have fairly assimilated Emerson's poetry in their youth have been not so much born poets as born thinkers of a poetic cast. It is inevitable, and partakes of growth by exercise, that poets in youth should value a master's sound and color and form, rather than his priceless thought. They are drawn to the latter by the former, or not at all. Yet when poets, even in this day of refinement, have served their technical apprenticeship, the depth and frequent splendor of Emerson's verse grow upon them. They half suspect that he had the finest touch of all when he chose to apply it. It becomes a question whether his discords are those of an undeveloped artist, or the sudden craft of one who knows all art and can afford to be on easy terms with it. I think there is evidence on both sides;—that he had seasons when feeling and expression were in circuit, and others when the wires were down, and that he was as apt to attempt to send a message at one time as at the other. But he suggested the subtilty and swiftness of the soul's reach, even when he failed to sustain it.

I have said that of two poets, otherwise equal, the one who acquires the broadest knowledge will draw ahead of him who only studies his art, and the poet who thinks most broadly and deeply will draw ahead of all. There can be little doubt of Emerson as a thinker, or as a poet for thinkers satisfied with a deep but abstract, and not too varied, range. Yet he did not use his breadth of culture and thought to diversify the purpose, form, symbolism, of his poems. They are mostly in one key. They teach but one lesson; that, to be sure, is the first and greatest of all, but they fail to present it, after Nature's method, in many forms of living and beautiful interest,—to exemplify it in action, and thus bring it within universal sympathy. That this should be so was, I say, inevitable from the field of

Emerson's research,—that of pure rather than of applied philosophy. Thus far, however, he represents Thought in any adjustment of our poetic group, and furthermore,—his thought being independent and emancipatory,—the American conflict with superstition, with servility to inherited usage and opinion.

We shall see that he had himself a noble and comprehensive ideal of what a typical poet should be, and was aware that his own song fell short of it. Still, he called himself a poet, and the consent of the best minds has sustained him in his judgment. His prose alone, as Lowell said, showed that he was essentially a poet; another with reason declared of his spoken essays that they were "not so much lectures as grave didactic poems, theogonies," adorned with "odes" and "eclogues." Thirty years later a cool and subtle writer looks back to find them the "most poetical, the most beautiful productions of the American mind." For once the arbiters agree, except in a question akin to the dispute whether all things consist solely of spirit or solely of matter. Common opinion justified Mr. Sanborn's fine paradox that, instead of its being settled that Emerson could not write poetry, it was settled that he could write nothing else. We know his distaste for convention, his mistrust of "tinkle" and "efficacious rhymes." But his gift lifted him above his will; even while throwing out his grapnel, clinging to prose as the firm ground of his work, he rose involuntarily and with music. And it well may be that at times he wrote verse as an avowal of his nativity, and like a noble privileged to use the language of the court. Certainly he did not restrict himself to the poet's calling with the loyalty of Tennyson and Longfellow. In verse, however careful of his phrase, he was something of a rhapsodist, not apt to gloss his revelations and exhortings with the nice perfection of those others. He must be reviewed as one whose verse and parable and prophecy alike were means to an end,—that end not art, but the enfranchisement and stimulation of his people and his time. When Longfellow, the poet of graceful art and of sympathy as tender as his voice, took his departure, there went up a cry as from a sense of fireside loss. People everywhere dwelt upon the story of his life and recalled his folk-songs. Emerson glided away almost unperceived under the shadow of the popular bereavement. But soon, and still multiplying from the highest sources, tributes to his genius began to appear,—searching, studying, expounding him,—as when a grand nature, an originating force, has ceased to labor for us. This is the best of fame: to impress the selected minds, which redistribute

the effect in steadfast circles of extension. More than his associates, Emerson achieved this fame. He had the great man's intellect, which, according to Landor, "puts in motion the intellect of others." He was, besides, so rare a personage, that one who seeks to examine his writings apart from the facts and conduct of his life, needs must wander off in contemplation of the man himself. Yet anything that others can write of him is poor indeed beside a collect of his own golden sayings. He felt his work to be its own and best interpreter, and of recent authors who have justly held this feeling he doubtless was the chief.

## II.

It is not my province to take part in the discussion of Emerson's philosophy, his system or lack of system. Some notion of this, however, must affect our thoughts of him as a poet, since of all moderns he most nearly fulfilled Wordsworth's inspired prediction, uttered sixty years ago, of the approaching union of the poet and the philosopher. He deemed the higher office that of the poet,—of him who quaffs the brook that flows fast by the oracles,—yet doubtless thought himself not so well endowed with melody and passion as that his teaching should be subordinate to his song. But the latter was always the flowering of his philosophic thought, and it is essential to keep in view the basis of that pure reflection. He looked upon Nature as pregnant with Soul; for him the Spirit always moved upon the face of the waters. The incomprehensible plan was perfect: whatever is, is right. Thus far he knew, and was an optimist with reverent intent. It was in vain to ask him to assert what he did not know, to avow a creed founded upon his hopes. If a theist, with his intuition of an all-pervading life, he no less felt himself a portion of that life, and the sense of omnipresence was so clearly the dominant sense of its attributes, that to call him a theist rather than a pantheist is simply a dispute about terms; to pronounce him a Christian theist is to go beyond his own testimony. Such a writer must be judged by the concurrence of his books; they are his record, and the parol evidence of no associate can weigh against his written manifest for an instant. His writings assure us that he accepted all bibles and creeds for what good there was in them. One thing for him was "certain": "Religions are obsolete when lives do not proceed from them." He saw that "unlovely, nay frightful, is the solitude of the soul which is without God in the world;" but the creeds and dogmas of an-

thropomorphic theology were merely germinal. "Man," thus far, has "made all religions, and will yet make new and even higher faiths."

Emerson, a man of our time, while a transcendentalist, looking inward rather than to books for his wisdom, studied well the past, and earlier sages were the faculty of his school. A latter-day eclectic, he took from all literatures their best and essential. A Platonic idealist, he was not averse to the inductive method of Aristotle; he had the Alexandrian faith and ecstasy, the Epicurean zest and faculty of selection; like the Stoics, he observed morals, heroism, self-denial, and frugality. There is much in his teachings that recalls the beautiful ethics of Marcus Aurelius, and the words of Epictetus, as reported by Arrian. His spiritual leanings never stinted his regard of men and manners. He kept a sure eye on the world; he was not only a philosopher, but the paragon of gentlemen, with something more than the Oriental, the Grecian, or the Gallic, tact. He relished to the full the brave distinctions, the portraiture and tests of Plutarch, and found the best of all good company in the worldly wise, the cheery and comfortable Montaigne. One may almost say that he refined and digested what was good in all philosophies, and nothing more. He would get hold of Swedenborg, the mystic, yet not be Swedenborg exclusively, nor imitate the rhetoric of the Sophists, the pride of the Cynics. From all he learned what each confesses in the end,—the limitations of inquiry,—that the Finite cannot measure, though it may feel, the Infinite. No more would he formulate a philosophy, but within it he could recognize nature, art, taste, morals, laws, religion, and the chance of immortality. When it was said that he had no new system, he thought that he needed none, and was skeptical of classification.

It appears that he found the key to his own nature in Plato, being an idealist first of all. His intuitive faculty was so determined, that ideality and mysticism gave him the surest promise of realities; his own intellect satisfied him of the power of intellect. Plainly hearing an interior voice, he had no doubt that other men were similarly monished. Plato, the guide of his youth, remained his type of philosopher and man. To Plato's works alone should Omar's saying of the Koran be applied: "Burn the libraries, for their value is in this book." Nowhere else was there such a range of speculation. "Out of Plato come all things." And thus he held to the last. "Of Plato," he said, years afterward, "I hesitate to speak, lest there should

be no end. \* \* \* Why should not young men be educated on this book? It would suffice for the tuition of the race." Yet Emerson's philosophy was a greater advance from Neo-Platonism than the Alexandrians were able to make upon the lines indicated by their elemental master. In personal life and bearing, Plotinus, with whom our poet seems to have been most in sympathy, was very closely his prototype. There is first to be noted the curious resemblance between the eclectic, investigating Alexandrian age and our present time; and secondly, it is Plotinus of whom we are told that "He lived at the same time with himself and with others, and the inward activity of his spirit only ceased during his hours of sleep. \* \* \* His written style was close, pregnant, and richer in thought than in words, yet enthusiastic, and always pointing to the main object. He was more eloquent in his oral communications, and was said to be very clever in finding the appropriate word, even if he failed in accuracy on the whole. Besides this, the beauty of his person was increased when discoursing; his countenance was lighted up with genius." Taylor's translation of selections from the Works of Plotinus, published in London, 1834, must have fallen into Emerson's hands, and I am satisfied of their impression upon his mind. As one examines the lives and writings of the two men, the likeness is still more notable, especially with respect to their views of fate, will, ethics, the "higher law," the analysis of the beautiful, and in the ardor with which young students, and many of the elderly and wise, listened to their respective teachings. Emerson was a Plotinus reanimate after the lapse of sixteen centuries of Christianity. He has now, like the Neo-Platonist, "led back the Divine principle within 'him' to the God who is all in all."

To the great thinkers of the past, the New England teacher, without fear or boasting, well might feel himself allied. The accepted great, free of the ordinary bounds of place and time, recognize one another across the vague, like stars of the prime magnitude in the open night. Emerson knew the haps and signs of genius: "Whenever we find a man higher by a whole head than any of his contemporaries, it is sure to come in doubt what are his real works." We cannot say "What is master, and what school." "As for their borrowings and adaptings, they know how to borrow. \* \* \* A great man is one of the affinities, who takes of everything." But they are not above the law of perfect life; virtue, simplicity, absolute sincerity, these are their photosphere. "Live as on a mountain. Let men see, let them know, a real man,

who lives as he was meant to live." To this Roman standard the New Englander subjoined the shrewd, kindly wisdom of his stock and region. He was eminent among those whose common sense is the most telling point to be made against Locke's negation of innate ideas,—whose judgment is so apt that, granting Locke's theory, it can be accounted for only by the modern theory of ideas prenatal and inherited. His written wisdom is more effective than Montaigne's, being less dependent on citations. He knew by instinct what our novelists learn from observation and experience; or is it that they study chiefly their own time and neighborhood, while he sat aloof and with the ages? Thus strong in equipment, sound in heart, and lofty of intellect, we find him revered by his pupils, and without a living peer in the faculty of elevating the purpose of those who listened to his buoyant words. We must confess that a differentiation between master and school, and between members of the school, after awhile became manifest. That such a process was inevitable is plain, when Emerson's transcendental and self-reliant laws of conduct are kept in mind.

One may say, in illustration, that his philosophical method bears to the inductive or empirical a relation similar to that between the poetry of self-expression and the poetry of æsthetic creation,—a relation of the subjective to the objective. The former kind of verse often is the more spontaneous, since it has its birth in the human need for utterance. It is the cry of adolescence and femininity, the resource of sensitive natures in which emotion outvies the sense of external beauty or power. It was the voice of Shakspeare's youth, nor was it ever quieted throughout the restless careers of Byron, Heine, and De Musset. But we accept as the great works of the poets their intellectual and objective creations, wherein the artist has gone beyond his own joy and pain, his narrow intro-vision, to observe, combine, transfigure, the outer world of nature and life. Such the epics, idols, dramas, of the masters. When subjective poetry is the yield of a lofty nature, or of an ideal and rapturous womanhood like Mrs. Browning's, it is a boon and revelation to us all; but when, as too often, it is the spring-rise of a purling, commonplace streamlet, its egotism grows pitiful and repulsive. This lesson has been learned, and now our minor poets, in their fear of it, strive to give pleasure to our sense of the beautiful, and work as artists,—though somewhat too delicately,—rather than to pose as exceptional beings, "among men, but not of them."

As with the subjective poets, so with many

of the transcendental acolytes. The force of Emerson lay in the depth and clearness of his intentions. He gave us the revelation and prophecy of a man among millions. Such a teacher aids the self-development of noble minds; his chief peril is that of nurturing a weaker class that cannot follow where he leads. Some of its enthusiasts will scarcely fail to set too high a value upon their personal impulses. They "still revere," but forget to "still suspect" themselves "in lowliness of heart." For the rest, the down-East instinct is advisory and homiletic; New Englanders are prone to teach, and slower to be taught. Emerson, however, grew to be their superior man, the one to whom all agreed to listen, and from whom all quote. His example, also, has somewhat advanced the art of listening, in which he was so perfect, with forward head and bright, expectant visage. His inculcations were of freedom, of the self-guidance that learns to unlearn and bears away from tradition; yet this, too, will breed false liberty of conceit in minor votaries, whose inward light may do well enough for themselves, yet not suffice for the light of the world. Hence the public, accepting Emerson, has been less tolerant of more than one Emersonian, with his *ego, et rex meus*. After all is said, we must see that our transcendentalists were a zealous, aspiring band of seekers after the true, the beautiful, and the good; what they have lacked in deference they have made up in earnestness and spirituality. There have been exquisite natures among them, upon whom, as indeed upon the genius of his people far and wide, the tonic effect of Emerson's life and precept has been immeasurable. Goethe's declaration of himself that he had been "to the Germans in general, and to the young German poets in particular, their liberator," may, with perfect truth, be applied to Emerson, and to a generation that has thriven on his word. He has taught his countrymen the worth of virtue, wisdom, courage,—above all, to fashion life upon a self-reliant pattern, obeying the dictates of their own souls.

### III.

RECOGNIZING Emerson's high mood as that of a most original poet, I wish chiefly to consider his relations to poetry and the poetic art. His imaginative essays are not poems. Speech is not song; the rarest mosaic lacks the soul of the canvas swept by the brush. The credentials that he presented from time to time, and mostly in that dawn when poets sing if ever, are few and fragment-

ary, but they will suffice. They are the trophies, the wreaths and golden vessels, the *spolia opima*, which he set before the shrine of the goddess. They are the avowal of a rare spirit that there are things which cannot be rendered in prose; that Poetry claims a finer art, a supream utterance, for her service, and that she alone can stamp the coins and bronzes which carry to the future the likeness of her viceroy.

In his verse, Emerson's spiritual philosophy and laws of conduct appear again, but transfigured. Always the idea of Soul, central and pervading, of which Nature's forms are but the created symbols. As in his early discourse he recognized two entities, Nature and the Soul, so to the last he believed Art to be simply the union of Nature with man's will—Thought symbolizing itself through Nature's aid. Thought, sheer ideality, was his sovereign; he was utterly trustful of its guidance. The law of poetic beauty depends on the beauty of the thought, which, perforce, assumes the fittest, and therefore most charming, mode of expression. The key to art is the eternal fitness of things; this is the sure test and solvent. Over and again he asserted his conviction: "Great thoughts insure musical expression. Every word should be the right word. \* \* \* The Imagination wakened brings its own language, and that is always musical. \* \* \* Whatever language the poet uses, the secret of tone is at the heart of the poem." He cites Möller, who taught that the building which was fitted accurately to answer its end would turn out to be beautiful, though beauty had not been intended. (The enforced beauty of even the rudest sailing craft always has seemed to me the most striking illustration of this truth.) In fine, Emerson sees all forms of art symbolizing but one Reason, not one mind, but The Mind that made the world. He refers "all production at last to an aboriginal Power." It is easy to discern that from the first he recognized "the motion and the spirit," which to Wordsworth were revealed only by the discipline of years; but his song went beyond the range of landscape and peasant, touching upon the verities of life and thought. "Brahma" is the presentation of the truth manifest to the oldest and most eastern East, and beyond which the West can never go. How strange that these quatrains could have seemed strange! They reveal the light of Asia, but no less the thought of Plato—who said that in all nations certain minds dwell on the "fundamental Unity," and "lose all being in one Being." Everywhere one stuff, under all forms, this the woven symbolism of the universal Soul, the only reality, the single and subdivided Identity that alone can "keep

and pass and turn again," that is at once the doubter and the doubt, the slayer and the slain, light and shadow, the hither and the yon. Love is but the affinity of its portions, the desire for reunion, the knowledge of soul by soul, to which the eyes of lovers are but windows. Art is the handiwork of the soul, with materials created by itself, building better than it knows, the bloom of attraction and necessity.

Thus far the theory of Emerson's song. It does not follow that he composed upon a theory. At times I think him the first of our lyric poets, his turns are so wild and unexpected. And he was never commonplace, even when writing for occasions. His verse changes unawares from a certain tension and angularity that were congenital, to an ethereal, unhampered freedom, the poetic soul in full glow, the inner music loosed and set at large. Margaret Fuller wrote that his poems were "mostly philosophical, which is not the truest kind of poetry." But this depends upon the measure of its didacticism. Emerson made philosophical poetry imaginative, elevating, and thus gave new evidence that the poet's realm is unbounded. If he sought first principles, he looked within himself for them, and thus portrays himself, not only the penetrative thinker, but the living man, the citizen, the New England villager, whose symbols are drawn from the actual woods and hills of a neighborhood. Certainly he went to rural nature for his vigor, his imagery and adornments. An impassioned sense of its beauty made him the reverse of the traditional descriptive poet. Most poetry of nature justly is termed didactic; most philosophical verse the same. Miss Fuller failed to make distinctions. All feel what didacticism signifies, but let us try to formulate it.

Didacticism is the gospel of half-truths. Its senses are torpid; it fails to catch and convey the soul of truth, which is beauty. Truth shorn of its beauty is tedious and not poetical. We weary of didactic verse, therefore, not because of its truth, but because of its self-delusive falsehood. It flourishes with a dull and prosaic generation. The true poet, as Mrs. Browning saw, is your only truth-teller, because he gives the truth complete in beauty or not at all.

Emerson doubts his power to capture the very truth of nature. Its essence—its beauty—is so elusive; it flees and leaves but a corpse behind; it is the pearly glint of the shells among the bubbles of the latest wave:

"I fetched my sea-born treasures home;  
But the poor, slightly, noisome things  
Had left their beauty on the shore,  
With the sun, and the sand, and the wild uproar."

But such poems as the "Forerunners" show how closely he moved, after all, upon the trail of the evading sprite. He seemed, by the first intention, and with an exact precision of grace and aptness, to put in phrases what he saw and felt,—and he saw and felt so much more than others! He had the aboriginal eye, and the civilized sensibility; he caught both the external and the scientific truth of natural things, and their poetic charm withal. As he triumphed over the untruthfulness of the mere verse-maker, and the dullness of the moralist, his instant, sure, yet airy transcripts gave his poems of nature a quality without a counterpart. Some of his measures had at least the flutter of the twig whence the bird has just flown. He did not quite fail of that music music-born,

"—a melody born of melody,  
Which melts the world into a sea.  
Toil could never compass it;  
Art its hight could never hit."

He infused his meditations with the sheen of Day itself,—of

"—one of the charmed days  
When the genius of God doth flow,  
The wind may alter twenty ways,  
A tempest cannot blow;  
It may blow north, it still is warm;  
Or south, it still is clear;  
Or east, it smells like a clover-farm;  
Or west, no thunder fear."

He returns with delight to Nature's blending of her laws of beauty and use, perceiving that she

—"beats in perfect tune,  
And rounds with rhyme her every rune,  
Whether she work in land or sea,  
Or hide underground her alchemy.  
Thou canst not wave thy staff in air,  
Or dip thy paddle in the lake,  
But it carves the bow of beauty there,  
And the ripples in rhymes the oar forsake."

"Woodnotes" is full of lyrical ecstasy and lightsome turns and graces. To assimilate such a poem of nature, or "The Problem," that masterpiece of religion and art, is to feed on holy dew, and to comprehend how the neophytes who were bred upon it find the manna of noontide somewhat rank and in-nutritious. "May-Day" is less lyrical, more plainly descriptive of the growth and meaning of the Spring, but not in any part didactic. It is the record of the poet's training, a match to Wordsworth's portrayal of his subjective communing with nature in youth; its spirit is the same with Lowell's woodland joyousness, one of child-like and unquestioning zest. Finally, this poet's scenic joinery is so true, so mortised with the one apt word,

as where he says that the wings of Time are "*pie'd* with morning and with night," and the one last word or phrase is so unlooked for, that, as I say, we scarcely know whether all this comes by grace of instinct, or with search and artistic forethought. It seems "the first fine careless rapture"; the labor, which results in the truth of Tennyson's landscape and the pathos of Longfellow's, may be there, but is not to be detected, and in these touches, if not otherwise, he excelled his compeers. His generalizations pertain to the unseen world; viewing the actual, he puts its strength and fineness alike into a line or epithet. He was born with an unrivaled faculty of selection. Monadnoc is the "constant giver," the Titan that "heeds his sky-affairs"; the tiny humming-bee a "voyager of light and noon," a "yellow-breeched philosopher," and again an "animated torrid zone"; the defiant titmouse, an "atom in full breath." For a snow-storm, or the ocean, he uses his broader brush, but once only and well. His minute truth and sense of values are held in honor by his pupils Whitman and Burroughs, our poetic familiars of the field, and by all to whom the seasonable marvels of the pastoral year are not unwelcome or unknown.

Thus keenly Emerson's instinct responded to the beauty of Nature. I have hinted that her secure laws were the chief promoters of his imagination. It coursed along her hidden ways. In this he antedated Tennyson, and was less didactic than Goethe and kindred predecessors. His foresight gave spurs to the intellect of Tyndall and other investigators,—to their ideal faculty, without which no explorer moves from post to outpost of discovery. Correlatively, each wonder-breeding point attained by the experimentalists was also occupied by our eager and learned thinker from the moment of its certainty. Each certainty gave him joy; reasoning *a priori* from his sense of a spiritual Force, the seer anticipated the truths demonstrated by the inductive workers, and expected the demonstration. Even in "The Sphinx," the first poem of his first collection, the conservation of force, the evolution from the primordial atom, are made to subserve his mystical faith in a broad Identity. Here, thirty years before Tennyson made his most compact expression of the central truth,—

"Flower in the crannied wall \* \* \*  
Little flower—but if I could understand  
What you are, root and all, and all in all,  
I should know what God and man is."

Emerson had put it in this wise :

"Thorough a thousand voices  
Spoke the universal dame:  
'Who telleth one of my meanings,  
Is master of all I am.'"

The reference, in "Bacchus," to the ascent of life from form to form, still remains incomparable for terseness and poetic illumination:

"— I, drinking this,  
Shall hear far Chaos talk with me;  
Kings unborn shall walk with me;  
And the poor grass shall plot and plan  
What it will do when it is man."

And in "Woodnotes" he discoursed of

"— the genesis of things,  
Of tendency through endless ages,  
Of star-dust and star-pilgrimages,  
Of rounded worlds, of space and time,  
Of the old flood's subsiding slime;"

but always thinks of the universal Soul as the only reality,—of creation's process as simply the metamorphosis which

"Melts things that be to things that seem,  
And solid nature to a dream."

Even in the pathetic "Threnody" he stays his anguish with faith in the beneficence of Law. With more passion and less method than afterward gave form to "In Memoriam," he declared that the "mysteries of Nature's heart" were "past the blasphemies of grief." He saw

"— the genius of the whole,  
Ascendant in the primal soul,  
Beckon it when to go and come."

Such a poet was not like to go backward. The "Song of Nature" is his pæan to her verities, still more clearly manifest in his riper years. This superb series of quatrains, cumulative as thunder-heads and fired with lyric glory, will lend its light to whatsoever the poetry of the future has in reserve for us.

It should be noted that Emerson's vision of the sublime in scientific discovery increased his distaste for mere style, and moved him to contentment with the readiest mode of expression. It tempered his eulogy of "Art," and made him draw this contrast: "Nature transcends all moods of thought, and its secret we do not yet find. But a gallery stands at the mercy of our moods, and there is a moment when it becomes frivolous. I do not wonder that Newton, with an attention habitually engaged on the paths of planets and suns, should have wondered what the Earl of Pembroke found to admire in 'stone dolls.'"

Right here we observe (deferring matters of construction) that our seer's limitations as

a poet are indicated by his dependence on out-door nature, and by his failure to utilize those higher symbols of the prime Intelligence which comprise the living, acting, suffering world of man. With a certain pride of reserve, that did not lessen his beautiful deference to individuals, he proclaimed "the advantage which the country life possesses for a powerful mind over the artificial and curtailed life of cities." He justified solitude by saying that great men, from Plato to Wordsworth, did not live in a crowd, but descended into it from time to time as benefactors. Above all he declared—"I am by nature a poet, and therefore must live in the country." But here a Goethe, or De Musset, or Browning might rejoin: "And I am a poet, and need the focal life of the town." If man be the paragon of life on this globe, his works and passions the rarest symbols of the life unseen, then the profoundest study is mankind. Emerson's theorem was a restriction of the poet's liberties. One can name great poets who would have been greater but for the trammels of their seclusion. I believe that Emerson's came from self-knowledge. He kept his range with incomparable tact and philosophy. Poets of a wider franchise—with Shakspeare at their front—have found that genius gains most from Nature during that formative period when one reads her heart, if ever, and that afterward he may safely leave her, as a child his mother, to return from time to time, but still to do his part among the ranks of men.

Emerson makes light of travel for pleasure and observation, but ever more closely would observe the ways of the inanimate world. Yet what are man's works but the works of Nature by one remove? To one poet is given the ear to comprehend the murmur of the forest, to another the sense that times the heart-beats of humanity. Few have had Emerson's inward eye, but it is well that some have not been restricted to it. He clung by attraction, no less than by circumstance, to "a society in which introspection," as Mr. James has shrewdly written, "thanks to the want of other entertainment, played almost the part of a social resource." His verse, in fact, is almost wholly void of the epic and dramatic elements which inform the world's great works of art. Action, characterization, specific sympathy, and passion are wanting in his song. His voice comes "like a falling star" from a skyey dome of pure abstraction. Once or twice, some little picture from life,—a gypsy girl, a scarcely outlined friend or loved one,—but otherwise no personage in his works except, it may be, the poet himself, the Saadi of his introspective song: even

that wise and joyous bard restored in fragments, suggested rather than portrayed. Emerson would be the "best bard, because the wisest," if the wisdom of his song illustrated itself in living types. He knew the human world, none better, and generalized the sum of its attainments,—was gracious, shrewd, and calm,—but could not hold up the mirror and show us to ourselves. He was that unique songster, a poet of fire and vision, quite above the moralist, yet neither to be classed as objective or subjective; he perceived the source of all passion and wisdom, yet rendered neither the hearts of others nor his own. His love poetry is eulogized, but wants the vital grip wherewith his "Concord Fight" and "Boston Hymn" fasten on our sense of manhood and patriotism. It chants of Love, not of the beloved; its flame is pure and general as moon-light and as high-removed. "All mankind love a lover," and it is not enough to discourse upon the philosophy of "Love," "Experience," "Power," "Friendship." Emerson's "Bacchus" must press for him

"—wine, but wine which never grew  
In the belly of the grape."

His deepest yearnings are expressed in that passionate outburst,—the momentary human wail over his dead child,—and in the human sense of lost companionship when he tells us,

"In the long sunny afternoon,  
The plain was full of ghosts."

Often he moves apart; his blood is ichor, not our own; his thoughts are with the firmament. We reverence his vocation, and know ourselves unfitted for it. He touches life more nearly in passages that have the acuteness, the practical wisdom of his prose works and days; but these are not his testimonials as a poet. His laying on of hands was more potent; a transmitted heat has gone abroad through the ministry of his disciples, who practice as he preached, and sometimes transcend both his preaching and his practice. All the same, the originator of a force is greater than others who add four-fold to its momentum. They are never so manifestly his pupils as when they are "scarifying" and "sounding and exploring" him, "reporting where they touch bottom and where not," on ground of their own, but with a pleasant mockery of the master's word and wont. There was a semblance between the poets Emerson and Rossetti, first, in the small amount of their lyrical work, and again in the positive influence which each exerted upon his pupils. In quality the Concord seer, and the English

poet who was at once the most spiritual and sensuous of his own school, were wholly unlike. Rossetti was touched with white fire, but dreamed of souls that meet and glow when disembodied. The spirits of his beatified thrill with human passion. Our seer brought something of heaven to earth, while Rossetti yearned to carry life through death to heaven.

The technical features of Emerson's verse correspond to our idea of its meaning. In fact, his view of personal culture also applied to his metrical style. "Manners are not to be directly cultivated. That is frivolous; leave it to children. \* \* \* We must look at the mark, not at the arrow, and perhaps the best rule is Lord Bacon's,—that to attain good forms one only needs not to despise them." Delicate and adroit artisans, in whose eyes poetry is solely a piece of design, may find the awkwardness of Emerson's verse a bar to right comprehension of its frequent beauty and universal purpose. I am not sure but one must be of the poet's own country and breeding to look quite down his vistas and by-paths: for every American has something of Emerson in him, and the secret of the land was in the poet,—the same Americanism that Whitman sees in the farmer, the deck-hand, the snag-toothed hostler, atoning with its humanities for their sins past and present, as for the sins of Harte's gamblers and diggers of the gulch. It may be, too, that other conditions are needed to open the ear to the melody, and to shut out the discords, of Emerson's song. The melody is there, and though the range be narrow, is various within itself. The charm is that of new-world and native wood-notes wild. Not seldom a lyrical phrase is the more taking for its halt,—helped out, like the poet's own speech, by the half-stammer and pause that were wont to precede the rarest or weightiest word of all. The true artist has somewhat to say, and would make his art say it; a curious workman may fail of the spirit of art. One tires, moreover, of artificers who through long lives merely repeat and perfect their method. A few sure lines, bits of essential matter, and, as elder races know, you have the features of a subject,—all that is absolutely valuable and to be expressed.

Among the followers of any art there are those whose compositions are effective in the mass, their treatment broad, the beauty pervasive; again, those who with small constructive feeling are rich in detail, and whose work is interspersed with fine and original touches; lastly, the complete artists, in whom, however vivid their originality and great their special beauties, the general design is always kept in hand. Emerson never felt the strength of

proportion that compels the races to whom art is a religion and a law. He has given many a pang to lovers of the beautiful, who have endured his irreverence by allowing for his supposed disabilities. He satisfied his conscience in the same easy way, declaring that he was from his "very incapacity of mechanical writing" a "chartered libertine." But his speech bewrayeth him. Who sounds one perfect chord can sound again. His greater efforts in verse, as in prose, show that he chose to deprecate the constructive faculty lest it might limit his ease and freedom. And his instinct of personality, not without a pride of its own, made him a nonconformist. We are told of his mode of preparing an essay,—of the slow-growing medley of thoughts on a topic, at last brought out and strung at random, like a child's variegated beads. But I do not find that his best essays read backward as well as forward; I suspect an art beneath their loose arrangement, and I see at times the proof of continuous heat. His early critic declared that he had not "written one good work, if such a work be one where the whole commands more attention than the parts." But again we see that she too rarely qualified her oracles. At that time he had written poems of which the whole and the parts were at least justly related masterpieces,—lyrical masterpieces, of course, not epic or dramatic; of such were the "Threnody" and "Woodnotes," to which was afterward added the "May-Day." Breadth and proportion, in a less degree, mark "The Problem," "Monadnock," "Merlin," and a few other pieces. But working similarly he falls short in the labored dithyrambic, "Initial, Dæmonic, and Celestial Love." He was formal enough in youth, before he struck out for himself, and at the age of eleven, judging from his practice-work, was as precocious as Bryant or Poe. But he soon gave up construction, putting a trade-mark upon his verse, and trusting that freedom would lead to something new. So many precious sayings enrich his more sustained poems as to make us include him at times with the complete artists. Certainly, both in these and in the unique bits so characteristic that they are the poet himself,—"Terminus," "Character," "Manners," "Nature," etc.,—he ranks with the foremost of the second class, poets eminent for special graces, values, sudden meteors of thought. In that gift for "saying things," so notable in Pope and Tennyson, he is the chief of American poets. From what other bard have so many original lines and phrases passed into literature,—coins that do not wear out, of standard value, bright and current gold? It is worth while, for the mere effect,

to group some of them together, and especially those which, appearing in his first book forty years ago, long since became a constituent part of our literary thought and expression:

"'Tis the law of bush and stone,  
Each can only take his own."

"The thoughts that he shall think  
Shall not be forms of stars, but stars,  
Nor pictures pale, but Jove and Mars."

"Hast thou named all the birds without a gun?  
Loved the wood-rose and left it on its stalk?"

"Heartily know,  
When half-gods go  
The gods arrive."

"What is excellent,  
As God lives, is permanent;  
Hearts are dust, hearts' loves remain."

"Born for the future, to the future lost."

"Not for all his faith can see  
Would I that cowed churchman be."

"Not from a vain or shallow thought  
His awful Jove young Phidias brought;  
\* \* \* \* \*

Out from the heart of nature rolled  
The burdens of the Bible old."

"The hand that rounded Peter's dome  
\* \* \* \* \*

Wrought in a sad sincerity;  
Himself from God he could not free;  
He builded better than he knew;—  
The conscious stone to beauty grew."

"Earth proudly wears the Parthenon  
As the best gem upon her zone;  
And Morning opes with haste her lids,  
To gaze upon the Pyramids."

"One accent of the Holy Ghost  
The heedless world hath never lost."

"Or ever the wild Time coined itself  
Into calendar months and days."

"Set not thy foot on graves."

"Good-bye, proud world! I'm going home."

"What are they all, in their high conceit,  
When man in the bush with God may meet?"

"—If eyes were made for seeing,  
Then Beauty is its own excuse for being."

"Leave all thy pedant lore apart,  
God hid the whole world in thy heart."

"And conscious Law is King of kings."

"—Mount to paradise  
By the stairway of surprise."

"Here once the embattled farmers stood,  
And fired the shot heard round the world."

"Great is the art,  
Great be the manners, of the bard."

"The silent organ loudest chants  
The master's requiem."

Verses from Emerson's later poems,—which came at rare intervals, after the public had learned to seek for the sweet kernel in every nut that fell from his tree,—are scarcely less familiarized and put to use :

"Deep in the man sits fast his fate  
To mold his fortunes mean or great:  
Unknown to Cromwell as to me  
Was Cromwell's measure or degree."

"O tenderly the haughty day  
Fills his blue urn with fire!"

"I hung my verses in the wind,  
Time and tide their faults may find;  
All were winnowed through and through,  
Five lines lasted sound and true."

"Winters know  
Easily to shed the snow,  
And the untaught Spring is wise  
In cowslips and anemones."

"It is time to be old,  
To take in sail,—  
\* \* \* \* \*

Obeys the voice at eve obeyed at prime:  
'Lowly faithful, banish fear,  
Right onward drive unharmed;  
The port, well worth the cruise, is near,  
And every wave is charmed.'"

"He spoke, and words more soft than rain  
Brought the Age of Gold again;  
His action won such reverence sweet  
As hid all measure of the feat."

The poet's rhythm and gift of compression made verse like the foregoing a kind of ambrosial pemmican, easily carried for spiritual sustenance. Phrases in his prose, which have become more current, move in foot-beats, such as,—*"Hitch your wagon to a star," "Nature is loved by what is best in us,"* and *"The hues of sunset make life great."* He thought rhythm indispensable, and rhyme most efficacious, as the curators of poetic thought. "Every good poem I know I recall by its rhythm also."

Popular instinct, recognized by those who compile our anthologies, forbid an author to be great in more than one way. These editors go to Emerson for point and wisdom, and too seldom for his truth to nature and his strictly poetic charm. Yet who excels him in quality? That Margaret Fuller had a fine ear, and an independent one, is proved by her admission that "in melody, in subtilty of thought and expression," he took the highest rank. He often captures us with absolute beauty, the poetry that poets love,—the lilt and melody of Shelley (whose vagueness irked him) joined to precision of thought and outline. Poe might have envied "Uriel" his lutings of the spangled heaven; he could not have read "Woodnotes," or he would

have found something kindred in the bard who said,

"Quit thy friends as the dead in doom,  
And build to them a final tomb;  
Let the starred shade that nightly falls  
Still celebrate their funerals,  
And the bell of beetle and of bee  
Knell their melodious memory."

Emerson "listened to the undersong," but rejoiced no less in the "divine ideas below" of the Olympian bards,

"Which always find us young  
And always keep us so."

His modes of expression, like his epithets, are imaginative. The snow is "the north-wind's masonry;" feeling and thought are scarcely deeper than his speech; he puts in words the "tumultuous privacy of storm," or the "sweet varieties of chance." With what high ecstasy of pain he calls upon the deep-eyed boy, the hyacinthine boy, of his marvelous "Threnody"! Time confirms the first impression that this is the most spontaneous, the most elevating, of lyrical elegies,—that it transcends even the divine verse of Bishop King's invocation to his entombed wife. How abrupt, how exquisitely ideal, the opening phrase! Afterward, and throughout, the pure spirit of poetry rarefied by the passion of its theme: the departed child is the superangelic symbol of the beauty, the excellence, that shall be when time ripens and the harmonies of nature are revealed,—when life is no longer a dream within a dream. Read the "Threnody" anew. What grace! What *Æolian* music, what yearning! What prophecy and exaltation! See how emotion becomes the soul of art. Or is it that true passion cannot but express itself in verse at once simple and sensuous, thus meeting all the cardinal points of Milton's law?

One readily perceives that "Merlin" conveys Emerson's spirited conception of the art and manners of the bard. His should be no trivial harp:

"No jingling serenader's art,  
Nor tinkle of piano strings;  
\* \* \* \* \*

The kingly bard  
Must smite the cords rudely and hard,  
As with hammer or with mace;  
\* \* \* \* \*

He shall not his brain encumber  
With the coil of rhythm and number;  
But leaving rule and pale forethought,  
He shall aye climb  
For his rhyme."

Thus fearlessly should a poet compel the Muse, and even to a broader liberty of song one, at least, of Emerson's listeners, pushed

with deliberate zeal. Walt Whitman was stimulated by this teaching, and by the rugged example of Carlyle, to follow resolutely the method which suited his bent and project; and Emerson's "Mithridates," we may say, is at once the key-note and best defense of Whitman's untrammelled, all-heralding philosophy. The descriptive truth, the lusty Americanism, of the democratic chanter took hold upon the master's expectant heart. A later modification of the first welcome, and the omission of the new songs from "Parnassus," had no bearing upon the question of their morals or method; Emerson was moved solely by his taste,—and New England taste has a supreme dislike of the unsavory. The world, even the Concord world, is not wholly given over to prudery. It has little dread, nowadays, of the voluptuous in art, ancient or modern. But to those of Puritan stock cleanliness is even more than godliness. There is no "fair perdition" tempting us in the "Song of Myself" and the "Children of Adam." But here are things which, whether vessels of honor or dishonor, one does not care to have before him too often or too publicly, and which were unattractive to the pure and temperate seer, whose race had so long inhabited the clean-swept keeping-rooms of the land of mountain breezes and transparent streams. The matter was one of artistic taste and of the inclinations of Emerson's nature, rather than of prudery or censorship.

As for his own style, Emerson was impressed in youth by the free-hand manner of the early dramatists, whom he read with avidity. He soon formed his characteristic measure, varying with "sixes," "sevens," and "eights," resembling Ben Jonson's lyrical style, but even more like that of Milton, Marvell, and other worthies of the Protectorate. In spirit and imagery, in blithe dithyrambic wisdom, he gained much from his favorite Orientals—Saadi and Hafiz. One stately and various measure he rarely essayed, but showed that it was well suited to his genius. In "Muskuetaquid" and "Sea-shore" we see the aptness of his ear and hand for blank verse. The little poem of "Days," imitated from the antique, is unmatched, outside of Landor, for compression and self-poise:

"Daughters of Time, the hypocritic Days,  
Muffled and dumb like barefoot dervishes,  
And marching single in an endless file,  
Bring diadems and fagots in their hands.  
To each they offer gifts after his will,  
Bread, kingdoms, stars, and sky that holds them all.  
I, in my pleached garden, watched the pomp,  
Forgot my morning wishes, hastily  
Took a few herbs and apples, and the Day  
Turned and departed silent. I, too late,  
Under her solemn fillet saw the scorn."

We could wish that Emerson had written more blank verse,—a measure suited to express his highest thought and imagination. Probably, however, he said all that he had to say in verse of any kind. He was not one to add a single line for the sake of a more liberal product.

He is thought to have begun so near the top that there was little left to climb. None of his verse is more pregnant than that which came in the first glow, but the later poems are free from those grotesque sayings which illustrate the fact that humor and a lively sense of the absurd often are of slow development in the brain of an earnest thinker. There was, it must be owned, a tinge of provincial arrogance, and there were expressions little less than ludicrous, in his early defiance of usage. He was too sincere a personage to resort to the grotesque as a means of drawing attention. Of him, the leader, this at least could not be suspected. Years afterward he revised his poems, as if to avoid even the appearance of affectation. On the whole, it is as well that he left "The Sphinx" unchanged; that remarkable poem is a fair gauge of its author's traits. The opening is strongly lyrical and impressive. The close is the flower of poesy and thought. The general tone is quaint and mystical. Certain passages, however, like that beginning "The fiend that man harries," are curiously awkward, and mar the effect of an original, almost an epochal, poem. This would not be admitted by the old-fashioned Emersonian,—never, by any chance, a poet pure and simple,—who makes it a point of faith to defend the very passages where the master nods. Just so the thick-and-thin Browningite, who testifies his adoration by counting the *m's* and *n's* of the great dramatist's volumes, and who, also, never is a poet pure and simple, celebrates Mr. Browning's least poetic experiments as his masterpieces. I think that the weakness of "transcendental" art is as fairly manifest in Emerson's first and chief collection of verse as were its felicities,—the former belonging to the school, the latter to the seer's own genius. Poe, to whom poetry was solely an expression of beauty, was irritated to a degree not to be explained by contempt for all things East. He extolled quaintness, and justly detested obscurity. He was prejudiced against the merits of such poets as Channing and Cranch by their prophetic bearing, which he berated soundly as an effort to set up as poets "of *unusual* depth and *very* remarkable powers of mind." Admitting the grace of one, he said that it was "laughable to see that the transcendental poets, if beguiled for a minute or two into

respectable English and common-sense, are always sure to remember their cue just as they get to the end of their song, and round off with a bit of doggerel." Their thought was the "cant of thought," in adopting which "the cant of phraseology is adopted at the same time." This was serviceable criticism, *et ab hoste*, though Poe's lack of moral, and keenness of artistic, sense made him too sure of the insincerity of those who place conviction above expression. And Mr. James sees that Emerson's philosophy was "drunk in by a great many fine moral appetites with a sense of intoxication." The seer himself was intoxicated at times, and spoke, like the hasheesh-eaters, with what then seemed to him music and sanity. In a more reflecting season he excluded from his select edition certain pieces from which too many had taken their cues,—for example, the "Ode" to W. H. Channing, "The World-Soul," and "Tact." The Ode begins finely with a manner caught from Ben Jonson's ode "To Himself," and we can ill spare one passage ("The God who made New Hampshire"); but was it the future compiler of "Parnassus" who preceded this with laughter-stirring rhymes, and shortly avowed that "Things are of the snake," and again that "Things are in the saddle, And ride mankind?" Well, he lived to feel that to poets, "of all men, the severest criticism is due," and that "Poetry requires that splendor of expression which carries with it the proof of great thoughts."

But the forte of bardlings is the foible of a bard. Emerson became his own censor, and did wisely and well. We have seen that his art, even now, upon its constructive side, must often seem defective,—unsatisfactory to those whose love of proportion is a moral instinct. Many poets and critics will feel it so. The student of Emerson learns that he, too, moved upon their plane but would not be confined to it. More than other men, he found himself a vassal of the unwritten law, whether his impulse lifted him above, or sent him below, the plane of artistic expression. If he could not sustain the concert-pitch of his voice at his best, he certainly knew what is perfection, and said of art much that should be said. He was not, he did not wish to be, primarily an artist: he borrowed Art's aid for his lofty uses, and held her at her worth. His essay on Art would be pronounced sound by a Goethe or a Lessing, though such men probe less deep for the secret principle of things, and deal more fealty with the exterior. Elsewhere he insists that we must "disabuse us of our superstitious associations with place and time, with number and size.

\* \* \* Where the heart is, there the muses, there the gods sojourn. \* \* \* A great man makes his climate genial in the imagination of man, and its air the beloved element of all delicate spirits." And again (like Arnold) he speaks of the modernness of all good books: "What is well done, I feel as if I did; what is ill done, I reckon not of." He revised his prose less carefully, for republication, than his verse, and doubtless felt surer of it. He himself would have been the first to declare, as to the discordant and grotesque portions of his verse or prose, that the thought was proportionately defective,—not strong and pure enough to insure the beauty of the art which was its expression. Above all he knew, he confessed, that it is the first duty of a poet to express his thoughts naturally, counting among "the traits common to all works of the highest art,—that they are universally intelligible, that they restore to us the simplest states of mind." This was his own canon. Where he failed of it, he might not surely know; where he knew, there he rebuked himself. He struck out, in his self-distrust, many things of value to those who loved his verse. We dwell with profit on the fact that he retained so little that should be stricken out.

## IV.

It is but a foolish surmise whether Emerson's prose or verse will endure the longer, for they are of the same stuff, warp and woof, and his ideality crosses and recrosses each, so that either is cloth-of-gold. Of whichever a reader may first lay hold, he will be led to examine the whole fabric of the author's work. Few writers, any one of whose essays, met with for the first time, seems more like a revelation! It will not be, I think, until that time when all his prose has passed into a large book, such as the volume we call *Montaigne*, that its full strength and importance can be felt. In certain respects it dwarfs other modern writing, and places him among the great essayists. These are not the efforts of a reviewer of books or affairs, but chapters on the simplest, the greatest, the immemorial topics, those that lie at the base of life and wisdom: such as Love, Experience, Character, Manners, Fate, Power, Worship—lastly, Nature herself, and Art her ideal counterpart. If to treat great themes worthily is a mark of greatness, the chooser of such themes begins with the instinct of great design. Bacon's elementary essays excepted, there are none in English of which it can be more truly averred that there is nothing superfluous in them. Compare them with the rest in theme

and method. Carlyle, outside of "Sartor Resartus" and "Hero-Worship," usually reviews books, histories, individuals, at extreme length, and with dramatic comment and analysis. Emerson treats of the principles behind all history, and his laconic phrases are the very honey-cells of thought. There are let-downs and surplusage even in Landor. Throughout Emerson's writings each word is of value; they are the discourse of one who has digested all the worthy books, and who gives us their results, with latter-day discoveries of his own. He is the citizen of a new world, observing other realms and eras from an unrestricted point of view.

The intent of our essayist is the highest, and by no means that of writing for the exercise or glory of authorship. "Fatal," he declares, "to the man of letters is the lust of display. \* \* \* A mistake of the main end to which they labor is incidental to literary men, who, dealing with the organ of language \* \* \* learn to enjoy the pride of playing with this splendid engine, but rob it of its almightiness by failing to work with it." He estimates books at their worth. They "are for nothing but to inspire. I had better never see a book than to be warped by its attraction clean out of my own orbit, and made a satellite instead of a system."

Thus the thought of Style, it may be, should enter into the mind of neither writer or reader. Style makes itself, and Emerson's is the apothegmatic style of one bent upon uttering his immediate thoughts,—hence strong in sentences, and only by chance suited to the formation of an essay. Each sentence is an idea, an epigram, or an image, or a flash of spiritual light. His letters to Carlyle show that he was at one time caught by the manner of the author whose character, at least, seemed of the most import to him. This was but a passing trace. When he was fresh from the schools, his essays were structural and orderly, but more abstract than in latter years. During his mature and haply less spiritual period, had he cared to write a history, the English would have been pure English, the narrative racy and vigorous. Portions of the "English Traits" make this plain. Since De Foe, where have we found anything more idiomatic than his account of Wordsworth delivering a sonnet?

"This recitation was so unlooked for and surprising,—he, the old Wordsworth, standing apart, and reciting to me in a garden-walk, like a schoolboy declaiming,—that I at first was near to laugh; but recollecting myself, that I had come thus far to see a poet, and he was chanting poems to me, I saw that he was right and I was wrong, and gladly gave myself up to hear."

Note also his account of an ocean voyage. For charm of landscape-painting, take such a passage as that, in the second essay on Nature, beginning: "There are days which occur in this climate." But terseness is the distinctive feature of his style. "Men," he says, "descend to meet." "We are all discerners of spirits." "He [a traveler] carries ruins to ruins." No one has compressed more sternly the pith of his discourse.

No poet, let us at once add, has written prose and shown more incontestably his special attribute. Emerson's whole argument is poetic, if that work is poetic which reaches its aim through the analogies of things, and whose quick similitudes have the heat, the light, the actinism, of the day-beam, and of which the language is rhythmic without degeneracy,—clearly the language of prose, always kept from weakness by the thought which it conveys. No man's writing was more truly his speech, and no man's speech so rhythmic: "There are Muses in the woods to-day, and whispers to be heard in the breezes"; and again, "Hawthorne rides well his horse of the night." As he spoke, so he wrote: "Give me health and a day, and I will make the pomp of emperors ridiculous"; "The conscious ship hears all the praise"; of young idealists, "The tough world had its revenge the moment they put the horses of the sun to plough in its furrow"; of Experience, "was it Boscovich who found out that bodies never come in contact? Well, souls never touch their objects. An innavigable sea washes with silent waves between us and the things we aim at and converse with." In the same essay,— "Dream delivers us to dream, and there is no end to illusion. Life is a train of moods like a string of beads, and as we pass through them, they prove to be many-colored lenses which paint the world their own hue."\* And of Love's world, with the cadences of Ecclesiastes,— "When the day was not long enough, but the night, too, must be consumed. \* \* \* When the moonlight was a pleasing fever, and the stars were letters, and the flowers ciphers, and the air was coined into song; when all business seemed impertinence, all the men and women running to and fro in the streets mere pictures." But to show the poetry of Emerson's prose is to give the whole of it; these essays are of the few which make us tolerate the conceit of "prose poems." Their persistent recourse to imagery and metaphor, their suggestions of the secret relations of things, at

\* "Life, like a dome of many-colored glass,  
Stains the white radiance of eternity."  
Shelley's "Adonais."

times have subjected them to the charge of being obscure. The fault was not in the wine:

"Hast thou a drunken soul?

Thy bane is in thy shallow skull, not in my silver bowl!"

In mature years the essayist pays more regard to life about him, to the world as it is; he is more equatorial, less polar and remote. His insight betrays itself in everyday wisdom. He is the shrewd, the benignant, the sagacious, Emerson, writing with pleasant aptitude, like Hesiod or Virgil, of domestic routine, and again of the Conduct of Life, of Manners, Behavior, Prudence, Grace. This is in the philosophic order of progress, from the first principles to the application of them. Some of his followers, however, take him to task, unwilling that the master should venture beyond the glory of his cloud. As for his unique treatises upon Behavior, it was natural that he should be led to think upon that topic, since in gentle bearing, in his sweetness, persuasiveness, and charm of smile and voice, he was not excelled by any personage of our time, and what he said of it is of more value than the sayings of those who think such a matter beneath his regard. His views of civic duty and concerning the welfare of the Republic are the best rejoinder to his early strictures upon Homer and Shakspeare for the temporal and local features of their master-works. As a critic he was ever expectant, on the lookout for something good and new, and sometimes found the one good thing in a man or work and valued it unduly. When he made a complete examination, as in his chapter on Margaret Fuller, he excelled as a critic and delineator. "Parnassus" is not judicial, but oddly made up of his own likings, yet the best rules of criticism are to be found in its preface. With the exception of "English Traits," he published no long treatise upon a single theme. His general essays and lectures, however, constitute a treatise upon Man and Nature, and of themselves would serve as America's adequate contribution to the English literature of his period. We are told of an unprinted series of his essays that may be grouped as a book on the Natural History of the Intellect. Should these see the light, it would be curious to compare them with the work of some professional logician—with the standard treatise of President Porter, for instance—upon a similar theme. Much in quantity may yet be added to Emerson's literary remains. But it will not differ in quality; we have had the gist of it: for he was a writer who, though his essays were the fruit of a prolonged life, never wrote himself out.

VOL. XXV.—84.

Often an author has gained repute by one or two original works, while his ordinary efforts, if not devoted to learned or scientific research, have been commonplace. The flame of Emerson's intellect never fades or flickers, and never irks us. It burns with elemental light, neither of artifice nor of occasion, serene as that of a star, and with an added power to heat the distance which receives it.

V.

IN summing up the traits of Emerson one almost ceases to be critical, lest the highest praise may not be quite undue. More than when Bion died, the glades and towns lament him, for he left no heir to the Muse which he taught his pupils. In certain respects he was our most typical poet, having the finest intuition and a living faith in it,—and because there was a sure intellect behind his verse, and because his influence affected not simply the tastes and emotions, but at last the very spirit, of his countrymen. He began where many poets end, seeking at once the upper air, the region of pure thought and ideality. His speech was wisdom, and his poesy its exhalation. When he failed in either, it seemed to be through excess of divining. His triumphs were full of promise for those who dare to do their best. He was as far above Carlyle as the affairs of the soul and universe are above those of the contemporary, or even the historic, world. His problem, like that of Archimedes, was more than the taking of cities and clash of arms. The poet is unperturbed by temporal distractions; yet poets and dreamers, concerned with the ideal, share in the world's battle equally with men of action and practical life. Only, while the latter fight on the ground, the idealists, like the dauntless ghosts of the Huns and Romans, lift the contest to the air. Emerson was the freest and most ideal of them all, and what came to him by inheritance or prophetic forecast he gave like a victor. He strove not to define the creeds, but to stimulate the intellect and purpose of those who are to make the future. If poetry be that which shapes and elevates, his own was poetry indeed. To know the heart of New England you must hear the songs of his compeers; but listening to those of Emerson, the east and west have yielded to the current of its soul.

The supreme poet will be not alone a seer, but also a persistent artist of the beautiful. Of those who come before the time for such a poet is ripe, Longfellow on the whole has done the most to foster the culture of poetry among us as a liberal art. Emerson has given

us thought, the habit of thinking, the will to think for ourselves. He drained the vats of politics and philosophy, for our use, of all that was sweet and fructifying, and taught his people, seeing their vital needs, "self-reverence, self-knowledge, self-control." He set chief value upon those primitive laws which are the only sure basis of national law and letters. And as a poet, his verse was the sublimation of his rarest mood, that changed as water into cloud, catching the first beams of sunrise on its broken edges, yet not without dark and vaguely blending spots between. Emerson and Longfellow came at the parting of the ways. They are of the very few whom we now recognize as the true founders of an American literature. No successors with more original art and higher imagination can labor to more purpose. If the arrow hits its mark, the aim was at the bowstring; the river strengthens and broadens, but the sands of gold wash down from near its source.

Not a few are content with that poetry which returns again and again to its primal conceptions, yet suggests infinite pathways and always inspires,—the poetry of a hermitage whose Lar is Nature, and whose well-spring flows with clear and shining Thought. To such,—who care less for sustained flights of objective song, who can withdraw themselves from passion and dramatic life, who gladly accept isolated cadences and scattered, though exquisite, strains of melody in lieu of symphonic music "wandering on as loth to die,"—Emerson will seem the most precious of our native poets. He will not satisfy those who look for the soul incarnate in sensuous

and passionate being. Such readers, with Professor Dowden, find him the type of the New World transcendentalist, the creature of the drying American climate, one "whose nervous energy has been exalted," so "that he loves light better than warmth." He is not the minstrel for those who would study men in action and suffering, rather than as heirs to knowledge and the raptured mind. He is not a warrior, lover, recounter, dramatist, but an evangel and seer. The greatest poet must be all in one, and I have said that Emerson was among the foremost to avow it. Modern singers poorly satisfy him, being meager of design, and failing to guide and console. Wordsworth was an exception, yet he had "written longer than he was inspired." Tennyson, with all his tune and color, "climbs no mount of vision." Even Shakspeare was too traditional, though one learns from him that "tradition supplies a better fable than any invention can." In face of the greatest he felt that "the world still wants its poet-priest, a reconciler, who shall not trifle with Shakspeare the player, nor shall grope in graves with Swedenborg the mourner; but who shall see, speak, and act with equal inspiration." Thus clearly he conceived of the poet's office, and equally was he assured that he himself was not, and could not be, the perfect musician. He chose the part of the forerunner and inspirer, and when the true poet shall come to America, it will be because such an one as Emerson has gone before him and prepared the way for his song, his vision, and his recognition.

*Edmund C. Stedman.*

### FORSAKEN.

I WATCH the budding lilac leaves  
This March with jealous eye:  
The birds all past me fly  
Nor stay to build beneath my eaves.

This time last year it was not so—  
Then was cheery chirp and twitter  
About a pretty sitter  
Under my roof-tree brown and low.

A stir of little wings quite near,  
And trills of tender song,  
That still would wake a throng  
Of happy thoughts my heart to cheer.

Their last year's nest hangs from the eaves  
All ragged and forlorn,  
Half from the rafter torn,  
Inside, for birds, some withered leaves.

The lilac tree is in full leaf,  
I watch and wait in vain,  
They will not come again—  
Who told the birds about my grief?

## A WOMAN'S REASON.\*

BY W. D. HOWELLS,

Author of "Venetian Life," "A Chance Acquaintance," "A Modern Instance," etc.

### VI.

"WHAT perplexed me the most about it," said the Captain to Mrs. Butler, when he came home the day after the sale, "was that the auctioneer had so misrepresented his first talk with me. He never asked me to withdraw the property at all; he knew I couldn't; he merely offered to bet me that he would get thirty thousand for it. Well! I don't see what I could do about it. I couldn't have proved that the bids were fictitious, and the attempt to try would have made a great scandal. That's the way Hibbard looks at it; I went to him for advice; I put the case to him, and he says that there's no way of going back of the fact, for the auctioneer would swear, to save himself, that he heard the bids, or thought he did. *Most* probably he *did*; it was all confusion; and my not having heard them proves nothing at all. Besides, Everton was not obliged to bid thirty-five thousand, and he *did* get a great bargain. The property is worth fifty, in any decent times. And that extra five thousand is a perfect godsend for Helen, poor girl! It's all she'll have in the world. I tell you, my dear, I haven't had many things in life that gave me more satisfaction than meeting the principal creditors to-day. You see, when I looked into his affairs with Joshua the day he died I was very badly discouraged. They were all in confusion; he seemed to have lost his grip of them; I suppose it was his failing health, but he couldn't make head or tail of anything; and when I was appointed administrator I reported the estate insolvent. It was precipitate—"

"It was like you, my dear," said Mrs. Butler. "You never believe that anything is wrong till you believe that everything is wrong."

"Well, well—very likely," returned the Captain. "I had what I thought very good reason for my course. But afterward I set a shrewd hand at work on the books, and we found out that things were very much better, as I told you at the time. When a man's affairs are in such confusion as Joshua's, the confusion is usually against him, but in this

case it was mostly for him. There wasn't a day after I reported the estate insolvent that the case didn't brighten. If it had been any other case I should have been mortified at the way things turned out. To be sure, I didn't believe there'd be anything for Helen; but before the sale, I saw that unless the property went for nothing the estate would pay all Joshua's debts, dollar for dollar. This morning we called a meeting of the creditors. They had the notion they were going to lose, and they were prepared for that. When I told them how matters really stood they were tremendously taken aback. But they had behaved very handsomely all along, out of respect for Joshua's memory, and they came out strong now about him, and said such things—well, *I* can't tell you," said the Captain. "But," he added, confusedly, "I wish Harkness could have been there!"

"Perhaps he was," said Mrs. Butler, devoutly.

"Eh?" cried the Captain sharply. "Ah! Yes! Well, perhaps. Old Rogers asked me to wait a minute, and they had a little confabulation among themselves, and then Rogers came forward and asked if there would be anything left for Helen. Then I told them the estate had yielded five thousand dollars more than the indebtedness, so far as I knew of it; and we had congratulations all round, and if Joshua had been alive to resume, he might have started business again on a better basis than ever he had in his life. I wish—confound it!—I could be sure about those bids."

"Why, my dear!" cried his wife, "you talk as if some fraud had been really committed. Can't you look at it as Mr. Hibbard does? Probably the man *did* hear the bids. He wouldn't have *dared* to pretend that he heard them; it wouldn't have been safe for him."

"No," said the Captain, thoughtfully. "Why, of course not," he added briskly, after a moment. "Of course you're right about it. He wouldn't have dared. Where's Helen?"

He went down and found Helen on the rocks by the sea, where she often strayed apart from the others; they did not follow

her; they respected her right to what solitude she would. Her sorrow was no longer a thing of tears and sobs; but it was no more comprehensible than at first; her bereavement still seemed the one great unreasoned fact of the universe. She turned the pathos of her bewildered smile upon the Captain, as she heard him climbing the rocks behind her, and rose to meet him.

"No, sit down," he said. "I want to have a little talk with you, Helen, as your man of business."

"You're my man of business as—as—papa was," said Helen, with a grateful look.

"Thank you, my dear, for that," answered the Captain. "I've only tried to do what he would have done for my girls. I don't know, my dear, whether I had ever given you the idea that your father was in embarrassed circumstances?"

"Oh, yes; I knew that," said Helen.

"Well, we wont enlarge upon the fact. It isn't necessary. Would you like me to go into particulars about the settlement of the estate?"

"No," answered Helen, "that isn't necessary either. I shouldn't be any the wiser if you did. Tell me whatever you think I ought to know, Captain Butler."

"I was very much afraid, my dear," said the Captain, "when I began to look into your father's affairs that there would be nothing, or worse than nothing, left." This did not seem to affect Helen as a matter of personal concern, and the Captain went on: "There was a time when I was afraid that the creditors would not get more than seventy-five per cent. of their money, and might be very glad to get that." Helen looked round at the Captain with a quick glance, as if here were something that touched her. "But as I got along toward the bottom, things looked better, and I saw that unless the sale turned out very badly, we should save ourselves. The sale turned out far beyond my expectations. Helen," cried the Captain, "the prospect now is that I shall pay up every cent that your father owed in the world, and have some five thousand dollars left for you."

"Oh, Captain Butler!"

"It isn't a great sum——"

"It's more than I dared to dream of!"

"But if it's carefully handled, it can be made to go a great way."

"Oh, it's ample, ample! But I don't care for that. What I think of—and I feel like going down on my knees for it—is that no one loses anything by papa. He would rather have died than wronged any one, and that any one should have suffered by him after he was helpless to repair the wrong, *that* would

have been more than the bitterness of death to me. Oh, I'm so happy about this, Captain Butler; you can't think how much more of a comfort it is than anything else could have been!"

"You're a good girl, Helen," said the Captain, with a reverent fondness; "you're your father's girl, my dear. He would have died a rich man if he had not stood by people whom he knew to be in a bad way because they had helped him long ago, when it was no risk for them to do so."

"He was right!" cried Helen. "He would not have been papa if he had done less."

"I should not have said he was right," said Captain Butler, "if he had not believed that he had already put you beyond want. He had insured his life for twenty-five thousand dollars in the Metropolitan Reciprocal; but that went to pieces two years ago."

"That's nothing. I couldn't have managed so much money," promptly answered Helen. "The five thousand will be enough, and more than enough, for my utmost desires. I'm not extravagant. I can get on with very little, and this is wildly abundant."

The Captain, from rejoicing in her mood, suddenly looked aghast, as if a terrible idea had presented itself. "You understand, Helen," he said, "that it will be some time yet—six months at least—before I can place the money due you at your disposal. It isn't certainly due you till all the creditors have had full notice to present their claims and these have been passed upon by the commissioners."

"Oh, that makes no difference," said Helen. "I'm in no haste for the money."

"And you understand," pursued the Captain, as if this were really the point he wished to insist on, "that it is only five thousand."

"Oh, yes, I understand perfectly," quickly answered the girl, and then she stopped, and cast a keen glance at the Captain, without, however, seeming to perceive his chop-fallen aspect: she was, perhaps, looking deeper.

"You haven't brought any more letters for me, I suppose?" she said.

"No, I must have got everything the last time," replied the Captain. "I went carefully through all the drawers again before the sale began."

"I shall ask you to take care of those law-papers for me, Captain Butler; I don't know what to do with them. The letters were all recent ones. I thought there might have been some old ones. Not that I have missed any. But you did sometimes lose home letters when you were off on those long voyages of yours, didn't you?"

"No, very few," the Captain responded. "We get them nearly all, sooner or later."

"But sometimes they had to wander about after you?"

"Yes, sometimes. And sometimes they waited."

"It must have been terribly distressing," said Helen, "to wait for them."

"Well," returned the Captain, "that depended a good deal on whom the letter was from." Helen flushed a little. "There were some letters that I shouldn't have cared if I'd never got. But, generally speaking, the fellows in the navy had the advantage of us in the merchant service."

"I don't see why," said Helen.

"Oh, their letters were addressed to them through the Navy Department, and of course they came the straightest and safest way. I recollect once at Singapore," and the Captain went on with much circumstance to give a case in point. Helen had furnished him a thread of associations which the Captain never willingly dropped. She listened at first with interest, then patience, then respect. At last she said it was getting a little chilly, and Captain Butler agreed that it was. They went back to the house together, and parted on the piazza, where Helen paused a moment to say:

"I haven't thanked you, Captain Butler, because it seemed no use to try. Where should I end?"

"Don't begin," said the Captain, with the smile which he kept for Helen; she was as dear to him as his own daughters, and just strange enough to be a color of romance in his thoughts. It always astonished him, and slightly abashed him that she should be a young lady; she had so long been a little girl.

She looked fondly into his kind eyes. "It is too much—too much!" she cried, and slipped away with a fallen head.

The words made the Captain think of the money again, and the smile went and the trouble came back to his face as he walked away to find his wife.

"Well?" said Mrs. Butler.

"Catharine," said the Captain, "I'm afraid she thinks it's five thousand a year."

"Oh, *no*, she doesn't!" pleaded his wife.

"Yes, she does, my dear. She spoke of it as an enormous sum, and I hadn't the courage to make the thing clear. I began to, and then gave it up. I don't see what's to be done about it. I'm afraid it's going to be a dreadful blow when she finds out what it really is." Captain Butler looked ruefully at his wife.

"I think you're mistaken," said Mrs. Butler. "It's her ignorance of money that makes her

think of five thousand, and not the income from it; but as you've raised the doubt, she must be told that it is not five thousand a year, and she must be told just how much it is." The Captain groaned. "But you needn't tell her, John. You've gone through quite enough. I will tell her."

Captain Butler looked ashamed, but relieved. "Well, my dear, I must let you. It's shirking, but I can't help it. You can manage it better than I can. When I think of telling that poor child how very little better than a beggar she is, my tongue turns to a chip in my mouth."

"Yes, it's hard. But suppose she'd had nothing?"

"Then something better than this might have been done with the creditors. Some were old friends. But you can't ask people to help a girl who has five thousand dollars. It sounds preposterous."

"I doubt whether Helen would have allowed herself to be helped in that way if she had known it, and how could it have been kept from her?" Mrs. Butler rose to go to another room.

"Catharine," asked the Captain, "was it at Singapore that I got that first letter of yours, after it had chased me round so long?"

"No; it was at Cape Town," said Mrs. Butler. "Why?"

"I told Helen it was at Singapore."

"How in the world came you to be talking to Helen of our old love-letters, my dear?"

"Oh, she was asking if letters to the East didn't often get lost. I don't know why she should have happened to ask; but she did."

"I suppose," said Mrs. Butler simply, "she is going to write to Robert Fenton."

A light dawned upon Captain Butler; he laughed in a shamefaced way, and then he frowned a little. "Why didn't she ask me outright which was the best way to address him?"

"How *could* she? She couldn't have asked her own father. You wouldn't have wished your own daughter to do it."

"Yes, I should," defiantly answered the Captain.

"Well, she wouldn't," replied Mrs. Butler. The Captain was silenced, but not satisfied. He suffered Mrs. Butler to go, but remained still with that duped smile, and did not half like it.

That night Helen came rather late and tapped at Mrs. Butler's door. "It's I—Helen—Mrs. Butler. May I speak with you?"

"Yes, come in, Helen."

She pushed in impetuously. "I came to ask Captain Butler's pardon for the mean little intriguing way I got out of him how to

address a letter to Robert Fenton. He must have told you!"

"He said you asked him if his letters from home weren't lost sometimes," said Mrs. Butler, with a little smile. "*I* understand, my dear," she added, leaning forward to smooth Helen's hair, where she had sunk on the cricket at her feet. "It was a perfectly natural thing."

"Oh, yes, only *too* natural with *me*! But I hate and detest all that beating round the bush, in me, even when I'm doing it; and what I came for *now*, Mrs. Butler, is to ask you *how* I had better write to Robert." Neither found anything worthy of remark in this second avowal of purpose, which might be said in a manner to supersede the first. "If it hadn't been for my wretched shilly-shallying ways, I shouldn't have to write to him at all. But now I must. There is something—something—that I must tell him for his own sake, and—for his peace of mind. For if a person hates any one, especially if it's through a mistake, I don't think we ought to let any foolish pride interfere; do you, Mrs. Butler?"

"No, Helen," said Mrs. Butler, with perfect intelligence.

"That's what I think, too, and it would be perfectly easy—more than easy—to write and tell him that, and take the consequences, whatever they were. You see it is just this: we had a quarrel before we went away,—or not a quarrel, but a misunderstanding; that is, *he* misunderstood—and he was so vexed with me that he wouldn't come to say good-bye. I don't care for that. He did perfectly right. But what I can't forgive is his not trying to see papa, and bid *him* good-bye. I can't bear to have him think any longer that I was trifling with him, and yet I can't write to him, when I think of the way he treated papa. It seems very bad-hearted in him. Of course, I didn't see how he *could* have borne to see papa under the circumstances, and feeling the way he did toward me; and, of course, if papa had lived it would have been different, and if it hadn't been for me, I know Robert wouldn't have done it, for he's one of the best and kindest—" Helen stopped, and Mrs. Butler waited a moment before she answered.

"Did you ever think, Helen, that Robert loved your father like—not like you, not like a daughter—but like a son?"

"Why, papa had always *been* a father to him!" cried Helen. "Why shouldn't he?"

"And were *you* never remiss with your father, because you trusted that somehow, sometime, the love you felt for him would more than make it up to him?"

"Oh, a thousand times!" cried Helen, bowing her head on Mrs. Butler's knees.

The pale hand continued to stroke her hair.

"That's a risk we all take with those we love. It's an earnest of something hereafter, perhaps. But for this world it isn't safe. Go, and write your letter, my dear, and give Robert all our love."

Mrs. Butler leaned forward and kissed the beautiful head good-night, and Helen, after a silent embrace, went back to her room again. It was easy now to write the letter which she had found so hard before, and a deep peace was in her heart when she read it over, and found no shadow of resentment or unkindness in it. She was glad to have abased herself so utterly before him, to have put herself so completely in his power. Now he might do as he pleased, but he never could have it to say that he had misunderstood her, or that he had cause to think her proud or cruel.

"Dear Robert," the letter ran, "it is five weeks now since papa died. I wrote you a line to tell you the sad news as soon as I could bring myself to put it in words, and I suppose you will get that letter before this reaches you. But for fear that it may fail (I sent you a newspaper with the account, too), I will tell you again that it was very sudden, and while I was away here at Beverly, where he expected to join me in a day or two. It was at his office; Captain Butler was there with him. I thought I could tell you more about it; but I cannot. He died of disease of the heart. I will send a cutting from another newspaper that will tell you more.

"The day before papa died I told him everything about that last letter I wrote you, and he took your part. The last words he spoke of you were full of affection and sympathy. I thought you would like to know this. You were mistaken about that letter. Read it again, and see if it doesn't mean something different. But I'm afraid you tore it up in your disgust with me. Well, then, I must tell you *I did love you all the time*. There,—I don't care what you think of me. You can't think less of me than I do.

"The house has been sold, and everything in it. Papa did not leave a will, but I know he would have liked you to have his watch, and I am keeping that for you.

"I am with the Butlers at Beverly. They have been everything to me, and are everything.

"HELEN."

In Helen's tall hand it took three sheets of note-paper to hold this letter; the paper was very thin, but she put on double postage

to make perfectly sure. Then she decided to keep the letter till she should go up to Boston, and post it herself in the general post-office.

## VII.

HELEN had been three weeks at the Butlers', and, in spite of their goodness, which guarded her freedom, as well as all her wishes, she began to feel a constraint which she could not throw off. Life had come to a pause with her, and when it should move forward it must be seriously, and even sadly; and she was morbidly conscious that she somehow clogged the joyous march of Marian Butler's days. There had been an effort to keep out of her sight the preparations for the wedding, till she had protested against it, and demanded to see every dress. But this very demand emphasized the dark difference between her fate and her friend's, and Marian was apologetically happy in Helen's presence; however they both tried to have it otherwise. Once Marian had explained with tears that she would like to put it off for Helen's sake, if she could, but the time of the marriage had been fixed with regard to so many other matters that it could not be postponed. Helen had answered that Marian made her very wretched talking of such a thing, and that she must go at once if Marian spoke of it again. They had embraced with perfect tenderness and sympathy, and Helen had remained with the helpless feeling of her incongruity in a house of rejoicing. It seemed to her intolerable that she must bring her sorrow thither; she suffered till she could get away with it; all they did to make her feel at ease could only heighten her trouble. She had waited with a painful patience till the Captain should report to her on the settlement of her father's affairs, and she could begin to shape her future; now that he had spoken, she need wait no longer.

She found Mrs. Butler in the parlor the morning after she had written to Robert.

"Mrs. Butler," she said, "I want you to let me go away next week."

"I can't bear to have you talk of leaving us, Helen!" cried Mrs. Butler, with a wistful trouble in her eyes and voice, yet as if she had expected this.

"Yes, I know," returned Helen; "but I must go. It's foolish and useless to keep staying on; and now that I've made up my feeble mind about it, don't try to stop me."

"Helen," said Mrs. Butler, "don't go! We all want you to stay. We want you to go to Europe with us—to be our guest, our

child. Put away your scruples, my dear—I understand them, and honor them—and go with us."

"You know I can't, Mrs. Butler."

"But if your father had been living you would have felt free to accept our invitation."

"Perhaps. But it would have been different then. Don't press me."

"I'm sorry, Helen," sighed Mrs. Butler. "I won't press you. But stay with us, my dear. It does us good to have you. Mr. Butler and I often talk of it; we all feel it. Say that you'll stay till we go away, and then we'll feel as if we had parted because we must." Helen was standing before Mrs. Butler, who had the girl's hands in her's, as she sat in her easy-chair, and looked up into her evasive face.

"No," said Helen, gently taking away her hands, and sitting down near the other, "I couldn't. *Don't* let us deceive ourselves. I'm a shadow in the house; we all know it and feel it. Nobody's to blame. nobody can help it," she added quickly, to stay a protest from Mrs. Butler; "but it's true. You see how I have to take my blackness out of the room when your friends come; I give them a painful shock when they catch sight of me; it checks the pleasant things they would like to say; and I hate myself for glooming about the house in secret; I feel that I must cast a shadow on them even through the walls and floors."

"Helen, dear, there's no friend we have who is so precious to us as you are!"

"Oh, yes—yes! I know how kind you are. But you see it can't be. I should have to go away at the time of the wedding, and you had better let me go before."

"Go away at the time of Marian's wedding? Not be—Why, Helen!"

"Yes. Think, Mrs. Butler! It couldn't be." Mrs. Butler was silent. "I shouldn't care for myself, and I know you wouldn't care for yourselves; but the others have some rights which we mustn't overlook. I should throw a chill over everything. I couldn't endure that, and you can't persuade me, Mrs. Butler; you mustn't try."

Mrs. Butler looked really disconsolate. Helen was right; there was no possibility of gainsaying her, much less of outreasoning her; and Mrs. Butler was one of those feminine temperaments, rather commoner in New England than elsewhere, whom a good reason absolutely silences: they may not often have it themselves, but their reverence for truth and a clear conclusion is such that they must bow to it in others. The most that she could say was, "But you will come back to us afterward, Helen? You will come after

Marian is gone, to comfort us, wont you? It will be a month before we shall sail, and we should so like to have you with us. We shall not be gay ourselves, then, and you will feel more at home. I wont oppose you now, dear, but you'll promise me that!"

"Yes," answered Helen, "I'll come back, then, if you want me."

"And where are you going, now? Where do you mean to stay?"

"I don't know. I thought I should go to the Miss Amys—you remember them, don't you?—and ask them to let me stay with them for the present. I know they sometimes take people to board."

"Oh, yes, I remember them—on West Pomegranate street; one of those pleasant old houses, with the threshold level with the sidewalk. It will be a good place," said Mrs. Butler, cheered with the thought. "You must let Mr. Butler arrange for you. He—"

"No," said Helen, promptly; "I am not going to trouble Captain Butler any more. I must begin taking care of myself now, and I can't begin too soon. I have my own money, and I ought to know how to use it." Human nature is such a very simple as well as complex thing, that Helen could feel a childish pride in being absolute mistress of a certain sum, and for the moment could forget the loss that had endowed her with it. "I am going to be very saving of it, Mrs. Butler." She smiled, but the smile took away all hope from Mrs. Butler. She looked at Helen in despair, and did not know how to begin what she felt it on her conscience to say at once.

"Oh, Helen!" she broke out, and then checked herself.

"What, Mrs. Butler?" asked the girl, startled by her accent.

"Oh, nothing! I mean—has Mr. Butler told you how much it is?" Mrs. Butler was ashamed of her flighty reluctance and indecision, and now took herself firmly in hand.

"Yes, it's five thousand dollars—so much more than I ever—"

"Did you understand," interrupted Mrs. Butler, "that it's only five thousand in all? Not—not five thousand a year?" Mrs. Butler was prepared for the worst dismay that Helen could show, but Helen showed none. On the contrary, she gave a little laugh.

"Five thousand a *year*? No, indeed! Why, Mrs. Butler, what have you been thinking of? That would be insanity."

Mrs. Butler looked like one to whom the worst dismay might have been welcomer than this cheerfulness: this might be a far more hopeless condition than the realization of the fact that the sum of five thousand dollars was

not a fortune; Helen might be thinking it was. Mrs. Butler felt obliged to ask, "Do you know how much that will give you to live on?"

"Not exactly," said Helen, "but not much, I suppose."

Perhaps she thought a thousand a year. Mrs. Butler must still go on. "Some of Mr. Butler's Chicago mortgages bring him nine per cent. That would be five times ninety—four hundred and fifty?"

"Oh, I should never send *my* money away to Chicago. I want it where I can put my hand on it at once. I shall deposit it in savings-banks—like Margaret—at six per cent., and then I shall get three hundred dollars a year from it."

"But, poor child! you can't live upon that," Mrs. Butler besought her.

"No, I must do something. I'm determined *never* to encroach upon the principal, whatever happens. Don't you think that's the right way? I've always heard that its perfectly ruinous to live upon your principal."

Mrs. Butler could not combat these just conceptions. "Have you thought what you shall do, Helen?" she asked.

"Yes, I've been thinking about it nearly all night. I couldn't sleep, and I thought I might as well think. I couldn't decide. But one thing I have made up my mind I shall not do: I shall not paint holly-wood boxes." They both laughed, the elder lady pityingly and reluctantly. "In the first place, I paint horridly; but that wouldn't make any difference. What I couldn't do would be to ask the outrageous prices which holly-wood boxes bring from sympathizing friends when painted by young ladies in need. Beside, I think the market must be overstocked. Only consider, Mrs. Butler, how many holly-wood boxes must have been painted by this time, and what stores of them people must have laid by, that they couldn't give away if Christmas came twice a year from now to the millennium. And all so much alike, too: a farmhouse very deep in the snow; the moon monopolizing the sky, and Santa Claus, very fuzzy all over, and much too large for his sleigh, with his reindeers and his pipe just of a size; and fat robins at each end of the box. No, you needn't be afraid of holly-wood boxes from *me*, Mrs. Butler."

"Oh, Helen, you queer child!" laughed Mrs. Butler helplessly.

"But I *will* confess that when I thought of doing something for myself, holly-wood boxes popped into my head the first thing. I suppose there's really no getting away from them. And, oh, yes! I thought of something else; I thought of parlor-readings. What

should you think of parlor-readings, Mrs. Butler?"

Mrs. Butler visibly cowered under the proposition, and Helen gave a wild laugh.

"How they Brought the Good News from Ghent to Aix," don't you know? and Poe's 'Bells,' and 'Curfew Shall not Ring To-night.' How would that do? Don't you believe that if it could be generally given out, I might be handsomely bought off by public subscription? But I really needn't do anything at once, Mrs. Butler," Helen went on, seriously. "I've got clothes enough to last me indefinitely, for I shall expect to make over and *make* over, now; and I shall take a very cheap little room at the Miss Amys', and think it all over very carefully, and look about before I attempt anything. I'm not afraid: I can do all sorts of things. Don't—don't sympathize with me!" she added, suddenly breaking. "That *kills* me! It disheartens me more than anything."

"She understands perfectly well how much she's got," Mrs. Butler reported to her husband. "She had worked out just how much income it would be, and she says she expects to do something to help herself. But she is so cheerful about it that I don't believe she does. There's something between her and Robert Fenton."

"It would be the best thing that could happen," said the Captain, with a sigh of relief. "I hope to the Lord it's so! But he's off for three years!" he added, with dismay.

"She doesn't think of that. Or perhaps she hopes he can get leave to come home—or something. Besides, such a girl as Helen could wait thirty years," said Mrs. Butler, viewing the affair in the heroical abstract. "Her hope and her trust will support her."

"Morally, perhaps. But she would have to be supported otherwise," said the Captain.

He refused to be wholly comforted by his wife's manner. Still, its probability, in the absence of anything more substantial, afforded him a measure of consolation. At any rate it was, to his thinking, the sole hopeful outlook for Helen. Since the hard times began he had seen so much futile endeavor by able and experienced men to get something to do for even a scanty living, that he had grown skeptical of all endeavor at self-help. Every year he was called upon to assist at the disillusion of a score or more of bright young spirits fresh from the University, with their academic honors still green upon their brows, and eager for victory in the battle of life. He knew the boys' fathers and mothers, and of what excellent stock they came, what honest fellows they were, and what good reason there was to believe them capable of bearing

their part with distinction in any place demanding quality, and talent, and training. But there seemed to be no such place for them; the world in which their sires had prospered did not want them, did not know what to do with them. Through the strange blight which had fallen upon a land where there should be work for every one, and success for every one willing to work, there seemed to be nothing but idleness and defeat for these young men in the city of their ancestry and birth. They were fit to lead in any commonwealth, but the commonillness apparently would not have them; they were somehow anachronisms in their own day and generation; they were too far before or far behind their time. The Captain saw them dispersed in a various exile. Some tried cattle-raising in Colorado; some tried sheep-farming in Virginia, and some sheep-ranching in California. There were others who tried cotton-planting in the South, and orange-culture in Florida; there were others yet, bolder and more imaginative, who tried milk-farming in Massachusetts. The Captain heard of their undertakings, and then he saw them with their hats scrupulously on, at the club, which a few of their comrades had in a superior wisdom never abandoned.

They had got back, and they were not to blame. Perhaps there was some error in the training of these young gentlemen, which had not quite fitted them to solve the simple yet exacting problem of making a living. But then, people who had worked hard all their lives were not now solving this problem. Captain Butler thought of these nice fellows, and how willing and helpless they were; and then he thought, with compassion too keen for any expression but grim laughter, of such a girl as Helen, and what her training was for the task of taking care of herself. It was probably the same as Marian's, and he knew what that was. They had, in fact, gone to the same schools, and grown through the same circumstances into the same society,—in which everything they had been and had done fitted them to remain, and which was very charming and refined, and good in a good sense, and so very, very far from doing anything for anything but culture's, or pleasure's, or kindness' sake.

At five or six years of age, Helen had begun to go with the other little girls of her station in life to a school in which the established language was French, and in which she acquired a graceful and lady-like use of that tongue. It stood her in good stead when she went abroad one summer with her father, and she found that she spoke it as correctly as most English girls she met, and a great deal

more readily. But she had too much sense to be sure of her accent or her syntax; at Paris she found that her French was good, but with a difference, and she would not have dreamt of such a thing as teaching it. In fact she had not thought of that at any time, and she had no such natural gift for languages as would have enabled her to master it without such a design.

From this school she went to others, where she was taught what people must learn, with thoroughness and with an intelligence very different alike from the old-fashioned methods of young ladies' establishments, and from the hard, mechanical processes of the public schools. She was made to feel an enlightened interest in her studies; she liked some of them very much, and she respected those she did not like. Still she had not shown a passionate preference for any particular branch of learning; she had a lady-like ease and kindness withal; if she really hated anything it was mathematics, but because she hated this she had been the more conscientiously attentive to it. She had a good taste in music, and fair skill. After she left school, she had a musical enthusiasm, in the height of which she devoted herself, under her German instructor, to many hours of practice every day, and had her own ideas of becoming a great performer. But these gave way to clearer conceptions of her powers, and she remained an impassioned amateur of musical genius in others. She went devotedly to all the private *musicales*; she was unflinching at the rehearsals of the symphony concerts and of the Handel and Haydn Society. She made her father join the Apollo Club for her, and she made him go to some of the concerts with her. In those days her talk was of Bach and Beethoven; she thought poorly of Italian music, though she was very fond of the Italian operas.

It was to this period that her passion for German language also belonged. She had studied German at school, of course, but it was not till after leaving school that French was relegated to its true place as something charming enough, but not serious; and German engrossed her. She read Goethe's and Schiller's plays with her teacher, and Heine's songs with one of her girl-friends. She laid out a course of reading in German, which was to include Schopenhauer's philosophy, already familiar to her through the talk of a premature Harvard man, who rarely talked of anything else. But it never really came to this; German literature presently took the form of drama, and after Helen's participation in a certain number of German plays, it yielded to the pleasing dance of the same name; though not till it had superseded

Italian as well as French in her affections. Dante, of course, one must always respect, but after Dante, there was so little in Italian as compared with German! The soft throat from which the southern vowels came so mellow roughed itself with gutturals. But this, like music, was only for a time. In the end, Helen was always a girl of sense. She knew that she was not a German scholar, any more than a great performer, and she would have shrunk with astonished modesty from the notion of putting such acquirements as she had in either to practical use. She hid them away, when her frenzy for them was past, as really so little that one ought to be ashamed of them.

It was the same with painting—or Art, as she then called it—in which it has already been represented that she at one time took a great interest. She really liked it very much; she had that feeling for form and color without which no dress-maker can enable a young lady to dress exquisitely, and she enjoyed form and color in painting. But by and by, as the class fanned itself down to the grains of wheat in its large measure of amiable and well-meaning chaff, Helen found that her place was with the chaff. It did not need the eye of the great painter, glancing with a humorous gleam from her work to her, to teach her this; she had felt it before, and she gave it up before she had conspicuously disgraced herself. She was always very glad to have taken to it; the attempt to paint for herself had cleared and defined her taste in painting, and indefinitely enlarged the bounds of her knowledge and enjoyment. But it had not done anything more, and all that Helen had learnt and done had merely had the effect that was meant—to leave her a cultivated and agreeable girl, with bright ideas on all sorts of pleasant subjects. She was, as the sum of it, merely and entirely a lady,—the most charming thing in the world,—and, as regards anything but a lady's destiny, the most helpless.

It was the fact that Helen's life now seemed wrenched and twisted so far from its rightful destiny which bowed Captain Butler over it in such despair, and which well might strike pity into the hardiest beholder. Her old friend saw no hope for her but in the chance of there being something, as his wife suggested, between her and Robert Fenton. Yet it was against this hope that Helen herself had most strenuously steeled her heart. She had not the least doubt of Robert. He was a gentleman, and he would take what she had written in the right way. She rested in such absolute faith in his generosity, that she shrank from the possibility of abusing it as from

something like sacrilege. If Robert were that moment to come and ask her to marry him, she would not take him till she had fairly won him again; and if, when he had got her letter, and thought it all over, he decided that she was too light and flippant a girl to trust with his happiness, she should know just how to take it. She should not blame him; she should not think him less kind and true; he should be none the less her hero. In fact, it seemed as if his willingness to forget her folly would somehow mar the perfection of her self-sacrifice. So, while she clung the most fondly to the thought of him, it was with the austere readiness to give him up, and even a sort of impatience. Women seldom reason, it is said; when they do so, it must be owned that it is with passionate largeness. The sum of Helen's emotional logic was that she must plan her future with as much severity and seriousness, as much will to venture and to endure, as if there were no Robert Fenton, or ever had been, in the world. Her sole difficulty was to imagine her future, and to begin to imagine it she must first escape from the affectionate restraint of these kind friends of hers. She had no purpose more definite than that.

When she went from Mrs. Butler to her own room, the chamber did not seem spacious enough for the tumult in her mind; and now that she had resolved to go up to Boston that afternoon, and was, as it were, already in motion, the inertness of the place was intolerable. She put on a wrap and a hat, and stole out to her accustomed place on the rocks. It was a very still morning late in September, after the first autumn gales had blown themselves away, and a glistening calm, with a deep heart of mellow warmth, had followed. The sea sparkled and shone with a thousand radiances in its nearer levels, and in its distance was a blue that melted into a hardly more ethereal heaven, a few white sails that might have been wings showing palely at its confluence with the sky. It washed languidly up the little beach of the cove with a slow, shouldering action, and softly heaved against the foot of the rocks where the sea-weed flung up by the storm hung drying its masses in the sun and trailing its ribbons in the tide. The air seemed to sparkle and burn like the sea, and was full of the same pungent saline odors.

Helen came round a knot of twisted cedars that hid her haunt from the house, and, climbing to the perch where she was used to sit, found herself confronted by a gentleman apparently in as great trouble as herself at their encounter. She could not mistake those sloping shoulders, that long neck, and that inef-

fective chin: it was Lord Rainford, not now in the blue yachting-stuff in which she had last seen him, but in a morning costume which seemed to make even less of him in point of personal attractiveness. Helen held the only pass by which he could have escaped, and, much as she would have liked to let him go, it was impossible for her to yield without speaking.

"Ah—good-morning. I'm intruding here, I'm afraid, Miss—Harkness," he began.

"Oh, no," she said, and paused, not knowing just what else to say.

"The fact is," the Englishman continued, "that I had been calling with Mr. Ray, and he went back a moment, and I stepped down here on the rocks, and—" Helen perceived that he had taken in the fact of her crapes, visiting them with a glance of wistful pity, as if he would like to say something fit and due about her bereavement. But he only asked, after his abrupt pause, "Have you been always well since I saw you?"

She remembered Ray's praises of Lord Rainford, and would have liked to put herself right with him. She hated to have him thinking her flippant and unfeeling, though she might have proved that it was his fault she had been so. But she could think of nothing more than "Thank you" to say; and then she asked, "Have *you* been well?"

"Oh, very," answered Lord Rainford. "My American summer has quite set me up."

This seemed to imply that he had not been very well when he came, but Helen did not ask. She was thinking that when he should have a heavier mustache and a beard to that feeble chin his face and neck might be helped off a little; but nothing could ever do anything for those shoulders. She settled this in her mind before she said, rather absently, "I am glad of that. You will be going soon, I suppose," she added, from mere dearth, though it occurred to her that this might be set down as an instance of the Yankee inquisitiveness that Englishmen are always in quest of.

"Yes, I'm going to sail to-morrow," said Lord Rainford. "Your friends have promised to come and see me in England."

"They told me," assented Helen.

"I'm sure they owe me a revenge in that way," continued the young man. "Mr. Ray has done me no end of kindness. In fact, everybody's been most uncommonly kind. I couldn't say enough of it!"

"I'm glad you have enjoyed your stay here," said Helen. "We Americans are rather weak about our country. We like people to like it, and take it a personal favor when they do. I suppose none of us," she added, "does anything to set even the least important per-

son in it before a stranger in a false light, without feeling sorry."

She examined Lord Rainford's face for an instant before she dropped her eyes, and saw it kindle with a delicate intelligence.

"I wish," he answered, "that I could be sure I leave everybody in America as well pleased with me as I am with all Americans."

"Good-bye," said Helen, "we shall be making international allusions to the language of Shakspere and Milton in another minute."

"No," said Lord Rainford; "it seems to me you don't care to do that any more. Very curious," he added; "I can't get the people I meet to say a good word for their country. They all seem ashamed of it, and abuse it, no end."

"That's because they want you to praise it," suggested Helen.

"Ah, but they won't let you praise it! They'll let you join them in crying it down."

"But you had better not."

"Ah, yes; very likely. I can't think that a country where I've met so many nice people, and seen scarcely anything but order and comfort even in these very bad times, can be going to the dogs; but I can't get anybody *here* to agree with me—that is, in society. I don't understand it."

"I can't explain," said Helen, with a little smile, "except by 'the settled opposition to our institutions which pervades the British mind.'"

"Ah, Chuzzlewit; I know. But you'll excuse my saying that I think your institutions have changed for the worse in this respect since Mr. Pogram's time. I think Pogramism is better than this other thing."

"What other thing?" asked Helen, not a great deal interested.

"Why, this not talking of America at all. I find your people—your best people, I suppose they are—very nice, very intelligent, very pleasant—only talk about Europe. They talk about London, and about Paris, and about Rome; there seems to be quite a passion for Italy; but they don't seem interested in their own country. I can't make it out. It isn't as if they were cosmopolitan; that isn't quite the impression, though—excuse my saying so—they try to give it. They always seem to have been reading the 'Fortnightly,' and the 'Saturday Review,' and the 'Spectator,' and the 'Revue des Deux Mondes,' and the last French and English books. It's very odd! Upon my word, at one dinner the Americans got to talking to one another about some question of local finance in pounds, shillings, and pence. I don't understand it."

Lord Rainford seemed to find nothing ridiculous, but only something mysterious in this, and reddened a little when Helen laughed.

"Perhaps you are embittered because experience has destroyed your ideal. You expected us all to call you a Britisher, and to flaunt Bunker Hill Monument in your face."

"Ah, now, do you think that's quite fair, Miss Harkness?"

Helen stooped a little sidewise and felt about her skirts with her left hand for the loop of her train, in that peculiar clawing and grappling manner which once had its fascination for the idle spectator. "We American women are accused of not caring anything about our institutions," she said. She secured the loop now, and, erecting herself, gave Lord Rainford her right hand for good-bye.

A deeper red dyed the young man's face as he took her hand and detained it a moment.

"Are you going?" he asked, and hesitated before he added, with an abrupt change of tone: "I can't let you go, Miss Harkness, without saying—without saying—without trying to say how very sorry I have felt at—at—your bereavement. It came so soon after I saw you that—that I—thought you—thought myself not altogether wrong to tell you. But I suppose I shouldn't have spoken. I beg your pardon!"

"You are very, very kind, Lord Rainford," answered Helen steadily, "and I thank you for speaking of it. I know people usually avoid speaking to others in—mourning—about it to spare them; but it's better to recognize it. I like it better than trying to ignore it."

"I've always felt," pursued Lord Rainford, "that I was painfully associated in your mind—I mean—I don't know—I hope you won't always think of me as a particularly disagreeable part of that day's experience." Lord Rainford still spoke with an awkward halt and hesitation, but the genuine feeling with which he seemed eager to leave Helen a better impression dignified his manner. "If you won't think it egotistical," he hastened to add, "I'll say that I believe I'm rather a serious man; at least I'm a heavy one; and when I attempt anything else, I—I know I'm disgusting—more disgusting than ordinarily. I was shocked—I can't tell you how much I was shocked—to think I had followed you up almost to the moment of that—intelligence, with imbecilities that must have been a—in distressing contrast. I don't know whether I make myself clear—whether I ought to speak —"

"Oh, yes!" cried Helen, touched at his as-

sumption of all the blame. "I'm so glad you have spoken of that, if only for the selfish reason that it gives me a chance to say how ashamed I am of my own part in it. I never thought of yours"—this was not quite true, but we cannot be very generous and quite true at the same time—"but it was the thought of my own frivolity that sometimes helped to make what followed so hard to bear. I was very rude."

"Oh, no, no!" answered the young man. "You said nothing but what I richly deserved. If you'd only said more, I should have liked it much better—afterward. But what I want you to think is, that I shouldn't have done so badly, perhaps, if I'd been acting quite naturally, or in my own character. That is——"

"I'm afraid," said Helen, "that I can't ask you to think that I was acting out of *my* character—or *all* of my characters: I seem to have so many——"

"Yes," interrupted Lord Rainford, "that's what I meant."

"It seems to me that it was only too much like one of mine—the one I'm most ashamed of. You will have a pleasant time to cross, Lord Rainford," she added, and took away her hand.

"Well, I don't know," said the other, accepting the close of this passage of their interview, and answering from the conscientiousness in talk which serves the English so well instead of conventional politeness, and is not so pleasant; "there are apt to be gales at this season, you know."

"Oh, yes, yes!" returned Helen, a little vexed at herself. "Gales, yes. But I was thinking of the equinoctial storm being past. They say it's past now."

"I'm a good sailor," said Lord Rainford. "I think I shall take a run over again next year."

"You've not got enough of America in three months?"

"No. I hope it hasn't got too much of me."

He looked at Helen as if he expected her to say something civil on the part of her hemisphere. But she refused to be the national voice, except very evasively.

"Oh, we ought to be flattered that people care to come back."

"You know," said Lord Rainford, "that I've seen almost nothing of the country yet. I've not even been in Washington, and I want to see Chicago and San Francisco." Helen did not say that she could not understand why, and Lord Rainford went on: "I'd only a few weeks in Canada, you know, before I came down to Orchard Beach—I think they

call it—with some Montreal people, and then I came to Boston, and I've been about Boston and Newport ever since. People have been extraordinarily kind. I couldn't really get away, and as I'm going away rather prematurely now, I must come back."

From this outline of his experience, Helen knew quite accurately all its details. She could have told just what had happened to him at Newport, going thither with Boston introductions, what lawn-parties, lunches, and dinners had been made for him, and in whose carriage he had first driven to the polo grounds. He had been perhaps once to the Town and Country Club; and he had been a good deal at the bathing-beaches, although early assured that nobody bathed there any more; and the Manhattan Yacht Club had sailed him over all the neighboring waters. He had seen the decay of the custom of Fort Day, and had been told what numbers of people used to go to the music in Fort Adams before polo began. When he returned to Boston, it was too soon for society to have come back in full force, but enough of it had got back to show him with what intensity of hospitality the sojourning Englishman, distinguished by rank or otherwise, or simply well accredited, is used among us. Helen knew, without asking, the houses and their succession, in which Lord Rainford had been entertained, and she could have guessed pretty well at what semi-civic feasts he had assisted. The Monday, Tuesday, Wednesday, Thursday, Friday, and Saturday Evening Clubs had all shared in him, and he had listened to part of a lecture at the Woman's Club. He had been taught much more about the charitable, penal, and educational establishments of Boston than any one Bostonian could endure to know, and he had kept his original impression that Boston reminded you of an English town. If he was at all astonished, as a young man, at the attentions heaped upon him, he must, as a lord, have been too much used to consideration in his own country to be surprised at it in ours. Men vastly his superiors in everything but birth liked to speak casually of him as that very nice young Englishman who had dined with them, and to let the fact of his rank rather patronizingly escape them in talk. People whose secret pride and dearest prejudices he had unwittingly trodden into pulp in his plump expressions of crude opinion professed rather to like his frankness. They said that there was something in his bearing—a simplicity, a directness, an unconsciousness—which showed the advantage of a standard of manners. The fact that you might often think him, at first glance, the most plebeian-looking person in

company, showed his extraordinary qualities of race; the persistence, through so many hundred years, of the ancestral traits which, in the attrition of a democratic society like our own, must have been obliterated long ago, was held to be a peculiar triumph of aristocratic civilization. One distinguished gentleman had proved himself much better versed in the Rainford pedigree than Lord Rainford himself. "Talked to me about my great-grandmother," said the nobleman afterward to Ray, "and my maiden step-aunts."

"Good-bye," said Helen once more; and nodding, she turned away, and went down the rocks.

Lord Rainford bowed, and said "Good-bye," too, following her with his eyes, but not otherwise pursuing her.

"You're back soon," he said to Mr. Ray, when the latter presently joined him.

At Salem that afternoon he came into the car where Helen sat. The place beside her was the only vacant one, and he stood leaning against the seat while he explained that he had been left by his train at that station in the morning. He looked as if he would like to be asked to take the vacant place, Helen thought; but she was perturbed and preoccupied. She could not endure the thought of talking all the way to Boston, and she made no sign of invitation. She was sorry, but she could not help it. He hesitated an instant, and, bidding her good-bye once more, said he was going forward into the smoking-car, and she did not see him again.

She went first to the post-office, where she had never been before, and which was so vast, and looked so hurried and careless with those throngs of people sweeping through its corridors, that she began to question whether it could be safely intrusted with a letter for Robert. Through one of the windows opening in the long façade of glass above the stretch of brass drawers which people were unlocking and locking up, all about, she saw a weary-looking clerk toss a little package into the air for relaxation and then throw it into a distant corner, and she thought, with a shudder, what if that had been her letter, and it had slipped under something and been lost! Besides, now that she had come to the post-office, she did not know in which of the many letter-holes to trust, and she studied the neighboring inscriptions without being able to make up her mind. At last she asked an old gentleman who was unlocking his box, and he showed her. She feigned to drop her letter according to his instructions, but waited till he went away, and then asked the clerk at the nearest window. He confirmed the statement of the old gentleman, and Helen had almost allowed her letter to go when she bethought herself to say to the clerk that it was to the care of the Navy Department. He smiled—sarcastically, Helen fancied—and said it was quite the same thing. Then she dedicated a final blush to the act, and posted her letter, and found herself quite at a distance from the post-office, walking giddily along, with a fluttering heart full of delicious shame. She was horrified to think she had done it, and was so glad it was done.

(To be continued.)

## THE PRIMITIVE FISH-HOOK.

I HAVE before me an illustrated catalogue of modern fish-hooks and angling implements, and in looking over its pages I find an *embarras de choix*. I have no need for rods, for mine, like well-kept violins, have rather improved by age. A lashing may be frayed, or a ferrule loose, but fifteen minutes' pleasant work will make my rods all right

again. Lines are sound, for I have carefully stretched them after use. But my hooks! They are certainly the worse for wear. I began my season's fishing with a meager stock. Friends borrowed from me, and in replenishing my fly-book in an out-of-the-way place, the purchase was unsatisfactory. As I lost more than one fish from badly tempered

or worse fashioned hooks, I recalled a delightful paper by Mr. Froude. Rod in hand, he was whipping some pleasant trout-stream, near an historic site, the home of the Russells, and, breaking his hooks, commenced from that very moment to indulge in the gloomiest forebodings as to the future of England.

Fairly familiar with the general character of fishing-gear, either for business or amusement, I see in my book, Kirby, Limerick, Dublin, O'Shaughnessy, Kinsey, Carlisle, Harrison, Central Draught, as somewhat distinct families of hooks, used for sea or river fishing, and from these main stocks there grow many varieties, with all conceivable twists, quirls, and crookednesses. I discard all trap-hooks, infernal machines working with springs, as only adapted for the capture of land animals. Somehow I remember an aggressive book, given to me at an early age, which, containing more than one depressing passage, had one of extraordinary malevolence. This was couched nearly as follows: "Suppose you were translated only some seven hundred years back, then pray what would you be good for? Could you make gunpowder? You have, perhaps, a vague idea that sulphur, saltpeter, and charcoal are the component parts, but do you know where or how they are procured?" I forget whether this spooking author was not equally harrowing in regard to the youthful reader's turning off a spectroscope at a minute's notice, or wound up with the modest request that you should try your hand among the Crusaders with an aneroid barometer of your own special manufacture.

Still this question arises: Suppose you were famishing, though fish were plenty in a stream, and you had neither line nor hook. What would you do? Now, has a condition of this kind ever occurred? Yes, it has, and certainly thousands of times. Not so many years ago, the early surveyors of the Panama route suffered terrible privations from the want of fishing implements. The rains had rendered their powder worthless: they could not use their guns. Had they only been provided with hooks and lines, they could have subsisted on fish. Then there are circumstances under which it would be really necessary for a man to be somewhat of a Jack-of-all-trades, and to be able to fashion the implements he might require, and so this crabbed old book might, after all, act in the guise of a useful reminder. There was certainly a period, when every man was in a condition of comparative helplessness, when his existence depended on his proficiency in making such implements as would catch fish or kill animals. He must fashion hooks or something else to take fish with, or die.

Probably man, in the first stage of his existence, took much of his food from the water, although whether he did or not might depend upon locality. If on certain portions of the earth's surface there were stretches of land, intersected by rivers, dotted by lakes, or bordering on the seas, the presence of shell-fish, the invertebrates or the vertebrates, cetaceans and fish, to the exclusion of land animals, might have rendered primitive man ichthyophagous, or dependent for subsistence upon the art of fishing. But herein we grapple at once with that most abstruse of all problems, the procession of life. Still it is natural to suppose, so far as the study of man goes, when considered in relation to his pursuits, that in the early dawn of humanity, animals, birds, and fish must have been synchronous.

After brute instinct, which is imitativeness, then came shiftiness and adaptiveness. The rapid stride of civilization, considered in its material sense, is due solely to the use of such implements as are specially adapted for a particular kind of work. With primitive man this could never have been the case. Tools of the Paleolithic or Neolithic age (which terms indicate stages of civilization, but are not chronological), whether they were axes, hammers, or arrows, must have served river-drift or cave-men for more than a single purpose. People with few tools do manage, by skill alone, to adapt these to a variety of ends. The Fijian and the Russian peasant, one with a stone adze, the other with a hatchet, bring to their trades the minimum of tools. The Kafir, with his assegai, fights his battles, kills cattle, carves his spoons, and shaves himself. It was only as man advanced that he devised special tools for different purposes.

According to our present acquaintance with primitive habits, if man existed in the later Miocene age, and used a lance or spear for the killing of land animals, he probably employed the same weapons for the destruction of the creatures—possibly of gigantic form—inhabiting the seas, lakes, and rivers. The presence of harpoons made of bone, found in so many localities, belonging to a later period, may not in all cases point to the existence of animals, but to the presence of large fish.

Following, then, closely the advance of man, when his fishing implements are particularly considered, we are inclined to believe that he first used the spear for taking fish; next the hook and line; and lastly, the net. There might have been an intermediate stage between the spear and the hook, when the bow and arrow were used.

Interesting as is the whole subject of

primitive fishing, we are, however, to occupy ourselves principally with the form of the primitive fish-hook. To-day there are some careful archæologists who are not willing to accept that particular form which is presented below. I believe, from the many

STONE FISH-GORGE, FROM THE VALLEY OF THE SOMME. (NEW YORK MUSEUM OF NATURAL HISTORY.)

reasons which can be advanced, that this simple form was the first device used by man in taking fish with a line. The argument I shall use is in some respects a novel one. These illustrations, exactly copied as to size, represent a small piece of dark, polished stone. It was found in the valley of the Somme, in France, and was dug out of a peat-bed twenty-two feet below the surface. The age of this peat-bed has been variously estimated. M. Boucher de Perthes thought that thirty thousand years must have elapsed since the lowest layer of peat was formed. The late Sir Charles Lyell and Sir John Lubbock, without too strict an adherence to date, believed that this peat-bed represented in its formation, "that vast lapse of time which began with the commencement of the Neolithic period." Later authorities deem it not older than seven thousand years B. C.

Wonderful changes have come to pass since this bit of polished stone was lost in what must have been a lake. Examining this piece of worked stone, which once belonged to a prehistoric man living in that valley, we find it fairly well polished, though the action of countless years has slightly "weathered" or disintegrated its once smooth surface. In the center a groove has been cut, and the ends of the stone rise slightly from the middle. It is rather crescent-shaped. It must have been tied to a line, and this stone gorge was covered with a bait. The fish swallowed it, and, the gorge coming crosswise with the gullet, the fish was captured.

The evolution of any present form of implement from an older one is often more cleverly specious than logically conclusive; nevertheless, I believe that, in this case, starting with the crude fish-gorge, I can show, step by step, the complete sequence of the fish-hook, until it ends with the perfected hook of to-day. It can be insisted upon even that there is persistence of form in the descendants of this fish-gorge, for, as Professor Mitchell writes in his "Past in the Present," "an old art may long refuse to disappear wholly, even in the midst of conditions which seem to be necessarily fatal to its continued existence."

In the Swiss lakes are found the remains of the Lacustrine dwellers. Among the many implements discovered are fish-gorges made of bronze wire. When these forms are studied, the fact must be recognized at once that they follow in shape and principle of construction the stone gorges of the Neolithic period. Now, it is perfectly well known that the early bronze-worker invariably followed the stone patterns. The Lacustrine gorges have had the name of *bricole* given them.

BRICOLE, FROM THE LAKE OF NEUCHÂTEL.

This is a faithful copy of a bronze bricole found in the Lake of Neuchâtel. It is made of bronze wire, and is bent in the simplest way, with an open curve allowing the line to be fastened to it. The ends of the gorge are very slightly bent, but they were probably sharpened when first made.

The bricole below varies from the rather straight one found in the Lake of Neuchâtel, and belongs to a later period. It is possible to imagine that the lake-dweller, according to his

BRICOLE OF A LATER PERIOD.

pleasure, made one or the other of these two forms of fishing implements. As the double hook required more bronze, and bronze at first was very precious, he might not have had material enough in the early period to make it. This device is, however, a clever one, for a fisherman of to-day, who had lost his hook, might imitate it with a bit of wire. Had any member of the hungry Isthmus party mentioned above known of this form of Lacustrine hook, he might have twisted some part of a suspender buckle, providing there were no thorny plants at hand, and have caught fish.

DOUBLE HOOK, FROM THE LAKE OF NEUCHÂTEL.

PREHISTORIC FORMS.

When we compare the four forms, showing only their outlines, the evolution of the fish-hook can be better appreciated. Returning to the stone fish-gorge, the work of the Neolithic period, it is evident that the man of that time followed the shape handed down to him by his ancestors; and as this fashioned stone from the valley of the Somme is of a most remote period, how much older must have been the paleolithic fish-gorge of rough stone? It might have been with a splinter of

flint attached to some tendril in lieu of a line, the first fish was taken.

It is very curious to learn that in France a modification of this gorge-hook is in use to-day for catching eels. A needle is sharpened at its eye-end, a slight groove is made in the middle of it, and around this some shreds of flax are attached. A worm is spitted, a little of the line being covered with the bait.

Not eels alone are taken with this needle, for M. de la Blanchere informs us that many kinds of fish are caught with it in France.

Any doubts as to the use of the Neolithic form of fish-gorge must be removed when it can be insisted upon that precisely this form of implement was in use by our Indians not more than forty years ago. In 1878, when studying this question of the primitive hook, I was fortunate enough to receive direct testimony on the subject. My informant, who in his younger days had lived among the Indians at the head-waters of Lake Superior, said that in 1846 the Indians used a gorge made of bone to catch their fish. My authority, who had never seen a prehistoric fish-gorge, save the drawing of one, said that the Indian form was precisely like the early shape, and that the Chipewew was fished some with the hook of civilization, others with bone gorges of a primitive period.

In tracing the history of the fish-hook, it should be borne in mind that an overlapping of periods must have taken place. By this is meant, that at one and the same time an individual employed tools or weapons of various periods. To-day the Western hunter lights his fire with a match. This splinter of wood, tipped with phosphorus, the chlorates, sulphur, or paraffine, represents the progress made in chemistry from the time of the alchemists. But this trapper is sure to have stowed away in his pouch, ready for an emergency, his flint and steel. The Esquimaux,

the Alaskan, shoots his seal with an American repeating rifle, and, in lieu of a knife, flays the creature with a flint splinter. The net of the Norseman is to-day sunk with stones or buoyed with wood,—certainly the same devices as were used by the earliest Scandinavian,—while the net, so far as the making of the thread goes, is due to the best modern mechanical appliances. Survival of form requires some consideration apart from that of material, the first having much the stronger reasons for persistence. It is then very curious to note that hooks not made of iron and steel, but of bronze, or alloys of copper, are still in use on the coast of Finland, as I have quite recently obtained brass hooks from Northern Europe, such as are commonly in use by fishermen there.

The origin of the double hook having been, I believe, satisfactorily explained, to make the barb on it was readily suggested to primitive man, as he had used the same device on fish-spears and harpoons.

This double-barbed hook from the Swiss lakes is quite common. Then, from the double to the single hook the transition was rapid. Single bronze hooks of the Lacustrine period sometimes have no barb. Such differences as exist are due to the various methods of attaching the line.

In Professor A. A. Mayer's collection there is a Lacustrine bronze hook, the shank of which is bent over parallel with the stem of the hook. This hook is a large one, and must have been used for big fish—probably the trout of the Swiss lakes.

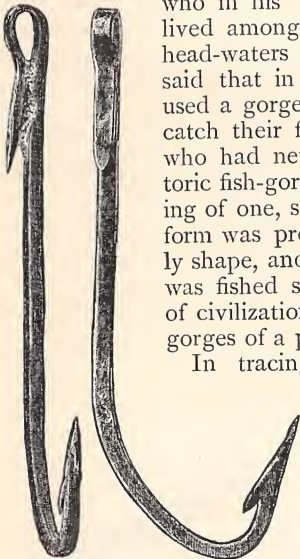

Hooks made of stone are exceedingly rare, and though it is barely possible that they might have been used for fish, I think this has not been conclusively shown. Wilson gives,

SHARPENED NEEDLE  
USED FOR CATCHING  
FISH IN FRANCE.

DOUBLE HOOK, BARBED.

BRONZE FISH-HOOK. (MAYER  
COLLECTION.)

ALASKAN HALIBUT HOOK.

in his work, drawings of two stone hooks, which were found in Scandinavia. Though the theory that these stone objects were fashioned for fishing is supported by so good an authority as Mr. Charles Rau, the archæologist of the United States National Museum at Washington, it does not seem to

always be cited. In the examples of hooks which illustrate works of travel, a good many errors arise from the simple fact that the writers are not fishermen. Although the outline of a hook be accurately given, the method of securing it to the line is often incorrectly drawn.

In THE CENTURY MAGAZINE for July, 1882, an Alaskan halibut-hook is represented. The form is a common one, and is used by all the savage races of the Pacific; but the main interest lay in the manner of tying the line to this hook. Since the fish to be caught was the halibut, the form was the best adapted to the taking of the *Hippoglossus Americanus*; but, had the line been attached in any other way than exactly as represented, this big fish could hardly have been caught with such a hook.

In the drawing, the halibut-hook hangs but slightly inclining toward the sea-bottom, the weight of the bait having a tendency to lower it. In this position it can be readily taken by the fish; but should it be suspended in a different way, it must be at once seen how difficult it would be for the fish to swallow it. In this Alaskan hook must be recognized the very first idea of what we call to-day the center-draught hook. A drawing is also given of a steel hook of a peculiar form, coming from Northern Russia. The resemblance between the Alaskan and this Russian hook is, at first, apparently slight, but they both are, nevertheless, constructed on the same principle. When this Russian hook is seized by the fish, and force is applied to the line by the fisherman, the point of the barb and the line are almost in one and the same direction. Almost the same may be said of the Alaskan hook. Desirous of testing the capabilities of this hook, I had a gross made after the Russian model,

ALASKAN HALIBUT HOOK.

me possible that these hooks could have been made for fishing. Such forms, from the nature of the material, would have been exceedingly difficult to fashion, and, even if made, would have presented few advantages over the primitive gorge.

This, however, must be borne in mind: that, in catching fish, primitive man could have had no inkling of the present curved form of fish-hook, which, with its barb, secures the fish by penetration. A large proportion of sea-fish, and many river-fish, swallow the hook, and are caught, not by the hook entering the jaws of the fish, but because it is fastened in their stomachs. In the Gloucester fisherman's language of to-day, a fish so captured is called "poke-hooked"; and accordingly, when the representative of the Neolithic period fished in that lake in the valley of the Somme, all the fish he took must have been poke-hooked. A bone hook, excellent in form, has been found near the remains of a huge species of pike (*Esox*). Hooks made of the tusks of the wild boar have also been discovered with Lacustrine remains.

In commenting on the large size of the bone hook figured in Wilson's work, its proximity to the remains of large fish was noticed. When the endless varieties of hooks belonging to savage races are subjects of discussion, the kind of fish they serve for catching should

RUSSIAN FISH-HOOK.

THE BEGINNING OF A SHELL-HOOK. (WEST COLLECTION.)

and sent them to Captain J. W. Collins, of the United States Fish Commission, stationed at Gloucester, requesting him to distribute them among the fishermen. While writing this article, I am in receipt of a letter from Captain Collins, informing me that these hooks are excellent, the captains of fishing-smacks reporting that a great many deep-sea fish were taken with them.

A study of these hooks—the Alaskan and Russian—with reference to the method of attaching the line, explains, I think, the peculiarity of certain shell-hooks of great antiquity found in California, which have puzzled archæologists. These hooks, the originals of which are to be found in the National Museum, at Washington, are shown in accompanying engravings. The notch cut in one of the hooks seems to show that the line was attached at that place. Hang the hooks in any other position and they would catch no fish,—for one could hardly suppose that the blunt barb could penetrate the mouth of the fish.

If there be some doubt entertained by American archæologists as to the use of these shell-hooks (page 904), there can be none in regard to their having barbs. The barbs turn outward, in which respect they differ from all the primitive European hooks I have seen. In confirmation of the idea advanced as to the proper place of attaching the line, Professors C. C. Abbott and F.

SHELL-HOOK. (NATIONAL MUSEUM, WASHINGTON.)

W. Putnam, in a chapter entitled "Implementments and Weapons made of Bone and Wood," in the United States Geographical Survey, west of the hundredth meridian, write, referring to these hooks: "These hooks are flattened, and are longer than wide. \* \* \* The barbs in these specimens are judged by fishermen of to-day to be on the wrong side of a good fish-hook, and the point is too near the shank. By having the line so fastened that the point of tension is at the notch at the base of the shank, instead of at the extreme end of the stem, the defect of the design of the hook would be somewhat remedied, as the barb would be forced down, so that it might possibly catch itself in the lower jaw of the fish that had taken the hook." The summing up of this is, I think, that in an imperfect way the maker of this Santa Barbara hook had some idea of the efficiency of a center-draught hook. As the first step in manufacturing this hook, a hole was drilled in the shell, and the hook finished up afterward by rounding the outside. Dr. West, of Brooklyn, has a whole series of such primitive work in his collection.

It is quite obvious that, in a study of this

SHELL-HOOK. (NATIONAL MUSEUM, WASHINGTON.)

character, it becomes necessary to understand the implements now in use by uncivilized man. To advance the idea that in all cases hooks have been improved by slightly increased culture among semi-civilized races, would be a source of error. It is quite possible that, in many instances, there has been retrogression from the better forms of fishing implements once in use. This relapse might have been brought about, not so much by a decrease of intelligence, as changes due to fortuitous causes. A fishing race might have been driven away from a shore or a river-bank, and replaced by an inland people ignorant of fishing.

Some primitive races still use a hook made from a thorn, and in this practice we find to-day a most wonderful survival. On the coast of France hooks made of thorns are still used to catch fish, the fishermen repre-

SHELL-HOOK FROM SANTA BARBARA. (NATIONAL MUSEUM, WASHINGTON.)

senting that they possess the great advantage of costing nothing, and of not fouling on the sea-bottom. The Piutes take the spine of a cactus, bending it to suit their purpose, and very simple barbless hooks of this kind may be seen in the collections of the National Museum at Washington.

Undoubtedly, in primitive times, hooks of a compound character were used. Just as men tipped a deer's antler with a flint, they combined more than one material in the making of their hooks, lashing together a shank of bone or wood with a bronze barb. It would be almost impossible in a magazine article to follow all the varieties of hooks used and the ingenuity displayed in their manufacture. Occasionally a savage will construct a lure for fish which rivals the daintiest fly ever made

ARTIFICIAL STONE SHRIMP. (MAYER COLLECTION.)

by the most fastidious of anglers. In Professor Mayer's collection there is an exceedingly clever hook coming from the North-western coast, which shows very fine lapidary work. A small red quartzose pebble of great hardness has been rounded, polished, and joined to a piece of bone. The piece is small, not more than an inch and three-quarters in length, and might weigh an ounce and a half. In the shank of bone a small hook is hidden. It somewhat imitates a shrimp. The parts are joined together by lashings of tendon, and

these are laid in grooves cut into the stone. It must have taken much toil to perfect this clever artificial bait, and, as it is to-day, it might be used with success by a clever striped-bass fisherman at Newport.

In this necessarily brief study of primitive fishing I have endeavored to show the genesis of the fish-hook, from the stone gorge to the more perfected implement of to-day. Simple as it may seem, it is a subject on which a good deal of research is still requisite. "It is not an acquaintance with a single series of things which can throw light on any subject, but a thorough comprehension of the whole of them." If in the Swiss lakes there are found bronze hooks of a very large size, out of proportion to the fish which swim there to-day, it is but just to suppose that, many thousands of years ago, long before history had its dawn, the aquatic fauna

SHELL-HOOK. FROM SANTA BARBARA. (NATIONAL MUSEUM, WASHINGTON.)

were then of greater bulk than in 1883. Considerations on the primitive form of the fish-hook must even comprehend examination of prior geological conditions, differences of land and water, or such geographical changes as may have taken place. Then ichthyology becomes an important factor, for by the character of the hook the kind of fish taken, in some instances, may be understood. We are fast coming to this conclusion: that, putting aside what can only be the merest speculations as to the condition of man when he is said to have first diverged from the brute, he was soon endowed with a wonderful degree of intelligence. And, if I am not mistaken, primitive man did not confine himself in his fishing to the rivers and lakes alone, but went out boldly to sea after the cod; and so the fishing instincts of the men of Cape Ann to-day go backward to that indefinite period the exact date of which is so far distant that no human mind has yet been able to fix it.

*Barnet Phillips.*

## VISITING THE GYPSIES.

LASHUS is a fine specimen of a native American, of a peculiar species, yet I venture to say that very few indeed of my readers know much about him, or even of the race to which he belongs,—for he is a native American Gypsy, of English Gypsy parentage. This stock, for vigorous faith in life and a critical knowledge of horses, cannot be surpassed by any in the world. Lashus did not know what his name meant till I explained to him that it had been handed down with many other

words in Romany from a Slavonian origin. It means Louis, which in Eastern Europe is called Lajos. When the Gypsies came, in the fifteenth century, to England, they brought with them no French words, but a number borrowed from Slavonic sources, such as *shuba*, a cloak or flowing skirt; *mass*, meat;

A HUNGARIAN ROMANY.

*adosta*, enough; and from Greek the words for a kettle, a bone, and a chair.

Not long ago, when Lashus was bidding me good-bye, just before folding his tents like the Arabs and silently stealing away, he said:

"There is a large camp of Romanies just now over in Oakdale Park, near Broad street. They are Lovels—Kamlos—you know?"

"It's a mistake," I confidently asserted. "There wasn't a Romany there three days ago. I should have heard of their arrival as soon as you."

"Will you bet *panj lil* [five dollars] on it?" said Lashus. "*No*,—well, that's five dollars saved to you, *rye* [sir]. For they *are* there, and very nice, deep, old-fashioned Romanies they are. Only be careful when you call, for I heard that the old grandmother, who is full a hundred years old, is dying. She's the Queen of the Gypsies, and knows a lot about old times. But—I say, *rye*—don't let on to them at first that you can *rokker* [talk Romany]."

AN OUT-DOOR KITCHEN.

*Play 'em*—have some fun out of 'em. They've never so much as heard of you, nor of the *tāni rāni*. It'll be a new sensation for 'em."

The *tāni rāni*, or young lady referred to, was Miss Elizabeth Robins, who is well known to most of the Gypsies who visit Philadelphia. It was only on Sunday that we could make our visit to the newly arrived, since on week-days the women, at least, are rarely at home in a Gypsy camp. So, on Sunday morning, we found ourselves at the Park.

A GYPSY DIANA.

"Why, it's quite a little Gypsy town of tents and vans," said L., as she looked at the camp. "I never saw so many here before. *Jasa tu sig-ān* [go on before, quickly!]"

I went on and found myself among the tents, where we were politely welcomed by a very striking-looking, middle-aged, and thorough Gypsy woman. We sat down on some wood, and I began:

"Why, what singular-looking persons you are? Are you foreigners?"

"We are Gypsies, sir," replied the woman.

"Gypsies—*Gypsies*!" I answered, reflectively. "I think I've read about Gypsies in books. Ah, yes—I remember! How strange, though, that I should really meet with one. Did you ever see a Gypsy before?" I said, turning to L., who looked innocent ignorance. "And is it true," I continued, to the woman, "that you can tell fortunes?"

"Yes, sir."

"How wonderful! But I am afraid that is very wrong. And can you tell a Gypsy when-ever you see one?"

"Always, sir."

"And have you a language of your own?"

"We have a broken one, sir, called Romany."

"Romany—Roman—why it must be like Latin. I know Latin. I will give you some words first in English, and then in Latin, and if you know what any of them means you must tell me."

There was great curiosity expressed to hear Latin. I began, and exclaimed with great solemnity:

"This is the English: 'Tiglath-Pileser said unto Nebuchadnezzar, Thou art the man,—for he played upon the harp of a thousand strings, spirits of the just made perfect.'"

There was no doubt of it. I was a moral missionary, and it was with a manifestation of great respect that the Latin was now solicited. Changing my expression, I said in Romany, or Gypsy:

"*Tutes a bori dinneli that dont jin tiri noki foki vanka tu diks a lende* [You are a great fool not to know your own people when you see them]."

There was a general spasm of amazement, and then a roar of laughter. No one enjoyed the joke more than a very venerable and picturesque woman in whom I at once recognized the hundred-year-old queen. But instead of lying at death's door, as I had been led to expect, she was now sitting up all alive, and enjoying a pipe, as I sincerely hope that all my readers may when they, too, achieve their centuries.

The sheep had proved to be a wolf, but there was a forlorn hope left in L. Turning to her, the Gypsy said:

"Shall I tell your fortune?"

"Tell *my* fortune, indeed!" returned L., in fluent Romany. "Hold up your hand and let me tell yours, or let us tell them one against another for a dollar——"

"And see who can tell the most lies in ten minutes," I added.

The Gypsy shook her head and said, seriously:

"Between such as we are there can be no lying. *Patserus*."

"And do *you* tell fortunes?" said the Queen to L., in amazement.

When Arbaces, the arch sorcerer, wished to reveal himself to the Witch of Vesuvius as belonging to her order, he exhibited the burning girdle. When my niece was thus questioned, she drew from her pocket a small book bound in old red morocco, and opening it, said:

"Here's my *dukkerin-lil*."

The reader must understand that, among the women Gypsies, there is no treasure so coveted as a so-called *dukkerin-lil*, or fortune-telling book. By this is not meant a dime

dream-book or a cheap fortune-teller, such as are generally to be found associated with cent-broadside ballads, but some quaint and ancient little work on chiromancy or magic, garnished with pictures of hands and strange cabalistic devices, such as abound in Agrippa and Trithemius. Such a book is to a fortune-teller what a wand was to a sorcerer or a broom to a witch. The possession of a really remarkable specimen of such literature in Gypsy circles confers a species of renown. One hears that a certain family owns it as one hears of another's owning a famous horse or a superior wagon. This which my niece had was a curiosity in its way, being filled with marvelous illuminated hands, dragons, and other monsters, in vermilion, gold, or silver, and looked as well able to raise Mephistopheles as any specimen of occult philosophy which eyes ever beheld. It was gazed at by a deeply appreciative audience with intense admiration, but by none so much as the Queen, who knew by nearly a century of experience what an aid such a work could be in all manner of secrecy. I need not say that she expressed a fervid desire to become the possessor of the volume, which was to her all that the book of gramarye of Michael Scott was to the Lady in "The Lay of the Last Minstrel"; but when I was asked its value, and I replied in rhymes,

"Miri dye,  
Mukela grai,  
Or a chai"—

that is, "It is worth a horse or a girl"—there was no further question of buying it.

A TYPE.

Then we talked of Gypsies known to us in England long ago, of the living and the dead, of races run lang syne, and of all the affairs of Egypt; how they had traveled far and wide in America, and of all the band of Gypsies from Providence, who had visited Philadelphia the week before, and bought many horses,—yes—two-hundred-and-fifty-dollar horses. There was much similar gossip, and many quaint confidences.

There is nothing in Gypsy life which is remarkable to an indifferent person, but there is certainly much in it which is very different from household ways to a keen perceiver. I could amuse myself all day in a Romany camp by watching the animals. They live

A HARD CASE.

on such familiar terms with such singular people of odd ways, that anybody can understand why the Hindoos, the ancestors of the Gypsies, believed as a matter of course that animals had souls. What duck, except a duck brought up in a family, would ever put its head in through a hole in the tent, quack to those in there in all but human fashion, and then retire shaking that head with such a meaning air? And the poultry! Why, Gypsy cocks and hens are as different in their demeanor from the ordinary denizens of the barn-yard as are their mistresses from the Gentile farm-wives. Just watch them, and mark their superior familiarity with man.

I had noticed lying at my feet a mysterious, large, fluffy ball, a thing of woolliness and mystery, which might have been photographed for an enormous tarantula, or octopus, or hedgehog, or hairy crab,—or as a mixture of them all. This thing growled as I at first sat down,—not angrily, but in tones which plainly said: "Um—m! What sort of folk be these here?" But when I spoke in Romany, it opened two awful eyes, fixed them steadily on me with a superhuman stare, and grunted with an expression distinct as words: "Well, *you're* all right—I shouldn't have thought it—but *you'll* bear watching."

"That's a *fino jucko*! [a fine dog]" remarked a younger woman. This was Mrs. Lovel, junior. The *fino jucko* opened his eyes and winked affirmatively. There was a sound from within the tent like *Auwa*, or yes, uttered in a cawing tone. I looked up inquiringly, and Mrs. Lovel said:

"It's our *rakkerin chillico* [talking-bird or parrot]." She should have said *chiriclo*, which

is more correct. In the Thug slang of India, the word *chiricea* is applied to a small owl, whose cry formed a most significant omen which encouraged or deterred them from the most desperate enterprises.

"And the parrot talks Romany?"

"Yes."

I wondered if it had occurred to any people who had seen this bird on its constant

scarlet red, she seemed the very ideal of Gypsy and sorceress. There are not many left at the present day of the old *kālo-ratt*—the black, or unmixed blood; and the Gypsies of this generation are losing all their old ways so rapidly, that one like the Queen is becoming a curiosity. By strange chance I also knew very well, in England, old Charlotte Cooper of Bow Common, whom the reader may find

A GYPSY CAMP.

travels, that, though American-born, its native tongue, acquired in America, was a dialect of the old Hindi Persian Urdu or camp-language formed during the tremendous struggle which centered round the fierce Mahmoud of Ghazneh? But it did not seem strange to me when I looked at the half-Indian faces before me, at the old Queen, who, with her daughter, would have passed unobserved in Calcutta as a Northern native, or even the children, who evidently had more Gentile blood in them than there was in the mothers.

The parrot, by speaking Romany, had a right to be called a Gypsy-bird, or would have, were not the word already preëmpted by another. In England, the water-wagtail has this name, from a strange superstition that he who beholds one will soon after meet with Gypsies. There is some cause for the belief. The wagtail haunts solitary places, near water, and in such spots Gypsies love to camp. In folk-lore it is an unearthly, witch-like bird, owing to its eccentric ways and haunts, and therefore it is not an inapt symbol for such weird people as the Romany. But the greatest living curiosity in the *tan*—that is, the place or *tent*—was the old Queen. Dark as an Indian, with gold ear-rings, and many strings of well-worn coral beads around her neck, and all her head attire and neck-wraps of

described in George Borrow's "*Romano Lavo-Lil*." Charlotte is dark, and is supposed by the people to be also a hundred years old; but when I asked her if this was the case, she, with the natural instinct of her sex to appear as young as possible, replied, "Indeed I'm not; I'm only ninety-four." This was five or six years ago. Should any of the residents of London who read these lines take the pains to ascertain whether Charlotte be still alive, as I think she is, he may see not only a veritable centenarian, but also one whom George Borrow, as he told me, he believed to be the last Gypsy of absolutely pure blood in England. I think this is, however, very doubtful. From their habits of intermarrying there are, I think, still many who are, in all probability, perfectly *kālo-ratt*, and of these the Queen seems to be a good specimen. That she is an accomplished fortune-teller, not without faith in her own powers to ban or bless, I was subsequently well assured. As we sat in the tent by the smoldering fire, whose smoke gave a delicate chiaro-oscuro to the scene, and I looked at the old woman, so unlike anybody whom I meet in ordinary life, my mind wandered to the strange people and scenes which she must have lived among long, long ago. She had known the chiefs of her people in the

days when they were really fierce and law-defying men who died on the gallows-tree, or in some form of violent death,—the days when the Rom was a leader in the prize-ring, or noted as a highwayman, and wore hunting-boots, and green coats with spade-guineas for buttons, and always carried the tremendous *chuknee* or jockey-whip, characteristic of his people. She was a living link with all that was wildest in England before the days of railroads and gas, steamboats and telegraphs.

\* \* \* It is a curious coincidence that, as I write, and since I wrote that last line, I have received a note from Dr. Oliver Wendell Holmes, in which he says: "I remember, by the way, that Cooper, the Gypsy, was one of the heroes and portraits of Boxiana. You may have known the very fellow in his old age." This was Jack Cooper, the husband of Charlotte, to whom I alluded. I did not know him, because he was sent lang syne as a convict to Australia. If still existing, he must be as old as his wife, but it is a strange thing that the Gypsies are all certain that he is yet alive. He abandoned his wife when young, and went off with another girl. But to the very last, old Charlotte always believed, as she still believes, if alive, that Jack will yet return to England and to her. I shall never forget how truly touched I was when this old woman, well-nigh at the end of her century, spoke with trembling, loving tones of her long-lost husband, and said that she knew he was not dead—she had dreamed it so often—and that he would yet return. Even among the Lovels, when I visited the Gypsy Queen, I found that they believed that Jack was yet of this world. I well remember my last visit to old Charlotte. I was accompanied by a lady who spoke Romany perfectly, and who took to the old woman a warm winter jacket for a present. After duly admiring it and uttering *paraco tute*, or "thank you," many times, the ancient Gypsy remarked to me roguishly:

"It's a beautiful coat, *rye* [master],—but—how perfect it would be—if the pocket wasn't quite empty." As she said this her attention was diverted, and by a dexterous exertion of *hanki panki*, or legerdemain, I slipped a shilling into the empty *putsi* [pocket], and bade her search again. I think that she was as much pleased with the gypsy way in which the money was given as with the coin itself.

After a most entertaining call, we took our

THE QUEEN OF THE GYPSIES.

departure. A few days after, I determined to pay the Queen another visit, in company with Mr. Pennell, the artist. Miss Robins did not accompany us, but, with great generosity, sent her magic book as a present to her majesty. "The dear old soul," she said, "was really dying to get it. Did you ever see anybody gaze at anything with such longing eyes? You will astonish her with it!" So I took the volume with me. We found all the family at home, the parrot preaching away in Romany or the unknown tongues, the children charmed to see us. I need not say that her majesty was also charmed to receive her present. But when she was told that the *tāni rāni*, or young lady, wished, in return, to have her picture and that of the others taken by Mr. Pennell, there was great reluctance, it being well known that it is a very unlucky thing to have one's picture taken, unless, indeed, it be done by the sun. I had in Egypt a friend named Mahomet, who was a strict Mussulman. He even considered it to be a great sin to have one's likeness painted. "How is it, then, that you have your daughter's photograph?" I asked. To which Mahomet gravely replied: "Him man no takee; Sun takee that portraits." Fortunately I had, foreseeing this reluctance, provided myself with a red string, it being well known that anybody's portrait may be taken with full exemption from harm if the sitter be presented with a shoe-string or a red cord. This being duly given, the sittings commenced. It was a good picture of itself to see the artist seated almost on the ground in the darkened tent near the fire, over which leaned the *sarshta*, or kettle-iron, with its pendent kettle, grimed with smoke. Everything seemed so gypsy and witchlike, as if one were living in one of Hoffmann's "*Phantasie-stücke*." The spout of the kettle looked to me like a long nose; I fancied I saw a goblin face in the soot-marks on it. I began to think that the

A GYPSY WOMAN.

Queen-Witch had lost no time with the red book of gramarye, but had already begun to raise something *bengalo* or diabolical. There was a forked radish lying on the ground, and I at once recalled the Mandrake and the Queen of the Gypsies, who form part of the unearthly company in the carriage, in "Isabella of Egypt." As for Pennell, what with visiting Voodoo queens in New Orleans, and consorting with Gypsies, he, too, is becoming over-familiar with uncanny folk, and would, I fear, sit down to paint the Father of Lies himself as coolly as ever did the Spanish artist famed in Southey's song.

While speaking of Gypsies and unearthly things, I may interest the reader by remarking that their language is full of strange hints, which they themselves do not now understand. The Romany word for a bone, borrowed from the modern Greek, is *kokalos* or *kuklos*. But it also means a dwarf, a puppet, a doll, a fairy, a goblin, and unquestionably refers us to many old Greek and Indian stories in which a bone is renewed by a sorcerer into humanity, or in which it changes to a diminutive being. So, too, the word *mullo* (*moolo*), or "dead," is applied not only to corpses and ghosts, but also to the shadow of a man, to bubbles which dance and break on rapid rivulets, and to rings of smoke. The

"LIKE AN INDIAN."

on his breast. So it is in talking with very old people, who being, of course, by reason of their age, much nearer heaven than we, are continually rising beyond us in memory. So when I spoke with the Queen of Plato Buckland, she at once remembered him, but we soon discovered that my Plato is the grandson of the one whom her majesty knew in her youth, and who was a famous Romany in his day. Witness the following song, or its incident, for the truth of which nobody vouches:

"Two Romany fellows were banished afar,  
Far away over the dark rolling sea,  
Lasho for robbing,  
And Plato for fobbing,  
The purse of a lady as grand as could be.

"And when they came to the far-away land,  
The land that is over the dark rolling sea,  
One came to the halter,  
But one at the altar  
Soon married a lady as fair as could be.

"Would you like to know who the lady was?  
'Twas the lady whose purse he had stolen, d'ye  
see;  
For the chap had an eye,  
Black, witch-like, and sly,  
And she'd followed him over the dark rolling sea."

While I was singing this in the original Romany, it was not to an attentive audience, since I was accompanied by the parrot with a hymn in the unknown tongues, into which a Gypsy word now and then peeped like a dark heathen through a window upon a white congregation, and the three Mrs. Lovel, three children, and three dogs maintained, each in their way, a running conversation as Pennell sketched, and exclaimed at regular intervals: "Turn your head that way!"—"Look to one side!"—"Look up!"—"Keep still!" Even

THE BELLE OF THE CAMP.

connection between these is obvious, but their connection by a single word is poetical.

I once said of an interview with the giant Chang that I was continually startled when turning my head toward him, as we were seated in conversation, and expecting to meet his eyes, to find myself looking at the buttons

the fire seemed to be sociable, for it emitted its volumes like an author who, unable to talk in society, inflicts his opinions on it in puffs, and in fact with much the same result, since the smoke soon obliged me to look out-of-doors and get fresh air. Reëntering, I distributed Havanas,—for as fire may be used to fight fire, smoke also neutralizes smoke, as I found,—a good cigar being specially appreciated among the Gypsies, who are all right valiant smokers. Of which I may, by the way, remark that the Latin writer, who made *fumum vendere* or selling smoke a synonym for that which is without value, never foresaw cigars nor their present price.

One of the children was a pretty, sturdy little miss, named Madonna. It is a part of the quaint picturesque life and nature of the Gypsies that they generally take strange names, particularly for women. One of those present was called Shéva—in my book, “The Gypsies,” the reader may find such appellations as Alabina, Marbelenni, Starlina, Otchamé, and Catseye. Madonna was occupied with a spitz, holding it at one minute and pulling it by the tail the next.

It is a curious fact that no people put more faith in quaint observances and magical practices than those who live by them, though one would think that, like the augurs of old, there would be no great exchange of magic between them out of business hours. But when I showed the Queen a very large pocket-knife, which I have had for many years, and as I mentioned to her, had carried even in Egypt, and when I told her I esteemed it highly, she bade me hold it in my right hand. Then, having uttered the appropriate words in Romany, I was told to make a wish. I asked if I might not have three wishes, for it was a very strong *dukke*, and three being allowed I made them. This is a charm which never fails when granted by a very old woman, and it was a great favor to bestow it on me. The secret of this spell is beautifully set forth by Heine in the “Pictures of Travel,” where he declares that objects long worn or carried become as it were inspired with our life, or magical, and give to us again, in another form, the life we gave them. This, he thinks, is the origin of the German tales in which spoons and staves and chairs think and talk, and the bean and straw go forth on their travels. Who is there that has not felt the nameless charm attached to some old coin or gem which he has got into the habit of carrying, he hardly knows how? I read recently in the newspapers of a gentleman in the West, who believes there is a spirit in his cane; still more recently, I read of a large tribe in the East—I think it

is in Borneo—who worship their walking-sticks. Thus amber beads long worn become each the shrine of a little guardian sprite, while in every cherished cross there dwells a little Christian fairy. Whether the Gypsy charm given to me is not some remote transmission of the Hindoo oath on the knife, esteemed so sacred by the Thugs, who were also a species of Gypsies, I do not know, but the Gypsies, even in America, have exactly the same word for knife—*chûri*—as that used in India; and taking all things into consideration, I am inclined to think that this “blessing of the poignards” is an extremely ancient and curious incantation. It was indeed the oath by the knife and the cord which was the great adjuration not only of the Indian sect, and of the Assassins of Syria, but also of the Vehmgericht of Germany; and the reader may remember how, only an hour before the spell of the knife, I had removed ill-luck from portrait taking or giving, by bestowing a string.

There was an outlying encampment of the Lovel family, a mile distant, by the rising sun, and there I went with “our artist,” after sketching the Queen and her court. Here, too, we were unknown, and there was only a little girl about, who evidently had never heard of us, since when I asked her where her mother was, she went up to a closed van, and said in a low voice in Romany: “*Dai, shan dui mushi akai* [Mother, here are two men],” and then ran aside. I began to ask her what the language was in which she had spoken, but of course she kept silence. “Was it French?” Great was her astonishment when the mother came forth and I spoke to her in the secret tongue. We were most cordially received, the *dai* being a lady-like woman of middle age, with fine features, much resembling those of a high-caste Hindoo. Her style was reflected by the neatness of her person, the cleanliness of her children, and the remarkable luxury of a carpet on the floor or earth of her tent, while there were coverings on the boxes or furniture on which to sit.

The family had just come from Florida, and had brought with them a black goat who looked as if he should have been the property of the Witch Queen. I never saw an animal so suggestive of the Brocken. He was very tame, however, and did not object to be ridden by the youngest child, a very pretty boy, who, when mounted, reminded me of many a picture of fairies or sylvan *amoretti* on similar steeds.

In conclusion, I may briefly answer a question which many persons have put—“Who and what are the Gypsies?” To this, I reply,

that they are of a mixed Aryan and non-Aryan stock from Northern India, where they have been known since prehistoric times. In their own language they call themselves *Rom*, meaning husband; but the word may also have some affinity with *ramna*, meaning to roam or wander. I believe that I have been the first to prove that there is at the present day in India, among the one hundred and fifty kinds of wandering castes of that country, which are all Gypsies, one in particular which is there regarded as specially Gypsy, and which calls itself *Rom*, and which uses words not collected in any other Indian dialect, but which are used by the Gypsies of Syria, Turkey, and Europe. This tribe is allied to, and is most probably, only a more widely wandering branch of the Dom, who are also known as outcasts and Gypsies. When I speak of so many kinds of wanderers as Gypsies, and yet not identical with our own, I may make my meaning clearer by saying, that as all the tramps, peddlers, etc., who roam in our roads, are still not Romany, so of all the Indian nomads, there is but one which in every partic-

"AULD MON LOVEL."

ular, especially that of language, exactly corresponds to those whom I have described.

*Charles G. Leland.*

## LOVE.

If thou would'st truly love—love when the stars  
 Look down upon thee from their crystal homes;  
 When o'er the caverned night their swelling domes  
 Rise up the purple ether with their spars  
 Of burning beauty; when the trivial jars  
 Of earth and all its "must be" vanish dim  
 In hushed serenity, and, save the hymn  
 Of night and loneliness, naught earthly mars  
 Thy soul's deep gratitude: 'tis then unbars  
 The shrine of thy religion; the strong heart  
 Of thy stirred aspirations, worn apart  
 Like missals from the world—the spell that wars  
 With aught inconsonant to heart or eye;  
 The midnight's challenge and thy soul's deep-breathed reply!

*William M. Briggs.*

## THE PASSION PLAY AT OBERAMMERGAU.

THE stir the Passion Play brings does not begin in Oberammergau till the Friday afternoon before the Sabbath of the play. Then, gradually, as a hum begins and swells in a disturbed hive of bees, begins and swells the bustle of the incoming of strangers into the little place. By sunset the crooked lanes and streets are swarming with people who have all fancied they were coming in good season, before the crowd. The open space in front of George Lang's house was a scene for a painter as the sun went down on Friday, September 5th, 1880. The village herd of cows was straggling past on its easy homeward way, the fifty bells tinkling even more sleepily than in the morning; a little goat-herd, with bright brown eyes, and bright brown partridge feathers in his hat, was worrying his little flock of goats along in the jam; vehicles of all sorts—einspanners, diligences, landaus—all pulling, twisting, turning, despairing, were trying to go the drivers did not know where, and were asking the way helplessly of each other. To heighten the confusion, a load of hay upset in the middle of the crowd. Twenty shoulders were under it in a twinkling, and the cart was rolled on, limping, on three wheels, friendly hands holding up the corner. Thirty-four vehicles, one after another, halted in front of George Lang's door; out of many of them the occupants jumped confidently, looking much satisfied at sight of so comfortable a house, and presenting little slips of white paper consigning them to Mr. Lang's care. Much crestfallen, they reëntered their vehicles, to be driven to the quarters reserved for them elsewhere. Some argued; some grumbled; some entreated; all in vain. The decrees of the house of Lang are like those of the Medes and Persians.

It was long after midnight before the sound of wheels and voices, and the cracks of postilions' whips ceased under my windows; and it began again before daylight the next morning. All was hurry and stir; crowds going to the early mass; still greater crowds, with anxious faces, besieging the doors of the building where were to be issued the numbered tickets for seats at the Play; more crowds coming in, chiefly pedestrians; peasant men and women in all varieties and colors of costume; Englishmen in natty traveling clothes, with white veils streaming from their hats; Roman Catholic priests in squads,

their square-brimmed hats and high black coats white with dust. Eager, intent, swift, by hundreds and hundreds they poured in. Without seeing it, one can never realize what a spectacle is produced by this rushing in of six thousand people into a little town in the space of thirty-six hours. There can be nothing like it except in the movements of armies. Being in the streets was like being in a chorus or village fair scene on an opera stage a mile big, and crowded full from corner to corner. The only thing to do was to abandon oneself to currents, like a ship afloat, and drift, now down this street, and now down that, now whirl into an eddy and come to a stop, and now hurry purposelessly on, just as the preponderating push might determine. Mingled up in it all, in everybody's way and under all the horses' feet, were dozens of little mites of Oberammergauers, looking five, six, seven years of age, like lost children, offering for sale "books of the Passion Play." Every creature above the age of an infant is busy at this time in other ways in Oberammergau, so it is left for the babies to hawk the librettos round the streets, and very shrewdly they do it. Little tots that are trusted with only one book at a time, all they can carry, as soon as it is sold, grab the pennies in chubby hands and toddle home after another.

As the day wore on, the crowd and the hum of it increased into a jam and a racket. By four o'clock it was a din of wheels, cracking whips, and postilions' cries. Great diligences, loaded down till they squeaked and groaned on their axles; hay-wagons of all sizes, rigged with white cloth stretched on poles for a cover, and rough planks fastened to the sides for seats, came in procession, all packed with the country people; hundreds of shabby einspanners bringing two or three, and sometimes a fourth holding on behind, with dangling feet; fine traveling carriages of rich people, their postilions decked in blue and silver, with shining black hats, and brass horns swung over their shoulders by green and white cords and tassels—on they came into the twist and tangle, making it worse, minute by minute.

Most remarkable among all the remarkable costumes to be seen was that of an old woman from Dachau. She was only a peasant, but she was a peasant of some estate and degree. She had come as escort and maid for four young women belonging to a Roman Cath-

olic institution, and wearing its plain uniform. The contrast between the young ladies' conventional garb of black and white and the blazing toilet of their guide and protector was ludicrous. She wore a jacket of brocade stiff with red, green, and silver embroidery. The sleeves puffed out big at the shoulder, straight and tight below to the wrist. It came down behind only a little lower than her shoulder-blades, and it was open in front from the throat to the waist-belt, showing beneath a solid mass of gold and silver braid. Nine enormous silver buttons were sewed on each side the fronts; a scarf of soft black silk was fastened tight round her throat by a superb silver ornament, all twists and chains and disks. Her black woolen petticoat was laid in small, close flutings straight from belt to hem, edged with scarlet, and apparently was stiff enough to stand alone. It was held out from her body, just below the belt, by a stiff rope coil underneath it, making a tight, hard, round ridge just below her waist, and nearly doubling her apparent size. All the women in Dachau must be as "thick" as that, she said—and "lovers must have long arms to reach round them!" The jacket, petticoat, and scarf, and all her ornaments, had belonged to her grandmother. What a comment on the quality of the fabrics and the perpetuity of a fashion! She was as elegant to-day as her ancestor had been nearly a century before her. On her head she wore a structure of brocaded black ribbon, built up into high, projecting horns or towers, and floating in streamers behind. As she herself was nearly six feet tall, this shining brocade fortress on the top of her head moved about above the heads of the crowd like something carried aloft for show in a procession.

Another interesting sight was the peasants who had come bringing edelweiss and blue gentians to sell,—great bunches of the lovely dark blue chalices, drooping a little, but wonderfully fresh to have come two days, or even three, from home; the edelweiss blossoms were there by sheaves, and ten pfennigs a flower seemed none too much to pay to a man who had climbed among dangerous glaciers to pick it, and had walked three whole days to bring it to market.

The very poor people, who had walked, were the most interesting. They came in groups, evidently families, two women to one man—carrying their provisions in baskets, bundles, or knapsacks, worn and haggard with dust and fatigue, but wearing a noticeable look of earnestness, almost of exaltation. Many of them had walked forty or fifty miles; they had brought only black bread to eat; they would sleep the two

nights on hay in some barn—those of them who had had the great good fortune to secure such a luxury; the rest, and that meant hundreds, would sit on the ground, anywhere where they could find a spot clear and a rest for their heads; and after two nights and a day of this, they trudged back again their forty miles or fifty, refreshed, glad, and satisfied for the rest of their lives. This is what the Passion Play means to the devout, ignorant Catholic peasant of Bavaria to-day, and this is what it has meant to his race for hundreds of years.

The antagonism and enlightenment of the Reformation did not reach the Bavarian peasant; did not so much as disturb his reverence for the tangible tokens and presentations of his religion. He did not so much as know when Miracle Plays were cast out and forbidden in other countries. In Chester, England, one of their early strongholds, they were played for the last time in 1574, and a curious old chronicle, written twenty years later, and still preserved in Chester, says that this last performance of them took place:

"Sir John Savage Knight, being Mayor of Chester, which was the last time they were played, and we praise God, and praye that we see not the like profanation of Holy Scripture: but O, the mercie of God for the time of our ignorance!"

But it was sixty-one years later than this that the Oberammergau people, stricken with terror at a plague in their village, knew no better device to stay it than to vow to God the performance of a Play of the Divine Passion of Christ. It is as holy a thing to the masses of them now as it was then, and no one can do justice to the Play, even as a dramatic spectacle, who does not look at it with recognition of this fact.

The early history of the Play itself is not known. The oldest text-book of it now extant bears the date 1662, nearly a generation later than the first performance of it in Oberammergau. This manuscript is still in possession of the Lang family, and is greatly amusing in parts. The prologue gives an account of the New Testament plan of salvation, and exhorts all people to avail themselves of it with gratitude and devotion. At this juncture in rushes a demon messenger from the devil, bearing a letter, which he unfolds and reads. In this letter the devil requests all the people not to yield to the influence of this play, asks them to make all the discordant noises they can while it is going on, and promises to reward them well if they will do so. The letter is signed: "I, Lucifer, Dog of Hell, in my hellish house, where the fire pours out of the windows." The demon having read the letter

aloud, folds it up, and addresses the audience, saying: "Now you have heard what my master wishes. He is a very good master, and will reward you! Hie, Devil! up and away!" with which he leaps off the stage, and the play at once begins, opening with a scene laid in Bethany, a meeting between Christ and his disciples. These grotesque fancies, quips, and cranks were gradually banished from the Play. Every year it was more or less altered, priest after priest revising or rewriting it, down to the time of the now venerable Daisenberger, who spent his youth in the monastery of Ettal, and first saw the Passion Play acted at Oberammergau in 1830.

In 1845 the Oberammergau people, in unanimous enthusiasm, demanded to have Daisenberger appointed as their pastor. He at once identified himself warmly with the dramatic as well as the spiritual life of the community; and it is to his learning and skill that the final admirable form of the Passion Play, and the villagers' wonderful success in rendering it, are due. He has written many biblical dramas and historical plays founded on incidents in the history of Bavaria. Chief among these are "The Founding of the Monastery of Ettal," "Theolinda," "King Heinrich and Duke Arnold of Bavaria," "Otto Von Wittelsbach at the Veronese Hermitage," "The Bavarians in the Peasants' War," "Luitberge, Duchess of Bavaria." He has also dramatized some of the legends of the saints, and has translated the "Antigone" of Sophocles and arranged it for the Oberammergau stage. A half-century's training under the guidance of so learned and dramatic a writer, who added to his learning and fine dramatic faculty a profound spirituality and passionate adherence to the faiths and dogmas of the Church, might well create, in a simple religious community, a capacity and a fervor even greater than have been shown by the Oberammergau people. To understand the extent and the method of their attainment, it is needful to realize all this; but no amount of study of the details of the long process can fully convey or set forth the subtle influences which must have pervaded the very air of the place during these years. The acting of plays has been not only the one recreation of their life, otherwise hard-worked, somber, and stern—it has been their one channel for the two greatest passions of the human heart—love of approbation and the instinct of religious worship; for the Oberammergau peasant, both these passions have centered on and in his chance to win fame, please his priest, and honor God, by playing well some worthy part in the Passion Play. The hope and the ambition for this have been

the earliest emotions roused in the Oberammergau child's breast. In the tableaux of the Play even very young children take part, and it is said that it has always been the reward held up to them as soon as they could know what the words meant: "If thou art good, thou mayest possibly have the honor of being selected to play in the Passion Play when the year comes round." Not to be considered fit to take any part in the Play is held, in Oberammergau, to be disgrace; while to be regarded as worthy to render the part of the Christus is the greatest honor which a man can receive in this world. To take away from an actor a part he has once played is a shame that can hardly be borne; and it is on record that once a man to whom this had happened sank into a melancholy which became madness.

When the time approaches for the choice of the actors and the assignment of the parts, the whole village is in a turmoil. The selections and assignments are made by a committee of forty-five, presided over by the priest and by the venerable "Geistlicher Rath" Daisenberger, who, now in his eightieth year, still takes the keenest interest in all the dramatic performances of his pupils. The election day is in the last week of December of the year before the Play, and the members of the committee, before going to this meeting, attend a mass in the church. The deciding as to the players for 1880 took three days' time, and great heart-burnings were experienced in the community. In regard to the half-dozen prominent parts there is rarely much disagreement; but as there are some seven hundred actors required for the play, there must inevitably be antagonisms and jealousies among the minor characters. However, when the result of the discussions and votes of the committee is made public all dissension ceases. One of the older actors is appointed to take charge of the rehearsals, and from his authority there is no appeal. Each player is required to rehearse his part four times a week; and as early in the spring as the snow is out of the theater the final rehearsals begin. Thus each Passion Play year is a year of very hard work for the Oberammergauers. Except for their constant familiarity with stage routine and unbroken habit of stage representation through the intervening years, they would never be able to endure the strain of the Passion Play summers; and as it is, they look wan and worn before the season is ended.

It is a thankless return that they have received at the hands of some travelers, who have seen in the Passion Play little more than a show of mountebanks acting for money. The truth is that the individual per-

formers receive an incredibly small share of the profits of the Play. There is not another village in the world whose members would work so hard, and at so great personal sacrifice, for the good of their community and their Church. Every dollar of the money received goes into the hands of a committee selected by the people. After all the costs are paid, the profits are divided into four portions; one quarter is set aside to be expended for the Church, for the school, and for the poor; another for the improvement of the village, for repairs of highways, public buildings, etc.; a third is divided among the tax-paying citizens of the town who have incurred the expense of preparing for the Play, buying the costumes, etc. The remaining quarter is apportioned among the players, according to the importance of their respective parts; as there are seven hundred of them, it is easy to see that the individual gains cannot be very great.

The music of the Play, as now performed, was written in 1814, by Rochus Dedler, an Oberammergau schoolmaster. It has for many years been made a *sine qua non* of this position in Oberammergau that the master must be a musician, and, if possible, a composer, and Dedler is not the only composer who has been content in the humble position of schoolmaster in this village of peasants. Every day the children are drilled in chorus singing and in recitative; with masses and other church music they are early made familiar. Thus is every avenue of training made to minister to the development of material for the perfection of the Passion Play.

Dedler is said to have been a man of almost inspired nature. He wrote often by night, and with preternatural rapidity. The music of the Passion Play was begun on the evening of Trinity Sunday; he called his six children together, made them kneel in a circle around him, and saying, "Now I begin," ordered them all to devote themselves to earnest prayer for him that he might write music worthy of the good themes of the Play. The last notes were written on the following Christmas Day, and they are indeed worthy of the story for which they are at once the expression and the setting. The harmonies are dignified, simple and tender, with movements at times much resembling some of Mozart's Masses. Many of the chorals are full of solemn beauty. A daughter of Dedler's is still living in Munich, and to her the grateful and honest-minded Oberammergau people have sent, after each performance of the Passion Play, a sum of money in token of their sense of indebtedness to her father's work.

The Passion Play cannot be considered solely as a drama; neither is it to be con-

sidered simply as a historical panorama, presenting the salient points in the earthly career of Jesus called Christ. To consider it in either of these ways, or to behold it in the spirit born of either of these two views, is to do only partial justice to it. Whatever there might have been in the beginning of theatrical show and diversion and fantastic conceit about it, has been long ago eliminated. Generation after generation of devout and holy men have looked upon it more and more as a vehicle for the profoundest truths of their religion, and have added to it, scene by scene, speech by speech, everything which in their esteem could enhance its solemnity and make clear its teaching. However much one may disagree with its doctrines, reject its assumptions, or question its interpretations, that is no reason for overlooking its significance as a tangible and rounded presentation of that scheme of the redemption of the world in which to-day millions of men and women have full faith. It is by no means distinctively a Roman Catholic presentation of this scheme; it is Christian. The Holy Virgin of the Roman Catholic Church is, in this play, from first to last, only the mother of Jesus: the mother whom all lovers and followers of Jesus,—wherever they place him or her, however they define his nature and her relations to him,—yet hold blessed among the women who have given birth to leaders and saviors of men.

This presentation of the scheme of redemption seeks to portray not only the scenes of the life of Jesus on earth, but the typical foreshadowing of it in the Old Testament narratives: its prophecy as well as its fulfillment. To this end there are given before each act of the Play, tableaux of Old Testament events, supposed to be directly typical, and intended to be prophetic, of the scenes in Christ's life which are depicted in the act following. These are selected with skill, and rendered with marvelous effect. For instance, a tableau of the plotting of Joseph's brethren to sell him into Egypt is given before the act in which the Jewish priests in the full council of the Sanhedrim, plot the death of Jesus; a tableau of the miraculous fall of manna for the Israelites in the wilderness, before the act in which is given Christ's Last Supper with his Disciples; the sale of Joseph to the Midianites before the bargain of Judas with the priests for the betrayal of Jesus; the death of Abel, and Cain's despair, before the act in which Judas, driven mad by remorse, throws down at the feet of the priests the "price of blood," and rushes out to hang himself; Daniel defending himself to Darius, before the act in which Jesus is

brought into the presence of Pilate for trial; the sacrifice of Isaac, before the scourging of Jesus and his crowning with the thorns: these are a few of the best and most relevant ones.

The Play is divided into eighteen acts, and covers the time from Christ's entry into Jerusalem, at the time of his driving the money-changers out of the temple, till his ascension. The salient points, both historical and graphic, are admirably chosen for a continuous representation. In the Second Act is seen the High Council of the Jewish Sanhedrim plotting measures for the ruin and death of Jesus. This is followed by his Departure from Bethany, the Last Journey to Jerusalem, the Last Supper, the Final Interview between Judas and the Sanhedrim, the Betrayal in the Garden of Gethsemane.

The performance of the Play up to this point consumes four hours; and as there is here a natural break in the action, an interval of an hour's rest is taken. It comes none too soon, either to actors or spectators, after so long a strain of unbroken attention and deep emotion.

The next Act is the bringing of Jesus before the High Priest Annas: Annas orders him taken before Caiaphas, and this is the ninth act of the Play. Then follow: The Despair of Judas and his Bitter Reproaches to the Sanhedrim, The Interview between Jesus and Pilate, His Appearance before Herod, His Scourging and Crowning with Thorns, The Pronouncing of his Death Sentence by Pilate. The Ascent to Golgotha, The Crucifixion and Burial, The Resurrection and Ascension. The whole lesson of Christ's life, the whole lesson of Christ's death, are thus shown, taught, impressed with a vividness which one must be callous not to feel. The quality or condition of mind which can remain, to the end, either unmoved or antagonistic is not to be envied. But, setting aside all and every consideration of the moral quality of the Play, looking at it simply as a dramatic spectacle, as a matter of acting, of pictorial effects, it is impossible to deny to it a place among the masterly theatrical representations of the world. One's natural incredulity as to the possibility of true dramatic skill on the part of comparatively unlettered peasants melts and disappears at sight of the first Act, the Entry of Christ into Jerusalem.

The stage, open to the sky, with a background so ingeniously arranged as to give a good representation of several streets of the city, is crowded in a few moments by five hundred men and women and children: all waving palm branches, singing hosannas, and crowding around the

central figure of Jesus riding on an ass. The verisimilitude of the scene is bewildering. The splendor of the colors is dazzling. Watching this crowd of five hundred actors closely, one finds not a single man, woman or little child performing his part mechanically or absently. The whole five hundred are acting as if each one regarded his part as the central and prominent one; in fact, they are so acting that it does not seem acting; this is characteristic of the acting throughout the play. There is not a moment's slighting or tameness anywhere. The most insignificant part is rendered as honestly as the most important, and with the same abandon and fervor. There are myriads of little by-plays and touches, which one hardly recognizes in the first seeing of it, the interest is so intense and the movement so rapid; but, seeing it a second time, one is almost more impressed by these perfections in minor points than by the rendering of the chief parts. The scribes who sit quietly writing in the foreground of the Sanhedrim Court; the disciples who have nothing to do but to appear to listen while Jesus speaks; the money-changers picking up their coins; the messengers who come with only a word or two to speak: the soldiers drawing lots among themselves in a group for Jesus's garments, at a moment when all attention might be supposed to be concentrated on the central figures of the Crucifixion—every one of these acts with an enthusiasm and absorption only to be explained by the mingling of a certain element of religious fervor with native and long-trained dramatic instinct.

This dramatic instinct is shown almost as much in the tableaux as in the acting. The poses and grouping are wonderful, and the power of remaining a long time motionless is certainly a trait which the Oberammergau people possess to a well-nigh superhuman extent. The curtain remained up, during many of these tableaux, five and seven minutes, and there was not a trace of unsteadiness to be seen in one of the characters. Even through a powerful glass, I could not detect so much as the twitching of a muscle. This is especially noticeable in the tableau of the Fall of Manna in the Wilderness, which is one of the finest of the Play. There are in it more than four hundred persons: one hundred and fifty of them are children, some not over three years of age. These children are conspicuously grouped in the foreground, many of them are in attitudes which must be difficult to keep: bent on one knee, or with outstretched hand, or with uplifted face; but not one of the little creatures stirs head or foot or eye. Neither is there to be seen, as

the curtain begins to fall, any tremor of preparation to move. Motionless as death they stand till the curtain shuts even their feet from view. Too much praise cannot be bestowed on the fidelity, accuracy, and beauty of the costumes. They are gorgeous in color and fabric, and have been studied carefully from the best authorities extant, and are not the least among the surprises which the Play affords to all who go to see it expecting it to be on the plane of ordinary theatrical representations. The splendor of some of the more crowded scenes is rarely equaled: such a combination of severe simplicity of outlines and contours, classic models of drapery, with brilliancy of coloring, is not to be seen in any other play now acted.

The high-water mark of the acting in the Play seems to me to be reached, not in the Christus, but by Judas. This part is played by an old man, Gregory Lechner. He is over sixty years of age, and his snowy beard and his hair have to be dyed to the red hue which is desired for the crafty Judas's face. From the time when, in Simon's house, he stands by, grumbling at the waste of the precious ointment poured by Mary Magdalene on the feet of Jesus, to the last moment of his wretched existence, when he is seen wandering in a desolate wilderness, about to take his own life in his remorse and despair, Judas's acting is superb. Face, attitudes, voice, action—all are grandly true to the character, and marvelously full of life. It would be considered splendid acting on any stage in the world. Nothing could surpass its subtlety and fineness of conception, or the fire of its rendering. It is a conception quite unlike those ordinarily held of the character of Judas; ascribes the betrayal neither to a willful, malignant treachery, nor, as is sometimes done, to a secret purpose of forcing Jesus to vindicate his claims to divine nature by working a miracle of discomfiture to his enemies, but to pure, unrestrained avarice, the deadliest passion which can get possession of the human soul. This theory is tenable at every point of Judas's career as recorded in the Bible, and affords far broader scope for dramatic delineation than any other theory of his character and conduct. It is, in fact, the only theory which seems compatible with the entire belief in the supernatural nature of Jesus. Expecting up to the last minute that supernatural agencies would hinder the accomplishment of the Jews' utmost malice, he thought to realize the full benefit of the price of the betrayal, and yet not seriously imperil either the ultimate ends or the personal safety of Jesus. The struggle between the insatiable demon of avarice in

his heart, and all the nobler impulses restraining it, is a struggle which is to be seen going on in his thoughts and repeated in his face in every scene in which he appears. And his final despair and remorse are but the natural culmination of the deed which he did only under the temporary control of a passion against which he was all the time struggling, and which he himself held in detestation and scorn. The gesture and look with which he at last flings down the bag of silver in the presence of the assembled Sanhedrim, exclaiming:

"Ye have made me a betrayer!  
Release again the innocent One! My  
Hands shall be clean,"

are a triumph of dramatic art never to be forgotten. His last words as he wanders, distraught, in the dark wastes, among barren trees, are one of the finest monologues of the play. It was written by the priest Daisenberger:

"Oh, were the Master there! Oh, could I see  
His face once more! I'd cast me at his feet,  
And cling to him, my only saving hope.  
But now he lieth in prison,—is, perhaps,  
Already murdered by his raging foe—  
Alas, through my own guilt, through my own guilt!  
I am the outcast villain who hath brought  
My benefactor to these bonds and death!  
The scum of men! There is no help for me!  
For me no hope! My crime is much too great!  
The fearful crime no penance can make good!  
Too late! Too late! For he is dead—and I—  
I am his murderer!"

Thrice unhappy hour  
In which my mother gave me to the world!  
How long must I drag on this life of shame,  
And bear these tortures in my outcast breast?  
As one pest-stricken, flee the haunts of men,  
And be despised and shunned by all the world?  
Not one step farther! Here, oh, life accursed,  
Here will I end thee!"

The character of Christ is, of necessity, far the most difficult part in the Play. Looking at it either as a rendering of the supernatural, or a portraying of the human Christ, there is apparent at once the well-nigh insurmountable difficulty in the way of actualizing it in any man's conception. Only the very profoundest religious fervor could carry any man through the effort of embodying it on the theory of Christ's divinity; and no amount of atheistic indifference could carry a man through the ghastly mockery of acting it on any other theory. Joseph Maier, who played the part in 1870, '71, and '80, is one of the best-skilled carvers in the village, and, it is said, has carved never anything but figures of Christ. He is a man of gentle and religious nature, and is, as any devout Oberammergau would be, deeply pervaded by a sense of the solemnity of the function he performs in the Play. In the main, he acts the part with wonderful dignity and pathos. The only

drawback is a certain undercurrent of self-consciousness which seems ever apparent in him. Perhaps this is only one of the limitations inevitably resulting from the over-demand which the part, once being accepted and regarded as a supernatural one, must, perforce, make on human powers. The dignity and dramatic unity of the Play are much heightened by the admirable manner in which a chorus is introduced, somewhat like the chorus of the old Greek plays. It consists of eighteen singers, with a leader styled the "Choragus." The appearance and functions of these "Schutzgeister," or guardian angels, as they are called, has been thus admirably described by a writer who has given the best detailed account ever written of the Passion Play:

"They have dresses of various colors over which a white tunic with gold fringe and a colored mantle are worn. Their appearance on the stage is majestic and solemn. They advance from the recesses on either side of the proscenium, and take up their position across the whole extent of the theater, forming a slightly concave line. After the chorus has assumed its position, the choragus gives out in a dramatic manner the opening address or prologue which introduces each act; the tone is immediately taken up by the whole chorus which continues either in solo, alternately, or in chorus, until the curtain is raised in order to reveal a tableau vivant. At this moment the choragus retires a few steps backward, and forms with one-half of the band a division on the left of the stage, while the other half withdraws in like manner to the right. They thus leave the center of the stage completely free, and the spectators have a full view of the tableau thus revealed. A few seconds having been granted for the contemplation of this picture, made more solemn by the musical recitation of the expounders, the curtain falls again, and the two divisions of the chorus coming forward resume their first position, and present a front to the audience, observing the same grace in all their motions as when they parted. The chanting still continues, and points out the connection between the picture which has just vanished, and the dramatic scene which is forthwith to succeed. The singers then make their exit. The task of these Spirit-singers is resumed in the few following points: They have to prepare the audience for the approaching scenes. While gratifying the ear by delicious harmonies, they explain and interpret the relation which shadow bears to substance—the connection between the type and its fulfillment. And as their name implies, they must be ever present as guardian spirits, as heavenly monitors, during the entire performance. The addresses

of the choragus are all written by the Geistlicher Rath Daisenberger. They are written in the form of the ancient strophe and antistrophe, with the difference that while in the Greek theater they were spoken by the different members of the chorus, they are delivered in the Passion Play by the choragus alone."

It is impossible for any description, however accurate and minute, to give a just idea of the effects produced by this chorus. The handling of it is, perhaps, the one thing which, more than any other, lifts the play to its high plane of dignity and beauty. The costumes are brilliant in color, and strictly classic in contour; a full white tunic, edged with gold at hem and at throat, and simply confined at the waist by a loose girdle. Over these are worn flowing mantles of either pale blue, crimson, dull red, grayish purple, green, or scarlet. These mantles or robes are held in place carelessly by a band of gold across the breast. Crowns or tiaras of gold on the head complete the dress, which, for simplicity and grace of outline and beauty of coloring could not be surpassed. The rhythmic precision with which the singers enter, take place, open their lines, and fall back on the right and left, is a marvel, until one learns that a diagram of their movement is marked out on the floor, and that the mysterious exactness and uniformity of their positions are simply the result of following each time the constantly marked lines on the stage. Their motions are slow and solemn, their expressions exalted and rapt; they also are actors in the grand scheme of the Play.

On the morning of the Play, the whole village is astir before light; in fact, the village proper can hardly be said to have slept at all, for seven hundred out of its twelve hundred inhabitants are actors in the play, and are to be ready to attend a solemn mass at daylight.

Before eight o'clock every seat in the theater is filled. There is no confusion, no noise, the proportion of those who have come to the play with as solemn a feeling as they would have followed the steps of the living Christ in Judea is so large, that the contagion of their devout atmosphere spreads even to the most indifferent spectators, commanding quiet and serious demeanor.

The firing of a cannon announces the moment of beginning. Slow, swelling strains come from the orchestra; the stately chorus enters on the stage; the music stops; the leader gives a few words of prologue or argument, and immediately the chorus breaks into song.

From this moment to the end, eight long

hours, with only one hour's rest at noon, the movement of this play is continuous. It is a wonderful instance of endurance on the part of the actors; the stage being entirely uncovered, sun and rain alike beat on their unprotected heads. The greater part of the auditorium also is uncovered, and there have been several instances in which the play has been performed in a violent storm of rain, thousands of spectators sitting drenched from beginning to end of the performance.

How incomparably the effects are, in sunny weather, heightened by this background of mountain and sky, fine distances, and vistas of mountain and meadow, and the canopy of heaven overhead, it is impossible to express; one only wonders, on seeing it, that outdoor theaters have not become a common summer pleasure for the whole world.

When birds fly over they cast fluttering shadows of their wings on the front of Pilate's and Caiaphas's homes, as naturally as did Judean sparrows two thousand years ago. Even butterflies flitting past cast their tiny shadows on the stage; one bird paused,

hovered, as if pondering what it all could mean, circled two or three times over the heads of the multitude, and then alighted on one of the wall-posts and watched for some time. Great banks of white cumulus clouds gathered and rested, dissolved and floated away, as the morning grew to noonday, and the noonday wore on toward night. This closeness of nature is an accessory of illimitable effect; the visible presence of the sky seems a witness to invisible presences beyond it, and a direct bond with them. There must be many a soul, I am sure, who has felt closer to the world of spiritual existences, while listening to the music of the Oberammergau Passion Play, than in any other hour of his life; and who can never, so long as he lives, read without emotion, the closing words of the venerable Daisenberger's little "History of Oberammergau":

"May the strangers who come to this Holy Passion Play become by reading this book more friendly with Ammergau, and may it sometimes, after they have returned to their homes, renew in them the memory of this quiet mountain valley."

*H. H.*

#### YEARS AFTER.

I KNOW the years have rolled across thy grave  
Till it has grown a plot of level grass,—  
All summer does its green luxuriance wave  
In silken shimmer on thy breast, alas!  
And all the winter it is lost to sight  
Beneath a winding-sheet of chilly white.

I know the precious name I loved so much  
Is heard no more the haunts of men among;  
The tree thou plantedst has outgrown thy touch,  
And sings to alien ears its murmuring song;  
The lattice-rose forgets thy tendance sweet,  
The air thy laughter, and the sod thy feet.

Through the dear wood where grew thy violets,  
Lies the worn track of travel, toil and trade;  
And steam's imprisoned demon fumes and frets,  
With shrieks that scare the wild bird from the shade  
Mills vex the lazy stream, and on its shore  
The timid harebell swings its chimes no more.

But yet—even yet—if I, grown changed and old,  
Should lift my eyes at opening of the door,  
And see again thy fair head's waving gold,  
And meet thy dear eyes' tender smile once more,  
These years of parting like a breath would seem,  
And I should say, "I knew it was a dream!"

BY FRANCES HODGSON BURNETT,

Author of "That Lass o' Lowrie's," "Haworth's," "Louisiana," "A Fair Barbarian," etc., etc.

### CHAPTER XXXII.

THE last words of his half-reluctant, half-exultant confession had scarcely left Richard Amory's lips when Tredennis rose from his chair.

"If you can," he said, "tell me the literal truth. Blundel is at your house with your wife. There is something she is to do. What is it?"

"She is to hand him an envelope containing a slip of paper," said Richard, doggedly. "That is what she is to do."

Tredennis crossed the room, and took his hat from its place.

"Will you come with me," he said, "or shall I go alone?"

"Where?" asked Richard.

Tredennis glanced at his watch.

"He would not call until late, perhaps," he said, "and she would not give it to him at once. It is ten now. We may reach there in time to spare her that, at least."

Richard bit his lip.

"There seems to be a good deal of talk of sparing her," he said. "Nobody spares me. Every folly I have been guilty of is exaggerated into a crime. Do you suppose that fellow isn't used to that sort of thing? Do you suppose I should have run the risk if he had not shown his hand this afternoon? She knows nothing of what she is to give him. There is no harm done to her."

"How is he to know she is not in the plot?" said Tredennis. "How is he to guess that she is not—what she has been made to seem to be? What insult is he not at liberty to offer her if he chooses?"

"She will take care of herself," said Richard. "Let her alone for that."

"By heaven!" said Tredennis. "She has been let alone long enough. Has she ever been anything else but alone? Has there been one human creature among all she knew to help or defend or guide her? Who has given her a thought so long as she amused them and laughed with the rest? Who——"

Richard got up, a devouring curiosity in his face.

"What is the matter with *you*?" he said. "Have you been——"

The words died away. The Colonel's gleaming eye stopped him.

"We will go at once, if you please," said Tredennis, and strode out of the room before him.

When they reached the house, Bertha was still standing where her guest had left her a few moments before, and but one glance at her face was needed to show both of them that something unusual had occurred.

"You have had Blundel here?" Richard asked, with an attempt at his usual manner, which ill-covered his excitement. "We thought we saw him crossing the street."

"Yes," she answered. "He has just left me."

She turned suddenly and walked back to the hearth.

"He left a message for you," she said. "That is it——" and she pointed to the last bit of tinder flickering on the coals.

"The—letter!" exclaimed Richard.

"Yes," she answered. "Do you want Colonel Tredennis to hear about the letter, Richard, or does he know already?"

"He knows everything," answered Richard, "as every one else will to-morrow or the day after."

For a moment his despair made him so reckless that he did not make an effort at defense. He flung himself into a chair and gave up to the misery of the hour.

"You knew," said Bertha, looking toward Tredennis, "and did not tell me. Yes, I forgot," with a bitter little smile, "there was something you warned me of once and I would not listen, and perhaps you thought I would not listen now. If you know will you tell me what was in the letter? I do not know yet, and I want to hear it put into words. It was money—or an offer of money? Tell me, if you please."

"It was money," said Richard, defiantly. "And there are others who have taken the same thing peacefully enough."

"And I was to give it to him because—because he was a little more difficult, and seemed to be my friend. Do all female lobbyists do such things, Richard, or was I honored with a special service?"

"It is not the first time it has been done," he answered, "and it won't be the last."

"It is the first time I have done it," she returned, "and it will be the last. The—risk is too great."

Her voice shook a little, but it was perfectly cold; and though her eyes were dilated, such fire as might have been in them was quenched by some light to which it would have been hard to give a name.

"I do not mean the risk to myself," she said to Richard. "I do not count. I meant risk to you. When he burned the letter he said, 'Tell them I did it for your sake, and that it is safer for them that I did it.'"

"What else did he say?" asked Richard, desperately. "He has evidently changed his mind since this afternoon."

"He told me you had a reason for your interest in the scheme, which was not the one you gave me. He told me you had invested largely in it, and could not afford to lose."

Richard started up, and turned helplessly toward Tredennis. He had not expected this, just yet at least.

"I—I—" he faltered.

The Colonel spoke without lifting his eyes from the floor.

"Will you let me explain that?" he asked. "I think it would be better."

There was a moment's silence, in which Bertha looked from one to the other.

"You?" she said.

Richard's lids fell. He took a paper-knife from the table he leaned against, and began to play with it nervously. He had become a haggard, coarsened, weakened copy of himself; his hair hung in damp elf-locks over his forehead; his lips were pale and dry; he bit them to moisten them.

"The money," said Tredennis, "is mine. It was a foolish investment, perhaps, but the money—is mine."

"Yours!" said Bertha. "You invested in the Westoria lands!"

She put her hand in its old place on the mantel, and a strange laugh fell from her lips.

"Then I have been lobbying for you too," she said. "I—wish I had been more successful."

Richard put his hand up, and pushed back the damp, falling locks of hair from his forehead restlessly.

"I made the investment," he said, "and I am the person to blame, as usual; but you would have believed in it yourself."

"Yes," she answered; "I should have believed in it, I dare say. It has been easy to make me believe, but I think I should also have believed in a few other things,—in the possibility of there being honor and good faith——"

She paused an instant, and then began again.

"You told me once that you had never

regarded me seriously. I think that has been the difficulty—and perhaps it was my fault. It will not be necessary to use me any more, and I dare say you will let me go away for a while after a week or so. I think it would be better."

She left her place to cross the room to the door. On her way there she paused before Colonel Tredennis.

"I beg your pardon," she said, and went on.

At the door she stopped again one moment, fronting them both, her head held erect, her eyes large and bright.

"When Senator Blundel left me," she said, "he told me to go to my children. If you will excuse me, I will go."

And she made a stately little bow, and left them.

#### CHAPTER XXXIII.

THE great social event of the following week was to be the ball given yearly for the benefit of a certain popular and fashionable charity. There was no charity so fashionable, and consequently no ball so well attended; everybody was more or less interested, everybody of importance appeared at it, showing themselves for a few moments at least. Even Mrs. Merriam, who counted among the privileges earned by a long and unswervingly faithful social career, the one of immunity from all ordinary society duties, found herself drawn into the maelstrom, and enrolled on the list of patronesses.

"You may do all the work, my dear," she said to Mrs. Sylvestre, "and I will appropriate the credit."

But she was not so entirely idle as she professed to be, and indeed spent several mornings briskly driving from place to place in her comfortable carriage, and distinguished herself by exhibiting an executive ability, a promptness and decision in difficulty, which were regarded with secret awe and admiration by her younger and less experienced colleagues. She had been out doing such work on the afternoon of the day before the ball, and returned home at her usual hour. But not in her usual equable frame of mind. This was evident when she entered the room where Mrs. Sylvestre sat talking to Colonel Tredennis, who had called. There were indeed such signs of mental disturbance in her manner, that Mrs. Sylvestre, rising to greet her, observed them at once.

"I am afraid you have had an exciting morning," she said, "and have done too much work."

"My dear," was the reply, "nothing could be more true than that I have had an exciting morning."

"I am sorry for that," said Agnes, "I am sorry for it," said Mrs. Merriam; "more sorry than I can say." Then turning to Tredennis, "I am glad to find you here. I have been hearing some most extraordinary stories; perhaps you can tell me what they mean?"

"Whom do they concern?" asked Agnes. "We are entertained by many stories."

"They will disturb you as much as they have disturbed me," Mrs. Merriam answered. "They have disturbed me very much. They concern our little friend, Mrs. Amory."

"Bertha!" exclaimed Agnes.

Her tender heart beat quietly, and a faint flush showed itself on her cheek; she looked up at Colonel Tredennis with quick, questioning eyes. Perhaps she was not as unprepared for the statement as she might have been. She had seen much during the last few weeks which had startled and alarmed her. Mrs. Merriam looked at Tredennis also.

"You may be able to guess something of what the rumors form themselves upon," she said. "Heaven knows there has been enough foundation for anything in that miserable Westoria land scheme."

"You have heard something of it this morning?" said Tredennis.

"I have heard nothing else," was the answer. "The Westoria land scheme has come to an untimely end, with a flavor of scandal about it which may yet terminate in an investigation. The whole city is full of it, and stories of Mrs. Amory and her husband are the entertainment offered you on all sides. I say 'Mrs. Amory and her husband,' because it is Mrs. Amory who is the favorite topic. She has been making the most desperate efforts to influence people; her parlors have been filled with politicians and lobbyists all the season; the husband was deeply involved in the matter; bribes have been offered and taken; there are endless anecdotes of Senator Planefield and his infatuation, and the way in which it has been used. She would have accomplished wonders if it had not been for Senator Blundel, who suspected her and led her into betraying herself. It is Senator Blundel who is credited with having been the means of exploding the whole affair. He has been privately investigating the matter for months, and had an interview with Mrs. Amory the other night, in which he assured her of the most terrible things, and threatened her with exposure. That is the way the stories run."

"Oh! this is very cruel," said Agnes. "We must do something! We must try! We cannot let such things be said without making an effort against them."

"Whatever is done must be done at once,"

replied Mrs. Merriam. "The conclusion of the matter is that there seems actually to be a sort of cabal formed against her."

"You mean——" began Agnes, anxiously.

"I mean," said Mrs. Merriam, "that my impression is that if she appears at the ball there are those who will be so rude to her that she will be unable to remain."

"Aunt Mildred!" exclaimed Agnes in deep agitation. "Surely such a thing is impossible."

"It is not only not impossible, returned Mrs. Merriam, "but it is extremely probable. I heard remarks which assured me of that."

"She must not go!" said Agnes. "We must manage to keep her at home. Colonel Tredennis——"

"The remedy must go deeper than that," he answered. "The fact that she did not appear would only postpone the end. The slights she avoided one night would be stored up for the future, we may be sure."

He endeavored to speak calmly, but it was not easy, and he knew too well that such a change had come upon his face as the two women could not but see. Though he had feared this climax so long, though he had even seen day by day the signs of its approach, it fell upon him as a blow at last, and seemed even worse than in his most anxious hour he had thought it might be.

"She has friends," he said; "her friends have friends. I think there are those—besides ourselves—who will defend her."

"They must be strong," remarked Mrs. Merriam.

"There are some of them," he answered, "who are strong. I think I know a lady whose opinion will not go for nothing, who is generous enough to use her influence in the right direction."

"And that direction?" said Mrs. Merriam.

"If the opposing party finds itself met by a party more powerful than itself," he said, "its tone will change—and as for the story of Senator Blundel, I think I can arrange that he will attend to that himself."

"Mere denial would not go very far, I am afraid," said Mrs. Merriam. "He cannot deny it to two or three score of people."

"He can deny it to the entire community," he answered, "by showing that their intimacy remains unbroken."

"Ah!" cried Agnes, "if he would only go to the ball, and let people see him talking to her as he used to—but I am sure he never went to a ball in his life!"

"My dear," said Mrs. Merriam, "that is really a very clever idea—if he could be induced to go."

"He is an honest man," said Tredennis, flushing. "And he is her friend. I believe that sincerely—and I believe he would prove it by going anywhere to serve her."

"If that is true," said Mrs. Merriam, "a great deal will be accomplished—though it is a little difficult to figure to one's self how he would enjoy a ball."

"I think we shall have the pleasure of seeing," replied the Colonel. "I myself——" He paused a moment, and then added: "I chance to have a rather intimate acquaintance with him—he has interested himself in some work of mine lately, and has shown himself very friendly to me. It would perhaps be easier for me to speak to him than for any other friend of Mrs. Amory."

"I think you would do it better than any other friend," Mrs. Merriam said, with a kindly look at him.

The truth was that, since his first introduction to Colonel Tredennis, Blundel had taken care that the acquaintance should not drop. He had found the modest warrior at once useful and entertaining. He had been able to gather from him information which it was his interest to count among his stores, and, having obtained it, was not ungrateful, and, indeed was led by his appreciation of certain good qualities he recognized in him into something bordering on an attachment for his new friend.

"I like that fellow," he used to say, energetically.

And realizing something of this friendliness, and more of the honor and worth of his acquaintance, the Colonel felt that he might hope to reach his heart by telling his story simply and with dignity, leaving the rest to him. As for the lady of whom he had spoken, he had but little doubt that that kind and generous heart might be reached; he had seen evidences of its truth and charity too often to distrust them. It was of course the wife of the Secretary of State he was thinking of,—that good and graceful gentlewoman whose just and clear judgment he knew he could rely upon, and whose friendship would grant him any favor.

"She is very generous and sympathetic," he said, "and I have heard her speak most kindly of Mrs. Amory. Her action in the matter must have weight, and I have confidence that she will show her feeling in a manner which will make a deep impression. She has always been fond of Professor Herrick."

"That is as clever an idea as the other," said Mrs. Merriam. "She has drawn her lines so delicately heretofore that she has an influence even greater than was wielded by most of those who have occupied her position.

And she is a decided and dignified person, capable of social subtleties."

"Oh!" exclaimed Mrs. Sylvestre, "it seems very hard that it should be Bertha who should need such defense."

"It is miserable," said Mrs. Merriam, impatiently. "It is disgraceful when one considers who is the person to blame. It is very delicate of us not to use names, I suppose, but there has been enough delicacy—and indelicacy—and I should like to use them as freely as other people do. I think you remember that I have not been very fond of Mr. Richard Amory."

When Colonel Tredennis left them, he turned his steps at once toward the house of the woman who was his friend and upon whose assistance so much depended. To gain her sympathy seemed the first thing to be done, and one thought repeated itself again and again in his mind,—*"How shall I say it best?"*

But fortune favored him and helped him to speak as he had not anticipated that it would.

The lady sat alone in her favorite chair in her favorite room, when he was ushered into her presence, as he had frequently happened to be before somewhere about the same hour. A book lay open upon her lap, but she was not reading it, and he fancied had not been doing so for some time. He also fancied that when she saw him her greeting glance had a shade of relief in it, and her first words seemed to certify that he was not mistaken.

"I am more than usually glad to see you," she said. "I think that if you had not appeared so opportunely, I should have decided in about half an hour that I must send for you."

"I am very fortunate to have come," he answered, and he held her kind hand a moment, and there came into his face a look so anxious that, being in the habit of observing him, she saw it.

"Are you very well?" she asked, gently. "I am afraid not. You are rather pale. Sit down by my chair and let me look at you."

"Am I pale?" said the Colonel. "You are very good to notice it, though I am not ill. I am only—only——"

She looked at him with grave interest.

"Have you," she said, "have you heard of the illness of some friend? Is that it? I am afraid it is!"

"Yes," he answered, "that is it—and I am afraid you have heard of it, too."

"I am afraid I have," she returned. "Such things travel quickly. I have heard something which has distressed me very much. It is something I have heard faint

rumors of before, but now it has taken on a definite form. This morning I was out, and this afternoon I have had some callers who were not averse to speaking plainly. I have heard a great many things said which have given me pain and which embarrass me seriously. That was the reason I was wishing to see you. I felt that you would at least tell me a story without prejudice. There is a great deal of prejudice shown—of course. We need expect nothing else. I am sure Professor Herrick can know nothing of this. Will you tell me what you yourself know?"

"That is what I came to do," said the Colonel, still paler, perhaps. "There is a great deal to tell—more than the world will ever know. It is only—to such as you that it could be told."

There was more emotion in his voice and face than he had meant to reveal; perhaps something in the kind anxiousness of his companion's eyes moved him—he found that he could not sit still and speak as if his interest was only the common one of an outsider, so he rose and stood before her.

"I cannot even tell you how it is that I know what I do to be true," he said. "I have only my word, but I *know* you will believe me."

"You may be sure of that," she answered.

"I *am* sure of it," he returned, "or I should not be here, for I have no other proof to offer. I came to make an appeal to you in behalf of a person who has been wronged."

"In behalf of Mrs. Amory?" she said.

"Yes," he replied, "though she does not know I am here, and will never know it. It scarcely seems my business, perhaps; she should have others to defend her; but there are no others who, having the interest of relationship, might not be accused of self-interest too. There is a slight tie of kinship between us, but it is only a slight one, and—we have not always been very good friends, perhaps, though it must have been my own fault. I think I never pleased her very well, even when I saw her oftenest. She was used to brighter companionship. But her father liked me; *we* were friends, warm and close. I have felt almost as if I was his son, and have tried to spare him the knowledge of what would have hurt him. During the last few weeks I think he has had suspicions which have disturbed him, but they have not been suspicions of trouble to his child."

"I felt sure of that," the lady remarked.

"*She* has no suspicions of the true aspect of affairs," he continued, "though she has lately gained knowledge of the wrong done

her. It has been a great wrong. She has not been spared. Her inexperience made her a child in the hands of those who used her as their tool. She understands now that it is too late—and it is very bitter to her."

"You knew her when she was a girl," his companion said, with her kind eyes on his sad, stern face.

"Yes," he answered, "when she was a girl and happy, and with all of life before her, and—she did not fear it."

"I knew her, too," she replied. "She has greatly changed since then."

"I saw that when I returned here," he said. And he turned his head aside and began to take up and set down a trifle on the mantel. "At first I did not understand it," he added. "Now I do. She has not changed without reason. If she has seemed light, there are women, I suppose, who hide many a pain in that way. She has loved her children, and made them happy—I know that, at least—and—and she has been a kind wife and an innocent woman. It is her friends who must defend her."

"She needs their defense," said his hearer.

"I felt that when I was out this morning, and when my callers were with me, an hour ago." She held out her hand with sympathetic frankness. "I am her friend," she said, "and her father's—and yours. I think you have some plan—there is something you wish me to do. Tell me what it is."

"Yes," he answered, "there is something I wish you to do. No one else can do it so well. There are people who intend to testify to their belief in the stories they have heard by offering her open slights. It is likely that the attempt will be made to-morrow night at the ball. If you testify to your disbelief and disapproval by giving her your protection, the popular theory will be shaken, and there will be a reaction in her favor."

"It is not to be denied," she said, "that it is only women who can aid her. It is women who say these things, as a rule, and who can unsay them. The actions of men in such matters are of less weight than they should be—though it is true there is one man who might do her a service——"

"You are thinking of Senator Blundel," he said. "I—we have thought of that. We think—hope that he will come to the ball."

"If he does, and shows himself friendly toward her," she returned, "nothing more can be said which could be of much importance. He is the hero of the story, as I dare say you have heard. If he remains her friend, that proves that he did not accuse her of plotting against him, and that he has no cause for offense. If the story of the grand scene

between them is untrue, the foundation-stone is taken away, and, having the countenance of a few people who show their confidence with tact and discretion, she is safe. I will go to the ball, my friend, and I will use what influence I possess to insure that she is not badly treated."

"I knew you would be kind to her," Tredennis said, with kindling eyes. "I have seen you kind before to those who needed kindness, even to those who did not deserve it—and she does!"

"Yes, yes, I am sure she does!" she answered. "Poor child! Poor child!"

And she gave him her hand again, and, as he wrung it in his, her eyes were fuller of sympathy than ever.

He reached Senator Blundel's rooms an hour later, and found him in the midst of his papers and pigeon-holes—letters and pamphlets to right of him, to left of him, before and behind him.

"Well," he said, by way of greeting, "our Westoria friends are out of humor this morning."

"So I have heard," Tredennis answered.

"And they may well be—they may well be," he said, nodding sharply. "And there are some fine stories told, of course."

"I have come to tell you one myself, sir," said Tredennis.

"What!" cried Blundel turning on his chair, "you have a story?"

"Yes," returned the Colonel, "not a pleasant one, and as it concerns you, I will waste as few words as possible."

He wasted no words at all. The story was a brief one, but as forcible as simple words could make it. There was no effort to give it effectiveness, and yet there were touches here and there which appealed to the man who heard it, as he had been rarely appealed to before. They brought before him things which had found a lodging in corners of his practical political mind, and had haunted him rather pathetically since the night he had shrugged himself into his overcoat, and left the slight, desolate-looking figure behind him. He had enjoyed his friendship too much not to regret it now that he felt it was a thing of the past; he had felt the loss more than once of the new element it had introduced into his life, and had cast about in his mind in vain for a place where he could spend a spare hour or so as pleasantly as he had often spent such hours in a bright parlor he knew of. Before Tredennis had half finished his relation he was moving restlessly in his chair, and uttering occasional gruff ejaculations, and when it

came to an end he sprang up looking not a trifle heated.

"That's it, is it?" he exclaimed. "They have been inventing something new about her, have they, and dragged me into it into the bargain? And they are making up plots against her, poor little woman, as if she hadn't been treated badly enough. A lot of gossips, I'll wager!"

"Some of them are good enough," said the Colonel. "They only mean to signify their disapproval of what they would have the right to condemn, if it were a truth instead of a lie."

"Well, they shall not do it at my expense, that's all," was the answer. "It is a lie from beginning to end, and I will do something toward proving it to them. I don't disapprove of her, they shall see that! She's a genuine good little thing! She's a lady! Any fool can see that! She won *me* over, by George, when everything was against her! And she accused nobody when she might have said some pretty hard true things, and nine women out of ten would have raised the very deuce. She's got courage, and—yes, and dignity, and a spirit of her own that has helped her to bear many a bitter thing without losing her hold on herself, I'd be willing to swear. Look here!" he added, turning suddenly and facing Tredennis. "How much do you know of her troubles? Something, I know, or you wouldn't be here?"

"Yes," answered the Colonel. "I know something."

"Well," he continued, in an outburst of feeling, "I don't ask how much. It's enough, I dare say, to make it safe for me to speak my mind—I mean safe for her, not for myself. There's a fellow within a hundred miles of here I should like to thrash within an inch of his life, and an elegant, charming, amiable fellow he is too, who, possibly, persuaded himself that he was doing her very little injury."

"The injury has been done nevertheless," said Tredennis gravely. "And it is her friends who must right it."

"I'm willing to do my share," said Blundel. "And let that fellow keep out of my way. As to this ball—I never went to a ball in my life, but I will appear at this one, and show my colors. Wait a minute!" As if an idea had suddenly struck him. "Go to the ball?—I'll *take her* there myself."

The spirit of combat was aroused within him; the idea presented itself to him with such force, that he quite enjoyed it. Here arraigned on one side were these society scandalmongers and fine ladies; here on the other was himself, Samuel Blundel, rough and blunt, but determined enough to scatter them and their lies to the four winds. He

rather reveled in the thought of the struggle, if struggle there was to be. He had taken active part in many a row in the House in which the odds had been against him, and where his obstinate strength had outlived the subtle readiness of a dozen apparently better equipped men. And his heart was in this deed of valor too; it glowed within him as he thought how much really depended upon him. Now, this pretty, bright creature must turn to him for protection and support. He almost felt as if he held her gloved hand resting upon his burly arm already with a clinging touch.

"I'll take her myself," he repeated. "I'll go and see her myself, and explain the necessity of it—if she does not know all."

"She does not know all yet," said Tredennis, "and I think she was scarcely inclined to go to the ball; but I am sure it will be better that she should go."

"She will go," said Blundel, abruptly. "I'll make her. She knows *me*. She will go if I tell her she must. That is what comes of being an old fellow, you see, and not a lady's man."

He had not any doubt of his success with her, and, to tell the truth, neither had Colonel Tredennis. He saw that his blunt honesty and unceremonious, half-paternal domineering would prove to her that he was in the right, even if she were at first reluctant; and this being settled and the matter left in Blundel's hands, the Colonel went away. Only before going he said a few words, rather awkwardly:

"There would be nothing to be gained by mentioning my name," he said. "It is mere accident that—that I chance to know what I have spoken of. She does not know that I know it. I should prefer that she should not."

"What!" said Blundel. "She is not to know how you have been standing by her?"

"She knows that I would stand by her if she needed me. She does not need me; she needs you. I have nothing to do with the matter. I don't wish to be mentioned."

When he was gone Blundel rubbed his hair backward and then forward by way of variety.

"Queer fellow!" he said, meditatively. "Not quite sure I've exactly got at him yet. Brave as a lion and shy as a boy. Absolutely afraid of women."

#### CHAPTER XXXIV.

IN less than an hour his card was brought to Bertha as she sat with her children. She read it with a beating heart, and, having done so, put down Meg and her picture-book.

"I will go down at once," she said to the servant.

In two minutes she was standing in the middle of the parlor, and her guest was holding her hand in his, and looking at her earnestly and curiously.

"You didn't expect to see me here, did you?" he said.

"No," she answered; "but you are kind to come."

"I didn't expect to be here myself," he said. "Where is your husband? Somebody told me he had gone away."

"He is in New York," she replied.

He gave her one of his sharp glances and drew her toward a chair.

"Sit down by me," he said. "You are in no condition to be kept standing. I want to talk to you. You mustn't look like that," he said. "It won't do. You are worn out, but you mustn't give up. I have come to order you to do something."

"I will do anything you tell me," she answered.

"You will? Well, that's good! I thought you would, too. I want you to take me to this ball that is to be given to-morrow night."

She started in amazement.

"To the ball!" she exclaimed.

"Surprises you, doesn't it? I supposed it would; it surprises me a little, but I want to go nevertheless, and I have a reason."

"I am sure it is a good one," she said.

"It is," he answered. "None but the best would take me there. I never went to a ball in my life. *You* are the reason. I am going to take care of *you*."

A faint, sad smile touched her lips.

"Some one has said something more against me," she said, "and you want to defend me. Don't take the trouble. It is not worth while."

"The place is full of lies about you," he answered, suddenly and fiercely. "And I *am* going to defend you. No one else can: They are lies that concern me as well as you."

"Will you tell me what they are?" she asked.

He saw there was no room for hesitation, and told her what the facts were. As he spoke he felt that they did not improve in the relation, and he saw the blood rise to her cheeks, and a light grow in her eyes. When he had finished the light was a brilliant spark of fire.

"It is a charming story," she said.

"We will show them what sort of a story it is," he answered, "to-morrow night!"

"You are very good to me," she said.

Suddenly she put her hand to her side.

"Ah!" she exclaimed, "it seems very

strange that they should be saying these things of—Bertha Amory!”

She looked at him with a hopeless appeal in her eyes.

“Do they all believe them?” she said. “Ah, how can they? They know I was not—like that! I have not done anything! I have been unhappy, but—but I —”

She stopped a moment—or was stopped by her breaking voice.

“This has been too much for you,” he said. “You are ill, child!”

“I have been ill for some time,” she answered. “And the last few days have been very hard.”

She made an effort to recover herself.

“I will go to the ball,” she said, “if you think it best.”

“It *is* best,” he replied. “And you need not be afraid —”

“I am not afraid,” she interposed quickly, and the spark of fire showed itself in her eyes again. “I might allow myself to be beaten, if it were not for my children; but, as it is, you will see that I will not be beaten. I will be well for to-morrow night at least. I will not look like a victim. They will see that I am not afraid.”

“It is they who will be beaten,” said Blundel, “if anything depends on me! Confound it! I shall *like* to do it.”

#### CHAPTER XXXV.

HE went home quite eager for the fray, and his eagerness was not allowed to flag. The favorite story came to his ears again and again. Men met him in the streets, and stopped to speak of it; others dropped into his rooms to hear the truth from himself, when he went to his hotel to dine; talkers standing in groups in the lobbies turned to look at him, and when he had passed them returned to their conversation with renewed interest. To the first man who referred to the matter he listened until he had said his say. Then he answered him.

“You want to hear the truth about that,” he said, “don’t you?”

“That of course,” was the reply.

“And you want to be able to *tell* the truth about it when you are asked questions.”

“Most certainly.”

“Well, then, the truth is that there isn’t a word of truth in it from beginning to end; and if you want to *tell* the truth, say it’s a lie, and add that I said so, and I am prepared to say so to every man who wants to interview me; and what is more, every man who tells

another that it is a lie does me a favor that gives him a claim on me.”

He repeated the same thing in effect each time an opportunity presented itself, and as these opportunities were frequent and each time he gained something of heat and lost something of temper and patience, he was somewhat tired and by no means in the best of humors when he sat down to his dinner, in the big, glaring, crowded hotel dining-room, amid the rattle of knives, forks and crockery, the rushing to and fro of excited waiters, and the incoming and outgoing of hungry people. His calmness was not added to by observing that the diners at the tables near him discovered him as with one accord almost as soon as he entered, and cast glances of interest at him between the courses.

“Perfectly dreadful scene, they say,” he heard one lady remark, with an unconscious candor born of her confidence that the clatter of dishes would drown all sound. “Went down on her knees to him and wrung her hands, imploring him to have mercy on her. Husband disappeared next day. Quite society people too. She has been a great deal admired.”

What further particulars the speaker might have entered into there is no knowing, as she was a communicative person and plainly enjoyed her subject; but just at this juncture the lady to whom she was confiding her knowledge of the topics of the hour uttered an uneasy exclamation.

“Gracious! Maria!” she said. “He has heard you! I am sure he has! He has turned quite red—redder than he was—and he is looking at us! Oh, Maria!” in accents sepulchral with fright, “he is getting up! He is coming to speak to us! Oh!—Mari —!”

He was upon them at that very moment. He was accustomed to public speaking, and his experience led him to the point at once. He held his newspaper half folded in his hand, and, as had been said, he was a trifle redder than usual; but his manner was too direct to be entirely devoid of dignity.

“I beg your pardon,” he said, “but my name is Blundel.”

The most hopelessly terrified of the ladies found herself saying that he “was very kind,” and the one who had told the story gasped faintly, but with an evident desire to propitiate, that she “had heard so.”

“I take the liberty of mentioning it,” he added, “because I have been sitting quite near to you and chanced to overhear what you were saying, and as you are evidently laboring under an impression I am interested in correcting, I felt obliged to intrude on

you with a view to correcting it. I have been denying that story all day. It isn't true. Not a word of it. I never said an unkind word to the lady you mention, and I never had an unkind thought of her. No one has any right to speak ill of her. I am her friend. You will excuse my interrupting you. Here is my card." And he laid the card on the table, made a bow not so remarkable for grace, perhaps, as for perfect respectfulness, and marched back to his table.

There were few people in the room who did not turn to look at him as he sat down again, and nine out of ten began to indulge in highly colored speculations as to why he had addressed the women and who they were. There had never been a more popular scandal than the Westoria land scheme; the magnitude of it, the element of romance connecting itself with it, the social position of the principal schemers, all endeared it to the public heart. Blundel himself had become a hero, and had the rumors regarding his irreproachable and dramatic conduct only been rife at a time of election, they would have assured him an overwhelming majority. Perhaps as he approached the strangers' table there had been a fond, flickering hope cherished that these two apparently harmless women were lobbyists themselves, and that their disguise was to be rent from them and their iniquities to be proclaimed upon the spot. But the brief episode ended with apparent tameness and the general temperature was much lowered, the two ladies sinking greatly in public opinion, and the interest in Blundel himself flagging a little. There was one person, however, who did not lose interest in him. This was a little, eager, bird-like woman who sat at some distance from him, at a small table alone. She had seen his every movement since his entrance, and her bright, dark eyes followed him with an almost wistful interest. It was Miss Jessup; and Miss Jessup was full to the brim and pressed down and running over with anecdotes of the great scandal, and her delicate little frame almost trembled with anxious excitement as she gazed upon him and thought of what might be done in an interview.

He had nearly finished his dinner before he caught sight of her, but as he was taking his coffee he glanced down the room, saw and recognized her.

"The very woman!" he exclaimed under his breath. "Why didn't I think of that before?" And in five minutes Miss Jessup's heart was thrilled within her, for he had approached her, greeted her, and taken the seat she offered him.

VOL. XXV.—88.

"I have come," he said, "to ask a favor of you."

"Of me!" said Miss Jessup. "That does not sound exactly natural. I have generally asked favors of you. I have just been looking at you and making up my mind to ask one."

"Wanted to interview me?" he asked. "Didn't you?"

She nodded her head, and her bright eyes brightened.

"Well," sturdily, "I *want* you to interview me. Go ahead and do it."

"You *want* to be interviewed!" she exclaimed, positively radiant with innocent joy. "No! Really?"

"I am here for that purpose," he answered. She left her seat instantly.

"Come into the parlor," she said. "It is quiet there at this time. We can sit where we shall not be disturbed at all."

They went into the parlor and found at the far end of it the quiet corner they needed, and two chairs. Miss Jessup took one and Blundel the other, which enabled him to present his broad back to all who entered. Almost before he was seated Miss Jessup had produced her neat note-book and a pencil.

"Now," she said, "I am ready for anything; but I must say I don't see how I am favoring *you*."

"You are going to favor me by saving me the trouble of contradicting a certain story every half-hour," he said.

"Ah!" ejaculated Miss Jessup, her countenance falling a little; "it is not true?"

"Not a word of it."

Humane little creature as she was, as she glanced down at her note-book, Miss Jessup felt that some one had been a trifle defrauded.

"And there was no scene?"

"No."

"And you did not threaten to expose her?"

"No."

"And you wish me to tell people that?"

"Yes, as pointedly as possible, in as few words as possible, and without mentioning names if possible."

"Oh, it would not be necessary to mention names; everybody would understand the slightest reference."

"Well, when you have done that," said Blundel, "you have granted me my favor."

"And you want it to be brief?" said Miss Jessup.

"See here," said Blundel; "you are a woman. I want you to speak the truth for another woman as plainly, and—as delicately as a woman can. A man would say too much or too little—that is why I come to you."

She touched her book with her pencil, and evidently warmed at once.

"I always liked her," she said, with genuine good feeling, "and I could not help hoping that the story was not true, after all. As it was public property, it was my business to find out all about it if I could; but I couldn't help being sorry. I believe I *can* say the right thing, and I will do my best. At any rate, it will be altogether different from the other versions."

"There won't be any other versions if I can prevent it," returned Blundel. "I shall have some interviews with newspaper men to-night, which will accomplish that end, I hope."

"Ah!" exclaimed Miss Jessup, "then mine will be the only statement."

"I hope so," he answered. "It will if I have any influence."

"Oh, then," she said, "you have done me a favor, after all."

"It won't balance the favor you will have done me," he replied, "if you do your best in this matter. You see, I know what your best is, and I depend on it."

"Well," she said, "it is very kind of you to say so, and I will try to prove myself worth depending on, but—" And she scribbled a little in her note-book. "I don't mind telling you that the reason that is strongest in my mind is quite an unprofessional one. It is the one you spoke of just now. It is because I am a woman, too."

"Then she is safe," he returned. "Nothing could make her safer. And I am grateful to you beforehand, and I hope you will let me say so."

And they shook hands and parted the best of friends, notwithstanding that the interview had dwindled down into proportions quite likely to be regarded by the public as entirely insignificant.

#### CHAPTER XXXVI.

It had certainly been expected by the public that the morning papers would contain some interesting reading matter, and in some respects these expectations were realized. The ignominious failure of the Westoria land scheme was discussed with freedom and vigor, light being cast upon it from all sides, but upon the subject which had promised most there was a marked silence. Only in one paper there appeared a paragraph—scarcely more—written with much clearness and with a combined reserve and directness which could not fail to carry weight. It was very well done, and said so much in little and with such unmistakable faith in its own statements and such suggestions of a foundation for that faith, that it was something of a shock to those who had delighted in the most elabo-

rate ornamentation of the original story. In effect it was a denial not only of the ornamentation, but of the story itself, and left the liberal commentator not a fact to stand upon, so that he became temporarily the prey of discouragement and spiritual gloom, which was not a little added to by the events of the day.

There was, however, no sense of discouragement in the mind of Senator Blundel as he attired himself for the fray when night arrived. His mood was a fine combination of aggressiveness, generous kindness, hot temper, and chivalric good feeling. He thought all day of the prospect before him, and in the afternoon went to the length of calling at a florist's and ordering a bouquet to be sent to Mrs. Amory, choosing it himself and feeling some pride in the good taste of his selection. He was so eager, indeed, that the day seemed quite long to him, and he dressed so early after dinner that he had two or three hours to wait before his carriage arrived.

But it did arrive at last, and he went down to it, drawing on with some difficulty an exceedingly tight pair of gloves, the obduracy of whose objections to being buttoned gave him something to combat with and suited his frame of mind to a nicety.

He was not called upon to wait very long after his entrance into the parlor. A few moments after his arrival Bertha came down. She was superbly dressed in white, she carried his roses and violets, and there burned upon her cheeks a color at once so delicate and brilliant that he was surprised by it. He had, indeed, rather expected to see her paler.

"Upon my soul," he said, "you don't look much frightened!"

"I am not frightened at all," she answered.

"That is a good thing," he returned. "We shall get on all the better for it. I never saw you with a brighter color."

She touched her cheek with her gloved finger.

"It is not rouge," she said. "I have been thinking of other parties I have attended—and of how these ladies will look at me to-night—and of what they possibly said of me yesterday—and it has been good for me."

"It was not so good for them, however," he suggested, regarding her with new interest. Her spirit pleased him; he liked it that she was not ready to allow herself to be beaten down, that she held her head erect and confronted her enemies with resolute eyes; he had a suspicion that there were women enough who would have been timorous and pathetic.

"I could not hurt them," she replied. "It

would matter very little what I thought or said of them—it is only they who can harm me.”

“They shall none of them harm you,” he said, stoutly. “I will see to that—but I’m glad you are looking your best.”

But she could not help seeing that he was a trifle anxious about her. His concern manifested itself in occasional touches of half-paternal kindness which were not lost upon her. He assisted her to put on her wrap, asked her if it was warm enough, ordered her to draw it closely about her, and tucked her under his arm as he led her out to the carriage with an air of determined protection not to be mistaken.

Perhaps his own views as to what form of oppression and opposition they were to encounter were rather vague. He was sufficiently accustomed to the opposition of men, but not to that of women; but, whatever aspect it assumed upon this occasion, he was valiantly determined not to be moved by it.

“I can’t dance with you,” he said, “that’s true—I wish I could—but I will see that you have plenty of partners.”

“I don’t think the difficulty will be in the partners,” Bertha replied, with a faint smile. “The men will not be unkind to me, you will see.”

“They won’t believe it, eh?” said Blundel.

Her eyes met his, and the faint smile had a touch of bitterness.

“Some of them will not believe it,” she answered; “and some will not care.”

There was not the slightest shade of any distrust of herself or her surroundings, either in her face or manner, when, on reaching their destination, she made her way into the cloak-room. The place was already crowded—so crowded that a new-comer was scarcely noticeable. But, though she seemed to see nothing, glancing to neither right nor left, and occupying herself with the removal of her wraps, and with a few calm last touches bestowed upon her toilet before a mirror, scarcely a trifle escaped her. She heard greetings, laughter, gay comments on the brilliancy and promise of the ball; she knew where stood a woman who would be likely to appear as an enemy, where stood another who might be neutral, and another who it was even possible might be a friend. But she meant to run no risks, and her long training in self-control stood her in good stead; there was neither consciousness nor too much unconsciousness in her face; when the woman whom she had fancied might lean toward friendliness saw and bowed to her, she returned the greeting with her pretty, inscrutable smile, the entire composure of which

so impressed the matron who was disposed to neutrality, that she bowed also, and so did some one near her. But there were others who did not bow, and there were those who, discovering the familiar, graceful figure, drew together in groups, and made an amiable comment or so. But she did not seem to see them. When, taking up her flowers and her white ostrich-feather fan, she passed down the little lane, they expressed their disapproval by making way for her as she turned toward the door. She was looking at two ladies who were entering, and, general attention being directed toward them, they were discovered to be Mrs. Sylvestre and Mrs. Merriam.

“Now,” it was asked, “what will *they* do?”

What they did was very simple in itself, but very remarkable in the eyes of the lookers-on. They paused and spoke to the delinquent in quite their usual manner.

“We would ask you to wait for us,” Mrs. Merriam was heard to say, finally, “but there are so many people here to be attended to, and we saw Senator Blundel waiting for you at the door. May I tell you how pretty your dress is, and how brilliant you are looking?”

“Senator Blundel!” was repeated by the nearest groups. “It could not be Senator Blundel who is with her.”

But those who were near enough to the door were subjected to the mental shock of seeing that it was Senator Blundel himself. He appeared in festal array, rubicund, and obstinately elate, and, stepping forward, took his charge’s hand, and drew it within his portly arm.

“What!” he said, “you are not pale yet—and yet there were plenty of them in there. What did they do?”

“Three of them were good enough to bow to me,” she answered, “and the rest drew away and discussed me in undertones. The general impression was, I think, that I was impudent. I did not feel impudent, and I don’t think I looked so.”

“Poor little woman!” he said. “Poor little woman!”

“No! no!” she exclaimed, looking straight before her, with dangerously bright eyes; “don’t say that to me. Don’t pity me, please—just yet—it isn’t good for me. I need—I need——”

There was a second or so of dead silence. She did not tell him what she needed.

When they entered the ball-room a waltz was being played, and the floor was thronged with dancers; the ladies who formed the committee of reception stood near the door; a party of guests had just received the usual

greetings and retired. The Commandress-in-chief turned to meet the new-comers. She was a stately and severe dowager, with no intention of flinching from her duty; but her sudden recognition of the approaching senatorial figure was productive of a bewilderment almost too great for her experience to cope with. She looked, caught her breath, lost it and her composure at one and the same time, cast a despairing glance at her aides, and fell a victim to circumstances. Here was the subject under ban calmly making the most graceful and self-possessed obeisance before her—and her escort was the man of whom it had been said that a few days ago he had exposed her infamous plotting. This was more than even the most experienced matron could be prepared for. It must be admitted that her presence of mind deserted her, and that her greetings were not marked by the ready tact which usually characterized them.

"My first ball, Madam," remarked the Senator, scenting difficulty in the breeze, and confronting it boldly. "But for my friend, Mrs. Amory, I am afraid I should not be here. I begin to feel indebted to her already."

"It promises very well," said Bertha. "I never saw the room gayer. How pretty the decorations are."

They passed on to make room for others, leaving the estimable ladies behind them pale with excitement, and more demoralized than they would have been willing to admit.

"What does it mean?" they asked one another. "They appear to be the best of friends! What are we to understand?"

There was one kindly matron at the end of the line who looked after the pair with an expression of sympathy which was rather at variance with the severity of the rôle she had been called upon to enact.

"It appears," she said, "as if the whole story might be a fabrication, and the Senator determined to prove it so. I hope with all my heart he will."

By the time they reached their seats the news of their arrival had made the circle of their room. Bertha herself, while she had listened with a smile to her escort's remarks, had seen amazement and recognition flash out upon a score of faces; but she had preserved her smile intact, and still wore it when she took her chair. She spoke to Blundel, waving her fan with a soft, even motion.

"We have run the gauntlet," she said, "and we have chosen a good position. Almost everybody in the room has seen us—almost every one in the room is looking at us."

"Let them look!" he answered. "I have no objection to it."

"Ah, they will look!" she returned. "And we came to be—to be looked at. And it is very good of you to have no objections. Do I seem perfectly at ease? I hope so—though I am entirely well aware that at least a hundred people are discussing me. Is the expression of my eyes good—careless enough?"

"Yes, child, yes," he answered, a little uneasily. There was an undertone in her voice which troubled him, much as he admired her spirit and self-control.

"Thank you," she said. "Here is a bold man coming to ask me to dance. I told you the men would not be afraid of me. I think, if you approve of it, I will dance with him."

"Go and dance," he answered.

When her partner bore her away, he took charge of her flowers and wrap in the most valiant manner, and carried them with him when he went to pay his respects to the matrons of his acquaintance who sat against the wall discussing with each other the most exciting topic of the hour; and who, when he addressed them, questioned him as closely as good-breeding would permit, upon all subjects likely to cast light upon this topic.

"Never was at a ball in my life before," he admitted. "Asked Mrs. Amory to bring me. Wanted to see how I should like it."

"With Mrs. Amory?" remarked matron No. 1. "She is dancing, I believe."

"Yes," he said good-naturedly. "She will be dancing all night, I suppose, and I shall be carrying her flowers; but I don't mind it—in fact, I rather like it. I dare say there are two or three young fellows who would be glad enough to be in my place."

"I have no doubt," was the reply. "She has been very popular—and very gay."

"She is very popular with me," said the Senator, "though I am an old fogey, and don't count. We are great friends, and I am very proud to be her escort to-night. I feel I am making my *début* under favorable circumstances."

There could be no doubt of his sentiments after that. He was her friend. He admired her. He even made a point of saying so. What became of the story of the scandal? It seemed to have ended in nothing and worse than nothing; there was something a little ridiculous about such a tame termination to such an excitement. One or two of the ladies who had found it most absorbing looked aimlessly into space, and an embarrassed silence fell upon them.

Bertha ended her dance and returned to her seat. Her color was even brighter than before, and her smile was more brilliant. For a few moments a little group surrounded her, and her programme was half full. Blundel

came back to his post like a sentinel. If she had been looked at before, she was regarded now with a double eagerness. Those who were not dancing watched her every movement; even those who danced asked each other questions. The group about her chair was added to and became gayer, but there were no women numbered in the circle. The general wonder was as to what would be done in the end. So far, round dances only had been danced. The next dance was a quadrille. The music struck up, and the dancers began to take their places. As they did so a party entered the room and made its way toward the end where the group stood about the chair. Bertha did not see it; she was just rising to take her station in the set nearest to her. The matron of the party, who was a figure so familiar in social circles as to be recognized at once by all who saw her, was accompanied by her daughter and an escort. It was the wife of the Secretary of State, and her cavalier was Colonel Tredennis.

"There is Mrs. Amory," she said to him as they approached. "She is taking her place in the quadrille. One moment, if you please."

Experience had taught her all that might be feared, and a quick eye showed her that something was wrong. Bertha advanced to her place, laughing a little at some jest of her partner's. She had not seen who the dancers were. The jest and the laugh ended, and she looked up at her *vis-à-vis*. The lady at his side was not smiling; she was gazing steadily at Bertha herself. It seemed as if she had been waiting to catch her eye. It was the "great lady," and, having carried the figurative pebble until this fitting moment, she threw it. She spoke two or three words to her partner, took his arm, turned her back, and walked away.

Bertha turned rather pale. She felt the blood ebb out of her face. There was no mistaking the significance of the action, and it had not escaped an eye. This was more than she had thought of. She made a movement, with what intention she herself was too much shaken to know, and, in making it, her eyes fell upon a face whose expression brought to her an actual shock of relief. It was the face of the kind and generous gentlewoman who had just entered, and who, at this moment, spoke to her daughter.

"My dear," she said, "I think you promised Colonel Tredennis the first quadrille. Go and take that vacant place, and when you speak to Mrs. Amory ask her to come and talk to me a little as soon as the dance is over."

There was a tone of gentle decision in her

voice and a light in her eye which were not lost upon the by-standers. She gave Bertha a bow and smile and sat down. The most fastidious woman in Washington,—the woman who drew her lines so delicately that she had even been called almost too rigorous, the woman whose well-known good taste and good feeling had given her a power mere social position was powerless to bestow,—had taken the subject of the hour's scandal under her protection, and plainly believed nothing to her discredit.

In five minutes the whole room was aware of it. She had greeted Mrs. Amory cordially, she had openly checkmated an antagonist, she had sent her own daughter to fill the place left vacant in the dance.

"She would not have done that if she had not had the best of reasons," it was said.

"And Senator Blundel would scarcely be here if the story had been true."

"He has told several of his friends that he is here to prove that it is *not* true!"

"He denied it again and again yesterday."

"It was denied in one of the morning papers, and they say he kept it out of the rest because he was determined she should not be more publicly discussed."

"She is not one of the women who have been in the habit of giving rise to discussion."

"She is a pretty, feminine-looking little creature."

"Poor girl! It must have been bitter enough for her."

"Rather fine of old Blundel to stand by her in this way."

"He would not do it if there was not something rather fine in her. He is not a ladies' man, old Sam Blundel. Look at him! How he looms up behind his bouquet!"

The tide of public opinion had taken a turn. Before the dance had ended two or three practical matrons who were intimately known to Colonel Tredennis's friendly supporter had made their way to her and asked her opinion and intentions frankly, and had received information calculated to set every doubt at rest.

"It is scarcely necessary for me to speak of my opinion of the matter," the lady said, "when we have the evidence of Senator Blundel's presence here with Mrs. Amory to-night. I should feel myself unpardonably in the wrong if I did not take the most open measures in the defense of the daughter of my old friend, who has been treated most unjustly. And I cannot help hoping that she will have other defenders than myself."

Several of the matrons so addressed were seated within speaking range when Bertha came to her friend at the close of the dance,

and she recognized at once on approaching them that she need fear them no longer. But she could not say much in response to their greetings; she answered them briefly, bowed slightly, and sat down in the chair near the woman who had protected her. She could even say but little to her; the color had died out of her face at last; the strain she had borne so long had reached its highest tension to-night, and the shock of the moment, received through an envious woman's trivial spite, slight as it might have been in itself, represented too much to her. As he had passed her in the dance and touched her hand, Tredennis had felt it as cold as ice, and the look of her quiet, white face had been almost more than he could bear to see.

"Bertha," he had said to her once, "for God's sake, take courage!"

But she had not answered him. A few months ago she would have given him a light, flippant reply if her very soul had been wrung within her, but now she was past that. As she sat by her friend, her hand shook as she held her fan.

"You were very kind to me just now," she said, in a low voice. "I cannot express my thanks as I wish."

"My dear," was the reply, "do not speak of it. I came to take care of you. I think you will have no more trouble. But I am afraid this has been too much for you. You are shivering a little."

"I am cold," Bertha answered, "I—feel as if—something strange had happened to me. It was not so before. I seem—to have lost courage."

"But you must not lose courage yet," he said, with a manner at once soft and firm. "A great many people are looking at you. They will be very curious to know how you feel. It is best that you should not let them see."

He spoke rather rapidly, but in a low voice. No one near could hear. He was smiling as if the subject of the conversation was the least important in the world.

"Listen to me," he said, in the same manner, "and try to look as if we were speaking of ordinary topics. I dare say you feel as if you would prefer to go away, but I think you must remain. Everybody here must understand that you have friends who entirely disbelieve all that has been said against you, and also that they wish to make their confidence in you public. I should advise you to appear to enjoy yourself moderately well. I think I wish you to dance several times again. I think there will be no difficulty in arranging the next square dance. When the presidential party arrives, the President will, I have no doubt, be pleased

to talk to you a little. It would be republican to say that it is absurd to consider that such a thing can be of consequence; but there are people with whom it will have weight. As soon as possible, I shall send you down to the supper-room with Senator Blundel. A glass of wine will do you good. Here is Senator Blundel now. Do you think you can talk to him in your usual manner?"

"I will try," said Bertha. "And if I do not, I think he will understand."

He did understand. The little incident had been no more lost upon him than upon others. He was glowing with repressed wrath, and sympathy, and the desire to do something which should express his feeling. He saw at once the change which had come upon her, and realized to the full all that it denoted. When he bore her off to the supper-room, he fairly bristled with defiance of the lookers-on who made way for them.

"Confound the woman!" he said. "If it had only been a man!"

He found her the most desirable corner in the supper-room, and devoted himself to her service with an assiduity which touched her to the heart.

"You have lost your color," he said. "That won't do. We must bring it back."

"I am afraid it will not come back," she answered.

And it did not, even though the tide had turned, and that it had done so became more manifest every moment. They were joined shortly by Colonel Tredennis and his party, and by Mrs. Merriam and hers. It was plain that Mrs. Amory was to be alone no more; people who had been unconscious of her existence in the ball-room, suddenly recognized it as she sat surrounded by her friends; the revulsion of feeling which had taken place in her favor expressed itself in a hundred trifles. But her color was gone, and returned no more, though she bore herself with outward calmness. It was Colonel Tredennis who was her first partner when they returned to the ball-room. He had taken a seat near her at the supper-table, and spoken a few words to her.

"Will you give me a place on your card, Bertha," he had said, and she had handed it to him in silence.

He was not fond of dancing, and they had rarely danced together, but he wished to be near her until she had had time to recover herself. Better he than another man who might not understand so well; he knew how to be silent, at least.

So they went through their dance together, exchanging but few words, and interested spectators looked on, and one or two remarked to each other that, upon the whole,

it appeared that Mrs. Amory was rather well supported, and that there had, evidently been a mistake somewhere.

And then the Colonel took her back to her seat, and there were new partners; and between the dances one matron after another found the way to her, and, influenced by the general revulsion of feeling, exhibited a cordiality and interest in marked contrast with the general bearing at the outset of the evening. Perhaps there were those who were rather glad to be relieved of the responsibility laid upon them. When the presidential party arrived, it was observed that the President himself was very cordial when he joined the group at the end of the room, the center figure of which was the wife of his friend and favorite cabinet officer. It was evident that he, at least, had not been affected by the gossip of the hour. His greeting of Mrs. Amory was marked in its kindness, and before he went away it was whispered about that he also had felt an interest in the matter when it had reached his ears, and was not sorry to have an opportunity of indirectly expressing his opinion.

The great lady took her departure in bitterness of spirit, the dances went on, Bertha went through one after another, and between her waltzes held her small court and was glanced at askance no more. Any slight opposition which might have remained would have been overpowered by the mere force of changed circumstances. Before the evening was at an end, it had become plain that the attempt to repress and overwhelm little Mrs. Amory had been a complete failure, and had left her better defended than it had found her.

"But she has lost something," Senator Blundel said to himself, as he watched her dancing. "Confound it!—I can see it—she is not what she was three months ago—she is not what she was when she came into the room."

Tredennis also recognized the change which had come upon her, and before long knew also that she had seen his recognition of it, and that she made no effort to conceal it from him. He felt that he could almost have better borne to see her old, careless gayety, which he had been wont to resent in secret bitterness of heart.

Once, when they chanced to stand alone together for a moment, she spoke to him quickly.

"Is it late?" she asked. "We seem to have been here so long! I have danced so much Will it not soon be time to go home?"

"Do you want to go home?" he asked.

"Yes!" she answered, almost breathlessly; "the music seems so loud it bewilders me a

little. How gay it is! How the people dance! The sound and motion make me blind and dizzy. Philip!"

The tone in which she uttered his name was so low and tense that he was startled by it.

"What is it?" he asked.

"If there are many more dances, I am afraid—I cannot go through them—I think—I am breaking down, and I must not—I must not! Tell me what to do!"

He made a movement so that he stood directly before her and shielded her from the observation of those near them. He realized the danger of the moment.

"Look up at me!" he said. "Try to fix your eyes on me steadily. This feeling will pass away directly. You will go soon and you must not break down. Do not let yourself be afraid that you will."

She obeyed him like a child, trying to look at him steadily.

"Tell me one more dance will be enough," she said, "and say you will dance it with me if you can."

"I will," he answered, "and you need not speak a word."

When the Senator found himself alone in the carriage with her his sense of the triumph achieved found its expression in words.

"Well," he said, "I think we have put an end to *that* story."

"Yes," Bertha answered, "they will not say anything more about me. You have saved me from that."

She leaned forward and looked out of the window. Carriages blocked the street, and were driving up and driving away; policemen were opening and shutting doors and calling names loudly; a few street-Arabs stood on the pavement and looked with envious eyes at the bright dresses and luxurious wraps of the party passing under the awning; the glare of gas-light fell upon a pretty face upturned to its companions, and a girl's laugh rang out on the night air. Bertha turned away. She looked at Senator Blundel. Her own face had no color.

"I think," she said, "I think I have been to my last ball."

"No,—no," he answered. "That's nonsense. You will dance at many a one."

"I think," she said, "I think this is the last."

Senator Blundel did not accompany her into the house when they reached it. He left her at the door, almost wringing her small cold hand in his stout warm one.

"Come!" he said. "You are tired now, and no wonder, but to-morrow you will be

better. You want sleep and you must have it. Go in, child, and go to bed. Good-night. God bless you! You will—be better to-morrow."

She went through the hall slowly, intending to go to her room, but when she reached the parlor she saw that it was lighted. She had given orders that the servants should not sit up for her, and the house was silent with the stillness of sleep. She turned at the parlor door and looked in. A fire still burned in the grate, her own chair was drawn up before it, and in the chair sat a figure, the sight of which caused her to start forward with an exclamation—a tall, slender, old figure, his gray head bowed upon his hand.

"Papa!" she cried. "Can it be you, papa? What has happened?"

He rose rather slowly, and looked at her; it was evident that he had been plunged in deep thought; his eyes were heavy, and he looked aged and worn. He put out his hand, took hers, and drew her to him.

"My dear," he said. "My dear child!"

She stood quite still for a moment, looking up at him.

"You have come to tell me something," she said at length, in a low, almost monotonous voice. "And it is something about Richard. It is something—something wretched."

A slight flush mounted to his cheek—a flush of shame.

"Yes," he answered, "it is something wretched."

She began to shake like a leaf, but it was not from fear.

"Then do not be afraid," she said, "there is no need! Richard—has not spared me!"

It was the first time through all she had borne and hidden, through all the years holding, for her, suffering and bitterness and disenchantment which had blighted all her youth—it was the first time she had permitted her husband's name to escape her lips when she could not compel herself to utter it gently, and that at last he himself had forced such speech from her was the bitterest indignity of all.

And if she felt this, the Professor felt it keenly, too. He had marked her silence and self-control at many a time when he had felt that the fire that burned in her must make her speak; but she had never spoken, and the dignity of her reserve had touched him often.

"What is it that Richard has done now, papa?" she said.

He put a tremulous hand into his pocket, and drew forth a letter.

"Richard," he said—"Richard has gone abroad."

She had felt that she was to receive some blow, but she had scarcely been prepared for this. She repeated his words in bewilderment.

"Richard has gone abroad!"

The Professor put his hand on her shoulder. "Sit down, my dear," he said. "You must sit down."

There was a chair near her; it stood by the table on which the Professor had been wont to take his cup of tea; she turned and sat down in this chair, and resting her elbows on the table, dropped her forehead upon her hands. The Professor drew near to her side, his gentle, refined old face flushed and paled alternately; his hands were tremulous; he spoke in a low, agitated voice.

"My dear," he said, "I find it very hard to tell you all—all I have discovered. It is very bitter to stand here upon your husband's hearth, and tell you—my child and his wife—that the shadow of dishonor and disgrace rests upon him. He has not been truthful; we have—been deceived."

She did not utter a word.

"For some time I have been anxious," he went on, "but I blame myself that I was not anxious sooner. I am not a business man—I have not been practical in my methods of dealing with him; the fault was in a great measure mine. His nature was not a strong one—it was almost impossible for him to resist temptation; I knew that, and should have remembered it. I have been very blind. I did not realize what was going on before my eyes. I thought his interest in the Westoria scheme was only one of his many whims. I was greatly to blame."

"No," said Bertha; "it was not you who were to blame. I was more blind than you—I knew him better than—than any one else."

"A short time ago," said the Professor, "I received a letter from an old friend who knows a great deal of my business affairs. He is a business man, and I have been glad to intrust him with the management of various investments. In this manner he knew something of the investment of the money which was yours. He knew more of Richard's methods than Richard was aware of. He had heard rumors of the Westoria land scheme, and had accidentally, in the transaction of his business, made some discoveries. He asked me if I knew the extent to which your fortune had been speculated with. Knowing a few facts, he was able to guess at others —"

Bertha lifted her face from her hands.

"My money!" she exclaimed. "My fortune!"

"He had speculated with it at various

times, sometimes gaining, sometimes losing—the Westoria affair seems to have dazzled him—and he invested largely——”

Bertha rose from her chair.

“It was Philip Tredennis’s money he invested,” she said. “Philip Tredennis——”

“It was not Philip’s money,” the Professor answered; “that I have discovered. But it was Philip’s generosity which would have made it appear so. In this letter—written just before he sailed—Richard has admitted the truth to me—finding what proof I had against him.”

Bertha lifted her hands and let them fall at her sides.

“Papa,” she said, “I do not understand this—I do not understand. Philip Tredennis! He gave money to Richard! Richard accepted money from him—to shield himself, to——! This is too much for me!”

“Philip had intended the money for Janey,” said the Professor, “and when he understood how Richard had involved himself, and how his difficulties would affect you and your future, he made a most remarkable offer: he offered to assume the responsibility of Richard’s losses. He did not intend that you should know what he had done. Such a thing would only have been possible for Philip Tredennis, and it was because I knew him so well, that, when I heard that it was his money that had been risked in the Westoria lands, I felt that something was wrong. He was very reticent, and that added to my suspicions. Then I made the discoveries through my friend, and my accusations of Richard forced him to admit the truth.”

“The truth!” said Bertha—“that I was to live upon Philip Tredennis’s money—that, having been ruined by my husband, I was to be supported by Philip Tredennis’s bounty!”

“Richard was in despair,” said the Professor, “and in his extremity he forgot——”

“He forgot *me!*” said Bertha. “Yes, he forgot—a great many things.”

“It has seemed always to be Philip who has remembered,” said the Professor, sadly. “Philip has been generous and thoughtful for us from first to last.”

Bertha’s hand closed itself.

“Yes,” she cried; “always Philip—always Philip!”

“What could have been finer and more delicate than his care and planning for you in this trouble of the last few days, to which I have been so blind!” said the Professor.

“His care and planning!” echoed Bertha, turning slowly toward him. “His! Did you not hear that Senator Blundel——”

“It was he who went to Senator Blundel,” the Professor answered. “It was he who

spoke to the wife of the Secretary of State. I learned it from Mrs. Merriam. Out of all the pain we have borne, or may have to bear, the memory of Philip’s faithful affection for us——”

He did not finish his sentence. Bertha stopped him. Her clenched hand had risen to her side, and was pressed against it.

“It was Philip who came to me in my trouble in Virginia,” she said. “It was Philip who saw my danger and warned me of it when I would not hear him; but I could not know that I owed him such a debt as this!”

“We should never have known it from him,” the Professor replied. “He would have kept silent to the end.”

Bertha looked at the clock upon the mantel.

“It is too late to send for him now,” she said, “it is too late, and a whole night must pass before——”

“Before you say to him—what?” asked the Professor.

“Before I tell him that Richard made a mistake,” she answered, with white and trembling lips, “——that he must take his money back—that I will not have it.”

She caught her father’s arm and clung to it, looking into his troubled face.

“Papa,” she said, “will you take me home again? I think you must if you will. There seems to be no place for me. If you will let me stay with you until I have time to think.”

The Professor laid his hand upon hers and held it closely.

“My dear,” he said, “my home is yours. It has never seemed so much mine since you left it; but this may not be so bad as you think. I do not know how much we may rely upon Richard’s hopes—they are not always to be relied upon—but it appears that he has hopes of retrieving some of his losses through a certain speculation he seems to have regarded as a failure, but which suddenly promises to prove a success.”

“I have never thought of being poor,” said Bertha; “I do not think I should know how to be poor. But, somehow it is not the money I am thinking of—that will come later, I suppose. I scarcely seem to realize yet——”

Her voice and her hand shook, and she clung to him more closely.

“Everything has gone wrong,” she said wildly, “everything must be altered. No one is left to care for me but you! No one must do it but you. Now that Richard has gone, it is not Philip who must be kind to me—not Philip—Philip last of all!”

“Not Philip!” he echoed. “*Not* Philip?”

And as he said it, they both heard feet ascending the steps at the front door.

"My child," said the Professor, "that is Philip now. He spoke of calling in on me on his way home. Perhaps he has been anxious at finding me out so late. I do not understand you—but must I go and send him away?"

"No," she answered, shuddering a little, as if with cold, "it is for me to send him away. But I must tell him first about the money. I am glad he has come—I am glad another night will not pass without his knowing. I think I want to speak to him alone—if you will send him here, and wait for a little while in the library."

She did not see her father's face as he went away from her; he did not see hers; she turned and stood upon the hearth with her back toward the door.

She stood so when a few minutes afterward Philip Tredennis came in; she stood so until he was within a few feet of her. Then she moved a little and looked up.

What she saw in him arrested for the moment her power to speak, and for that moment both were silent. Often as she had recognized the change which had taken place in him, often as the realization of it had wrung her heart, and wrung it all the more that she had understood so little, she had never before seen it as she saw it then. All the weariness, the anxious pain, the hopeless sadness of his past seemed to have come to the surface; he could endure no more; he had borne the strain too long, and he knew too well that the end had come. No need for words to tell him that he must lose even the poor and bitter comfort he had clung to; he had made up his mind to that when he had defended her against the man who himself should have been her defense.

So he stood silent and his deep eyes looked out from his strong, worn, haggard face, holding no reproach, full only of pity for her.

There was enough to pity in her. If she saw anguish in his eyes, what he saw in hers as she uplifted them he could scarcely have expressed in any words he knew; surely there were no words into which he could have put the pang their look gave him, telling him as it did that she had reached the point where he could stand on guard no more.

"Richard," she said at length, "has gone away."

"That I knew," he answered.

"When?" she asked.

"I had a letter from him this morning," he said.

"You did not wish to tell me?" she returned.

"I thought," he began, "that perhaps—" and stopped.

"You thought that he would write to me too," she said. "He—did not."

He did not speak, and she went on.

"When I returned to-night," she said, "Papa was waiting for me. He had received a letter too, and it told him—something he suspected before—something I had not suspected—something I could not know——"

Her voice broke, and when she began again there was a ring of desperate appeal in it.

"When I was a girl," she said, "when you knew me long ago, what was there of good in me that you should have remembered it through all that you have known of me since then—there must have been something—something good or touching—something more than the goodness in yourself—that made you pitiful of me, and generous to me, and anxious for my sake? Tell me what it was."

"It was," he said, and his own voice was low and broken too, and his deep and sad eyes wore a look she had never seen before—the look that in the eyes of a woman would have spoken of welling tears, "it was—yourself."

"Myself!" she cried. "Oh, if it was myself—and there were goodness and truth, and what was worth remembering in me, why did it not save me from what I have been—and from what I am to-day? I do not think I meant to live my life so badly then; I was only careless and happy in a girlish way. I had so much faith and hope, and believed so much in all good things—and yet my life has all been wrong—and I seem to believe no more, and everything is lost to me; and since the days when I looked forward there is a gulf that I can never, never pass again."

She came nearer to him, and a sob broke from her.

"What am I to say to you," she said, "now that I know all that you have done for me while I—while I—Why should you have cared to protect me? I was not kind to you—I was not careful of your feelings——"

"No," he answered. "You—were not."

"I used to think that you despised me," she went on; "once I told you so. I even tried to give you reason. I showed my worst self to you—I was unjust and bitter—I hurt you many a time."

He seemed to labor for his words, and yet he labored rather to control and check than to utter them.

"I am going away," he said. "When I made the arrangement with Richard, of which you know, I meant to go away. I gathered, from what your father said, that you mean to render useless my poor effort to be of use to you."

"I cannot—" she began, but she could go no farther.

"When I leave you—as I must," he said, "let me at least carry away with me the memory that you were generous to me at the last."

"At the last," she repeated after him, "the last!"

She uttered a strange, little, inarticulate cry. He saw her lift up one of her arms, look blindly at the bracelet on her wrist, drop it at her side, and then stand looking up at him.

There was a moment of dead silence.

"Janey shall take the money," she said. "I cannot."

What the change was that he saw come over her white face and swaying figure he only felt, as he might have felt a blow in the dark from an unknown hand. What the great shock was that came upon him he only felt in the same way.

She sank upon the sofa, clinging to the cushion with one shaking hand. Suddenly she broke into helpless sobbing, like a child's, tears streaming down her cheeks as she lifted her face in appeal.

"You have been good to me," she said. "You have been kind. Be good to me—be kind to me—once more. You must go away—and I cannot take from you what you want to give me; but I am not so bad as I have seemed—or so hard! What you have wished me to be—I will try to be! I will live for my children. I will be—as good—as I can. I will do anything you tell me to do—before you leave me! I will live all my life afterward—as Bertha Herrick might have lived it! Only do not ask me to take the money!"

For a few seconds all the room was still. When he answered her she could barely hear his voice.

"I will ask of you nothing," he said.

He lifted her hand and bowed his head over it. Then he laid it back upon the cushion. It lay there as if it had been carved from stone.

"Good-bye," he said. "Good-bye."

He saw her lips part, but no sound came from them.

So he went away. He scarcely felt the floor beneath his feet. He saw nothing of the room about him. It seemed as if there was an endless journey between himself and the door through which he was to pass. The extremity of his mortal agony was like drunk enness.

When he was gone, she fell with a shudder, and lay still with her cheek against the crimson cushion.

The Professor was sitting at her bedside when she opened her eyes again. Her first

recognition was of his figure, sitting, the head bowed upon the hand, as she had seen it when she came first into the house.

"Papa," she said, "you are with me?"

"Yes, my dear," he answered.

"And—there is no one else?"

"No, my dear."

She put out her hand and laid it upon his arm. He thought, with a bitter pang, that she did it as she had often done it in her girlhood, and that, in spite of the change in her, she wore a look which seemed to belong to those days too.

"You will stay with me," she said. "I have come back to you."

#### CHAPTER XXXVII.

MISS JESSUP was very eloquent in the paragraph which she devoted to the announcement of the departure of Colonel Trendennis, "the well-known hero of the plains, whose fine, bronzed face and soldierly figure have become so familiar to us during the past three seasons." She could scarcely express the regret felt by the many friends he had made, on losing him, and, indeed, there ran throughout the flowers of speech a suggestion of kindly, admiring sympathy and womanly good-feeling which quite went to the Colonel's heart, and made him wonder at his own good fortune when he read the paragraph in question. He was far away from Washington when the paper reached him. He had become tired of life at the Capital, it was said, and had been glad to exchange with a man who found its gayeties better suited to him.

"It is true," he said to himself when he heard of this report, "that they were not suited to me, nor I to them."

How he lived through the weeks, performing the ordinary routine of his duty, and bearing with him hour by hour, night and day, the load of grief and well-nigh intolerable anguish which he knew was never to be lighter, he did not know. The days came and went. It was morning, noon, or night, and he did not feel the hours either long or short. There were nights when, his work being done, he returned to his quarters and staggered to his seat, falling upon it blind and sick with the heavy horror of the day.

"This," he would say, again and again, "*this* is unnatural. To bear such torture and live through it seems scarcely human."

Sometimes he was so wrought upon by it physically that he thought he should not live through it; but he bore so much that at last he gained a hopeless faith in his own endurance. He was not alone. It was as he had

told her it would be. From the hour that he looked his last upon her, it seemed that her face had never faded from before his aching eyes. He had all the past to live over again, all its bitter mysteries to read in a new light and learn to understand.

There was time enough now for him to think it all over slowly, to recall to his mind every look and change and tone; her caprices, her coldness, the wounds she had given him, he bore them all again, and each time he came back with a pang more terrible to that last moment—to her last look, to her last, broken words.

"Oh, God!" he cried, "does *she* bear this too?"

He knew nothing of her save what he gained at rare intervals from Miss Jessup's society column, which he read deliberately from beginning to end as each paper reached him. The friends of Mrs. Amory, Miss Jessup's first statement announced, would regret to learn that the health of that charming young wife and mother was so far from being what was to be desired, that it necessitated a temporary absence from those social circles of which she was so bright and graceful an ornament. For a while her name was missing from the lists of those who appeared at the various entertainments, and then he began occasionally to see it again, and found a little sad comfort in the thought that she must be stronger. His kind, brown face changed greatly in these days; it grew lean and haggard and hopeless, and here and there a gray thread showed itself in his close, soldier-cropped hair. He planned out heavy work for himself, and kept close in his quarters, and those of his friends who had known him before his stay in Washington began to ask each other what had so broken Philip Tredennis.

The first time that Mrs. Amory appeared in society, after her indisposition, was at the house of her friend, Mrs. Sylvestre. During her temporary seclusion she had seen Mrs. Sylvestre frequently. There had been few days when Agnes had not spent some hours with her. When she had been denied to every one else, Agnes was admitted.

"It is only fatigue, this," Bertha had said; "but other people tire me so! You never tire me."

She was not confined to her bed. She had changed her room, taking possession of the pretty pink and blue chamber, and lay upon the sofa through the days, sometimes looking at the fire, often with her eyes closed.

The two conversed but little; frequently there was silence between them for some time; but Agnes knew that she was doing

as Bertha wished when she came and sat with her.

At the end of a week, Mrs. Sylvestre came in one morning and found Bertha dressed and sitting in a chair.

"I am going down-stairs," she said.

"Do you think you are strong enough?" Agnes asked. She did not look so.

"I must begin to try to do something," was the indirect reply. "One must always begin. I want to lie still and not speak or move; but I must not do that. I will go down-stairs, and I think I should like to see Laurence."

As she went down the staircase she moved very slowly, and Agnes saw that she clung to the balustrade for support. When she reached the parlor door she paused for a moment, then crossed the threshold a little hurriedly, and went to the sofa and sat down. She was tremulous, and tears had risen to her eyes from very weakness.

"I thought I was stronger," she said. But she said nothing more until, a few moments later, she began to speak of Tom and Kitty, in whom she had been much interested. It had been at her suggestion that, after divers fruitless efforts, the struggle to obtain Tom a "place" had been abandoned, and finally there had been procured for him a position likely to prove permanent, in a house of business where principles might be of value. Tom's lungs were still a trifle delicate, but he was rapturously happy in the small home to purchase which Mrs. Sylvestre had advanced the means, and his simple bliss was greatly added to by the advent of Kitty's baby.

So they talked of Tom and Kitty and the baby, and of Arbuthnot, and his friendship for them, and the oddities of it, and his way of making his efforts and kindness seem more than half a jest.

"No one can be kinder than Laurence," Bertha said. "No one could be a truer friend."

"I think so now," Agnes answered, quietly.

"He is not so light, after all," said Bertha. "Perhaps few of us are quite as light as we seem."

"I did him injustice at first," Agnes replied. "I understand him better now."

"If he should go away, you would miss him a little," said Bertha. "He is a person one misses when he is absent."

"Does he?"—Agnes began. "I have not heard him speak of going away."

"There is just a likelihood of it," Bertha returned. "Papa has been making an effort for him with the Secretary of State. He might be sent abroad."

"I have not heard him refer to the possibility," said Agnes. Her manner was still

quiet, but she had made a slight involuntary movement, which closed the book she held.

"I do not think Papa has spoken to him for some time," Bertha replied. "And when he first referred to his plan, Laurence thought it out of the question, and did not appear to regard it seriously."

For a few moments Mrs. Sylvestre did not speak. Then she said:

"Certainly it would be much better for him than to remain here."

"If he should go," said Bertha, "no one will miss him as I shall. We used to be so gay together, and now——"

She did not end her sentence, and for a while neither of them spoke again, and she lay quite still. Agnes remained to dine with her, and in the evening Arbuthnot came in.

When he entered the bright, familiar room, he found himself glancing round it, trying to understand exactly what mysterious change had come upon it. There was no change in its belongings—the touches of color, the scattered trifles, the pictures and draperies wore their old-time look of having been arranged by one deft hand; but it did not seem to be the room he had known so long,—the room he had been so fond of, and had counted the prettiest and most inspiring place he knew.

Bertha had not left the sofa; she was talking to Agnes, who stood near her. She had a brilliant flush on her cheeks, her eyes were bright when she raised them to greet him, and her hand, as he took it, was hot and tremulous.

"Naturally," she said, "you will begin to vaunt yourself. You told me I should break down if I did not take care of myself, and I have broken down—a little. I am reduced to lying on sofas. Don't you know how I always derided women who lie on sofas? This is retribution; but don't meet it with too haughty and vainglorious a spirit; before Lent I shall be as gay as ever."

"I don't doubt it," he answered. "But in the meantime allow me to congratulate you on the fact that the sofa is not entirely unbecoming."

"Thank you," she said. "Will you sit down now and tell me—tell me what people are saying?"

"Of——" he began.

She smiled.

"Of me," she answered. "They were saying a great deal of me a week ago; tell me what they say now. You must hear in going your giddy rounds."

"You are very well treated," he replied. "There is a certain great lady who is most uncomfortably commented upon. I can scarcely imagine that she enjoys it."

Her smile ended in a fatigued sigh.

"The tide turned very quickly," she said. "It is well for me that it did. I should not have had much mercy if I had stood alone. Ah! it was a good thing for me that you were all so brave. You might have deserted me, too—it would have been very simple—and then—then the gates of paradise would have been shut against me."

"That figure of speech meaning—?" suggested Arbuthnot.

"That I should have been invited to no more dinner-parties and receptions; that nobody would have come to my Thursday Evenings; that Miss Jessup would never again have mentioned me in the *Wabash Gazette*."

"That would have been very bitter," he answered.

"Yes," she returned, "it would have been bitter, indeed."

"Do you know," he said next, "that I have come to-night partly for the reason that I have something to tell you?"

"I rather suspected it," she replied, "though I could scarcely explain why."

"Am I to hear it, too?" inquired Agnes.

"If you are kind enough to be interested," he answered. "It will seem a slight enough affair to the world at large, but it seems rather tremendous to me. I feel a trifle overpowered and nervous. Through the kind efforts of Professor Herrick I have been honored with the offer of a place abroad."

Bertha held out her hand.

"Minister to the Court of St. James!" she said. "How they will congratulate themselves in London!"

"They would," he replied, "if an ill-adjusted and singularly unappreciative government had not particularized a modest corner of Germany as standing in greater need of my special abilities." But he took her offered hand.

When he glanced at Mrs. Sylvestre—truth to say he had taken some precautions against seeing her at all as he made his announcement—he found her bestowing upon him one of the calmest of her soft, reflective looks.

"I used to like some of those quiet places in Germany," she said, "but you will find it a change from Washington."

"I think," he answered, "that I should like a change from Washington," and as soon as he had spoken he detected the touch of acrid feeling in his words.

"I should fancy myself," she said, her soft look entirely undisturbed, "that it might be agreeable after one had been here some time."

He had always admired beyond expression

that touch of half forgetful, pensive calmness in her voice and eyes, but he did not enjoy it just now.

"It is a matter of temperament, I suppose," was his thought, "but, after all, we have been friends."

Neither could it be said that he enjoyed the pretty and picturesque stories of German life she told afterward. They were told so well that they brought very near the life he might expect to lead, and he was not exactly in the mood to care to stand face to face with it. But he controlled himself sufficiently to make an excellent audience, and never had been outwardly in better spirits than he was after the stories were told. He was cool and vivacious; he told a story or two himself; he was in good voice when he went to the piano and sang. They were all laughing, when Agnes left the room to put on her wraps to return home.

When she was gone the laugh died down with odd suddenness.

"Larry," said Bertha, "do you really want to go?"

"No," he answered, turning sharply, "I don't want to go. I loathe and abhor the thought of it."

"You want," she said, "to stay here?"

"Yes, I do," was his reply, "and that decides me."

"To go?" she asked, watching his pale, disturbed face.

"Yes, to go! There is nothing to stay here for. I need the change. I have been here long enough—too long!"

"Yes," she returned, "I think you have been here too long. You had better go away—if you think there is nothing to stay for."

"When a man has nothing to offer—" he broke off and flushed up hotly. "If I had a shadow of a right to a reason for staying," he exclaimed, "do you suppose I should not hold on to it, and fight for it, and demand what belonged to me? There might be a struggle—there would be; but no other man should have one jot or tittle that persistence and effort might win in time for me! A man who gives up is a fool! I have nothing to give up. I haven't even the right to surrender! I hadn't the right to enter the field and take my wounds like a man! It is pleasant to reflect that it is my own—fault. I trifled with my life; now I want it, and I can't get it back."

"Ah!" she said, "that is an old story!"

And then Agnes returned, and he took her home.

On their way there they talked principally of Tom and Kitty.

"They will miss you greatly," Agnes said. "They will be very kind to do it," was his reply.

"We shall all miss you," she added.

"That will be kinder still," he answered. "Might I be permitted to quote the ancient anecdote of the colored warrior, who, on running away in battle, was reproached and told that a single life counted as nothing on such great occasions, and that if he had fallen he would not have been missed,—his reply to this heroic statement of the case being, that he should have been likely to miss himself. I shall miss myself, and already a gentle melancholy begins to steal over me. I am not the gleesome creature I was before good luck befell me."

But despite this lightness of tone their walk was not a very cheerful one; indeed, after this speech they were rather quiet, and they parted with few words at the door, Arbuthnot declining to go into the house.

When Agnes entered alone, Mrs. Merriam looked up from her novel in some surprise.

"I thought I heard Mr. Arbuthnot," she said.

"He left me at the door," Mrs. Sylvestre answered.

"What!" said Mrs. Merriam, "without coming to say good-night to me! I wanted to tell him what a dissipated evening I have been spending with my new book."

"He has been telling us good news," said Agnes, standing before the fire and loosening her furs. "He has been offered a consulship."

Mrs. Merriam closed her book and laid it on the table.

"Will he accept it?" she asked.

"He could scarcely refuse it," Agnes replied. "It is a decided advance; he likes the life abroad, and it might even lead to something better in the future—at least one rather fancies such things are an opening."

"It is true," reflected Mrs. Merriam, "that he seems to have no particular ties to hold him in one place rather than another."

"None," said Agnes. "I don't know whether that is his fortune or his misfortune."

"His misfortune!" said Mrs. Merriam. "He is of the nature to know how to value them. Perhaps, after all, he may form them if he goes abroad. It is not too late."

"Perhaps so," said Agnes. "That would be another reason why it would be better for him to go."

"Still," remarked Mrs. Merriam, "for my own part I don't call it good news that he is going."

"I meant," said Agnes, "good news for him."

"It is bad news for us," Mrs. Merriam replied. "He will leave a gap. I have grown inconveniently fond of him myself."

But Agnes made no response, and soon afterward went to her room in silence. She was rather silent the next day when she made her visit to Bertha. Mrs. Merriam observed that she was rather silent at home; but, having seen her retire within herself before, she was too just to assign a definite reason for her quiet mood. Still she watched her with great interest, which had a fashion of deepening when Laurence Arbuthnot appeared upon the scene. But there was no change in her manner toward Arbuthnot. She was glad to see him; she was interested in his plans. Her gentle pleasure in his society seemed neither greater nor less than usual; her gentle regret at his approaching absence from their circle said absolutely nothing. In the gayeties of the closing season they saw even more of each other than usual.

"It will be generous of you to allow me a few additional privileges," Arbuthnot said; "an extra dance or so, for instance, on occasion; a few more calls than I am entitled to. Will you kindly, if you please, regard me in the light of a condemned criminal, and be lenient with me in my last moments?"

She did not refuse to be lenient with him. Much as he had been in the habit of enjoying the evenings spent in her parlor, he had never spent evenings such as fell to him in these last days. Somehow it happened that he found her alone more frequently. Mrs. Merriam had letters to write, or was otherwise occupied; so it chanced that he saw her as it had not been his fortune to see her very often.

But it was decided that he was to spend no more winters in Washington, for some time at least; and though he spent his evenings thus agreeably, he was making daily preparation for his departure, and it cannot be said that he enjoyed the task. There had been a time, it is true, when he would have greeted with pleasure the prospect of the change before him, but that time was past.

"I am having my bad quarter of an hour," he said, "and it serves me right."

But as the days slipped by he found it even a worse quarter of an hour than he had fancied it would be. It cost him an effort to bear himself as it was only discretion that he should. His one resource lay in allowing himself no leisure. When he was not otherwise occupied, he spent his time with his friends. He was oftenest with the Professor and Bertha. He had some quiet hours in the Professor's study, and in the parlor, where Bertha sat or lay upon the sofa before the fire. She did not allow herself to lie upon the sofa often, and

refused to be regarded as an invalid; but Arbuthnot never found himself alone with her without an overpowering realization of the change which had taken place in her. But she rarely spoke of herself.

"There is nothing more," she said, once, "to say about *me*."

She was willing enough to speak of himself, however, and of his future, and her gentle interest often moved him deeply.

"We have been such good friends," she would say,— "such good friends. It is not often that a man is as true a friend to a woman as you have been to me. I wish—oh, I wish you might be happy!"

"It is too late," he would reply, "but I shall not waste time in complaining. I will even try not to waste it in regretting."

But he knew that he did waste it so, and that each passing day left a sharper pang behind it, and marked a greater struggle.

"There is a great deal of trouble in this world," the Professor said to him, simply, after watching him a few minutes one day. "I should like to know what *you* are carrying with you to Germany."

"I am carrying nothing," Arbuthnot answered. "That is my share."

They were smoking their cigars together, and through the blue haze floating about him the Professor looked out with a sad face.

"Do you—" he said, "do you leave anything behind you?"

"Everything," said Arbuthnot. The Professor made a disturbed movement.

"Perhaps," he said, "this was a mistake. Perhaps it would be better if you remained. It is not yet too late—"

"Yes, it is," Arbuthnot interposed, with a faint laugh. "And nothing would induce me to remain."

It was on the occasion of a reception given by Mrs. Sylvestre that he was to make his last appearance in the social world before his departure. He had laid his plans in such a manner that, having made his adieus at the end of the evening, half an hour after retiring from the parlors he would be speeding away from Washington on his way to New York.

"It will be a good exit," he said. "And the eye of the unfeeling world being upon me, I shall be obliged to conceal my emotions, and you will be spared the spectacle of my anguish."

There were no particular traces of anguish upon his countenance when he presented himself, the evening in question having arrived. He appeared, in fact, to be in reasonably good spirits. Nothing could have been more perfect than the evening was from first to last; the picturesque and charming home was at

its best; Mrs. Sylvestre the most lovely central figure in its picturesqueness; Mrs. Merriam even more gracious and amusing than usual. The gay world was represented by its gayest and brightest; the majority of those who had appeared on the night of the ball appeared again. Rather late in the evening, Blundel came in fresh from an exciting debate in the Senate, and somewhat flushed and elated by it. He made his way almost immediately to Bertha. Those who stood about her made room for him as he came. She was not sitting alone to-night; there seemed no likelihood of her being called upon to sit alone again. She had not only regained her old place, but something more. The Professor had accompanied her, and at no time was far away from her. He hovered gently about in her neighborhood, and rarely lost sight of her. He had never left her for any great length of time since the night Tredennis had gone away. He had asked her no questions, but they had grown very near to each other, and any mystery he might feel that he confronted only made him more tender of her.

When Senator Blundel found himself standing before her he gave her a sharp glance of scrutiny.

"Well," he said. "You are rested and better, and all the rest of it. Your pink gown is very nice, and it gives you a color and brightens you up."

"I chose the shade carefully," she answered, smiling. "If it had been deeper it might have taken some color away from me. I am glad you like it."

"But you are well?" he said, a little persistently. He was not so sure of her after all. He was shrewd enough to wish she had not found it necessary to choose her shade with such discretion.

She smiled up at him again.

"Yes, I am well," she said. "And I am very glad to see you again."

But for several seconds he did not answer her; standing, he looked at her in silence as she remembered his doing in the days when she had felt as if he was asking himself and her a question. But she knew it was not the same question he was asking himself now, but another one, and after he had asked it he did not seem to discover the answer to it, and looked baffled and uncertain, and even disturbed and anxious. And yet her pretty smile did not change in the least at any moment while he regarded her. It only deserted her entirely once during the evening. This was when she said her last words to Arbuthnot. He had spent the previous evening with her in her own parlor. Now, before she went away—which she did rather early

—they had a few minutes together in the deserted music-room, where he took her while supper was in progress.

Neither of them had any smiles when they went in together and took their seats in a far corner.

Bertha caught no reflected color from her carefully chosen pink. Suddenly she looked cold and worn.

"Laurence!" she said, "in a few hours—" and stopped.

He ended for her.

"In a few hours I shall be on my way to New York."

She looked down at her flowers and then up at him.

"Oh!" she said, "a great deal will go with you. There is no one now who could take from me what you will. But that is not what I wanted to say to you. Will you let me say to you what I have been thinking of for several days, and wanting to say?"

"You may say anything," he answered.

"Perhaps," she went on, hurriedly, "it will not make any difference when it is said; I don't know;" she put out her hand and touched his arm with it; her eyes looked large and bright in their earnest appeal.

"Don't be angry with me, Larry," she said; "we have been such good friends and the best, *best* friends. I am going home soon. I shall not stay until the evening is over. You must, I think—until every one is gone away. You might—you might have a few last words to say to Agnes."

"There is nothing," he replied, "that I could say to her."

"There might be," she said, tremulously, "there might be—a few last words Agnes might wish to say to you."

He put his head down upon his hand and answered in a low tone:

"It is impossible that there should be."

"Larry," she said, "only you can find out whether that is true or not, and—don't go away before you are quite sure. Oh! do you remember what I told you once?—there is only one thing in all the world when all the rest are tried and done with. So many miss it, and then everything is wrong. Don't be too proud, Larry—don't reason too much. If people are true to each other, and content, what does the rest matter? I want to know that some one is happy like that. I wish it might be you. If I have said too much, forgive me; but you may be angry with me. I will let you—if you will not run the risk of throwing anything away."

There was a silence.

"Promise me," she said, "promise me."

"I cannot promise you," he answered.

He left his seat.

"I will tell you," he said. "I am driven to-night—driven! I never thought it could be so, but it is—even though I fancied I had taught myself better. I am bearing a good deal. I don't know how far I may trust myself. I have not an idea about it. It is scarcely safe for me to go near her. I have not been near her often to-night. I am *driven*. I don't know that I shall get out of the house safely. I don't know how far I can go, if I *do* get out of it, without coming back and making some kind of an outcry to her. One can't bear everything indefinitely. It seems to me now that the only decent end to this would be for me to go as quickly as possible, and not look back; but there never was a more impotent creature than I know I am to-night. The sight of her is too much for me. She looks like a tall, white flower. She is a little pale to-night—and the look in her eyes—I wish she were pale for sorrow—for me. I wish she were suffering; but she is not."

"She could not tell you if she were," said Bertha.

"That is very true," he answered.

"Don't go away," she said, "until you have said good-bye to her alone."

"Don't you see," he replied, desperately, "that I am in the condition to be unable to go until I am actually forced? Oh!" he added bitterly, "rest assured I shall hang about long enough." But when he returned to the supper-room, and gave his attention to his usual duties, he was entirely himself again, so far as his outward bearing went. He bore about ices and salads, and endeared himself beyond measure to dowagers with appetites, who lay in wait. He received their expressions of grief at his approaching departure with decorum not too grave and sufficiently grateful. He made himself as useful and agreeable as usual.

"He is always ready and amiable, that Mr. Arbuthnot," remarked a well-seasoned, elderly matron, who recognized useful material when she saw it.

And Agnes, who had chanced to see him just as his civilities won him this encomium, reflected upon him for a moment with a soft gaze, and then turned away with a secret thought her face did not betray.

At last the rooms began to thin out. One party after another took its departure, disappearing up the stairs and reappearing afterward, descending and passing through the hall to the carriages, which rolled up, one after another, as they were called. Agnes stood near the door-way with Mrs. Merriam, speaking the last words to her guests as they left her. She was still a little pale, but the

fatigues of the evening might easily have left her more so. Arbuthnot found himself lingering, with an agonizing sense of disgust at his folly. Several times he thought he would go with the rest, and then discovered that the step would cost him a struggle to which he was not equal. Agnes did not look at him; Mrs. Merriam did.

"You must not leave us just yet," she said. "We want your last moments. It would be absurd to bid you good-night as if we were to see you to-morrow. Talk to me until Agnes has done with these people."

He could have embraced her. He was perfectly aware that, mentally, he had lost all his dignity, but he could do nothing more than recognize the fact with unsparing clearness, and gird at himself for his weakness.

"If I were a boy of sixteen," he said, inwardly, "I should comport myself in something the same manner. I could grovel at this kind old creature's feet because she has taken a little notice of me."

But at length the last guest had departed, the last carriage had been called and had rolled away. Agnes turned from the door-way and walked slowly to the fire-place.

"How empty the rooms look," she said.

"You should have a glass of wine," Mrs. Merriam suggested. "You are certainly more tired than you should be. You are not as strong as I was at your age."

Arbuthnot went for the glass of wine into the adjoining room. He was glad to absent himself for a moment.

"In ten minutes I shall be out of the house," he said; "perhaps in five."

When he returned to the parlor Mrs. Merriam had disappeared. Agnes stood upon the hearth, looking down. She lifted her eyes with a gentle smile.

"Aunt Mildred is going to ask you to execute a little commission for her," she said. "She will be down soon, I think."

For the moment he was sufficiently abandoned and ungrateful to have lost all interest in Mrs. Merriam. It seemed incredible that he had only ten minutes before him and yet could retain composure enough to reply with perfect steadiness.

"Perhaps," he thought, desperately, "I am not going to do it so villainously after all."

He kept his eyes fixed very steadily upon her. The soft calm of her manner seemed to give him a sort of strength. Nothing could have been sweeter or more unmoved than her voice.

"I was a little afraid you would go away early," she said, "and that we could not bid you good-bye quietly."

"Don't bid me good-bye too quietly," he

answered. "You will excuse *my* emotion, I am sure?"

"You have been in Washington," she said, "long enough to feel sorry to leave it."

He glanced at the clock.

"I have spent ten years here," he said; "one grows fond of a place, naturally."

"Yes," she replied.

Then she added:

"Your steamer sails —"

"On Wednesday," was his answer.

It was true that he was driven. He was so hard driven at this moment that he glanced furtively at the mirror, half fearing to find his face ashen.

"My train leaves in an hour," he said; "I will bid you —"

He held out his hand without ending his sentence. She gave him her slender, cold fingers passively.

"Good-bye!" she said.

Mrs. Merriam was not mentioned. She was forgotten. Arbuthnot had not thought once of the possibility of her return.

He dropped Agnes's hand, and simply turned round and went out of the room.

His ten minutes were over; it was all over. This was his thought as he went up the staircase. He went into the deserted upper room where he had left his overcoat. It was quite empty, the servant in charge having congratulated himself that his duties for the night were over, and joined his fellows down-stairs. One overcoat, he had probably fancied, might take care of itself, especially an overcoat sufficiently familiar with the establishment to outstay all the rest. The garment in question hung over the back of a chair. Arbuthnot took it up and put it on with unnecessary haste; then he took his hat; then he stopped. He sank into the chair and dropped his brow upon his hand; he was actually breathless. He passed through a desperate moment as he sat there; when it was over he rose, deliberately freed himself from his coat again, and went down-stairs. When he reëntered the parlor, Agnes rose hurriedly from the sofa, leaving her handkerchief on the side-cushion, on which there was a little indented spot. She made a rapid step toward him, her head held erect, her eyes at once telling their own story, and commanding him to disbelieve it; her face so inexpressibly sweet in its sadness that his heart leapt in his side.

"You have left something?" she said.

"Yes," he answered, "I left — you."

She sat down upon the sofa without a word. He saw the large tears well up into her eyes, and they helped him to go on as nothing else would have done.

"I couldn't go away," he said. "There was no use trying. I could not leave you in that cold way, as if our parting were only an ordinary, conventional one. There is nothing conventional about my side of it. I am helpless with misery. I have lost my last shred of self-respect. I had to come back and ask you to be a little kinder to me. I don't think you know how cold you were. It was like death to drop your hand and turn away like that. Such a thing must be unendurable to a man who loves a woman."

He came nearer.

"Beggars should be humble," he said. "I am humble enough. I only ask you to say good-bye a little more kindly."

Her eyes were full and more beautiful than ever. She put out her hand and touched the sofa at her side.

"Will you sit here?" she said.

"What!" he cried, "I?"

"Yes," she answered, scarcely above her breath, "no one else." He took the place, and her slender hand.

"I have no right to this," he said. "No one knows that so well as I. I am doing a terrible, daring thing."

"It is a daring thing for us both," she said. "I have always been afraid — but it cost me too much when you went out of the door."

"Did it?" he said, and folded her hand close against his breast. "Oh!" he whispered, "I will be very tender to you."

She lifted her soft eyes.

"I think," she said, "that is what I need."

#### CHAPTER XXXVIII.

THE next six months Laurence Arbuthnot spent in his quiet corner of Germany, devoting all his leisure moments to the study of certain legal terms to which he had given some attention at a previous time when, partly as a whim, partly as the result of a spasm of prudence, he had woven himself a strand of thread to cling to in the vague future by taking a course of law. His plan now was to strengthen this thread until it might be depended upon, and he spared no determined and persistent effort which might assist him to the attainment of this object.

"I find myself an astonishingly resolute person," he wrote to Agnes. "I am also industrious. Resolution and industry never before struck me as being qualities I might lay claim to with any degree of justice. Dr. Watts himself, with his entirely objectionable bee, could not 'improve each shining hour'."

with more vigor than I do, but—I have an object, and the hours are shining. Once there seemed no reason for them. It is not so now. I will confess that I used to hate these things. Do you repose sufficient confidence in me yet to believe me when I tell you that I actually feel a dawning interest in Blackstone, and do not shudder at the thought of the lectures I shall attend in Paris. Perhaps I do not reflect upon them with due deliberation and coolness—I cannot help remembering that you will be with me.”

When he resigned his position and went to Paris she was with him. He had made a brief visit to Washington and taken her away, leaving Mrs. Merriam to adorn the house in Lafayette Square, and keep its hearth warm until such time as they should return.

It was when they were in Paris that they had the pleasure of meeting Mr. Richard Amory, who was very well known and exceedingly popular in the American colony. He was in the most delightfully buoyant spirits; he had been very fortunate; a certain investment of his had just turned out very well, and brought him large returns. He was quite willing to talk about it and himself, and was enraptured at seeing his friends. The news of their marriage delighted him; he was enchanting in his warm interest in their happiness. He seemed, however, to have only pleasantly vague views on the subject of the time of his probable return to America.

“There is no actual necessity for it,” he said, “and I find the life here delightful. Bertha and the children will probably join me in the spring, and we may ramble about for a year or so.” And he evidently felt he had no reason to doubt the truth of this latter statement. Bertha had been present at her friend’s marriage. She had been with her almost constantly during the last days preceding it. She found great pleasure in Agnes’s happiness. There had been no change in her own mode of life. Janey and Jack went out with her often, and when she was at home spent the greater part of the time with her. She helped them with their lessons, played with them, and made a hundred plans for them. They found her more entertaining than ever. Others found her no less entertaining. The old bright circle closed about her as before, and was even added to. Mr. Amory had been called abroad by business, and might return at any moment. The Professor was rarely absent from his daughter’s parlors when she had her guests about her. The people who had been interested in the Westoria scheme disappeared or became interested in something else. Senator Plane-field had made one call after Richard’s de-

parture, and then had called no more. Bertha had seen him alone for a short time, and before he took his leave, looking a trifle more florid than usual, he had thrown into the grate a bouquet of hot-house roses.

“Damn all this!” he cried, savagely. “What a failure it has been!”

“Yes,” said Bertha; “it has been a great failure.”

Senator Blundel did not disappear. He began to like the house again, and to miss his occasional evening there, if anything deprived him of it. He used to come and talk politics with the Professor, and hear Bertha sing his favorite ballads of sentiment. During the excitement preceding the presidential election the Professor found him absorbingly interesting. The contest was a close and heated one, and the usual national disasters were prophesied as the inevitable results of the final election of either candidate. Bertha read her way industriously through the campaign, and joined in their arguments with a spirit which gave Blundel keen delight. She read a great deal to her father, and made herself his companion, finally finding that she was able to help him with his work.

“I find great comfort in you, my child,” he said gently to her once, when she had been reading.

“Do you, dearest?” she answered, and she went to him and, standing near him, touched his gray hair with her cheek. “I find great comfort in you,” she said, in a low voice. “We seem to belong to each other as if—a little as if we had been left together on a desert island.”

When she went away for the summer with her children, the Professor went with her. He had never wondered at and pondered over her as he did in these days. Her incomings and outgoings were as they had always been. She shared the summer gayeties and went her way with her world, but it was but a short time before the kind old eyes looking on detected in her the lack of all that had made her what she had been in the past. They returned to Washington the day after the election of the new President. Their first evening at home was spent in reading the newspapers and discussing the termination of the campaign.

When Bertha rose to go to her room she stood a moment looking at the fire, and there was something in her face which attracted the Professor’s attention.

“My dear,” he said, “tell me what you are thinking of.”

She lifted her eyes and made an effort to smile, but the smile died out and left her face blank and cold.

"I am thinking of the last inaugural ball," she said, "and of Larry — and Richard — and of how I danced and laughed — and laughed — and that I shall never laugh so again."

"Bertha," he said, "my child!"

"No," she said, "never, never, — and I did not mean to speak of it — only just for a moment it all came back," and she went quickly away without finishing.

AFTER the election there came the usual temporary lull and the country settled itself down to the peaceful avocation of reading stories of the new President's childhood, and accounts of his daily receptions of interested friends and advisers. The only reports of excitement came from the Indian country, where little disturbances were occurring which caused anxiety among agents and frontiersmen. Certain tribes were dissatisfied with the arrangements made for them by the Government, quarrels had taken place, and it had become necessary to keep a strict watch upon the movements of the turbulent tribes. This state of affairs continued throughout the winter; the threatened outbreak was an inestimable boon to the newspapers, but, in spite of the continued threatenings, the winter was tided over without any actual catastrophes.

"But we shall have it," Colonel Tredennis said to his fellow officers; "I think we cannot escape it."

He had been anxious for some time, and his anxiety increased as the weeks went by. It was two days before the inaugural ceremonies that the blow fell. The Colonel had gone to his quarters rather early. A batch of newspapers had come in with the eastern mail, and he intended to spend his evening in reading them. Among these there were Washington papers, which contained descriptions of the preparations made for the ceremonies, — of the triumphal arches and processions, of the stands erected on the avenue, of the seats before the public buildings, of the arrangements for the ball. He remembered the belated flags and pennants of four years before, the strollers in the streets, his own feelings as he had driven past the decorations, and at last his words:

"I came in with the Administration; I wonder if I shall go out with it, and what will have happened between now and then."

He laid his paper down with a heavy sigh, even though he had caught a glimpse of Miss Jessup's letter on the first sheet. He could not read any more; he had had enough. The bitter loneliness of the moment overpowered him, and he bowed his face upon his arms, leaning upon the pile of papers and letters on

the table. He had made, even mentally, no complaint in the last month. His hair had grown grizzled and his youth had left him; only happiness could have brought it back, and happiness was not for him. Every hour of his life was filled with yearning sadness for the suffering another than himself might be bearing; sometimes it became intolerable anguish; it was so to-night.

"I have no part to play," he thought; "every one is used to my grim face, but she — poor child! — poor child! — they will not let her rest. She has worn her smile too well."

Once, during the first winter of his stay in Washington, he had found among a number of others a little picture of herself, and had asked her for it. It was a poor little thing, evidently lightly valued, but he had often recalled her look and words as she gave it to him.

"Nobody ever wanted it before," she had said. "They say it is too sad to be like me. I do not mind that so much, I think. I had rather a fancy for it. Yes, you may have it, if you wish. I have been gay so long — let me be sad for a little while, if it is only in a picture."

He had carried it with him ever since. He had no other relic of her. He took it from his breast-pocket now, and looked at it with aching eyes.

"So long!" he said. "So long!" And then again, "Poor child! poor child!"

The next instant he sprang to his feet. There was a sound of hurried feet, a loud knocking at his door, which was thrown open violently. One of his fellow officers stood before him, pale with excitement.

"Tredennis," he said, "the Indians have attacked the next settlement. The devils have gone mad. You are wanted —"

Tredennis did not speak. He gave one glance round the room, with its blazing fire and lonely, soldierly look; then he put the little picture into his pocket and went out into the night.

#### CHAPTER XXXIX.

IN all her honest, hard-worked little life, Miss Jessup had never done more honest, hard work than she was called upon to do on the day of the inauguration. She had written into the small hours the night before; she had described bunting and arches, evergreens and grand stands, the visiting regiments, club uniforms, bands, banners, torch-lights and speeches, and on the eventful day she was up with the dawn, arranging in the most practicable manner her plans for the day.

With letters containing a full and dramatic description of the ceremonies to be written to four Western papers, and with extra work upon the Washington weekly and daily, there was no time to be lost. Miss Jessup lost none. Each hour of the day was portioned off—each minute, almost. Now she was to take a glance at the procession from the steps of the Treasury; now she was to spend a few moments in a balcony overlooking another point; she was to see the oath administered, hear the President's address and form an estimate of his appreciation of the solemnity of the moment; she was to take his temperature during the afternoon, and be ready to greet him at the ball, and describe dresses, uniforms, decorations, flags, and evergreens again. Even as she took her hasty breakfast she was jotting down appropriate items, and had already begun an article, opening with the sentence, "Rarely has Washington witnessed a more brilliant spectacle," etc.

It could scarcely be said that she missed anything when she went her rounds later. No familiar face escaped her; she recognized people at windows, in carriages, on platforms. Among others she caught a glimpse of Mrs. Amory, who drove by on her way to the Capitol with her father and Jack and Janey.

"She looks a little tired about the eyes," thought Miss Jessup. "She has looked a little that way all the season, though she keeps going steadily enough. They work as hard as the rest of us in their way, these society women. She will be at the ball to-night, I dare say."

Bertha herself had wondered if she would find herself there. Even as she drove past Miss Jessup, she was thinking that it seemed almost impossible; but she had thought things impossible often during the winter which had gone by, and had found them come to pass and leave her almost as before. Gradually, however, people had begun to miss something in her. There was no denying, they said, that she had lost some of her vivacity and spirit; some tone had gone from her voice; something of color from her manner. Perhaps she would get over it. Amory had not behaved well in the Westoria land affair, and she naturally felt his absence and the shadow under which he rested.

"Very gradually," she said to the Professor once, "I think I am retiring from the world. I never was really very clever or pretty. I don't hide it so well as I used to, and people are finding me out. Often I am a little dull, and it is not likely they will forgive me that."

But she was not dull, at home, or the Professor never thought so. She was not dull

now, as she pointed out objects of interest to Jack and Janey.

"I wish Uncle Philip were here!" cried Jack. "He would have his sword on and be in uniform, and he would look taller than all the rest—taller than the President."

The day was very brilliant to the children; they were as indefatigable as Miss Jessup, and missed as little as if they had been in search of items. The blare of brazen instruments, the tramp of soldiers, the rattle of arms, the rushing crowds, the noise and color and excitement, filled them with rapture. When they finally reached home they were worn out with their delights. Bertha was not less fatigued; but, after the nursery was quiet and the children were asleep, she came down to dine with the Professor.

"And we will go to the ball for an hour," she said. "We cannot submit to having it described to us for the next two weeks by people who were there."

The truth was, that she could not sit at home and listen to the carriages rolling by, and watch the dragging hours with such memories as must fill them.

So at half-past ten she stood in her room putting the last touches to her toilet, and shortly afterward she was driving with the Professor toward the scene of the night's gayeties. She had seen the same scene on each like occasion since her eighteenth year. There was nothing new about it to-night; there was some change in dances and music, but the same types of people crowded against each other, looking on at the dancing, pointing out the President, asking the old questions, and making the old comments; young people whirled together in the center of the ball-room, and older ones watched them, with some slight wonder at the interest they evinced in the exercise. Bertha danced only a few quadrilles. As she went through them she felt again what she had felt on each such occasion since the night of the ball of the last year—the music seemed too loud, the people too vivacious, the gayety about her too tumultuous; though, judged by ordinary standards, there could have been no complaint made against it.

But, notwithstanding this feeling, she lingered longer than she had intended, trying to hide from herself her dread of returning home. No one but herself knew—even the Professor did not suspect, how empty the house seemed to her, and how its loneliness grew and grew until sometimes it overpowered her and became a sort of deadly presence. Richard's empty rooms were a terror to her; she never passed their closed doors without a shock.

At half-past twelve, however, she decided to go home. She had just ended a dance with a young attaché of one of the legations; he was a brilliantly hued and graceful young butterfly, and danced and talked well. There had been a time when she had liked to hear his sharp, slightly satirical nonsense, and had enjoyed a dance with him. She had listened to-night, and had used her pretty smile at opportune moments; but she was glad to sit down again.

"Now," she said to him, "will you be so good as to find my father for me, and tell him I will go home?"

"I will if I must," he answered. "But otherwise——"

"You will if you are amiable," she said. "I blush to own that I am tired. I have assisted in the inaugural ceremonies without flinching from their first step until their last, and I begin to feel that His Excellency is safe and I may retire."

He found her a quiet corner and went to do her bidding. She was partly shielded by some tall plants, and was glad of the retreat they afforded her. She sat and let her eyes rest upon the moving crowd promenading the room between the dances; the music had ceased, and she could catch snatches of conversation as people passed her. Among the rest were a pretty, sparkling-eyed girl and a young army officer who attracted her. She watched them on their way round the circle twice, and they were just nearing her for the second time when her attention was drawn from them by the sound of voices near her.

"Indian outbreak," she heard. "Tredennis! News just came in."

She rose from her seat. The speakers were on the other side of the plants. One of them was little Miss Jessup, the other a stranger, and Miss Jessup was pale with agitation and professional interest, and her note-book trembled in her little bird-like hand.

"Colonel Tredennis!" she said. "Oh! I knew him. I liked him—every one did—every one! What are the particulars? Are they really authenticated? Oh, what a terrible thing!"

"We know very few particulars," was the answer, "but those we know are only too well authenticated. We shall hear more later. The Indians attacked a small settlement, and a party went from the fort to the rescue. Colonel Tredennis commanded it. The Indians were apparently beaten off, but returned. A little child had been left in a house, through some misunderstanding, and Tredennis heard it crying as the Indians made their second attack, and went after it.

He was shot as he brought it out in his arms."

Little Miss Jessup burst into tears and dropped her note-book.

"Oh!" she cried. "He was a good, brave man! He was a good man!"

The band struck up a waltz. The promenading stopped; a score or two of couples took their place upon the floor, and began to whirl swiftly past the spot where Bertha stood; the music seemed to grow faster and faster, and louder, and still more loud.

Bertha stood still.

She had not moved when the Professor came to her. He himself wore a sad, grief-stricken face; he had heard the news too; it had not taken it long to travel round the room.

"Take me home," she said to him. "Philip is dead! Philip has been killed!"

He took her away as quickly as he could through the whirling crowd of dancers, past the people who crowded, and laughed, and listened to the music of the band.

"Keep close to me!" she said. "Do not let them see my face!"

When they were shut up in the carriage together, she sat shuddering for a moment, he shuddering, also, at the sight of the face he had hidden; then she trembled into his arms, clung to his shoulder, cowered down and hid herself upon his knee, slipped down kneeling upon the floor of the carriage, and clung to him with both her arms.

"I never told you that I was a wicked woman," she said. "I will tell you now; always—always I have tried to hide that it was Philip—Philip!"

"Poor child!" he said. "Poor, unhappy—most unhappy child!" All the strength of her body seemed to have gone into the wild clasp of her slender arms.

"I have suffered," she said. "I have been broken, I have been crushed. I knew that I should never see him again, but he was alive. Do you think that I shall some day have been punished enough?"

He clasped her close to his breast, and laid his gray head upon her brown one, shedding bitter tears.

"We do not know that this is punishment," he said.

"No," she answered. "We do not know. Take me home to my little children. Let me stay with them. I will try to be a good mother—I will try——"

She lay in his arms until the carriage stopped. Then they got out and went into the house. When they closed the door behind them and stood in the hall together, the deadly silence smote them both. They did not speak to each other. The Professor supported her

with his arm as they went slowly up the stairs. He had extinguished the light below before they came up. All the house seemed dark but for a glow of fire-light coming through an open door on the first landing. It was the door Philip Tredennis had seen open that first night when he had looked in and had seen Bertha sitting in her nursery-chair with her child on her breast.

There they both stopped. Before the Professor's eyes there rose, with strange and terrible clearness, the vision of a girl's bright face looking backward at him from the night, the light streaming upon it as it smiled above a cluster of white roses. And it was this that remained before him when, a moment afterward, Bertha went into the room and closed the door.

THE END.

---

SALVINI.

DEAD is old Greece, they said who never saw  
This Greek—this oak of old Achaian girth  
And stateliness, in mellower Lombard earth  
Far-sown by wingèd Chance's fatal law,  
When Greeks were like the templed oaks that rose—  
Not the lone ruin of a withered shaft,  
But quaffing life in every leafy draught,—  
Fathered by Storm and mothered by Repose.

Nay, doubt the gods are gone, till in the West  
His splendor sets, and in its twilight we  
The phantom glory of the actor's day  
Prolong, like memories of a noble guest;  
Then, musing on Olympus, men shall say:  
The myth of Jove took rise from lesser majesty.

*Robert Underwood Johnson.*

TOPICS OF THE TIME.

**A Great Metropolitan University.**

WE have no great university in New York, but the feeling is very general in the community that, before long, we must have one. Of denominational colleges, more or less fully equipped, we have quite a number, but there is not one among these which can lay claim to the title of a great university; not one which is to the city of New York what Harvard is to Boston, Yale to New Haven, and Johns Hopkins to Baltimore. Unquestionably the most prominent and the most dignified among our local institutions of learning is Columbia College, with its associated schools, and the question is naturally being asked by the friends of higher education in this city, whether this in many respects admirable institution might not serve as a nucleus for the future university. Columbia has an able corps of instructors, and has of recent years shown a laudable tendency to adapt itself, though slowly, to the demands of the age. It is not very long since a School of Political Science was established and placed under the direction of a competent professor, and quite recently steps have been

taken toward the establishment of a School of Modern Languages, in which extensive facilities will be offered for linguistic and literary study. In spite of these timely innovations, however, the college is, in certain other directions, deficient, and scientific study occupies a very subordinate place in its curriculum. Only elementary instruction is offered in the School of Arts, in chemistry and geology, and even this is elective. In physics there are opportunities for more advanced study under an excellent professor; and, in fact, in other scientific branches, it is not the instructors but the curriculum which is at fault. In essentials the college still seems to adhere to the traditional English system, in which Latin, Greek, and mathematics hold the places of honor, and other studies are but grudgingly allowed, and occupy an uncertain footing. Latin and Greek prose and metrical composition and exercises in choral scanning are, according to the "Circular of Information," obligatory partly in the Freshman and partly in the Sophomore year; and among the senior electives are archaic Latin and lectures on the Elements of Comparative Philology. Now, if this were all elective, there could be no

possible objection to including it in the college course; but, to devote time to drilling men in the writing of Greek verse, while leaving them in ignorance of the anatomy and physiology of their own bodies, and leaving it to their option whether they will inform themselves as to the significance of the physical phenomena which daily meet their eyes, seems, to say the least, a very narrow policy, and indicates, on the part of the framers of such a curriculum, a lack of sympathy with the great intellectual movements of the century. It is the conservatism of its trustees, in this regard, which makes the friends of Columbia College doubtful as to whether it possesses sufficient elasticity and progressive vitality to expand into a great university, responsive to every need of the age. If this doubt is justified, there can be no question that, before many years, the college will be superseded by an institution which will be in closer sympathy with the scientific tendencies of modern life. That this would be a misfortune to the college its friends can scarcely fail to appreciate.

The charter of Columbia (then King's) College is dated October 31, 1754. It has always maintained a close connection with the Episcopal Church, and particularly with Trinity Parish, to which it is indebted for a large share of its endowment. Its traditions were naturally derived from Oxford and Cambridge, and its course of instruction was modeled in accordance with that of its English prototypes. However, by the establishment of its Law School (1858), its Medical School (1860), and its School of Mines (1863), the college has gradually departed from these traditions, and there is nothing in its charter to prevent it from developing still further in the direction we have endeavored to indicate. The English universities have, of late, become aware of their mediæval infirmities, and the recent parliamentary commission has recommended some radical changes, which will modernize and secularize both their curriculum and their semi-monastic organization. It is as well understood in England as it is in Germany, at the present day, that it is useless to fight any longer for the supremacy of classics and mathematics, and that there are other studies which are entitled to at least an equal rank as agencies of culture. What a university has to do is, therefore, to offer the most extensive facilities for the pursuit of every branch of human knowledge, and to accord no artificial prominence to any one study which tradition may have invested with a fictitious virtue. If the old undergraduate course must be retained (and it is, in our opinion, in need of essential modifications), then there should be provided opportunities for advanced post-graduate study, such as have already been provided at Harvard and Johns Hopkins. That there is a vital demand in a city like New York for something more than elementary instruction in geology, chemistry, physiology, philology, and a dozen other sciences that might be named, can scarcely be questioned. Where is the institution to be found that satisfies this demand? In the Columbia School of Mines, lectures are delivered by men competent in those sciences which have a direct professional value to mining engineers, and the Medical School confines itself likewise to the single aim of training professional men for their future calling. Strictly scientific work, such as is done at

the Physiological Institute of Berlin and the Collège de France, finds no place in any New York institution of learning. Therefore our doctors who wish to attain exceptional proficiency in any special branch of their profession go to Paris, Berlin, or Vienna; philologists who wish to acquire a thorough scientific training go to Berlin or Leipsic; and, in fact, every scholar who aims at something more than respectable mediocrity spends a year or two at a German university. It ought to be perfectly evident to any one who has seen the great number of American faces in the German lecture-halls, that there is an urgent demand for something better in the way of scientific training than America now offers. These young men, many of whom have to borrow the money that maintains them while studying, go abroad not from preference, but because they cannot find what they want at home. New York, with all her magnificent churches, hospitals, and business palaces, has hitherto satisfied itself with mediocrity in learning, and has never endowed any institution sufficiently to raise it to the dignity of a university worthy of this metropolis; but, judging from the discussions we have heard of late in many quarters, the city is becoming aroused to a consciousness of its need, and when this moment shall have arrived the great Metropolitan University will be removed from the region of possibility to that of fact.

It is popularly supposed that Columbia College possesses a more than sufficient endowment to undertake the work which we have here outlined; but those who are more intimately acquainted with her affairs assert that this is by no means the case. The two new buildings which have recently been erected have absorbed a large share of her income for several years to come, and a third one, which is to occupy the plot where the old college now stands, will still further reduce her resources and prevent her from extending her usefulness in accordance with the demands of the times. It is therefore obvious that a larger endowment is needed, and it is scarcely doubtful that her many wealthy and influential friends and alumni would respond liberally to an appeal issued under the authority of her president and board of trustees. The college has been sufficient unto itself in times past, and though never refusing gifts, has not, so far as we know, stimulated the interest and loyalty of her alumni by annual reports of her wants, such as are issued by the president of Harvard, or by direct appeals for aid. Accordingly, there is a general impression abroad that Columbia is rolling in wealth, and really wants no more money than she has. This self-sufficiency is, undoubtedly, very dignified, but it has many and obvious disadvantages. Large sums of money, which might be offered to Columbia if the public were impressed with the fact that she needed them, find their way elsewhere, and that healthy interest which is aroused and kept alive by constant public discussion is allowed to languish, because the institution, while pursuing the even tenor of its way, holds aloof from the burning educational questions of the day, and thus furnishes no food for discussion.

The president of Columbia, who is an able and progressive man, would spare no effort to make his college second to none in usefulness if the financial condition of the institution warranted him in under-

taking well-recognized but expensive reforms. That the board of trustees, notwithstanding its conservative attitude on certain subjects in the past, would second him in every well-considered effort having this end in view, can scarcely be doubted; but until the financial problem shall have been satisfactorily solved, the board can hardly be expected to adopt any scheme involving heavier outlay. In the meanwhile, New York is waiting for her great university, and it is by no means an imaginary danger that Columbia, if she neglects her opportunity, may wake up some morning and find herself confronted with a formidable rival.

#### Slave or Master?

A COLORED clergyman of some education and much native wit was once discoursing to his congregation on what the apostle calls "the sinfulness of sin." "There are those, my brethren," he said, "who tell us that there is no such thing as sin; that man is created with certain appetites and propensities; that these were made to be gratified; and that, whenever we gratify them, we do that which is perfectly lawful and right." The last sentence was spoken with some emphasis; and four or five of the "leading brethren," understanding that it was the proper place to respond, punctuated the parson's falling inflection with a stalwart "Amen!"

The chorus in the colored meeting-house, like the chorus in the Greek tragedy, may be supposed to reflect the philosophy of the period. To an acute observer, the close relation between what is sometimes called the "advanced" thought of the day and the rude notions of the lowest stratum of society is often apparent. You shall find the fine-spun theories of materialistic science reduced to their lowest terms in the mouths of men in country groceries and city beer-gardens. The sentiment which the colored brethren rather infelicitously applauded—how does it differ from this dictum of Karl Vogt?—"Free will does not exist, neither does any amenability or responsibility, such as morals and penal justice, and heaven knows what, would impose upon us. At no moment are we our own masters, any more than we can decree as to the secretions of our kidneys. The organism cannot govern itself; it is governed by the law of its material combination." The doctrine that the colored clergyman was endeavoring so laudably, but with such indifferent success, to controvert, how could it be more clearly stated than in these words of Moleschott?—"Sin lies in the unnatural, and not in the will to do evil. Speech and style, good and bad actions, courage, half-heartedness, and treachery, are all natural phenomena, and all of them stand in a direct relation to indispensable causes as their natural consequences, just as much as the revolutions of the globe."

This kind of philosophy enters into the thought and speech of the most ignorant and depraved classes of the community to a considerable extent. Doubtless there is need of considering the disabilities that inhere in diseased organisms,—the hereditary tendencies to evil by which virtuous purposes are impeded; our judgments of our fellow-men will often be modified by such facts. But the "charity," or the "science," that denies human responsibility finds its proper issue and its natural votaries in the slums.

It is not, however, with the theological consequences of this philosophy that we are now concerned, but rather with its effect upon the education and training of the young. A doctrine that denies free will, and makes of man only a bundle of appetites and impulses and propensities whose law is in themselves, destroys not only religion and morality, it destroys also the foundations of education, and makes discipline a solecism. A logical deduction from it is the notion that pupils should study only what they like to study, and when they like to study; and that children should do only what they like to do, and when they like to do it. Modern theories of education are tinged by this notion; it finds place in the regimen of the home and the curriculum of the university. The popular lecturer who criticises the Old Testament with the fairness, erudition and wit of a stump-speaker, sneers at the old-fashioned notions of obedience and discipline; says that children ought to follow nature in the formation of their habits; and his audiences applaud the sentiment. It does not take such ideas long to filter down through all the strata of society, and thus to affect, in many ways, the conduct of old and young. Do we not note an increasing tendency to depend on moods and impulses? "I don't feel like work," is often proclaimed as the sufficient excuse for idleness. Disrelish for any particular pursuit is mentioned as ample reason for abandoning it. Even the paupers who beg at your door justify their failure to find employment by telling you that the labor offered them is not congenial.

Of course this plea has always been made, and, so long as the original sin of indolence continues to be so deeply rooted in human nature, it will be made; but it seems that now this vice of human nature is to be well-nigh elevated into the rule of life.

It is a pestilent notion. In it lurks the disorganizing force by which characters and communities are undermined and ruined. There never was a strong character that was not made strong by discipline of the will; there never was a strong people that did not rank subordination and discipline among the signal virtues. Subjection to moods is the mark of a deteriorating morality. There is no baser servitude than that of the man whose caprices are his masters, and a nation composed of such men could not long preserve its liberties.

This is a truth that the young must lay to heart. It will be a sorry day for this world, and for all the people in it, when everybody makes his moods his masters, and does nothing but what he is inclined to do. The need of training the will to the performance of work that is distasteful; of making the impulses serve, instead of allowing them to rule, the higher reason; of subjugating the moods instead of being subjugated by them, lies at the very foundation of character. It is possible to learn to fix the wandering thought, to compel the reluctant mental energy, to concentrate the power upon the performance of a task to which there is no inclination. Until this victory has been gained, life holds no sure promise; the achievement of this conquest is the condition of future success. No matter how splendid may be the natural gifts, unless there is a will that can marshal and command them, the life is sure to be a failure.

Even in the fine arts the highest inspirations wait on those who have learned to work. The poets who

never write except when they are in the mood, who do not learn to hold their minds firmly down to the work in hand, to justify the thought and shape the utterance, are not among the immortal bards. To the man who has wrought long and faithfully in perfecting the art of expression, in studying the subtle shades of meaning and the subtle tones of music that are found in words, and in combining them so that they will harmoniously tell some master truth of human experience, or show some phase of natural beauty, many a strain of beautiful and perfect melody comes suddenly; but it is because the molds of beauty were fashioned in the poet's mind by long and painful study. What is true of the poetic art is true of every other; the condition of artistic success is faithful work and thorough training.

The young men in the colleges know that training is indispensable to physical perfection. They know that the men who eat and drink just what their appetites crave, and take their exercise only when they feel like it, never win the boat-races or the foot-ball matches. It should not be difficult for them to see that mental and moral power, without which success and happiness in life are impossible, are equally dependent on discipline. The body will not do its best work unless, as a great authority says, it is "kept under"; and what is true of the body is equally true of the mind; its whims and caprices and moods must be brought under the subjection of a masterful will; the man must become not the servant, but the ruler of his own nature.

#### The Press and the New Reform.

THE platform seems to have had less to do proportionately with the triumphs of the principles of civil service reform than it had to do with the triumphs of anti-slavery principles. It would appear that the new political reform owes more to the arguments of writers than to the eloquence of speakers. We by no means intend to disparage the labors of speakers in Congress, in political conventions, in the pulpit, and elsewhere; but it should not be forgotten that the great work of educating the people in the matter of the new reform has been mainly by means of the printing-press, by means of books, pamphlets, and periodicals.

When Mr. Curtis, in a recent number of "Harper's

Weekly," writes of the late Thomas Allen Jenckes, of Rhode Island, as "The Father of Civil Service Reform," he does justice to one who should not be overlooked in the apportionment of honors. But Mr. Curtis is hardly the man to give a full and truthful account of the entire struggle, for modesty might occasion a serious hiatus in the story. As an orator, and in his office as President of the Reform Association, Mr. Curtis's labors have been great; but, as a writer and editor, they have been greater. Mr. E. L. Godkin should be mentioned with Mr. Curtis among those whose pens have been powerful in bringing about the just-begun reform. The wider dissemination of Mr. Curtis's political writings, in the pages of a popular illustrated weekly, is to be taken into the account; but the influence of "The Nation" upon the great body of thoughtful minds in all sections of the country can hardly be over-estimated. Not only the direct teachings of "The Nation" on the subject of civil service reform have been of incalculable value at this epoch in our history, but the tone that this journal has helped to impart to political thinking and discussion in general has been of the greatest importance.

We have named Mr. Curtis and Mr. Godkin especially; but we think it no more than just that Dr. Holland's convinced and convincing writings on this subject, in these columns, should be mentioned in this connection. Many of the monthly magazines and reviews have, moreover, welcomed papers by such able and persistent promoters of the reform as Mr. Dorman B. Eaton and Dr. Washington Gladden; and many of the religious weeklies and a certain number of the daily newspapers have kept up for years an able and earnest advocacy of the reform, though in these cases it is not so easy to detect the individual writers and single them out for the praise they deserve.

But, as we have said, the great reform is really only just begun. The adaptation of these new methods to our political system, the proper enforcement of the law, the extension of the reform to the machinery of our State and municipal governments,—these, also, are matters not so much for oratorical discourse and appeal as for the alert watchfulness and calm arguments and warnings of the press. Our political writers have by no means finished their work, with relation to the civil service; there is, if anything, more need of vigilance and wisdom than ever before.

---

#### LITERATURE.

##### Conway's "Emerson at Home and Abroad."\*

THE numerous readers of Mr. Conway's earlier books are accustomed to think of him as an insatiable explorer of facts and traditions, an enthusiastic hero-worshipper, and a *littérateur* of unfailing vivacity and almost unerring tact. His drawbacks have seemed to

lie in a certain exuberance of material, some neglect of arrangement, and an occasional want of minute accuracy in details. It is pleasant to see that, as time goes on, he gains more and more self-mastery, and puts his faults behind him. In this book we find him at his best. Even that which has been criticised as a slightly over-confidential and too autobiographical tone, in the opening chapter, is so frank and ardent as really to disarm all objection; and it has its peculiar value as giving the key-note for the whole

\* Emerson at Home and Abroad. By Moncure Daniel Conway. Boston: Jas. R. Osgood & Co.

book. It is the tribute of a pupil to the master, and it is essential to such a tribute that the pupil should give some revelation of himself.

There is here and there a passage in the book which suggests that it was written in England,—the spelling of "favour" and "storeys," the estimate of Emerson's early income in pounds sterling, and the pains taken (p. 33) to explain that "it was the rule in the [Emerson] family to distribute their possessions equally between the members of their family." The absence of an index is also a defect more common in English books than in American; but the flavor of the book has that essential Americanism which Mr. Conway's long English residence has not at all impaired, and there is even a distinct air of old-fashioned transcendentalism about the titles of the chapters. "Fore-runners," "Sursum Corda," "Sangreal," "Concordia," and "The Python" remind us anew of the ardent young prophet who once essayed to give "The Dial" a new lease of life in Cincinnati, and still remains true to his early visions.

It is in the story-telling faculty that we are chiefly reminded how the prophet has become a magazinist; and certainly no single volume has yet brought together so many fresh memorials of Emerson as are here combined. At the very outset, with his wonted appetite for a good bit of symbolism, Mr. Conway emphasizes the fact that the first American Emerson was a baker, and points out that his great descendant furnished the bread of truth to men (p. 132). Probably, if we looked far enough into the genealogy of any eminent person, we should come to some such apt analogy; as in the fact lately brought to light by Mr. Kennedy, that the pioneer Whittier's chief outfit for America was a bee-hive. Those who have visited the house of Goethe at Frankfort will remember the paternal horse-shoes converted into lyres above the front door, and our American bards seem to be as neatly provided with appropriate emblems.

It was in a letter to Mr. Conway that Mr. Emerson wrote a sentence which has already been widely circulated: "They say the ostrich hatches her egg by standing off and looking at it, and that is my present secret of authorship" (p. 14). There is another charming letter to him on the birth of a child (p. 15). Mr. Emerson told Mr. Conway that no early intellectual experience had ever so influenced him as Wordsworth's description of the effect of nature on the mind of a boy (p. 50); that he had used his sermons as material for his essays (p. 65); and many other private confidences. There are also very interesting statements illustrative of Emerson's influence in England,—the best of these being the fact that Professor Tyndall wrote "Purchased by Inspiration" in his copy of Emerson's "Nature" as being the book which first gave an active impulse to his mind.

Mr. Conway has also had access to some peculiarly valuable unpublished materials, apart from his own recollections; as in the case of an important correspondence between Mr. Emerson and the late Mrs. Lyman of Northampton (pp. 59-60); of a letter from Emerson to Mr. Ireland, describing his first visit to Carlyle (p. 75); and of an exquisite letter by Emerson to a youth who had sent him some verses. "They have truth and earnestness, and a happier hour may add that external perfection which can neither be com-

manded nor described" (p. 124),—which last phrase sums up all the canons of criticism in ten words. But perhaps the best of all the new matter in the book is the description by Miss Sarah Hennell of a visit made to her family by Emerson in 1848, where he saw "George Eliot," then Miss Marian Evans, and so remote from fame as to be mentioned by Miss Hennell as "Mary Ann." "He was much struck with Mary Ann (Miss Evans); expressed his admiration many times to Charles—"That young lady has a calm, serious soul'" (p. 338). It seems quite characteristic of both that, when Emerson asked her "What one book do you like best?" she answered, "Rousseau's Confessions," and he said, "So do I. There is a point of sympathy between us" (p. 339).

We find some errors in Mr. Conway's book, but they are mostly such as would naturally be made by one writing in England about American affairs, after slight points of time and locality had grown dim in memory. Rev. James Freeman Clarke did not "surrender his pulpit rather than exclude Theodore Parker from it" (p. 9), but he merely endangered it. Some of his influential parishioners left him, but he and his church went on. It is not "a mistake" (p. 86) to attribute to the New England Quakers the naked exhibition several times charged upon them, nor has Mr. Whittier proved that this was merely the reaction from Puritan whippings. Southey's "Commonplace Books" contain a long extract from the diary of an English Quaker of that period, who vindicates these naked performances as proper symbolical acts, without resorting to any such justification as Mr. Whittier has offered. The "Boston Museum" (mentioned on p. 160) is not a systematic collection of natural history, but is mainly a theater; Mr. Conway must mean the "Museum of Comparative Zoölogy" at Cambridge. Emerson was not made LL. D. at Harvard in 1867, but in 1866 (p. 162). Mr. George William Curtis was not graduated at Harvard, but at Brown University (p. 237). Mr. Alcott's twenty-dollar gold piece (p. 247) is reduced by several narrators to five or ten dollars. The name of George Searle Phillips is curtailed to "George Searle Phil" (p. 329), probably through some typographical misfortune. It was not at Longfellow's funeral, but on the way home from it, that Emerson spoke of having forgotten that poet's name (p. 382).

Exception might be taken to some of Mr. Conway's points of criticism or description. When he says of Emerson (p. 136): "He studied the sciences carefully, always keeping abreast of their vanguard," he goes too far. Emerson, after all, approached science as a literary man, not as a scientist, and simply read about it instead of studying it. There is sometimes a little inconsistency, as where Mr. Conway says (p. 112) that, from the time Emerson began to read "Lander," "his tone became less fervid and prophetic, and more secular," and then afterward remarks (p. 123): "In the first discoverable scrap of Emerson's writing there is to be found nearly the same literary style as in his last. The only authors whose influence seems traceable are Shakspere and Montaigne." On the other hand, some of his remarks are singularly acute and valuable, as this: "It would be difficult to cite from any generation authors so various in air and style as those whose minds have been personally

and strongly influenced by Emerson" (p. 297). Mr. Conway is himself conspicuously one of these minds, and the "personal equation" of his book is not a thing which we should wish to eliminate, but, indeed, contributes to give it a distinct and probably a permanent value as a part of the Emerson literature.

Dresser's "Japan: Its Architecture, Art and Art Manufactures."\*

IN his new book on Japan, Dr. Christopher Dresser has wisely chosen an entirely untrodden field in Japan. In "A Glimpse at the Art of Japan," Mr. Jarves has tantalized the student and the inquirer with a series of suggestive essays, chiefly historical, and none of which gives the slightest clue to what we want to know of the art of that wonderful and much-written-about country. Dr. Dresser went to Japan on a special mission: he was determined to discover, if possible, the secret of Japanese art. He thirsted for information concerning the motives and the processes of art, as it has been practiced for hundreds of years in an isolated and secluded kingdom. He accomplished much in the four months spent in the country; and, when we consider what he might have given us after an extended sojourn, we must needs regret the haste which necessarily characterizes his work. The faults of the book, which are by no means few or slight, are partly chargeable to the shortness of his stay and to his invincible and amiable good nature. It was his custom, evidently, to believe all that was told him.

Nevertheless, we have in this volume the first clear and satisfactory glimpse of the subject of which it treats. It is the only book, it may be said, that gives an intelligible notion of the theory and practice of art in Japan. Dr. Dresser was not only a guest of the nation, going on an official errand, but he is, as he says, "an architect and ornamentist by profession," and it is as a specialist that he submits his laborious volume. In the course of his extended journeys, he visited sixty-eight potteries and more than one hundred temples and shrines, many of which he studied minutely.

The work is divided into two parts, the first containing the simple narrative of the author's movements, his daily observations, and his reflections upon all that he saw and heard. These are set down with conscientious fidelity, and with much of what we may call "the local color." The second part contains chapters devoted to special subjects, religion and architecture, analogies and symbols, the manufactures of lacquer, pottery, metals, fabrics, etc., being each treated separately and with delightful clearness and minuteness. This part of the author's work contains a great deal that is new and valuable. It is to be regretted that he did not have time and space to describe at greater length the details of working in what is popularly known as cloisonné enamel. The general description of this branch of art with which he favors us is not new; and if he could have gone into details as to the methods employed in the preparation and coloring of the materials used in the

enameling, he would have done a substantial service to the potter's art. But the chapters on lacquers and pottery may be commended to the reader as models of patient and intelligent study and preparation.

The author is evidently a close student of what may be termed evolution in art. It was his desire to discover, if possible, whence the Japanese have derived their designs, theories, and knowledge of art and art-processes. He finds in Japan many curious analogies leading to Egypt, Greece, India, China, Corea, and distant parts of Asia. His studies of these branches of inquiry, although they may not all be received with unquestioning faith, are highly interesting. In the matter of designs of a purely native origin, also, the reader will find much novel entertainment in the illustrations that profusely adorn the work. A striking example may be found on page 278, where is given a cut from a Japanese artist's drawing, showing the origin of the familiar "hawthorn" pattern of decoration on porcelain. The translation of the legend, "The late frost nips the plum blossoms, and causes them to fall on the thin and cracked ice," sufficiently explains the design and its source.

The only drawback to the complete enjoyment of the volume is the ineptitude with which it has been put together. The flaws in the composition are numerous and often flagrant. The persistent use of the present tense is tedious, exasperating, and sometimes ludicrous. The author seems to have taken out a license to revise the generally received orthography of Japanese names to suit his own whims. For example, there is neither sense nor reason in his giving us "sachi" for the liquor commonly known as sake, and so spelled by all makers of Anglo-Japanese dictionaries. Nor is "Cutane," for Kutani, any more reasonable than any of the numerous other changes in the names of towns and cities which the author has unwarrantably made. We find him taking from Dr. Wistar the dedication to him of the climbing plant known as the wistaria, and repeatedly referring to it as the "westeria." These little liberties taken with existing facts and accepted theories are calculated to shake our faith in the authority of the writer. But this is a minor drawback to one's enjoyment of what must long be considered the best work ever written on the industrial art of Japan.

Mabie's "Norse Stories."\*

To render poetry, and especially old Scandinavian poetry, in good English prose, is a difficult task, as any one who has tried it is apt to appreciate. What Mr. Mabie has undertaken to do, however, is not to paraphrase the lays of the Elder Edda and the tales of the Younger, but rather to select the most interesting and poetic myths, clothing them in a form which would appeal to modern readers. A translation of the Elder Edda, retaining the alliterations and the rhapsodic form, was published many years ago by Mr. Thorp; and Professor R. B. Anderson, of the University of Wisconsin, gave us recently a very creditable version of the principal portions of the Younger. These two works, and possibly also Mallet's "North-

\* Japan: Its Architecture, Art, and Art Manufactures. By Christopher Dresser, Ph. D., F. L. S., etc. London: Longmans, Green, & Co. New York: Scribner & Welford.

\* Norse Stories Retold from the Eddas. By Hamilton Wright Mabie. Boston: Roberts Brothers. 1882.

ern Mythology," have furnished Mr. Mabie with the material for his pleasing stories, and it must be admitted that he has performed his task both with taste and skill. The arrangement of the myths, in what might be called their chronological sequence, is especially to be commended. The creation of the world from the body of the giant Ymer, the happy life of the gods in the shining Valhalla, their adventures and perpetual warfare with the giants, their destruction at Ragnarök by the powers of evil, and the final regeneration of the world under the reign of one god, All-father, are described with a happy simplicity and a keen appreciation of the poetic element in each separate myth. Especially delightful is the story of Balder, the God of Love, who, through the machinations of Loke, was slain by the blind god Höder, and had to descend to the under-world, whence he returned after the great battle of Ragnarök to reign once more over a peaceful and happy earth.

Although Mr. Mabie's book is primarily intended for youthful readers, to whom the heroic element in such tales as Thor's "Fishing" and his fight with Hrungner must strongly appeal, there is a poetic suggestiveness in many of the myths, the full significance of which can only be appreciated by maturer minds. Thus, the charming tales of the "Apples of Ydun" and Odin's "Search for Wisdom" are replete with elusive hints, which invite to poetic treatment; and "The Twilight of the Gods," with its sequence "The New Earth," seem to contain an obvious allegory, prophesying the end of the bloody reign of the ancient gods, and the harmonious development of humanity under a new and peaceful code, when war shall have disappeared, and Balder the Beautiful, returning from the dead, shall pervade the earth with his beneficent influence. Mr. Mabie has done wisely, however, in confining himself to pure narrative and avoiding the many tempting opportunities for allegorical interpretation. That the above-named myths indicate a dim consciousness on the part of the Norsemen that their fierce and fratricidal religion was destined to be superseded by a gentler and more humane creed, is scarcely to be questioned, but beyond that fact all conjectures are unsafe. That Odin was neither a sun-myth, nor personified valor, nor a corruption of an original purer conception of the deity, has been demonstrated; while there is a strong probability in the theory which assigns both him and his colleagues definite places in remote history as chiefs who led the Teutonic tribes in their early wanderings from their home in Central Asia.

#### Bartlett's "Life of Rimmer" \*

DR. RIMMER is one of the many figures in American art that fill one with uneasiness. The artistic genius in this country, until recently, has had no place. In other circumstances Rimmer might have achieved more satisfactory results; here everything was against him, though perhaps nothing was so much against him as a disquiet and pride inherited from a father who believed himself a prince by birth, and his own inherent

lack of patience and humble teachableness. He had a strong artistic temperament, but was thorough in nothing except anatomy. In that he was an excellent theoretic teacher, though he always disapproved of dissection for art-students, and, in explaining the most difficult parts of interior anatomy, would use the blackboard only.

Rimmer made his strongest impression not in his studied designs, pictures, and modelings, but at the blackboard. He had a most facile pencil, and would improvise on the blackboard as a musician does on the key-board, producing varied and beautiful harmonies of line. He was eminently a draughtsman, caring little for the illusion which a picture-maker is apt to cherish. He was totally ignorant of color, and took very uncertain interest in form as such; but *line* as a rapid means of expressing a situation, an idea, a passion, was always at his own command, and strongly moved him in such men as Rembrandt and Michael Angelo. His enormous egotism not only prevented him from understanding and learning from his immediate contemporaries, but kept him from acknowledging indebtedness to an older artist like Allston (whom he was doubtless affected by), or to a modern master like Blake, who also evidently had a decided effect upon his thought.

As a teacher he will long be remembered with gratitude by many who were helped on by his stimulating manner and ready encouragement. As is apt to be the case to-day, his best pupils were women, who, for the sake of learning, were willing to be "bullied," and who would blindly follow his lead. Mr. Bartlett's book contains many curious testimonials and notes from this class of acquaintances and critics. The author throughout has done, perhaps, a little more than justice to an extraordinary man—a man of an irascible and far from frank disposition; of much untrained and unfruitful power; and one whose career was pathetically painful and unsatisfactory. The reproductions scattered through the volume will give an idea of the largeness and vigor of some of Rimmer's conceptions.

#### Hunt's "Talks on Art." \*

THE second series of the late Mr. Hunt's "Talks," as preserved by one of his pupils, is, if anything, of more value and interest than the first,—although the first has had a success at home and abroad which must have been gratifying to the artist. Both books give an interesting insight into his method of teaching, which seems to have been by a series of mental shocks—alternations of scorn with extravagant praise. He regarded his pupils as little children, and scolded or commended them accordingly. Artists will find the book full of suggestion, and the general reader will learn much in it of interest in regard to Millet and Couture (both of whom Hunt knew well) and in regard to many other persons and things of artistic and human interest; and the same general reader, as well as the artist, will get either a pleasant or a painful, and very likely a profitable mental fillip, from nearly every paragraph.

## Ole Bull.\*

OLE BULL was an interesting character, and his long and eventful life afforded the material for a capital biography; and if his wife has failed to avail herself of her opportunity, her failure is attributable to the fact that wives are never good biographers. It may be that Mrs. Bull, in calling her book a memoir, disclaims the purpose of writing a biography, in the sense of a complete and systematic account of her late husband's career. But even a memoir, though it permits of a looser construction, can scarcely be called successful, unless it presents a tolerably vivid picture of its subject and affords the reader an insight into the workings of his mind. After reading Mrs. Bull's book, we know Ole Bull no better than we did before. We are, to be sure, made acquainted with the circumstances of his life, and several entertaining anecdotes are related, which tend to exhibit him in his heroic rather than in his every-day aspect. The tale of his triumphs, which were indeed well merited, is recited at great length, and the exemplary manner in which he bore all the vicissitudes of fate is commented upon. But, though we should not presume to question the correctness of the biographer's view, it is not to be denied that it fails to command the reader's credence. Such bloodless perfection as is here exhibited would be highly anomalous in an artist of Ole Bull's volatile, impulsive and passionate nature. The man Ole Bull whose acquaintance we hoped would in some degree account for the artist Ole Bull and make him humanly intelligible, has not sat for the portrait in this book, though his external lineaments are faithfully enough depicted in the frontispiece. It is an apotheosized ideal of an artist and husband which is reflected in these pages, and though there may be glimpses here and there of the handsome Norwegian gentleman whom many of us had the good fortune to know, it is, as it were, only his public and stage character which we are permitted to view.

The most entertaining portion of the book is, perhaps, the chapter relating to Ole Bull's childhood among the mountains and fiords of Norway. He was born in Bergen, in 1810; his family were well-to-do and belonged to the upper classes. The boy's musical genius manifested itself at an early age, and his passion for his "fiddle" (which was not encouraged by his parents) induced him to practice at night in a ravine called the "Giant's Caldron," scaring the peasants out of their wits and giving rise to legends about fairies and nixies. His struggles with poverty during his first years of study abroad, and his first decisive triumph at Bologna, brought him in contact with all the musical celebrities of the day, and before long all Europe was echoing with his fame. The sketches of great singers and virtuosos like Malibran, Beriot, Fanny Elssler, Chopin, and Liszt, which are here introduced, are very pleasant reading, and the intrigues by which rival artists and impressarios tried to arrest his triumphal progress are of the kind which we are prepared to look for in the life of every eminent musician. What lends, however, an additional interest to the career of Ole Bull, is the more or less

intimate relations which he sustained with nearly all the celebrities of the century, in the world of letters, art, and politics. There was a singular charm in his presence, to which even the most obdurate cynic had in time to surrender. Kings and emperors lavished favors upon him, and poets, sculptors and painters found inspiration in his music and pleasure in his company. This music is now out of date, and the school which he represented has been superseded by another in which technique plays a larger rôle. The more complex and perhaps more profound interpretation of emotion, attained by later masters of the violin, presupposes a higher musical culture on the part of the public, and would scarcely have appealed to American audiences thirty or forty years ago as did the direct and headlong method of Ole Bull with his imitation of natural sounds and alluring echoes from Norse fiords and mountains. The unexampled enthusiasm which he excited during his first visit to the United States, in 1843, is reflected in diaries, newspapers and magazines, from which Mrs. Bull makes copious extracts. Even though we may hesitate to indorse the extravagant verdict of his eulogists of that time, the fact still remains that he was a man of genius whose art and personality merit a more critical study than they have here received.

## "College Cuts."\*

IN the many daily, weekly, fortnightly, and monthly journals edited and published by the undergraduates of American universities, is to be seen in actual operation that College of Journalism, which was once the hypothetical subject of much discussion and desire. The young man who has done his stint of work on his college paper has got something of an insight into journalism in both its literary and its practical aspect; and if the paper was illustrated, he has a still wider experience. Since the improvement of the various processes of photo-engraving, many of these college journals are illustrated, none of them more successfully than the "Spectator" of Columbia College, which for several years has been adorned with satiric cartoons, generally on college topics, and with pertinent and impertinent cuts on society at large. Yet it was a bold thing to collect three or four score of these sketches of society, and to send them forth in a volume with a dedication to Mr. Du Maurier. But boldness is justified of its children. The drawings are better than one would expect from inexperienced young men, and the jokes beneath them have often a high degree of literary merit. There is abundant humor and point in the legends, some of which are as neat and as polished as one could wish. "Cause and Effect" (page 41) and "Robbing Peter" (page 45) have true comedy in them; and "A Sinecure" (page 50) is a delightful bit of fun,—a little too collegiate in its flavor, it may be, for most readers, but only the more enjoyable, perhaps, to those who can appreciate the point. It must be noted, however, that but few of these "College Cuts" have to do with student-life; most of them are pictures of society as it is seen outside of scholastic halls. And it may be that the future

\* College Cuts. Chosen from the "Columbia Spectator." 1880-81-82. New York: White & Stokes.

social satirist of New York, who is to do for America what Leech and Mr. Du Maurier have done for England, is to be found among these young artists. For one thing, they are Americans, and they depict American scenes and feelings. For another, their drawing is really promising, and their present performance is of merit enough to warrant hope of much better work in the future. Consider the earlier sketches of Mr. Du Maurier himself, and see the progress the artist has made as he gained mastery over himself; consider especially the delicate indelicacies of M. Grévin, a draftsman whose work is now done with the utmost economy of labor, in the merest and most effective outline, with no stroke wasted; consider M. Grévin's earlier drawings, involved, elaborated, cross-hatched,

and note how different they are from the work he does now, when he has full confidence in himself; consider these things, and confess, as we turn these "College Cuts," that Mr. Herzog and Mr. M'Vickar and Mr. Coles have qualities which may develop greatly in the future,—when they will demand more consideration than need now be vouchsafed to these firstlings of their muse, interesting and amusing as this volume of "College Cuts" will be found.

IN the first edition of THE CENTURY for February, 1883, page 603, first column, for "Pompey," read "Titus"; and page 581, second column, for "Robert G. Shaw," read "Francis G. Shaw."

## BRIC-À-BRAC.

## Cupid as Reporter :

A REMINISCENCE OF ST. VALENTINE'S.

I'm not at home if Cupid calls (she said)  
To ask for "news" concerning whom I'll wed;  
The subject has no interest for me,  
Nor even sense, so far as I can see.  
Besides, I hate the matrimonial press,  
And petty puffs of fortune, face, and dress.  
So, if he calls—that brazen baggage, Cupid!—  
Just say I'm out, or ill, or—stay, you stupid!  
Invite him in—but say, with cold regard—  
Mind, *very* cold!—"Please, sir, I'll take your card!"

Hark! some one knocks! Can it be he, I wonder?  
It must be he—just hear the knocker thunder!  
Yes!—*Come right up!*—Poor fellow, he's in haste;  
'T would be a shame his precious time to waste.  
'What rosy cheeks!—what *perfect* taste in dressing!  
And yet, I fear!—these press-men are so pressing!  
Good-day, kind sir!

CUPID.

Sweet Lady, I am sent  
By "Hymen's Times" to get your views anent  
A candidate for our next spring-election;  
Is Mr. C—the man of your selection?

SHE.

Oh, dear me, no! (Be seated, please, by me.)  
Yet do not think we do not quite agree;  
And do not say that I have told you this,  
Or that I'm not for him—swear on this kiss!—  
And this!—since two are needed to a bargain.  
And this!—since three will leave one kiss for margin.

CUPID.

Sweet Lady, please repeat! I've seldom heard  
Such eloquence, and wish to jot each word.  
Ah, thanks!—I fear you'll smother my next question!  
If you will pardon me the bold suggestion,  
Do you prefer some other candidate?

SHE.

Oh, dear me, no! But, sir, you must not state  
That he's *already* on the Party-slate!—  
And do not say that I have told you this,  
Or that I care for him!—swear on this kiss!—

CUPID.

Sweet Lady, I can "swear" the heavens blue—  
And I am free to say *he* swears by *you*!  
The point is not, to swear my blue eyes dim,  
But frankly this: will *you* swear thus by *him*?  
If you refuse, 'tis settled in a trice!—  
Another Party calls him "*very nice*!"

SHE.

What, she!—O Cupid, hasn't he more sense?  
Her charms are all in the imperfect tense.  
I will say this: He's far too good a man,  
To be entrapped by that sly Party's plan.  
He ought to join some Party of the best  
Youth, beauty, taste, found either East or West;  
Whose principles, both elegant and sound,  
Are firmly based on such important ground  
As strict reform of the Domestic Service—  
But do not say that I have told you this,  
Or know such Party—swear upon this kiss!

CUPID.

Sweet Lady, you're that Party to the letter,  
But he describes your virtues, more and better,—  
Then may I understand we *quite* agree?—

SHE.

Who has my suffrage asks on bended knee!  
But do not say that I have told you this—

CUPID.

I "swear," Sweet Lady, on a triple-kiss!

\* \* \* \* \*

SHE.

Here's "Hymen's Times," Feb. 14—'83;  
I wonder what it says regarding me?—  
GOOD GRACIOUS!—was there ever such a scandal!  
He's *printed every word I said!*—THE VANDAL!  
Not only that!—He's interviewed my maid!  
And she has told him all she knew!—The jade!

Ah, well!—who'll be the wiser anyway?—  
You can't believe a word the papers say.

Clarence Clough.

## Rondeaux of Cities.

## I.

## RONDEAU À LA BOSTON.

A CULTURED mind! Before I speak  
The words, sweet maid, to tinge thy cheek  
With blushes of the nodding rose  
That on thy breast in beauty blows,  
I prithee satisfy my freak.

Canst thou read Latin and eke Greek?  
Dost thou for knowledge pine and peak?  
Hast thou in short, as I suppose,  
A cultured mind?

Some men require a maiden meek  
Enough to eat at need the leek;  
Some lovers crave a classic nose,  
A liquid eye, or faultless pose;  
I none of these. I only seek  
A cultured mind.

## II.

## RONDEAU À LA NEW YORK.

A POT of gold! O mistress fair,  
With eyes of brown that pass compare,  
Ere I on bended knee express  
The love which you already guess,  
I fain would ask a small affair.

Hast thou, my dear, an ample share  
Of this world's goods? Wilt thy papa \*  
Disgorge to gild our blessedness  
A pot of gold?

Some swains for mental graces care;  
Some fall a prey to golden hair;  
I am not blind, I will confess,  
To intellect or comeliness;  
Still let these go beside, *ma chère*,  
A pot of gold.

## III.

## RONDEAU À LA PHILADELPHIA.

A PEDIGREE! Ah, lovely jade!  
Whose tresses mock the raven's shade,  
Before I free this aching breast,  
I want to set my mind at rest;  
'Tis best to call a spade a spade.

What was thy father ere he made  
His fortune? Was he smeared with trade,  
Or does he boast an ancient crest—  
A pedigree?

Brains and bright eyes are overweighed;  
For wits grow dull and beauties fade;  
And riches, though a welcome guest,  
Oft jar the matrimonial nest.  
I kiss her lips who holds displayed  
A pedigree.

## IV.

## RONDEAU À LA BALTIMORE.

A PRETTY face! O maid divine,  
Whose vowels flow as soft as wine,  
Before I say upon the rack  
The words I never can take back,  
A moment meet my glance with thine.

\* Pronounced papaire.

Say, art thou fair? Is the incline  
Of that sweet nose an aquiline?  
Hast thou, despite unkind attack,  
A pretty face?

Some sigh for wisdom. Three, not nine,  
The graces were. I wont repine  
For want of pedigree, or lack  
Of gold to banish Care the black,  
If I can call forever mine  
A pretty face.

Robert Grant.

## Aphorisms from the Quarters.

SOME pocket-knives mus' 'a' been made to len' out.

A man dat kin make a libin' playin' de fiddle aint ap' to pester de hoe-handle.

'Casionally, a man wid right smart edication can't find his knife when it git in de wrong pocket.

A long spell o' roomatiz is ap' to p'int out your bes' friends.

De rainbow might be better lookin' ef 'twa'n't sech a cheap show.

De bottom o' de meal-box make mighty po' music.

Big blaze o' fire can't roas' your 'taters.

De bes' seed ain't bound to make big water-millions.

It's a mighty rotten old house dat wont make kindlin'-wood.

Bresh-fire soon gone.

Heap o' wummy scaly-barks come orf de top limbs.

De crawfish gits into trouble by buildin' too fine a chimney to a little house.

You can't take de twis' out de gra'-vine by cultervatin' it.

Peacock can't hide his foots by spreadin' his tail.

Green 'simmons aint 'fraid o' nobody.

Edication don't come by bumpin' 'g'in de school-'ouse.

When de morkin'-bird try to mork eb'rything, he boun' to let out some music dat aint wuf much.

It's a mighty lazy nigger dat don't keep his ax sharp.

A hole under de garden palin's is a hard secret to keep.

See whar you gwine to hit 'fo' you lif' your hoe.

Sas'fus-root tea wont hu't your 'specterbility when de crap come out short.

Too much trabblin' on de railroad make some folks lose de right lick for de cotton-patch.

De young peaches safe when de martin start her nes'.

You don't need much fence roun' de cowcumber vine.

J. A. Macon.

THE readers of this Department will be glad to know that Mr. J. A. Macon, whose name often has appeared of late as a contributor to these pages, has recently collected his published poems, songs, and aphorisms, and with much additional matter has issued them in book-form. This volume, entitled "Uncle Gabe Tucker; or Reflection, Song, and Sentiment in the Quarters," is published by Messrs. J. B. Lippincott and Co., of Philadelphia.
